Ipecacuan was firf brought into Europe about the middle of laft century, and an account of it publifhed about the fane time by Pifo; but it did not come into general ufe till about the year 1686, when Helvetius, under the patronage of Louis XIV. introduced it into practice. This rout is one of the millefl and fafeft emetics with which we are acquainted; and has this peculiar advantage, that if it thuuld not operate by vonit, it paftes off by the other emunctories. It was firl introduced amongr us with the character of an almolt infallible renedy in dyfenteries, and other inveterate fluxes, as menorrhagia and leucorrheea, and allo in difurders procteding from obllructions of long flanding: $n$ re lias it loft much of its reputation by time. In dyfenteries, it almolt always produces happy effects, and often performs a cure in a very thort face of time. In other fluxes of the helly, in beginning dyfenteries, and fuch as are of a niahgnant kind, or where the patient breathes a trinted air, it has not been found equally fuccefsful: in thefe caies it is neceffary to continue the ufe of this medicine for feveral days, and to join with it opiates, diaphuretics, and the like. This root, given in fuhilance, is as effectual, if not more fo, than any of the preparations of it : the pure refin acts as a llrong irritaing emetic, but is of little fervice in dyfenteries; while an extract prepared with water is almolt of equal fervice in thefe cales with the root itfelf, though it has little effect as an emetic. Geoffroy concludes from hence, that the chief virtue of ipecacuan in dyfenteries depends upon its gummy fubftance, which lining the inteftines with a foft mucilage, when their own mucus has been abraded, occalions their exulcerations to heal, and defends them from the acrimony of the juices : and that the refinous part, in which the emetic quality refides, is required, where the morbific matter is lodged in the glands of the ftomach and inteftines. But if the virtues of this root were entirely owing to its mucilaginous or gummy part, pure gums, or mucilages, might be employed to equal advantage. Water, affilted by a boiling heat, takes up from all regetables a confiderable portion of refinous along with the guminy matter: if the ipecacuan remaining after the action of water be digetted with pure fpirit, it will not yteld half fo much refin as at firtt: fo that the aqueeus extract differs fion the crude root only in degree, being proportionably lefa

## I P E

refinous, and having lefs effect, both as an emetic, and in the sure of dyfenteries. The virtues of ipecacuan, in this diforder, depend upon its promoting perfpiration, the freedom of which is here of the utmoft importance, and an increafe of which, even in healthful perfons, is generally obferved to fupprefs the evacuation by dool. In dyfenteries, the nisin is for the molt part dry and tenfe, and perfpiration obftructed: the commundiaphoretics pafs off without effect through the intellinal canal: but ipecacuan, if the patient after a puke or two be coverce up warm, brings on a plentiful fweat. After the removal of the dyfentery, it is neceffary to continue the ufe of the medicine for fome time longer, in order to prevent a relapfe; for this purpofe, a few grains divided into feveral dofes, fo as not to occafion any fenfible evacuation, may be exhibited every day; by this means the cure is effectually eftablithed. And indeed fmall dofes given, even from the beginning, have been often found to liave better cffects in the care of this difeafe than larger ones. Geoffroy informs us from his own experience, that he has obferved ten grains of the powder to act as effectually as a fcruple or two; and therefore confines the dofe betwixt fix and ten grains: it has lately been found, that even fmaller dofes prove fufficiently emetic. The only officinal preparation of this root is a tincture made in wine, which accordingly has now the appellation of vinum ipecacuanhs, both in the London and Edinburgh pharmacopœias.

Many ingenious experiments have been made on the fubject of ipecacuan by Dr Irving, for which he obtailued the prize medal of the Harveian Society at Edinburgh for $1^{78} 4$. He has afcertained, that while this root contains a gummy relinous matter, yet that the gummy exifts in a much greater proportion than the refinous part ; that the gummy part is much more powerfully emetic than the relinons; that although the cortical part of the root be more active than the lignecus, yet that even the pure ligneous part poffefics a corfiderable emetic power: and that the whole of the root pofferis confiderahie influence, hoth as an autifeptic and a'tringent To deter:mine whether the emetic power of ipecacuan was of a volatile or fixed nature, Dr Irving ful jected it ro diftillation. The water obtained by difillation was found to have very little in. fluence; but the decoction which remained in the fill, not only operated violently as an emetic, but produced rigours, cold fweats, and other alarming fymptoms. By long continued builing, the acivity of the root itfelf is almo! totally deftroyed; but Dr Irring found, that the emetic property of ipecacuan was moft effectually counteracted by mears o the acetous acid, infomuch that thirty graius of the powder taken in two ounces of vinegar produced anly fome loofe Itools.

Ipecacuan, particularly in the ftate of powder, is now advantageounly employed in almot every difeafe in which full vomiting is indicaied; and when combined with opium under the form of the puivis fudorificus, it furnifhes us with the mor ufeful and active fweating medicine which we poffefs. It is alfo often given with advantage in very fmall dofes, fo as neither to operate by vomiting purging, nor fweating.

The full dofe of the powder is a fcruple or half a dram, and double that in form of watery infulion. The full dofe is recoromeaded in the paroxyfm of
fpafmodic anthma, and a dofe of three or four grains Iphivenia every morning in habitual althmatic indifpofition. A dofe of $\frac{4}{\tau}$ or $\frac{1}{2}$ grain rubbed with fugar, and given every four hours or oftener, is recommended in uterine hemorrhagy, cough, pleurify, lwamoproe, \&cc. and has often been found highly fer viceable.

IPHIGENIA, a dangliter of A gamemnon and Clýteinneltr.t. When the Greeks going to the Trojan war were detained by contraty winds at Aulis, they were informed by one of the foothrayers, that to appeafe the gods they mult facrifice Ipligenia Agamemnon's daughter t, Disaa. The father, who had provoked the goddefs by kiiling her farourite flag, heard this with the greatell horror and indiguation, and rather than to fhed the blood of his dausiter, he commanded one of his huralds, as chief of the Grecian forces, to order all the affembly to depart each to his refpective home. Ulyffes and the other generals interfeted, and Agamemnon confented to immolate his daughter for the common caufe of Greece. As Iphigenia was tenderly loved by her mother, the Greeks fent for her on pretence of giving her in marriase to Achilles. Clytemnettra gladly permitted her departure, and Iphigenia came to Aulis. Here fhc faw the bloody preparations for the facrifice. She implored the forgivenefs and protection of her father; but tears and eatreaties were unavailing. Calchas took che knife in his hand; and as he was going to trike the fatal blow, Iphigenia fuddenly difappeared, and a god of uncommon fize and beauty was found in her place for the facritice. This fupernatural charre animated the Greeks, the wind fuddenly became favourable, and the combined flet fet fail from Aulis.

IPICRATES, general of the Athenians, had that command conferred upon him at 20 years of age, and became famous for the exacinefs of his military difcipline. He made war on the Thracians; rettored Senthes, who was an ally of the Athenian:; atracked the Lacedxmonians; and, on many other occafions, gave figual proofs of his conduct and conrage. Many ingeniuns repartes have been mentioned of this general: a man of good family with no other merit than his nobility, reproaching him one day for the meannefs of his birth, he replited, " 1 thall be the firft of my race, and thou the latit of thine." He died 3 So B. C.
iPOMEA, evamolit, or Scarlet Convolvinus: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 29th order, Campanacee. The corolla is funnel-fhaped; the ftigma round-headed; the capfule triloculor. There are feveral ípecies; but not more than one, (the coccinea), cultivated in our gardens. This hath long, flender, twining ftalks, rifing upon fupport fix or feven feet high. The leaves are heart-fhaped, pointed, and angulated at the bafe, and from the fides of the talks and branches arife many flender footftalks; each fupporting feveral large and beautiful funnel- flaped and icarlet flowers. Thore is a variety with orange coloured flowers. Buth of them are annual, rifing from feed in fpring, flowering in July and Augull, ripening their feeds in September and October, and totally perifhing in a fhort time afttr. They are tender, and mult be brought up in as bot-bed till the lattic end of May or beginning of borders, or fome may be planted in pots to move occafionally to adorn any particular place; but in either cafe, there muft be Aicks for them to twine upon.

IPSWICH, the capital of the county of Suffolk in England, feated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon Gypefrich, that is, a town fituated upon the Gyppen, now called Orvell. It had once 21 churches, but now has only 12 . It was plundered by the Danes in 991, and afterwards befieged by king Stephen. It had charters and a mint in the reign of king John, but its laft charter was from Charles II. The remains of a wall and fix or feven religious houfes are till to be feen. Though it is not in fo flourifhing a flate as formerly when the harbour was more commodious, yet it is fill a large well-built town. Befides the churches already mentioned, it has feveral meeting-houfes, two chapels, a town-hall, council-chamber, a large market-place with a crofs in the middle of it , a fhire-hall for the county feffions, a library, feveral hofpitals, a free-fchool, a handfome fone-bridge over the river, ftately fhambles in the matkes-place built by cardinal Wolley, who was a native of the town and a butcher's fon, and who alfo began to build a college here on the ruins of a fmall college of black canons, which fill bears his name, though it was never finifhed. Here are alfo feveral alms-houfes, three charity-fchools, and a convenient key and cultom-houfe. By virtue of Charles II.'s charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a townclerk, two coroners, and 24 common-council. The bailiffs and 4 of the portmen are juttices of the peace. The town enjoys a great many privileges, as paffing fines and recoveries, trying criminal, and even crown and capital caufes among themfelves, fettling the affize of bread, wine, and beer. No freeman is obliged to ferve on juries out of the town, or bear any office for the king, except that of the Cheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty jurifdiction beyond Harwich on the Effex coaft, and on both fides the Suffolk coaft, by which they are intitled to all goods caft on fhore. The bailiffs even hold an admiralty-court beyond Landguard-fort. By a trial in king Edward III.'s time, is appears that the sown had a riglit to the cu-ftom-duties for all goods coming into Harwich-haven. They claim a right alfo to all waifes and ftrays, \&c. The manufactures of the town are chiefly woollen and linen cloth. It has ftill a confiderable foreign trade. The tide rifes pretty high, and brings great hips within a fmall diftance of the town. They export a great deal of corn to London, and fometimes to Holland. Formerly, they had a great trade in Bhipbuilding; but that having declined, they now fend great quantities of timber to the king's yard at Chatham. It has feveral great fairs for cattle, chetfe, and butter; and is admirably fituated for the trade to Greenland, becaule the fame wind that carries them out of the river will carry them to Greenland. It is worth remarking, that it is one of the belt places in England for perfons in narrow circumitances, houferent being eafy, provifions cheap and plentiful, the paffage by land or water to London, \&c. conve$\mathrm{N}^{\circ} 168$.
nient, and the cumpany of the place good. It gives title of vifcount, as well as Thetford, to the duke of Grafton ; and fends two members to parliament.

IRASCIBLE, in the old philofophy, a term applied to an appetite or a part of the foul, where anger and the other paffions, which animate us againft things difficult or odious, were fuppofed to refide.

Of the eleven kinds of paffions attributed to the foul, philofophers afcribe five to the irafcible appetite; viz. wrath, boldnefs, fear, hope, and defpair: the other fix are charged on the concupifible appetite, viz. pleafure, pain, defire, averfion, love, and hatred.

Plato divided the foul into three parts; the reafonable, irafcible, and concupifcible parts. The two lat, according to that philofopher, are the corporeal and nortal parts of the foul, which give rife to our paffions.

Plato fixes the feat of the iraccible appetite in the heart; and of the concupifcible in the liver; as the two fources of blood and fpirits, which alune affect the mind.

IRELAND, one of the Britannic iflands, fituated between the 5 th and loth degrees of weft longitude, and between the 5 IIt and 56 th of north latitude, extending in length about 300 miles, and about 150 in breadth.

The ancient hiftory of this ifland is involved in fo much obfcurity, that it has been the object of contention among the antiquarians for upwards of a century and an half. The Irifh hiforians pretend to very great antiquity. According to them, the ifland was Ori firlt inhabited about 322 years after the flood. At the that time Partholanus the fon of Scara landed in Mun- acci fter on the $14^{\text {th }}$ of May with 1000 foldiers, and fome hift women, from Grcece. This voyage he had underta. ken on account of his having killed his father and mother in his native country. The fame hiftorians inform us, that a great number of lakes broke out in Ircland dusing the reign of Partholanus, which had no exiftence when he came into the inland, with many other particulars not worth mentioning ; but the molt furprifing circumftance is, that about 300 years after the arrival of this Grecian colony, all of them perifhed by a plague, not a fingle perfon remaining to tell the fate of the $r \in f t$; in which cafe, it is wonderful how the cataftrophe fhould have been known.

After the extinction of this firft colony, Ireland remained a perfeet wildernefs for 30 years; when another colony arrived from the eatt, under the direction of one Nemedius. He fet fail from the Euxine fea with 30 tranfports, each manned with 40 heroes; and at laft arrived on the coalts of Ireland, after a very tedious and ftrange navigation. During his reign alfo many lakes were formed in the country, which had no exiftence before ; the moft material circumitance, however, was an unfuccefsful wár in which he was engaged with fome African pirates, who in the end enflaved his people. The victors proved fuch infupportable tyrants, that the Irifh found themfelves under a neceffity of quitting the ifland altogether. They embarked on board a fleet of 1130 fhips, under the command of three grandfons of Nemedius, viz. Simon Breac, To Chath, and Briatan Maol. The firlt returned to Greece, the fecond failed to the northern parts of Eu-

## I R E

d. rope, and the third landed in the north of Scotland, and from him the ifland of Britain is faid to have taken its name, and the Wellh their origin.

About 216 years after the death of Nemclius, the defcendants of Simon Breac returned from Greece into Ircland. They were conducted by five princes of great reputation, who divided the inand into five kingdoms, nearly equal in tize. Thefe kingdoms were called Munfler, Deinfter. Connaurbt, Meath, and Ullfer; and the lubjects of thefe kings are called by the Irinh hiftorians Firbolgs.

The Firbulgs were in procels of time expelled or totally fubdued, after the lofs of 100,000 men in one battle, by the Tuudto de Dannans, a nation of necromancers who came from Attica, Breotia, and Achaia, into Denmark; from Denmark to Scotland; and from Scotland to Ireland. Thefe necromancers were fo completely fkilled in their art, that they could even refore the dead to life, and bring again into the field thofe wartiors who had been flain the day before. They had alfo fome curiofities which poffeffed a wonderful virtue. Thefe were a fivord, a fpear, a cauldron, and a mable chair ; on which laft were crowned firft the kings of Ircland, and afterwards thofe of Scotland. But neither the powerful virtues of thefe Danifl curiofities, нor the more powerful fells of the magic art, were able to preferve the Tuath de Dannans from being fubdued by the Gadelians when they invaded Ireland.

The Gadelians were defcended from one Gathelns, from whom they derived their name. He was a man of great confequence in Egypt, and intimately acquainted with Mofes the Jewifh legifator. His mother was Scota, the daughter of Pharaoh, by Niul the fon of a Scythian monarch cotemporary with Nimrod. The Gadelians, called alfo Scots, from Scota abovementioned, conquered Ireland about $1,300 \mathrm{~B} . \mathrm{C}$. under Heber and Heremon, two fons of Milefius king of Spain, from whom were defcended all the kings of Irelan 1 down to the Englifh conqueft, and who are therefore Atyled by the Irif hiftorians princes of the ATilyfun race.

Fium this period the Irifh hiftorians trace a gradual refinement of their countrymen from a fate of the groffell barbarity, until a monarch, named ollum Fodh, eftablifhed a regular form of government, erected a grand feminary of learning, and inftituted the Fes, or triennial convention of provincial kings, priets, and poets, at Feamor or Tarah in Meath, for the eftablifhrnent of laws and regulation of government. But whatever were the inflitutions of this monarch, it is acknowledged that they proved infufficient to withfland the wildnefs and diforder of the times. To Kimbath, one of his feeceffers, the arnalifts give the honour of reviving them, befides that of regulating U1fter, his family province, and adorning it with a llately palace at Eamannia near Armagh. EZis inmediate fuccefor, called Hugory, is fill more celcbrated for advancing the work of reformation. It feems, that, from the carlieft origin of the Irifn nation, the ifland had been divided into the five provincial kingdoms above. mentioned, and four of thefe had been fubject to the fifth, who was nominal monarch of the whole ifland. Thefe four, however, proved fuch ohflinate difturbers of the peace, that Hugony, to break their power, Vol. IX. Part. I.
parcelled out the country into 25 dynaftics, binding theu by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himfelf died a violent death, and all his fucceffors for a feries of ages were affaffinated, fcarcely with one exception.

About 100 B. C. the pentarchal government was reftored, and is faid to have been fucceeded by a con fiderable revolution in politics. The Irith bards had for many ages difpenfed the laws, and the whole nation fubmitted to their decifions; but as their laws were exceedingly obfcure, and could be interpreted only by themfelves, they took oceation from thence to opprefs the people, uncilat laft they were in danger of being totally exterminated by a general infurrection. In this emergency they fled to Convocar-Mac-Nefla, the reigning monarch, who promifed them his protection in cafe they reformed; but at the fane time, iu order to quict the juft complaints of his people, he employed the moft eminent among them to compile an intelligible, equitable, and diftinet, body of laws, which were received with the greatelt joy, and dignified with the name of celflial decifions. Thefe decifions feen to have produced but very little reformation among the people in general. We are now prefented with a new feries of barbarities, murders, factions, and anarchy ; and in this difordered fituation of affairs it was, accerding to the Irifh hiftorians, that the chieftain mentioned by Tacitus addreffed himfelf to Agricola, and encouraged him to make a defcent on Ireland. This fcheme happened not to fuit the views of the Roman general at that time, and therefore was not adopted; and fo confident are thefe hiltorians of the ftrength of their country even in its then diftracted flate, that they treat the notion of its being fubdued by a Roman legion and fome auxiliaries (the force propofed to Agricola), as utterly extravagant; acquainting us at the fame time, that the Irifin were fo far from dreading a Roman invafion, that they failed to the affillance of the Picts, and having mase a fuccefsful incurfion into South Britain, returned home with a confiderable booty.

In the fame flate of barbarity and confufion the kingdom of Ireland contimued till the introduction of Chriftianity by St Patrick, about the middle of the fifth century. This miffionary, according to the adverfaries of the Irifh antiquity, firt introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that antiquity maintain, that the Irifh had the knowledge of letters, and had made confiderable progrefs in the arts, before the time of St Patrick; though they allow, that he introduced the Roman charater, in which his copies of the Scripture and liturgies were written. To enter into the difpute would be contrary to our plan. It is fufficient to obferve, that, excepting by fome of the Irith themfelves, the hiftory already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Chritianity. An migin of the lifh nation hath been found out much nearer than Afia, Greece, or Egypt ; namely, the ifland of Britain, from whence it is now thought that Ireland was firft peopled. A dipute hath arifen concerning the place from whence the firf emigrants from Bitain fet fail for Ireland. The bonour

## I R E

of being the mother. country of the Irifh hath been
difputed between the North and Suuth Britons. Mr difputed between the North and South Britons. Mr Macpherfon has argued Arenuoully for the former, and Mr Whitaker for the latter. For an account of their difpute, howcver, we muft refer to the works of thefe gentlemen. Mr Whitaker claims the victory, and challenges to himfelf the honour of being the firt who clearly and truly demonftrated the origin of the Irifh.

The name of Ireland, according to Mr Whitaker, is obvioully derived from the word Far or Eir, which in the Celtic language fignfies " weft." This word was fometimes pronounced Iver, and Hiter; whence the names of Pris, Ierna, Juverna, Iverna, Hibernia, and Ireland; by all of which it hath at fome time or other been known.

About $350 \mathrm{~B} . \mathrm{C}$. according to the fame author, the Belgre croffed the channel, invaded Britain, and feized the whole extended line of the fouthern coatt, from Kent to Devonthire. Numbers of the former inhabitants, who liad gradually retired before the enemy; were obliged at laft to take flupping on the weftern coalt of England, and paffed over into the uninhabited ifle of Ireland. Thefe were afterwards joined by another body of Briions driven out by the Belga under Divitiacus, about 100 B. C. For two centuries and a half afterwards, thefe colonies were continually reinforced with frefh fwarms from Britain; as the populoufnefs of this ifland, and the vicinity of that invited them to fettle in the one, or the bloody and fucceffive wars in Britain during this period naturally induced then to relinquif the other: and the whole circuit of Ireland appears to have been completely peo. pled about 150 years after Cliritt: and as the inhabitants had all fled equally from the dominion of the Belga, or for fome other caufe left their native country, they were diftirguifled among the Britons by one general and very appofite name, viz. that of Scuites, or Scots, "the wanderers, or refugees."

Mr Whitaker alfo informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; by one upon the northern and three on the fouthern fhore, feven upon the weftern, fix on the eattern, and one in the centre.
"Along the eallern coaft, and the Vergivian or internal ocean, were ranged the Damnii, the Voluntii, and the Eblani, the Caucii, the Menapii, and the Coriondii. The firt inhabited a part of the two counties of Antrim and Down, extending from Fair-head, the moft north-eafterly extremity of the ifland, to Ifamnum Promoniorium, or the point of Ardglafs haven in the county of Down; and having the Logia or Lagan, which falls into Carrickfergus bay, within their poffffions, and Dunwm or Down-patrick for their capital. The Voluntii poffeffed the coaft from the point of that haven to the river Buvinda or Boyne, the remainder of Down, the breadth of Ardmagh, and all Louth; laving the Vinderus or Carling ford river in their dominions, and the town of Laberus near the river Deva (Atherdee in the county of Louth) for their metropolis. And the Eblani reached from the Boyne to the Lxbius, Lxv-ui, or Liffy; refiding in Ealt-Mcath, and in the large portion of Dublin county which is to the north of this river; and acknowledging Mediola. num, Eblana, or Dublin, for their principal town. 'The

Caucti fpread from the Liffy to the Letrim, the Oboca of the ancients; had the reft of Dublin county, and fuch parts of Wicklow as lie in the north of the latter ; and owned Dunum or Rath-Downe for their chief city. The Menapii occupied the coaft betwixt the Letrim and Cancarne-print, all the refl of Wicklow, and all Wexford to the point ; their chief town, Menapia, being placed upon and to the eaft of Modona, Slanus, or Slane. And the Coriondii inhabited at the back of the Caucii and Menapii, to the weft of the Slane and Liffy, and in all Kildare and all Catherlogh; being limited by the Boyne and Barrow on the weft, the Eblani on the north, and the Brigantes on the fouth.
"Upon the fouthern thore and along the verge of the Cantabrian ocean, lay the Brigantes, the Vodix, and the lbernii. The firlt owned the reft of Wexford and all Waterford: extending to the Blackwater, AvenMore, or Dabrona, on the fouth wett ; having the great mouth of the Barrow with their territories, and Brigantia, Waterford, or fome town near it, for their firf city ; and giving name of Brigas to the Suir or Swire, their limitary ftream on the north, and the appellation of Bergic to their own part of the connty of Wexford. The Vodix peffeffed the flire of Corke from the Blackwater to the Ban, the river of Kinfale, and the Dobona or Dubana of the ancients; and affixed the name of Vodium Promontorium to the point of Balycotton ifland. And the Ibernii inhabited the remainder of Corke, and all that part of Kerry which lies to the fouth eaft of Dingle-found; having Rutina or Ibaune for their capital, the Promuntorium Aultrinum or Mif-fen-Head about the middle of their dominions, and the river lbernus or Dingle found for their northern barrier; and leaving their names to the threc divifions of Ibaune, Beare, and Iveragh.
"Upon the wetlern thore of the ifland and along the Great l3ritanuic or Atlantic ocean, were the Lucanii or Lucenii, the Velaborii, and the Cangani, the Auterii, the Naguate, the Hardinii, and Venicnii. The Lucenii inhabited the peninfula of land that lies along the river Ibernus or Dingle-found, and perhaps fome adjoining parts of Kerry. The Velaborii ranged along the fmall remainder of the latter, and over the whole of Limerick to the Senus or Shannon; having the Durius or Cafheen flowing througla their dominions, and Regia, Limeric or fome town near it, for their metropolis. And the latter was probably that city near Limerick, the fite of which is itill famous, and retains the appeliation of Catbair, or the fortrefs; and where the remains of ftreess, and other marks of a tuwn, may yet be traced. The Cangani lived in the county of Clare: Macolicum near the Shannon, perhaps Feakle or Melic, being their principal town; a headland in the bay of Galway, near Glaniny, being denominated Benifamnum Pronontorium; and the adjuining ifes of Arran called Infule Cangane. The Auterii were fettled in the county of Galway; winding along the deep recefs of the Sinus Aufoba or bay of Galway; Aretching rowards the north as far as the Libnius, or the river that bounds the thire in that part ; and poffeffing the fmall portion of Mayo which lies to the fouth of it. And thefe were fubject to Auterium, anciently A terith, and now Athenree; and have left their name to the divifion of Athtnree. The Nagnata occupied the reft
nd. of the large county of Mayo, all Sligo and all Rof. common, all Letrim as far as Logh Allin on the foutls. eatt, and all Fermanagh to Balythannon and Logh Ernc ; being bounded by the Rhebius or river of Ba. lyfhannon, and the Lake Rhebius or Logh Ernc ; having a deep bay, called Magnus Sinus, that curves along Mayo, Sligo, and Letrim counties; and acknowledging Nagnat, Necmaht, or Alnecmaht, the town of the Nagnatz, for their capital. And the Hardinii and Venicnii were confederated together under the title of the Venicnian Nations, extended from Balyfhannon to the North.Cape, and poffeffed all Donnegalle, except the two whole divifions of Raphoe and Enis-Owen, and the eaftern part of Killmacrenen. The Venicnii lay along the immediate margin of the fhore, giving name to the Promontoriam Venicnium or Cape Horn, and to the Infula Venicnia or North-Arran ifland. And their metropolis Rheba was feated upon the lake Rhebius, and in the country of the Hardinii on the fouth-eaft.
"Upon the northern fhore and along the margin of the Deucaledonian ocean, were only the Robogdii ; inhabiting the reft of Donnegalle, all Derry, and all Antrim to the Fair-Head, and the Damnii; and giving their own name to the former and the divition of Kaphoe. And they had the rivers Vidua or Ship. harbour, Arigta or Logh Swilly, Darabouna or Logh Foile, and Banna or Ban, in their territories; and acknowledged Robogdium, Robogh, or Raphoe, for their chief city.
" The central regions of the ifland, all Tyrone, the remainder of Fermanagh and Letrim, all Monaphan, and the reft of Ardmagh; all Cavan, all Longford, and all Weft-Meath ; all the King's and Queen's county, all Kilkenny, and all Tipperary ; were planted by the Scoti. The Shannon, Logh Allin, and Logh Erne, were their great boundaries on the weft; the Barrow, Boyne, and Logh Neagh, on the ealt; the Swire and Blackwater on the fouth; and a chain of mountains on the north. And the two greareft of their towns were Rheba, a city feated, like the Rheba of the Venienians, upon the lake and river Khebius, but on a different part of them, and fomewhere in the north of Cavan; and Ibernia, a town placed a little to the eaft of the Shannon, and fomewhere in the county of Tipperary."

But whether we are to receive as truth the accounts given by Mr Whitaker, thofe of the Irifh annalifts or any other, it is certain, that, till little more than a century ago, Ircland was a fcene of confufiou and flaughter. The Irifh hiftorians acknowledge this, as we have already feen. Very few of their monarchs efcaped a violent death. The hiftories of their kings indeed amount to no more than this, viz. that they began to reign in fuch a year, reigned a cettain number of years, and were flain in battle by the valiant prince who fuccecded to the throne. The introduc. tion of Chriftianity feems to have mended the matter very little, or rather not at all. The fame wars between the chiefs continued; and the fame murders and treacheries took place among the inhabitants, rill they n of were invaded by the Danes or Normans, about the nes. end of the eightli century. At this time, we are told, that the monarchical power was weak, by reafon of the factions and affuming difpofition of the inferior dyna.

Atics; but that the evils of the political conflitution Preland. had confiderably fubfided by the refpect paid tos religion and learning. The firft invafions of the Danes were made in fmall parties for the fake of plunder, and were repelled by the chieftain whofe dominions were invaded. Other parties appeared in different parts of the ifland, and terified the inhahitants by the havoc they committed. Thefe were in like manner put to Alight, but never failed to return in a fhort time ; and in this manner was Ireland harafled for the fpace of 20 years, before the inhabitants thought of putting an end to their inteltine contefts, and uniting againft the common enemy. The northern pirates, either by force or treaty, gradually obtained fome fmall fettlements on the ifland; till at length Turges, or Turgefius, a warlike Norwegian, landed with a powerful armament in the year 855. He divided hisflect and army, in order toftrike terror in different quarters. His followers plundered, burned, and maliacred, without mercy, and perfecuted the clergy in a dreadful manner on account of their religion, The Danes already fettled in Ireland, flocked to the ftandard of 'lurgefius, who thus was enabled to feat himfelf in Armagh, from which he expelled the clergy, and feized their lands. The Irifh, in the mean time, were infatuated by their private quarrels; till at lait, after fome ill-conducted and unfuccefsful efforts, they funk into a ftate of abject fubmifion, and Turgefius was proclaimed monarch of the whole ifland in $8+5$.

The new king proved fuch a tyrant, that he foon became intolerable. A coufpiracy was formed againlt him; and he was feized by Melachline prince of Meath, in a time of apparent peace. An univerfal infurrection enfued; the Danes were maffacred or difperfed; their leader condemned to death for his cruclties, and drowned in a lake. The forcigners, however, were not exterminated, but the remains of them were al. lowed to continue on the ifland as fubjects or tributaries to fome particular chieftains. A new colony foon arrived, but under pretence of peaceable intentions, and a defign of enriching the country by commerce. The Irifh, through an infatuated policy, fuffered them to becone malters of Dublin, Limeric, Waterford, and other maritime places, which they enlarged and fortified with fuch works as had till then been unknown in Ireland. The Danes did not fail to make ufe of every opportunity of enlarging their territuries, and new wars quickly enfued. The Irih wire fometimes victorious, and fometimes nut; but were never able to drive out their enemies, fo that they continued to be a very diftinguifhed and powertul fopt, or tuibe, in Ireland. The wars with the Danes were no looner at at end, than the natives, as ufual, turned their arnus againtt each other. - The country was harafled by the competitions of the chiefs; laws and relision lof their influence, and the molt horrid licentioufnefs and im. morality prevailed. Thus the whole ifland feemed ready to become a prey to the firli invadar, when an attempt was made upon it by Magnus king of Norway. This attempt mifcarried, thruugh his own rath. nefs; for, having landed without oppofition, he advanced into the country without tie leall apprehenfion. The confequence of this was, that he was furrounded and cut in pieces with all his followers. His death, however, proved of little berefit to Ireland;

Ircland. the fame diforders which had gradually reduced the kingdom to a flate of extreme weaknefs, fill continued to uperate, and to facilitate the fuccefs of the Englifh invalion, which happened in the reign of Henry II.

Henry 11. The firlt motives which induced this monarch to meditates an isvafion of Ireland. think of an expedition againtt Ireland are not well known. It was fuppofed that he had been provoked by fome affatance which the Irifh princes had given to the French; but, whatever might be in this, it is certain that the defign was eonceived foon after he afcended the throne; and his flatterers foon furnifhed him with fufficient reafons for conficering the Irilh as his fubjects. It was affirmed that they had originally polfefled themfelves of their country by permifion of Gurguntius a Britifh king; and that, as defcendents of the Britons, they were the natural and rightful fubje Cts of the Englifh monarch. It was alfo fuggefted, that the renowned King Arthur, Egfred the Northumbrian prince, and Edgar one of the Saxon kings of England, had all led their armies into Ireland, and there made valuable aequilitions, which their fucceffor was in honour bound to recover and maintain. All thefe fuggeftions, however, or whatever elie had occurred to himfelf, feemed yet infufieient to Henry; and therefore he took the moft effectual method to enfure his reputation, namely, by an application to the pope. To hin he reprefented, that the inhabitants of 1 reland werc funk into the moit wretched tlate of corruption, both with regard to morals and religion ; that Henry, zealous for the honour and enlargement of God's kingdom, had conceived the pious defign of erceting it in this unhappy country; was ready to devote himfelf and all his powers to this meritorious fervice; implored the benediction of the pontiff; and requeiled his permifion and authority to enter Ireland, to reduce the difobedient and corrupt, to cradicate all fin and wickednefs, to infruct the ignorant, and fpread the bleffed influence of the gofpel in all its pusity and perfection ; promifing at the fame time to pay a yearly tribute to St Peter from the land thus to be reduced to his obedience, and to the hely fee. Adrian, the reigning pope, rejoiced at this application which 6 tended fo inuch to the advancement of his own power. Is inverted A bull was therefore inamediately formed, conformable wich the fovereignty by the pupe.
to the mofl fanguine wifhes of Henry, which was fent to England without delay, together with a ring, the token of his inveltiture as rightful fovereign of Ire. land. But whatever inelination the king of England or the pope might at this time (A. D. 1156) have for the fubjection of Ireland, the fituation of the Englifh affairs obliged him to defer it for fome time.

The ilate of Ireland, as we have already obferved, was at this time extremely favourable for an invafion. The monarch enjoyed litile more than a titular dignity, being haraffed by a faction, and oppofed by powerful rivals. A number of chieftains who afumed the title and rights of royalty, paid a precarious tribute to their fuperior, and united, if they were difpofed to unite, with him, rather as his allies than his fubjects. In Ulter, the family of the northern Hi Nial, as it was called, exercifed an hereditary jurifdiction over the counties now called Tirone, Derry, and Donnegal. They alfo claimed a right of fupremacy over the lords of Fermanagh, Antrim, and Argials which included
the counties of Armagh, Monaghan, Lowth, and fome adjacent diffricts: while Dunleve, prince of Uladh (now Down), difputed the fuperiority of this family, and affected an independent ftate. In Munfer reigned the defeendants of Brien, a famous fovereign of former times, impatient to recover the honours of their family; but at laft, being contined by powerful rivals to the territory of North Munfter, they were obliged to leave the family of Mac Arthy fovereigns of Defmond, the fouthern divifion. In Connaught, the princes known by the name of O'Connor were acknowledged fovereigns of the eaftern territory. Tiernan O'Ruarc, an active and reflefs military chief, had the fupremacy in Breffney, containing the modern county of Leitrim, and fome adjacent diltriets. Meath, or the fouthern Hi Nial, was fubject to the family of Clan-Colman, Murehard O'Malachiyn, and his fucceffors. Leintter, divided into feveral principalities, was fubject to Dermod, a fierce, haughty, and oppreflive tyrant. His farther had governed witb great cruelty. Seventeen of his vaffal lords had been either put to death, or had their eyes put out, by his order in one year; and Dermod feemed to inherit too great a portion of the fame temper. His flature and bodily ftrength made him admited by the inferior orders of his fubjects, and thefe he was careful to protect and favour. His donations and endowments of religious houfes recounmended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely odious.

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houfes of $\mathrm{O}^{\prime}$ Connor, and the northern Hi Nial. Tor$\operatorname{logh}$ O'Connor was in poffeflion ; but he was not generally recognifed, and was oppofed by his rival O'Lochlan : notwithftanding which, he maintained his dignity with magnificence and vigour, till a decifive victory gained by him over O'Brien raifed O'Loehlan's jealoufy fo much, that he obliged him in a convention of the flates, to allow him the fovereignty of the northern divifion. In confequence of this partition, it was refolved to transfer the territory of $O^{\prime}$ Ruarc to a perfon more inclined to the interefts of the two fovereigns. An expedition was accordingly undertaken; O'Ruarc was furprifed, defeated, and driven from his dominions. Dermod, who had conceived an unlawful paftion for Dervorghal, the wife of O'Ruarc, took the opportunity of her hufband"s dillrefles to carry her off in triumph. O'Ruarc conceived the moft implacable refentment againt Dermod; and therefore applying himfelf to Torlogh, promifed an inviolable attaehment to his interef; and prevailed on him not only to reinflate him in his poffefions, but to revenge the infulc offered by Dermod, and to rettore his wife. By means of fuch a powerful ally, O'Ruarc found frequent opportunities of haraffing his antagonift till the death of Torlogh, which happened in 1156 , upon which O'Lochlan fucceeded to the fovereignty. `Dermod was the firft to acknowledge the authority of this new fovereign, by whofe means he hoped to be able to revenge himfelf on O'Ruaic. He foon found, however, that he had acted too precipitately. His patron, having treacherounly feized and put out the eyes of Dunleve prince of Down, the neighbouring chicftains took

## I R E

The Irifh prince having now accomplifhed his purpole, fet fail for Ireland in the winter of st69, and recovered a fmall part of his dominiors even before the arrival of his new allies; but being attacked with a fuperior force by his old enemies Roderic and O'Ruarc, he found himfelf obliged to feign fubmiffion till the Englifh allics came to his affitance. The expected fuccours arrived in the month of May 1 ri70, in a creek called the Bunh, near the city of Wexford. Robert Fitz Stephen commanded 30 knights, 60 men in armour, and 300 archers. With thefe came Har. vey of Mountmorris, nephew to earl Kichard. He had no military force along with him ; but came folely with a view of difcovering the nature of the country, and reporting it to his uncle. Maurice of Penderyalt commanded 10 knights and 200 archers: and thus the Englifh force which was to contend with the whole Atrength of Ireland, amounted to no more than 600 men.

Trifing as this affiftance may feem, it neverthelefs Their fuct changed the face of affairs almott inftantaneounly. ${ }^{\text {cefs }}$ Numbers of Dermod's fubjects, who had abandoned him in his diftrefs, now flocked to his flandard. Wexford was immediately attacked, and furrendered in a few days; Fitz-Stephen and Fitz. Gerald were jointly invefted with the lordfhip of this city and its domain ; and Harvey of Mountmorris was declared lord of two confiderable diltricts on the coall. After three or four weeks fpent in feafting and rejoicing, a new expedition was undertaken againt the prince of Oftory (a dittrict of Leinfter), who had not only revolted from Dermod, but put out the eyes of one of his fons, and that with fuch cruelty, that the unhappy youth expired under the opetation. The allied army was now increafed to 3000 men, who were oppofed by the prince of Offory at the head of 5000 , Itrongly entrenched among woods and moraffes. By the fuperior conduct of the Englik troops, however, the Irifh were decoyed from their advantageous fituation, and thus were entirely defeated. The Englifh were for keeping the field till they had totally reduced their enemies: bui Dermod, accuftomed ouly to ravage and plunder, contented himfelf with deftroying the country; and a fudden reverfe of fortune feemed ready to take place. The prince or Oftory, though defeated, Aill appeared in arms, and only waited for an opportunity of again oppoling the enemy in the field. Maurice Pendergalt alfo joined him with his whole troop, being provolsed by Der. mod, who had refufed him leave to return to Wales. This defection, however, was in part fupplied by the arrival of Fitz-Gerald with 10 knights, 30 horfemen, and 100 archers. Pendergaft in a thont time repented of his new alliance, and retited into Wales; fo that the prince was obliged to make his fubmiffion to Dermod, which the latter with fome reluctaace accepted.

In the mean time, Roderick, having fettled all his other affairs, advanced againft the allies with a powerful army. Dermod was thrown into defpair ; but, encouraged by Fitz Stephen, he encamped in a very ftrong lituation, where he was foon befieged by Roderic. The latter, however, dreading the valour of the Englim, condefcended to treat firf with them, and then with Dermod, in order to detach them from the inte
ifreland. refts of each other: but as this procecded evidently from fear, his offers were rejected by both parties; upon which he began to prepare for battle: but at the very time when the engageinent thould have commenced, either through the fuggettions of his clergy, or of

11 Peace concluted.
his own fears, Roderic entered into a new negociation; which at laft terminated in a peace. The terms were, that Dermod hould acknowledge the fupremacy of Roderic, and pay him fuch fervice as the monarclis of Ireland had ufually received from inferior princes; and as a fecurity for his faithful performance of this article, he delivered up his favourite fon as an hotage to Roderic : but in order to eftablifh this accommodation on the firmett bafis, the latter obliged himfelf to give his daughter in inarriage to the young prince as foon as Leinfter fhould be reduced, and the peace of the ifland effectually reltored. By a fecret article, Durmod engaged to difmifs the Britifh forces immediately after the fettlement of his own province, and in the mean time not to bring over any further reinforcements from England.
Thus ended the firf Britigh expedition into Ireland; the confequences of which were fo little dreaded at that time by the natives, that their hillorians, though tbey divell upon the principal wars and contelts in other parts of the inand, fpeak of the fettlement of the Wellhmen in Leinfter with a carelefs indifference. But though the fettlement of this colony feemed very little alarming to the generality, it could not efcape the obfervation of difcerning perfons, that a man of Dermod's character would not long keep his treaties; and that on the firt emergency he would have recourfe to his former allies, who thus would eitablith themfelves more and more, till at laft they would reduce the country entirely under their fubjection. Thefe reflections, if any fuch were then made, were in a fhort time verified. Dcrmod was fearce fettled in his own dominions, when he began to afpire at the fovereignty, and furm fchemes for dethroning Roderic. He applied to Fitz. Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chepllow, more commonly known by the name of Strongbozv, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him firft to obtain the confent of king Henry. The king, however, did not incline that his fubjects fhould make conquetls for themfelves in any other country, and therefore difmiffed Rishard with an equivocal anfwer; but the latter being willing to underfand his fovereign's words in the molt favourable fenfe, immediately fet about the neceffary preparations for his expedition. In May 1171, Raymond le Crofs, Richard's domeftic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called Dondonalf, near Waterford, with 10 knights and 70 archers ; and along with them came Harvey of Mountmorris, attended by a fmall train. The Englifh immediately intren hed themfelves, and erected a temporary fort for themfelves: which proved a very neceffary precaution; for the natives, jultly attributing this new debarkation to the practices of Dermod, inftantiy formed a tumultuous army, and marched to cxpel the invaders. The Englifh prepared to meet them; but when they perceived the great fuperionity of the enemy,
they thought proper to retire to their fort. Here, however, they mu't have been totally cut off, lad they not luckily colleeted a numerous herd of cattle from the neighbouring country for their fubfiftence. Thefe they drove with fury among the Irifh, who were thus cris and put into the utmoft confufion. The invaders feized the favourable moment ; and, falling upon their difordered enemies, put them to flight, and drove great numbers of them into the fea, where they perifhed. Seventy prifoners were taken, all of them principal citizens of Waterford ; who, though they offered large fums for their ranfom, and even that the city flould be delivered up to the Englifh, were all barbaroufly put to death. This fuccefa and cruelty fo intimidated the Irifh, that they fuffered thefe mercilefs invaders to maintain their ftation unmoletted, and wait for the arrival of their affociates.

Richard in the mean time having affembled his vaffals, led them through Wales, where he was joined by great numbers of other adventurers; but, when juft on the point of embarking, was furprifed by a pofitive command from the king, to defift from his intended enterprize, on pain of forfeiture of his lands and honours. He was now, however, too much interefled in his fcheme to retract; and therefore pretended to difbelieve the authenticity of the royal mandate. On Earl Ris the eve of the feaft of St Bartholumew, lie landed at ard arril Waterford with 200 knights and 1200 infanty, all with a chofen and well appointed foldiers. They were imme powerfu diately joined by Raymond and his troop; and the einent. very next day it was refolved to make an attempt upon Waterford. The city was taken by florm, and a dreadful maflacre enfued; to which the cruel Dermod had the merit of putting an end. The martiage of Richard with Eva, the daughter of Dermod, was folemnized without delay, and a fcene of joy and feflivity facceeded the calamities of war.

A new expedition was now undertaken againft Dublin; the inhabitants of which had either manifefted fome recent difaffection to Dermod, or had never been thoroughly forgiven for their old defection. Roderic advanced againtt the allied army with a formicable body, confifting, as is faid, of 30,000 men : but, fearing to come to a general engagement, he contented himfelf with fome night Ekirmifhes; after which, great part of bis vafials forced him to difmifs them, and Dublin was left to its fate. The inhabitants were treated very feverely; however, a confiderable body of them, with Hefculph their governor, bad the good fortune to gain fome veffels lying in the harbour, and made their efcape to the northern iflands. Eanl Richard was now invefted with the lordhip of Dublin; and appointed Milo de Cogan, a brave Englifh knight, his governor; while he himfelf, in conjunction with the forces of Dermod, over-ran the country of Meath, committing every where the mott horrid cruelties. Roderic, in the mean time, unable to oppofe them in the field, fent deputies to Dermod, commanding him to retire, and putting bim in mind tbat his fon was in his hande, and mult anfwer with his life for the breach of thofe treaties which his father made fo little fertple to violate. Natural affection, bowever, liad very little place in the breatl of Dermod. He expreffed the utmolt indifference about his fon ; and, with

## I R E [ 319 I $\quad$ I R E

ind. the greatell arrogance, claimed the fovereignty of all Ireland: Roderic, provoked at this anfwer, cut off the young prince's head.

This piece of impotent cruelty ferved only to make the king ndious to his own ful.jects, while Dermad and his Englifh allies committed every where the greateft devaftations, and threatened to tubdue the whole ifland. This indeed they would probably have accomplifhed, had not the extraordinary fuccefs of Strongbow alarmed king Henry; who, fearing that he might render himfelf totally independent on the crown of Britain, iffued his royal edict, Atrictly forbidding any Englifh veffel from paffing into Ireland with men, arms, or time refident in Ireland, of whatever rank or degree, to return to their country before the enfuing feaft of Efher, on pain of forfeiting their lands, and being declared traitors.

Our adventurers were plunged inta the greatelt diAtrefs by this peremptury edict. They now found themfelves cut off from all fupplies in the midft of their enraged enemies, and in danger of being forfaken by thofe who had attached themfelves to them during their fuccefs. Raymond was difpatched with a moit fubmiffive meffage to the offended monarch; but before he received any favourable anfwer, every thing was ng. thrown into confufion by the death of Beeket *, fo that the king had neither leifure nor inclination to attend to the affairs of Ireland. About the farme time the death of Dermod their great ally feemed alinoft to of give a finifhing ftroke to the Englifh affairs. An univerfal defection took place among their affociates; and befure they had time to concert any proper meafures, Hefculph; who had formerly efcaped from Dublia, appeared before that city with a furmidable body of troops armed after the Danifh manner. A furious attack enfued; which at laft ended in the defeat and captivity of Hefculph, who was immediately put to death. This danger, however, was foon followed by one 1 ill greater. Roderic had formed a powerful confederacy with many of the Irifh chieftains, and the kings of the northern ifles, in order to extirpate the Englinh totally from the inand. The harbour of Dublin was blocked up by a feet of so fhips from the northern ines; while the confederated Irifh took their fations in fuch a manner as to furround the city, and totally cut off all fupplies of provitions. In two months time the Englih were reduced to great Atraits. On the firt alarm, Richard had fent for affiltance to Fitz. Stephen; who having weakened his own force, in order to ferve the earl, the people of Wexford had rifen and befieged Fitz-Stephen in his fort called Carrig near that city. A meffenger now arrived, informing Strongbow that his friend was in the utmolt danger, and muft fall into the hands of his enemies if not affitted within three days; upon which a council of war was called, in order to deliberate on the meafures neceflary to be purfued in this defperate emergency. It was foon refolved to enter into a treaty with Roderic upon any terms that were not totally fervile or oppreflive. Lausence prelate of Dublin was appointed to carry the terms ; which were, that Richard propofed to acknowledge Roderic as his fovertign, and to hold the province of Leinfter as his vafful, provided he would saife the fiege. Laurence foon returned with an
anfwer, probably of his own framing; namely, that Ireland. Dublin. Waterford, Wexford, and all the forts poffefed by the Britifh, fhould be immediately given up; and that the earl and his affociates hould depart with all their forces by a certain day, leaving every part of the ifland free from their ufurpatiens, and abfolutely renouncing all their pretended claims. On thefe conditions they were to befpared ; but the leaft reluctance or delay would determine the beliegers to florm the city.

Thefe terms, though they contained nothing infolent or unrealonable, confidering the prefent fituation of the Englifh, were yet intolerable to our indigent adventurers. After fome time fpent in filence, Milo de Cogan, fuddenly flarting up, declared his refolution to die bravely rather than fubmit to the mercy of barbarians. The \{pirit of defperate valour was inftantly caught by the whole affembly; and it was refolved to rik their whole fortune on one defperate effort, by fallying out againf the enemy, and to make their attack upon that quarter where Roderic himfelf commanded. Accordingly, having perfuaded a body They totaiof the townimen to take part in this defperate enter-ly difeat prife, they marched out againt their enemies, who their ence expected nothing lefs than fuch a fudden attack. The befiegers were fecure and carelefs, without difcipline or order; in confequence of which, they were onable to fultain the furious affault of the Englifh. A terrible fanghter enfued, and the Irifh inftantly fled in the greateit confufion; their monareh himfelf flcaping only by mixing half naked with the crowd. The "ther chieftains who were not attacked caught the panic, and broke up their camps with precipitation; while the victors returned from the purfuit to pluader, and among other advantages gained as much provifion as was fufficient to fupport them for a whole year.

Strongbow being thus relievtd from his diltrefs, committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford in order to relicee Fitz-Stephen : but in this lie was difappointed ; for that brave officer, having often repulfed his enemies, was at laft treacheromfly deceived into fubmiffion and laid in irons. Serongbow, however, continued to advance; and was againattacked by the $\mathrm{I}_{\mathrm{i}}$ ih, whom he ance more defeated. On his arrival at Wexford, he found it burnt to the ground ; the erremy having retired with Fitz-Stephen and the reft of the prifoners to Holy Ifland, a fmall inand in the middle of the herbour, from whence they fent a deputation, threatening to put all the prifoners to death if the leaft attempt was made to molelt them in their prefent fituation. The earl then proceeded to Waterford, and from thence to Ferns; where he for fome time excreifed a regal authority, rewarding lis friends and punifhing his enemies. A more important object; however, foon engaged his attention. The king of England having fetted his affairs as well as he could, now determined to conquer Ireland for himfelf. A fummons was inftantly dif. Earl Ruch patched to earl Richard, expreffing the greatell refent- ard fumment at his prefumption and difobedience, and requi. noned to ring his immediate prefence in England. The earl England. found himfelf under a neceffity of obeying; and lisving made the beft difpofitions the time would permit for the fecurity of his lrith puffeffions, embarked for England, and met the king at Newnlam near Glou-

Tresanc. cefter. Henry at firft affected great difpleafure; but fonn allowed himfelf to he pacified by a furrender of the city of Dublin, and a large territory adjacent, together with all the maritine towns and forts acquired by Strongbow: while on his part he confented that the carl fhould have all his other poffeffions granted in perpetuity, to be held of the king and his heirs. The other adventurers made their peace in a fimilar manner ; while the Jrifh chieftains, inftead of uniting in the defence of their country, only thought how to make the mott of the approaching invation, or at leat how to avert the threatened evils from their own particular diftricts. They faw the power of thcir own fovereign on the point of intal diffolution ; and they faw it with indifference, if not with an envious and malignant fatisfaction. Some were even ready to prevent their invader, and to fubmit before he appeared on the coaft. The men of Wexford, who had pofferfed themfelves of Fitz. Stephen, refolved to avert the confequences of their late perfidy and crueltv, by the forwardnefs of their zeal for the fervice of the king of England, and the readinefs of their fuhmiffions. Their deputies calt themfelves at Henry's feet; and, with the moft paffionate expreffions of obedience, humbly intreated that he would accept them as his faithful vaffals, rcady to refign themfelves, their lands, and porf(fions, to his abfolute difpofal. "They had already (they faid) endeavoured to approve their zeal by feizing Rnbert Fitz-Stephen, a traitor to his fovereign, who had lately entered their territory by force of arms without any due warrant or fair pretence, had flaughtered their people, feized their lands, and attempted to eftablifl himfelf independent of his liege lord. They kept him in chains, and were ready to deliver him to the difpofal of his fovereign." - The king received them with expreflions of the utmott grace and favour ; commended their zeal in repreffing the unwarrantahle attempts of Fitz Stephen ; declared that he fhould foon inquire into his crimes, and the wrongs they had fuftained, and inflict condien punithment for every offence committed by his undutiful fubjects. Thus were the lrifhmen difmiffed in the utmolt joy and exultation; and the artifice of Henry, while it infpired thefe men with difpofitions favourable to his interefts, proved alfo the molt effectual means of faving FitzStephen from their cruelty.

Henry, having completed the preparations ncceffary for his expedition, embarked at Milford with feveral
King Hen- on board a fleet of 240 fail. He landed at Waterry lands in ford on the fealt of St Luke in October $\mathrm{t} 17_{2}$; with a treland. profefled defign not to conquer, but ta take polfeffion of a kingdom already his own, as being granted him by the pope. Mott of the lrifh indeed feemed to be of the fame opinion, and therefore fubmitted without the leaft refiftance. Strongbow fet them an example, by making a formal furrender of Waterford, and doing homage to the king for the territory of Leinfter. Fitz-Stephen was delivered up, with many accufations of tyranny and injuutice. He was at firit fent to prifon ; but foon purchafed his liberty, by furrendering Wexford, and doing homage for the reft of his poffeffions to the king. The prince of Defmond was the firlt Irifh chieftain who fubmitted. On che very day after the king's arrival, he attended hie court, refigned $\mathrm{N}^{0}{ }_{168 .}$
the city of Corke, did him homage, and ftipulated to Irelar pay a tribute for the reft of his territory. An Englifi governnr and garrifon were immediately appointed to take poffeffion of his capital ; and the king difplayed his power and magnificence by marching to Lifmore, where he chofe a fituation and gave the neceffary orders for building a furt. The prince of Thomond next fubmitted and did homage. He was followed by the princes of Offury, Decies, and all the inferior chiefs of Munfler.

The king, after having provided for the fecurity of all his newly acquired territories, and put garrifnns in the citics of Limenick, Corke, Waterford, and Wexford, proceeded to take poffefion of Dublin, which had been furrendered by Strongbow. The neighbouring lords took the opportunity of fnbmitting as he advanced. O'Carrol of Argial, a chieftain of great confequence, repaired to his camp, and engaged to beconie his tributary; and even O'Ruarc, whom Roderic had made lord of a confiderable part of Mcath, voluntarily fubtnitled to the new fovereign.
Roderic, though furprifed at the defection of fo Rnleri many of his allies, thill determined to maintain his own nill ho dignity, and at leaft prcferve his province of Con- out. naught, feeing he could no longcr call himfelf monarch of the whole inand. With this defign he entrenched himfelf on the banks of the Shannoon; and now, when diencumbered from a crowd of faithlefs and difontented followers, he appears to have acted with a fpirit and dignity becoming his flation. Huzh de Lacy and Willians Fitz. Andelm were commiffioned by the king to reduce him : hut Rodcric was too Atrong to be attacked with any probability of fuccefs by a detachment from the Englifh army ; and he at leat affected to believc, that his fituation was not yet fo totally dcfperate as to reduce him to the nccefficy of refigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiiffs of Uliter fill kept retired in their own dillicts without any thoughts of fubmiffion. Henry in the mean time at tempted to attach the Irifh lords to his interelt by elegant and magnificent entertainments, fuch as to them appeared quite attonifling. Some hiftorians pretend that he eftablifhed the Englifh laws in all thofe parts which had fubmitted to his jurifdiation ; but this mult appear extremely improbable, when we confider how tenacious a rude and barbarous people are of their ancient laws and cuftoms. The Irifh lords had been accultomed to do homage to a fuperior; and they had made no fubmifion to Heury which they had not formerly done to Roderic, and probably thought their fubmiffion to the king of England more honourable than that to their Irifh monarchs; and it cannot be fuppofed, that a wife and politic monarch, fuch as Henry undoubtedly was, fhould form at once fuch an extravagant fcheme as altering the laws of a great number of communities, none of which he had fubdued by force of arms. By his tranfactions both with the natiscs and adventurers, however, Henry had attained the abfolute dominion of feveral maritine cities and their dependencies; fo that he had beth a confiderable number of real fubjects, and a large extent of territory, in the illand. To thefe fubjects indeed Henry granted the Englifh laws ; and gave the city of Dublin by charter to the inhabitants of Brifol, to be held of

## 

 him and his heirs, with the fame liberties and free cuftoms which they enjoyed at Briftol, and throughout all his land. And, by another charter, executed foon after, he contirmed to bis burgeffes of Dublin all manner of righto and immunities throughont his whole land of England. Normandy, Wales, and Licland, wherever they and their effects flall be, to be fully and honourably enjoyed ty them as his free and faithful fubjects. And as it. was not eafy to induce his Eng. lifh fubjeets immediately to fettle in thefe maritime towns, he permitted the Oltmen to take poffefion of Waterford; and to them he granted a particular right of denization, whereby they were invelted with the rights and privileges of free fubjects. and for the futire to be governed by the laws of his realm. For the better execution of thefe new laws the king alfo mide a divifion of the dillricts now fubject to him into fhires or counties; which was afterwards inproved and enlatged, as the extenfion of the Englifh fettements and the circumflances of the country requited. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other miniters of juftice, and officers of Atate, and every appendage of linglifi government and law. 'To complete the whole fyitem, a chief governor, or reprefentative of the king, was appointed. His bufinefs was to exereife the royal antthority, or fuch parts of it as might be committed to him in the king's abfence; and, as the prefent ftate of Iteland, and the apprehenfions of war or infurrections, made it neceflary to guard againtt fudden accidents, it was provided, That in cafe of the death of any chief governor, the chancellor, treafurer, chief. jultice, and chief baron, keeper of the rolls, and king's ferjeant at law fhould be empowered, with confent of the nobles of the land, to elect a fucceflor, who was to excreife the full power and authority of this oflice, until the royal pleafure fhould be further knownBut while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquifition into the death of Becket ; that having waited the king's arrival until their patience was exhaufted, they now fummoned him to appear without delay, as he would avert the dieadful fentence of excommunication, and preferve his dominions from a general interdict. Such denunciations were of too great confequence to admit of his fonger flay in Ireland; he therefore ordered his forces and the officers of his houfehold to embark without delay, referving three hips for the conveyance of himfelf and his immediate attendants. Having therefrie but a fhort time to fecure his Trift interefts, he addrefled himfelf to the original Englifl adventurers, and by grants and promifes laboured to detath then from Strengbow, and to bind them firmly to himfelf. l'o make amends for what hic had taken from Fitz. Stephen, he granted him a confiderable dillrict in the neigh. bou hood of Dublin, to be held by knight's fervice; at the fame time entrufting the maritime towns to his own immediate dependants Waterford was committed to Humplirey de Buhun. Robert Fitz-Bernard, and Hugh de Gundville, with a train of 20 knights. In Wexford were flationed William Fitz-Andelm, Vol. IX. Part I,

Philip of IJallings, and Philip de Braofa, with a like number of attendants. Hugh de Lacy had a grant of all the territory of Meath, where there was no fortified place, and where of confequence no particular refervation was neceffary, to he hell of the king and his heire, by the fervice of 50 knights, in as full a manner as it had been enjoyed by any of the Irina princes. He alfo conftituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz. Stephen and Msarice Fitz-Gerald were appointed his coadjutors, with an equal train; and thefe, with others of the firt adventurers, were thus obliged, under the pretence of an honourable employment, to refide at Dublin, fubject to the immediate infpection of de Lacy, in whom Henry feems to have placed his chicf confidence. lands were affigned in the neiphbourhood of each city for the maintenance of the kuights and foldiers. Orders were given to build a calle in Dublin, and fortrefles in ither convenient places; and to John de Courcey, a baron diftinguifhed by his enterprifing genius and abilities for war, was granted the whole piovince of Ultter, provided he could reduce it by force of arms.
Henry was no fooner gone, than his barons began Difr rders to contrive how they might bett Arengthen their own enfue on interells, and the Irifh how they might beft fhake of the king's the yoke to which they had foreadily fubmitted. De departure, Lacy parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. I'his gave offence to O'Ruare, who ftill enjoyed the eatlern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redrefa from Lacy for fome injuries real or pretended; but, as the parties could not come to an agrce. ment, another conference was appointed on a hill called Tarogh. Both parties came with a confiderable train of armed followers; and the event was a fcuffe, in which O'Ruare and feveral of his followers were killed, and which ferved to render the Englifh not a little odious to the natives.

The firit of difaffection had foon after an opportunity of fhowing itfelf on the rebellio:2 of king Henry's fous, of which an account is given under the article England, no iz I. © feq. The king had been obliged to weaken his forces in Ireland, by witharawing feveral of his garrifons. The folders who remained were, alfo difcontented with their gencral Hervey of Mountmorris, on account of his feverity in difcipline, and reftraining them from plunder, to which they imagined themfelves intitied on account of the defficiencies of their pay. Raymond le Gros, the fecond in command, was mnch more beloved by the foldiery: and to fuch a height had the jealoulies between the commanders arifen, that all effectual op. pofition to the Irifh chieftains was prevented; and the event might lave been fatal to the Englifh interefl, had not Henry found out a remedy. He fum- Strongbory moned earl Richard to attend him at Rouen in Nor-ve nirs of mandy, and communicated his intentions of commit- treland. ting the affairs of Ireland to his fole direation. The earl exprefled the utmof readinefs to ferve his matter; hut obferved, that he had already experienced the envy and maliguity of his fecret enenies; that if he fhould appear in fuch a diftinguifhed charatier as that of the king's deputy in Ireland, their infidious practices

## I R E . [ 322 ] I R E

Ereland. Wou'd be rencwed, and his conduct mifreprefented. He therefore requefted that a colleague might be appointed in the commiffion; and recommended Kay. mond as a perfou of approved loyalty and abilities, as well as highly acceptable to the foldiery. The king replied, with an affected air of regard and confidence, that he had his free coufent to employ Raymond in any fervice he fhould deem neceffary, not as a colleague, but as an affifant ; but that be relied entirely on the earl bimfelf, and implicitly trufted every thing to his direction. To reward his fervices, he granted him the town of Wexford, together with a fort erected at Wicklow ; and then difmiffed him with the moft gracious expreffions of favour.

The earl landed at Dublin, uhere he was received with all the refpect due to the royal commiffion. He fignified the king's pleafure, that Robert Fitz-Bernard, with the garrifon of Waterford, fould inftantly em bark and repair to Normandy; that Robert Fitz. Stephen, and Maurice Pendergaft, fhould attend the fervice of their fovereign in England; and, agrecably to the king's infructions, took on him the cuftody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacy, and Milo de Cogan, were, with the other lords, commanded to repair to England for the Cervice of the king; by which the earl's forces were confiderably weakened, and be foon found himfelf under a neceffity of appointing Raymond to the chief command. The new general proved fucceffful in fome enterprizes againtt the rebellious Irifh; but having prefumed upon his merits to demand in marriage Ba filia the earl's filler, Richard refufed his confent, and Raymond retired into Wales.

Thus the fupreme command again devolved upon Hervey of Mountmorris; who, being fenfible that his character had fuffered much from a comparifon with that of Raymond, determined to emulate his fucceffes by fome bold attempt againft the rebels. A detachment of 400 of his men, however, had the misfortune to be furprized and cut off by the enemy ; and this fuccefs ferved as a fignal for a general revolt. Several
of the Lecinfter chieftains, who had lately made their fubmiffions, and bound themfelves to the fervice of kirg Henry, now openly difclaimed all engagements. Even Donald Kevanagh, fon to the late king Dermod, who had hitherto adhered to the Englifh in their greateft difficulties, now declared againf them, and claimed a right to the kingdom of Leinfter; while Rocicric, on his part, was active in uniting the princes of Ulfter, the native lords of Meath, and other chiefs, againft their common enemy. This produced the inmediate recal of Raymond; and Richard no longer refufed his confent to the marriage with his fifter, which was folemnized immediately on Raymond's arrival. The very next morning, the bridegroom was obliged to take the field againt Roderic, who had committed great devaftations in Meath. By the vigorous conduct of the Englifh commander, however, he was not only prevented from doing farther mifchief, but at laft convinced of the folly of refiftance; and therefore determined to make a final fubmiffion. Yet, confcious of his dignity, he difdained to fubmit to a fubject ; and therefore, inftead of treating with earl Richard, he fent deputies direetly to the king. The deputies were, Catholicus archbifiop of Tuam, the
abbot of St Brandan, and Mafer Laurence, as he is Irelond fyled, chancellor to the king of Connaught.

The terms of this fubmiffion, by which Henry became fole monarch of Ireland, were as follow: Ro- his fubmi deric confented to do homage and pay tribute, as fion. liege-man to the king of England; on which condition he was allowed to hold the kingdom of Connaught, as well as his other lands and fovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vaffals were to hold under him in peace, as long as they paid their tribute and coutinued faithful to the king of England; in which Roderic was to enforce their due obedience, and for this purpofe to call to his affillance the Englifh government, if neceffary. The annual tribute to be paid was every 10 th merchantable hide, as well fromi Connaught as from the reft of the illand; excepting thofe parts under the immediate dominion of the king of England and his barons, viz. Dublin and Meath with their appurtenances, Wexford and all Leinfter, and Waterford with its lands as far as Dungarvan inclufive; in all which diffricts Roderic was not to interfere, nor claim any power or authority. The Irifh who had fled from thefe diftricts were to return, and either pay their tribute, or perform the fervices required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requifition of their lords, was to compel them to return. He was to take hoftages from his vaffals, fuch as he and his liege-lord fhould think proper ; and on his part to deliver either thefe or others to the king, according to the royal pleafure. His vaffals were to furnifh hawks and hounds annually to the Englifh monarch; and were not to detain any tenant of his immediate demefnes in Ireland, contrary to his royal pleafure and command. This treaty was folemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbilhop of Dublin one of the fubfcribing witneffes. As metropolitan of Leinter, he was now become an Luglifh fubject, and was probably fummoned on this occafion as one obliged to attend, and who had a right to affit in the king's great council. It is alfo obfervable, that Henry now treated with Roderic not merely as a provincial prince, but as monarch of Ireland. This is evidently implied and fuppofed in the articles; although his monarchical powers and privileges were little more than nominal, frequently difregarded and oppofed by the Irifh toparchs. Even by their fubmiffions to Henry, many of them in effect difavowed and renounced the fovereignty of Roderic; but now his fupremacy feems to be induftrioufy acknowledged, that the prefent fubaifion might appear virtually the fubmiffion of all the fubordinate princes, and thus the king of England be invefted with the fovereignty of the whole illand. The marks of fovereignty, however, were no more than homage and tribute: in every other particular, the regal rights of Roderic were left inviolate. The Englifh laws were only to be enforced ina the Englifh pale: and, even there, the Irifh tenant might live in peace, as the fubject of the Irifh monarch; bound only to pay his quota of tribute, and not to take arms againf the king of England.
But though the whole ifland of Ireland thus became fubject to the king of England, it was far from being

## I R E [ 323 [ R.E

and. being fettled in tranquillity, or indeed from laving the fituation of its inhabitants mended almoft in any degree. One great occafion of dilturbance, was, that the Englifh laws were confined only to thofe parts which had been fubdued by force of arms; while the chieftains that had only fubinitted to pay tribute, were allowed to retain the ancient Irifh laws within the limits of their own juridictions. By thefe old Irifa laws, many crimes acconnted capital with us, firch as robbery. murder, \&c. might be compenfated by a fum of innene: Hence it happened, that very unequal punthmentz were inflitted for the fame offence. If one Englithman killed another, he was punifhed with death; but if he killed an Irifhman, be was punifhed only by a fine. If an Irihman, on the other hand, killed an Englifhman, he was certainly punifhed with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumitance init mentioned tended to produce an implacalle hat:ed between the original inhabitants and the Englifh. As the Irih laws were thus more favourable to the barbarity natural to the tempers of fome individuals, many of the Englifh were allo tempted to lay afide the manners and culloms of their countrymen altogether, and to affociate themfelves with the Irifh, that, by becoming subject to their laws, they might thus have an opportunity of gratifying their brntal inclinations with lefs controul than formerly; and in procefs of time, thefe degenerate Engli/b, as they were called, proved more bitter enemies to their councrymen than even the Irifh themfelves.

Another caufe of the diftreftes of Ireland was, the great power of the Englifh barons, among whom Henry bad divided the greateft part of his Irih dominions. The extent of their authority only inflamed them with a defire for more; and, inflead of contributing their endeavours to increafe the power of their fovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and deftroy each other. Henry himfelf, indeed, feems to have been infected with a very fatal jealoufy in this refpect; for, though the abilities and fidelity of Raymond had abundantly manifefted themfelves, the king never could allow himfelf to continue him in the government of the ifland: and the confequence of degrading him never failed to he a feene of uproar and confufion. To tbefe two reafons we muft likewife add another; namely, that in thofe parts of the kingdom where the Irifh chieftains enjoyed the fovereignty, they were at full liberty to make war upon each other as formerly, without the leaft reftraint. This likewife induced many of the Englifh to degenerate, that they might bave an opportunity of tharing the plunder got by thefe petty wars; fo that, on the whole, the ifland was a perpetual fcene of horror, almoft unequalled in the hillory of any country.

After the death of earl Richard, Raymond was imad mediately elected to fucceed him; but was fuperfeded by the king, who appointed William Fitz-Andelm, a nobleman allied to kaymond, to fucceed in his place.

- The new governor had neither inclination nor abilities to perform the tafk affigned to him. He was of a rapacious temper, fenfual and corrupt in his manners; and therefore only fludied to earich himfelf. The
native Irith, provoked by fone depredations of the Englifh, commenced holtilities ; but Fitz.Andelm, inftead of repreffing thefe with vigour in the beginning, treated the chieftains with affected courtely and Hatterf. This they had fufficient difcernment to fee, and to defpife; while the original adventurers laad the burden of the whole defence of the Erglifh prie, as the Englith territories were called, thrown tpon them, at the fame time that the bad conduct of the governor was the caufe of perpetual diforders. The confequence of this was, that the lords avowed their hatred of [itz-dndeim : the foldiers were mutinous, ill-appointed, and unpaid: and the Irifh came in crowds to the governor with perpetual complaints agaioft the old adventurers, which were always decided againt the latter ; and this decifion increafed their confidence, without leffening their difaffection.

In this unfavourable fiate of affairs, John de Courcey, a bold adventurer, who had as yet reaped none of the benefits lie expected, refolved to undertake an expedition againft the natives, in order to enrich himfelf with their fpoils. The Irifh at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry: but treatics were of little avail, when put in competition with the neceffities of an indigent and rapacious adventurer. The confequence was, that the flame of war was kindled through the whole illand. The chifftains took advautage of the war with the Englifh, to commence hoftilities againft each other. Defmond and Tho. mond, in the fouthern province, were diftracted by the jealnufies of contending chiefs, and the whole land was walted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the fame kind, in fuch a manner as to perpetuate a fucceffion of outrages the moft horrid, and the moit difgraceful to humanity. The northern province was a feene of the like enormities; though the new Englifh fettlers, who were confidered as a common enemy, ought to have united the natives among themfelves. All were equally flrangers to the virtues of lomanity; nor was religion, in the form it then affumed, capable of reftraining thele violences in the leat.

Ireland was thus in a fhort time reduced to fuch a $\mathrm{He}_{\mathrm{is}} \mathrm{3I}^{\mathrm{I}}$ flate, that Henry perceived the necefinty of recalling feded by Fitz-Andelm, and appointing another governor. He Hugh de was recalled accordingly; and Hugh de Lacey ap.Lacey. pointed to fucceed him. He left his government without being regretted, and is faid by the hiltorians of thofe times to have done only one good action during the whole courfe of his adminiftration. This aftion was nothing more important, than the removing of a relic, called the ftaff of $\check{Y} t$ fus, from the cathedral of Armagh to that of Dublin; probably that it might be in greater fafety, as the war raged violently in Ullier. De Lacey, bowever, was a man of a quite different difpofition, and every way qualified for the difficult government with which he was invefted: but at the fame time, the king, by invetting his fon John Prince Jona with the lordihip of Ireland, gave occalion to greater madelord dilturbances than even thofe which had already happeued. The nature of this lordhip hath been much difputed; but the mo! probable opinion is, that the king's fon was now to be invefted with all the rights and powe:s which had formerly belonged to Roderic,

## I R E [ 324 ]

## I R E

Irelams. who was allowed the title of king of Ireland. It doth not appear, indeed, that Henry had any right to deprive Roderic of thefe powers, and Rill lefs had he to difpofe of any of the territories of thofe chicftains who had agreed to become his tributaries; which neverthelefs he certainly did, and which failed not to be productive of an immediate war with thefe chiefs.

The new governor entered on his office with all that fpirit and vigour which was neceffary; but being mif. reprefented to the king by fome lactious barons, he was in a fhort time recalled, and two others, totally unfit for the government, appointed in his room. This error was foon corrected, and Lacey was replaced in three months. The fame jealoufy which produced his firft degradation, foon produced a fecond; and Philip de Braola, or Pbilip of Wrorefler, as he is called, a man of a mo? avaritious difpofition, was appointed to fucceed him. This governor behaved in fuch a manner, that his fupertitious fubjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, bowever, was of fort duration ; for now prince John prepared to exercife the authority with which his father lad inveited him in Ireland. He was attended by a confiderable military force: his train was formed of a company of gallant Normans in the pride of youth; hut luxurious, infolent, and followed by a number of Englifhmen, ftrangers to athe conntry they were to vifit, defperate in their fortunes, accultomed to a life of profligacy, and filled with great expectations of advantage from their prefent fervice. The whole affembly embarked in a fleet of 60 fhips; and arrived at Waterford after a profperous voyage, filling the whole country with the greateft furprife and expectation.

The young prince had not yet arrived at the years of difcretion; nor indeed, from his fubfequent conduct, doth it appear that his difpofition was fuch as qualified bim in the lealt for the high dignity to which he was raifed. The hardy Welchmen who firft migrated into Ireland, immediately waited upon him to do him homage; but they were difagrecable to the gay courtiers, and to the prince himfelf, who minded nothing but his pleafures. The Irifh lords were at frlt terified by the magnificent reprefentation of the force of the Englifh army; and being reconciled to fubmifion by the dignity of the prince's ftation, haStened in crowds to Waterford to do him homage. They exhibited a fpectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridiculc. The lrifh lords, with unconth attire, thick bufhy beards, and hair ftanding on end, advan. ced with very little ceremony; and, according to their own notions of refpel, offered to kifs the young prince. His attendants ftepped in, and prevented this horrid violation of decorum by thrufting away the Irifhmen. The whole affembly burf into peals of laughter, pulled the beards, and committed feveral other indignities on the perfons of their guetts; which were immediately and feverely refented. The chieftains left the court, boiling with indignation; and meeting others of tbeir countrymen haftening to do homage to the prince, they informed them of the re-

## I R E

Id. now made a new and more ample divifion of the king's lands of Ireland into counties, where fieriffs, and many other oflicers, were appointed. Thefe counties wire, Dublin, Meath. Kildare, Argial, now called L.ozutb, Katberlkgh, Kilkenny, Wexford, Waterford, Cork, Kirry, Limeric, Tiipperary ; which marks the eitent of the Englifh doninions at this time as conlined to a part of Leinfler and Muntter, and to thofe parts of Meath and Argiak which lie in the province of U1fter, as now defined. Before his departure, the king gave liberty to John de Grey, biflop of Norwich, whom he appointed governor, to coin money of the fame weight with that of England; and which, by roval proclanation, was made current in England as well as Ireland.

This eeclefinftieal governor is faid to have managed affairs fo happily, thac during the violent contelfs between Jolut and his barons, Ircland enjoyed an unufual degree of tranquilitity _-We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Queen Elizabeth's reign, perfectly free from diforders, only they werc contined to thofe diftrict moft remote from the Englifh government. In $121 \%$, the conamotions were renewed, thro' the imneafurable amtition sud con entions of the Englifh barons, who defpificd all controul, and oppreffed the inlabitants in a terribie namner. The diforders in England during the reign of Henry III. encouraged them to defpifc the royal authority; they were ever the fecret enemiss, and fometimes the avewed adverfaries, of each other; and in many places where they had obtained fettlements, the natives were firlt driven into infuriections by thcir eruelty, and then punihhed with double crueliy for their refiftance. The Eaglifh laws, whieh tended to punifh the authors of thefe outrages, were fecrned by an imperious ariftocratic faction, who, in the phrenzy of rapine and amoition, trampled on the molt falutary inflitutions. In 1228, a remonflrance was prefented to the king againt this dangerons neglect and fufpenfion of the laws ; which he anfwered by a mandate to the chief governor, directing that the whole budy of nobility, knights, free tenants, and bailiffs of the feveral counties, fhould be convened ; that the charter of Englih laws and cuftoms receiviy) from king John, and to which they were bound by oath, fhould be read orer in their prefence ; that they fhould be directed for the future frictly to obferve and adhere to thefe; and that proclamation Should be made in every county of Ireland. ffrietly enjoining obedience, on pain of forfeiture of lands and tenements. How littie effect was produced by this order, we may learn from another, dated in 1246 ; where the barons are commanded, for the peace and tranquillity of the land, to permit it to be governed by the laws of England.
Nothing indeed ean be coneeived more terrible than ation the flate of Ireland doring the reign of Henry III. utrs. People of all ranks appear to have been funis in the loweft degree of depravity. The powerful Englift lords not only fubverted the peace and fecurity of the people, by refufing to admit the falutary laws of their own country, but behaved with the utmott injuftice and violence to the natives who did not erjoy the benefits of the Englifh confitution. The clergy appear so have been equally abandoned with the reft: nor in.
deed could it be otherwife; for through the partiali- Ireland. ties of Henry himfelf, the neglected, the worthlefs, and the depreffed among the Enslifh clergy; found refuge in the church of Ireland. What were the manners of thefe clergy, will appear from the following petition of a widow to king Elward $[$.
" Margaret le Blunde, of Caftel, petitions our lord the king's grace, that the may have her inheritance which the recovered at Clonmell before the king's judges, \&ce againt David Macmackerwayt bihop of Cahel.
" Item, the faid Margaret petitions redrefs on account that her father was killed by the faid bithop.
" Item, for the imprifonment of her grandfather and mother, whom lie fout up and detained in prifon until they perified by farmine, becaufe they attempted to feek redrefs for the death of their fon, father of your petitioner, who had been killed by the faid billiop.
-Item, fur the death of her fix brothers and filters, who were tlarved to death by the faid bifhop, becaufe he bad their inheritance in his hands at the time he killed their father.
"And it is to be noted, that the faid bifhop had built an abbey in the city of Cafhel, on the king'a lands granted for this purpofe, which he hath filled with robbers, who murder the Englifh, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he fulminates the fentence of excommunication againt them.
" It is to be noted alfo, that the faid Margaret has five times croffed the Irifh fea. Wherefore, the petitions for God's fake, that the king's grace will have compaffion, and that the may be admitted to take pof. feffon of her inheritance.
" It is further to be noted, that the aforefaid bifhop hath been guilty of the death of many other Englifhmen belides that of her father; and that the aforefaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reaion of the inhuence and bribery of the faid binop.
"She further petitions, for Ged's fake, that fhe may have colts and damages, \&c."
Matters continned in the fame deplorable Itate during the reign of Edward I. with this additional grie- Litte altevance that the kingdom was infelled by invafions of ration und the Scota. The Englifh monarch indeed poffeffed all der Edthat prudence and valour which were neceffary to have reduced the ifland to a fate of tranquillity; but his project of conquering Scotland left him but litule leifure to attend to the diftracted ftate of Ireland. Certain it is, however, that the grievous diftrefs of that country gave him great uneafinels; fo that he tranfmitted his mandate to the prelates of lreland, requiring them to interpofe their fpiritual authority for compongg the public diforders. About the fame time, the Irith who lay contiguous to the Engitih, and who dwelt among them, prefented a petition to the king, offering to pay him 8000 merks, upon condition that they were atmitted to the privileges of Englifh fubjects. To this petition he retured a favourable anfwer; but his good intentions were defeated by the licentious nabi. lity, who knew that thefe laws would have circuin.fcribed their rapacious views, and contoulel their

Frelan 3. violence and oppeffion. Petitions of the fame kind were feveral times repeated during this reign, but as ofien defeated; though fome means were ufed for the peace of the kingdom, fuch as the frequent calling of parliaments, appointing fheliffs in fome new counties, \&x.

Thefe means were not altogether without effect. They ferved to give fome check to the diforders of the realm, though by no means to terminate or fubdue them. The incurfions of the natives were repreffed, and the Englifi lords began to live on better terms with each other; and, in $13^{11}$, under Edward II. the moll powerful of them were reconciled by the martiage of Maurice and Thomas Fitz John, afterwards the heads of the illultrinus houfes of Deimon and Kildare, to two danghters of the earl of Ultter. But juit at this happy period, when the nation feemed to have fome profpect of tranquillity, more dreadful ca-

AI
Tnvafin of
ehe Scots in the reign of Edward I and any hitherto related were about to take place. The Scots had juft recovered their liberty under Robert Brace, and were now in no danger of being again enflaved by a foreign power. Edward, the king's brother, as a recompence for his fervices, demanded a hare of the reyal authority. This was refufed by Robert, and Edward was for the prefent fatisfied by being declared heir apparent to the crown. But the king, wiftly confidering the neceffity of finding out fome employment for a youth of fuch an afpiring and ambitious difpolition, pointed out to his brother the illand of Ireland, the conquett of which would be eafy, on account of the dillracted thate in which it atmoll always was, and which would make him an independent fovereign. This propofal was eagerly embraced by Eilward, and every thing necentaly for the expedition immediately got ready. On the 25 th of May 1315, he landed on the north-eaftern coatt of Ireland with 6000 men, to affert his claim to the fovereignty of this kingdom. The Irifh lords of Uliter, who had invited and encouraged him to this enterprize, were now prepared to receive their new monarch, flocked with eagerners to his flandard, and prepard to wreak their vengeance on the common enemy. Their progrefs was marked by defolation and carnage. The Englifh fettlers were flaughtered, or driven from their poffeflions, their caftles levelled with the ground, and their towns fet on fire. The Englifh lords were neither prepared to refilt the invafion, nor fufficiently united among themfelves. The confequence was, that the enemy for fome time met with no interruption. An intolerable fcarcity of provifions, however, prevented Bruce from purfuing his advantages; and though his brother landed in Ireland with a powerful army, the famine prevented him from being of any effential tervice. 'I'he forces which he left behind him, however, proved of confiderable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devaflations committed by Bruce and his affociates, now induced fome Englifh lords to enter into an aflociation to defend their poffeffions, and repel thefe invaders. For this purpofe, they raifed a confi. derable body of forces; which coming to an engagement with Fedlim prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with \&500 of his men. This defear, bowever, had very
little effect on the operations of B -uce himfe'f. He ravared the country to the walls of Dublin, traverfed the ditrict of Offory, and penetrated into Manfter, deftroying every thing with fire and fword. The Englih continued to augment their army, till at laft it amounted to 30,000 men; and then Bruce, no longer able to oppofe fuch a force, found it neceffary to retire into the province of Ullter. His retreat was effected with great difficulty ; and during the tim. of his inactivity, the dilteftes of his army increafid to fuch a degree, that they are faid to have fed upon the bodies of their dead companions. At laft an ent was put to the fufferings and the life of this adventurer in the battle of Dundalk, in 1318 , where he was defeated and killed by the Englih under Sir Robert Birming. ham. A brave Englih knight, named IToupas, had ruithed forward to enconntur Bruce himfelf, and both antagonifts had killed each other ; the body of Maupas being found, after the battle, Aretched upon that of Bruce. The king of Scotland had been advancing with powerful fuccours to his brother: but Edward, confident of victory, refufed to wait his arrival ; and Robert, on hearing of his brother's death, inflantly retired.

The defeat of the Scottifh invaders did not put an end to the difturbances of this unhappy country. The contentions of the Englith with one another, of the Irifh with the Euglifh, and among thenfelves, ftill kept the illand in a flate of the utmoft barbarity and confufion. An attempt was made indeed, in the reign of Edward II. to eflablifh an univerfity in Dubhn; but for want of proper encnuragement the inftitution for fome time languifhed, and then expired amidat the confufion and anarchy of the country. The reign of Edward III. proved not much more favourable than preceding times had been. He was too much taken up with the idea of conquering France, to pay much regard to the interefts of Ireland. The unhappy under people, indsed, fenfible of their own miferies, petitioned the king to admit all his fubjects in Ireland to a participation of the Englifh laws; but the petition being delivered as ufual to the chief governor, and laid before the parliament, it was either clandeftinely defeated or openly rejected. A new fcene of tumult and bloodhed immediately cufued; which at latt produced an order from the king, prohibiting all Irifh. men, or Englifhmen married and having eftates in Ireland, from bearing any public office whatever.This, inftead of having a tendency to promote peace, made the diforders much greater than before; and at laft produced a remonttrance from the flates met at Kilkenny, in which they gievounly complain not only of the diforders of the kingdom, but alfo of the conduct of the king himfelf in the edict above mentioned: and to this remonftrance the king thought proper to give a gracious and condefcending anfwer, in order to procure from Ireland the fuccours he wanted in his expedition againt France.
It is not to be fuppofed, that mere promifes, unaiGifted by any vigorous exertion, could make the leall alteration in the fate of a kingdom involved in fo much mifery. The diforders, however, at la became infupportable to the inhabitants themfelves; and a pariament was fummoned in 1367 , the refult of which was the famous flatute of Kilkenny. The preamble

## I R E [ 327 ] I R E

d. to this act recites, that the Englifh had become mere Irith in their language, names, apparel, and manmer of livine; had rejected the Englifh laws, and fubmitted to thole of the Inifh, with whom they had united by marriagt-alliance, to the ruin of the common-wealth. - It was therefore cnacted, that marriage, nurture of infants, \&ic. with the Irifh, fhould be confidered and punifhed as hish treafon.-Again, if any man of Englifh race that ufe an Irifh name, the Irifh language, or tle I:ith apparel, or any mode or cultom of the Irifh, the ast provides, that he fhall forfeit lands and tonements, until be hath given fecurity in the court of chancery to conform in every particular to the Enclifh manntrs ; or if he have no lands, that he fhall be imprifoned till the like fecurity be given. The Brehon law was pronounced to be a pernicious cuftom and innovation lately introduced among the Englith fubjects; and it was therefore ordained, that in all their controverfies they fhould be governed by the common law of England; and that whoever fhould fubinit to the Irifh juifdiction, fhould be adjudged guilty of high treafon. As the Englifh had been accultomed to make war or peace with the bordering Irifh at pleafure, they were now exprefsly prohibited from levring war without fpecial warrant from the Atate.-It was alfo made highly penal for the Englifh to permit their Irifh neighbours to graze their lands, to prefent them to ecclefiaftical benefices, or to receive them into monafteries or religions houfes; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who feduced them by falfe reports. - It was made felony to impofe or cefs any forces upon the Englifh fubject againft his will. And as the royal liberties and franchifes were become fanctuaries for malefactors, exprefs power was given to the king's fheriffs to enter into all franchifes, and there to apprehend felons and traitors.-Laftly, becaufe the great lords, when they levied forces for the public fervice, acted with partiality, and laid unequal burdens upon the fubjects, it was ordained that four wardens of the peace in every county fhould adjudge what men and armour every lord or tenant thould provide. - The ftatute was promulged with particular folemnity ; and the firitual lords, the better to enforce obedience, denounced an excommunication on thofe who fhould prefume to violate it in any inflance.

This ftatute, it is evident, could not tend to promote the peace of the kingdon. This could only bave been done by removing the animofity between the native Irifh and Englifh ; but fo far was the ftatute of Kilkenny from having any tendency of this kind, that it manifetly tended to increafe the hatred between them. During the whole of this reign, therefore, the fate of the Irifh government continued to be greatly difordered and embroiled. The Englifh intereft gradually declined; and the connections of the king's fubjects with the original inhabitants, occafioned by their vicinity and neceffary intercourfe, in defpite of all legal injunctions, obliged the king to relax the feverity of the fatutes of Kilkenny, in cafes where they proved impracticable, or oppreffive in the execution. The gerpetual hoftility, however, in which the different parties lived, proved an effectual bar to the introducsion of thofe arts which contribute to the comfort and
refinement of mankind. Even foreign merchants could not vencure into fuch a dangerons country without particular letters of protection from the throne. The perpetual fuccefion of new adventurers from Eagland, led by intereft or neceffity, ferved only to inflame dif. fention, inllead of introducing any effential improvement. Lawyers fent from England were notorionfy infuficient, if not corrupt; and, as fuch, had frequently been the obiects of complaint. The clergy were a mean grovelling race, totally infuenced by the crown. Even prelates were commonly made the inferior agents of governmeut in collecting forces, and raifing war againft the Irifh enemy; but were not to be enticed into this fervice, except by remittances from the exchequer. Attendance in parliament they dreaded as the greatel hardfhip; and either recurred to mean excufes to avert the penalty of abfence, or fued to the king io be exempted by patent fiom contributing or affenting to thofe laws by which they were to be governed.

In this deplorable fituation the kingdom continued power of till the time of Henry VII. who laid the foundation the Engline of the future civilization of the Irith, as he alfo did of revives unthe Englifh nation. This he effected by enacting fome Ver Henry falutary laws, and appointing faithful and active governors to fee them put in execution. Of thefe governors Sir Edward Poynings contributed more than any other to the tranquillity of the flate. Dering his adminiftration was enacted the law known by the name of Poyning's Law, and which hath fince been the fubject of much political debate. The purport of it was, That no parliament thould be held in that ifand with out firt giving notice to the king of England, and acquainting him with the acts to be paffed in that parliament; neither fhould any act paffed, or any parliament held, withont the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor, not having it in his power to affemble parliaments when he pleafed, became a perion of much lefs cona fequence. The whole Irifh legination alfo became dependent on that of England, and liath ever fince contio, nued to be.fo.

From this time we may date the revival of the Englifh power in Ireland; which from the Scottifh war in the time of Edward II. had gradually declined into a iniferable and precarious ftate of weaknefs. The authority of the crown, which had at laft been defied; infulted, and rejected, even in the Englifh territory, was rcitored and confirmed, and the rebellions vigoroufly oppofed and fuppreffed. The feignory of the Britilh crown over the whole body of the Irifh, which in former reigns feemed to have been totally forgotten, was now formally claimed and afferted, and fome of the molt ferocious chieftains by their marriage-connections became the avowed friends of the Engliih power. An ignominious tribute, called the Black Rent, was indeed ftill paid to fome chieftains; but their hoftilities were oppofed and chaftifed, and even in their own diftricts they were made to feel the fuperiority of Englifh goo vernment.

During the reign of Henry VIII. the Irifh affairs were neglected; and the diforders, which liad only been checked, and never thoroughly eradicated, rea turned as ufual. They were further promoted by the

## I I E

innovations in religion which the king introduced, and which were exceedingly difagreeable both to Englith and Jrih. The Reformation, however, continued to make forme progrefs, though flowly, during the reign of Edward VI. and even in the reign of queen Mary; for as the perfecution did not reach thither, many Protcllants fled to Ireland in order to avoid the queen's cruelty. The machinations of the Spaniards againft queen Elizabeth excited the lrifh to frefh infurrections. The king of Spain, indeed, not only encouraged the natives in thofe infurrections, but actually fent over troops to affil them in driving out the Englifh altogether. This they had well nigh effected; but the Spaniards, upon feeing an army of Irihi defeated by an handful of their enemies, were fo much provoked that they furrendered all the places they had made themfelves nafters of, and even offered to affit the Englifh in reducing the rebels; though it was not thought proper to accept of their affilance. The confequence of this was, that the Irim, abandoned By thefe allies, were umable ta carry on the war; and the grand rebcl O'Neal of Tirowen, or Tirone, after much treachery, evalion, and many pretendel fubmil-- fions, was at latt obliged to fubmit in good earnelt. He fell upon his knees before the deputy, and petitioned for mercy with an air and afpect of diftrefs. He fubfcribed his fubmiffion in the moft ample manner and form. He implored the queen's gracious commiferation; and humbly fued to be reflored to his dignity, and the fate of a fubject, which he had juitly forfeited. He utterly renounced the name of O'Neat, which he had affumed on account of the great veneration in which it was held among the Irifh. He abjured all foreign power, and all dependency except on the crown of England; refigned all clain to any lands ex. cepting fuch as thould be conferred upon him by letters patent; promifing at the fame time to affilt the ftate in abolithing all barbarous cuftoms, and eflablifhing -Iaw and civility among his people. The lord deputy, on the part of the queen, promifed a full pardon to him and all his followers; to himafelf the reforation of his bluod and honours, with a new patent for his lands, except fome portions referved for certain chieftains received into favour, and fome for the ufe of Englifh garrifons.

No infurgent now remained in this kingdom who had not obtained or fued for mercy. Many, indeed, were driven by neceffity to the continent, and earned a fubfiltence by ferving in the armies of Spain; and thus a race of lrih exiles was trained to arins, filled with a malignant refentment againft the Englifh. Thus the honour of reducing all the enemies of the crown of England in this inland, after a continued conteft for 440 years, was referved for the arms of Elizabeth. The ghatlinefs of famine and defelation was now fomewhat enlivened by the reftoration of tranquillity. Indeed, from the noft authentic accounts the prices of provifions were fo high, that confidering the value of money at that time, it is furprifing how the inhabitants could fubfift. From an account of the rates of provifions taken by the mayor of Dublin in 1602, it appears, That wheat had rifen from 368. to 91 . the quater: barley-malt from 10 s . to 43 s . the barre!; cat-malt from 5 s. to 22 s . the barrel; peafe from $\$$ s. to 40 s. the pect: oats from 3 s. 4 d. to 208 . the No 163.
barrel ; beef from 26 s. 8 d . so 81 . the carcaie ; mut. Ir ton from 3 s. to 26 s . the carcaí ; veal from jos. to 29 8. the carcale; a lanab from 12 d. to 6 s . ; a pork from 8 s , to zo s.

Under James I. Ireland began to aflume a quite dif. The ferent appearance. That monarch valued himfelf upor cuvil promoting the arts of peace, and made it his ftuly to Jam civilize his baıbarous Irith fubjects. By repeated con. Spiracies and rebellions, a valt tract of land had efcheated to the crown in fix northern counties, Tyrconnel, now called Donnegal, Tirone, Derry, Farmanagh, Cavan, and Armagh, amounting to about 500,000 acres; a tract of country covered with woods, where rebels and banditti found a fecure refuge, and which was deftined to lie wafte without the timely interpofition of government. Janies refolved to difpole of thefe lands in fuch a manner as might introduce all the happy confequences of peace and cultivation. He caufed furveys to be takert ot the feveral counties where the new fettlements were to be eftablithed; defcribed particularly the itate of each; pointed out the fituations proper for the erections of towns and cattes; delineated the characters of the Irih chieftains, the manner in which they fhould be treated, the temper and circumitances of the old inhabitants, the rughts of the new purchafers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his inftance it was refolved, that the perfons to whom lands were affigned flould be either new undertakers from Great Britain, efpecially from Scotland, or firvitors, as they were called; that is, men who had for fome time ferved in Ireland, eitiner in civil or military offices; or old Irifh chieftains or captains. A. mong the lait were included even thofe Irifh who had engaged in the rebellion of Tirone, and till harboured their fecret difoontents. T'o gain them, if pulfible, by favnur and lenity, they were created with particular indulgence. Their undertenaints and fervants were al. lowed to be of their own religion; and, while all the other planters were obliged to take the vath of allegiance, they were tacitly excepted. The fervitors were allowed to take their tenants either from [reland or Britain, provided no Popill recufants were admitted. The Britifh undertakers were contined to their own countrymen.
In the planeations which had been formerly attemp. ted, the Irifl and Englifh had been mixed together, from a fond imagination that the one would have learned civility and indultry from the other. But experience had now difcovered, that this intercourfe ferved only to make the !rith enoy the fuperior comforts of their Englifh neighbours, and to take the advantage of a free accefs to their houfes to Heal their goods and plot againft their lives. It was therefore deemed neceffary to plant them in feparate quarters; and in the choice of thefe fituations, the errors of former times were carefully corrected. The original Englifh adven. turers, on their firlt fettlement in Ireland, were captivated by the fair appearance of the plain and open dillrits. Here they erected their calles and habita. tions; and forced the old natives into the woods and mountains, their natural fortreffes. There the kent themfelves unknown, living by the milk of their kine, without hußbandry or tillage; there they increafed to

## I R E [ $\begin{array}{lll}329 & ]\end{array}$

R

Irelan'. incredible numbers by promifcuous generation; and there they held their affemblies, and formed their confpiracies, without difcovery. But now the northern Irifh were placed in the moll open and acceffible parts of the country, where they might hie under the clofe infpection of their neighbours, and be gradually habituated to agriculture and the mochanic arts. To the Britifh adventurers were affigned places of the greatelt flrength and command; to the fervitoss, ftations of the greateft danger, and greatelt advantage to the crown: but as this appeared a peculiar hardfhip, they were allowed guards and entertainment, until the country fhould be quietly and completely planted.

The experience of ages had fhown the inconvenience of enormous grants to particular lords, attended with fuch privileges as obftructed the adminittration of civil government: and, even in the late reign, favourite undertakers had been gratified with fuch portions of land as they were by no means able to plant. But, by the prefert feheme, the lands to be planted were divided in three different proportions; the greatelt to confilt of 2000 Englifh acies, the leaft of 1000 , and the middle of 1500 . One half of the efcheated lands in each county was affigned to the fmalleit, the other moiety divided between the other proportions: and the general diftributions being thus afcertained, to prevent all difputes between the undertakers, their fettleinents in the refpective diftrifts were to be determined by lot. Eftates were affigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king in capite; thofe of 1500 , by $k$ nights fervice; thofe of 1000 , in common foccage. The fint wcre to build a cafle, and inclofe a Atrong court yard, or lazen as it was called, within four $j$ jears; the fecond, to finifh an houfe and bawn within two years; and the third, to inclofe a bawn; for even this rude fpecies of fortification was accounted no inconfiderable defence againft an Irifh enemy. The firt were to plant upon their lands, within three years, 48 able men of Englin or Scottifh birth, to be reduced to 20 families; to keep a demefne of Gco acres in their own hands; to lave four fee farmers on 120 acres each; fix leafe holders, each on 100 acres; and on the reft, eight families of liuBandmen, artificers, and cottagers. The others were under the like obligations proportionably: All were, for five years after the date of their patents, to refide upon their lands either in perfon, or by fuch agents as fhould be approved by the ltate, and to keep a fufficient quantity of arms for their defence. The Britifh and fervitors were not to alienate theit lands to mere Irifh, or to demife any potions of them to fuch perfons as hould refufe to take the oatlis to government; they were to let them at determined rents, and for no fhorter term than 21 years or three lives. The houfes of their tenants were to be built after the Englifh fafhion, and united together in towns or villages. They had power to erect manours, to hold courts-baron, and to create tenures. The old natives, whofe tenures were granted in fee-fimple, to be held in foccage, were allowed the like privileges. They were enjoined to fet their lands at certain rents, and for the like terms as the other undertakers; to take no Irifh cxactions from their inferior tenants, and to oblige them to forfake their old Scythian cuftom of wandering with their cattle from place to place for pa-

## Vol. IX. Part I.

they called it; to dwell in Treland. towns, and conform to the Enghilh manner of tillage and hufbandry. An annual rent from all the lands was referved to the crown for every 60 Englifh acres, fix thillings and eight pence from the undertakers, ten fhillings from fervitors, and 13 fhillings and four pence from Irifh natives. But for two years they were exempt from fuch payments, except the natives, who were not 〔ubject to the charge of tranfportation. What gave particular credit to this undertaking, was the capital part which the city of London was perfuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend L. 20,000 on the plantation, to build the cities of Derry and Colerain, and Ilipulated for fuch privileges as might make their fettlements convenient and refpectable. As a compctent force was neceffary to protect this infant plantation, the king, to fupport the charge, inlituted the order of baronets, an hereditary dignity, to be conferred on a number not Exceeding 200; each of whom, on pafling lis patent, was to pay into the exchequer fuch a fum as would maintain 30 men in Ullter, for three years, at $8 d$. daily pay.

But fcarcely had the lands been allotted to the different patentees, when confiderable portions were reclaimed by the clergy as their rightful property. And fo far had the eitates of the northern bifhoprics been embarraffed, buth by the ufurpations of the Irifh lords, and the claims of patentees, that they fcarcely afforded a comperent, much lefs an honourable, provifion for men of worth and learning, while the tlate of the parochial clergy was ftill more deplorable. Moit of the northern churches had been either deftroyed in the late wars or had fallen to ruin: the benefices were fmall, and either fhamefully kept by the bifhops in the way of commendam or fequeftration; or filled with minifters as fcandalous as their income. The wretched flock was totally abandoned; and for many years divine fervice had not been ufed in any parifh-church of Ulfter, except in cities and great towns. To remedy thefe abufes, and to make fome proper provifion for the inftruction of a people immerfed in lamentable ignorance, the king ordained, that all ecelefattical lands fhould be reftored to their refpective fees and churches, and that all lands flould be deemed ecclefiaftical front which bifhops had in former times received rents or penfions: that compolitions fhould be made with the patentees for the fite of cathedral churches, the refidences of bifhops and dignitaries, and otber churchlands which were not intended to be conveyed to them: who were to rective equivalents if they compounded freely; or elfe to be deprived of their patents as the king was deceived in his grant, and the pofleffons reAored to the church. 'I'o provide for the inferior clergy, the bifhops were obliged to refign all their impropriations, and relinquifh the tythes paid them out of parifhes, to the refpective incumbents; for which ample recompence was made out of the king's lands. Every proportion allotted to undertakers was made a parifh, with a parochial church to each. The incumbents, befides their tythes and duties, had glebe-lands afligned to them of 60,90 , or 120 acres, according to the extent of their parifhes. To provide for a fuccef. fion of worthy paltors, free-fchools were endowed in T

## the

Irelan'. the principal towns, and confiderable grants of lands conferred "n the univerfity of Dublin, which had been re-eltablifnel by queen Elizabeth, together with the advowfon of fix parochial churches, three of the lapgett, and three of the middle proportion in each county.

Such was the general fcheme of this famous northern plantation, fo honourable to the king, and of fuch conlequence to the realm of Ircland. Its happy effects were immediately perceived, although the execution by no means correlponded with the original idea. Buildings were flowly erected: Britifh tenants were difficult to be procured in fufficient numbers; the old natives were at hand, offered higher rents, and were received into thofe diftricts from which it was intend. ed to exclude tiem. In this particular, the Londoners were accufed of being notorioully delinquent. They acted entirely by agents; their agents were interefled and indolent, and thercfore readily countenanced this tlangcrons iutrution of the natives; an error of which fufficient caufe was afterwards found to repent. For the prefent, however, a number of loyal and induflrious inhabitants was poured into the northern counties, confiderabic improvements made by the planters, and many tewns erected. To encourage their induAtry, and advance his own project, the king was pleafed to incorporate feveral of thefe towns, fo that they had a right of reprefentation in the Irifh parlia.
50 ment.
State ${ }^{50}$ fre. The only difturbance that now fnfued was from the land fince Popifh party, who never could bear to fee the Protethat time. Atant religion eftablifhed in preference to their own, while they had power to refift. After numberlefs ineffectual machinations and complaints, their fury broke out in a terrible maffacre of the new Englin fettlers in

- See Bri- the year 164t*. The affairs of Britain were at that $\operatorname{tain}, n^{\circ} 103$ time in fuch confution, that the rebellion could not be -106.
flaves to the defpicable, lazy, and oppreffive fubordinate landlords."

Another caufe confilted in the various reftrictions which it had been thought proper to lay upon the Irith trade, and trade, and the conftant and great preference given by difontents government to the Englifh manufacturers, at lat produced the moft grievous difcontents and diftreffes. Ou the part of England it was fuppofed, that as Ireland had part of England it was fuppoled, that as Ireland had m nt for
been fubdued by force of arms, the inhabitants ought and agains in every refpect to be fubject to the victorious ftate; the liilh. and that the interelt of the Eaglif ought on all occafions to be confulted, without regarding the inconveniences which might enfue to the Irifh. A very different idea, however, was entertained by the Irifh themfelves, or at lealt by the patriotic party among them. They rejected all notions of dependence upon the Britifh minittry and parliament; and though they did not foruple to acknawledge the king's risht of conqueft, they moft pofitively denied that the Britifh parliament had any authority whatever over them; and therefore looked upon the reftrictions laid upun their trade as the mott grievous and intolerable oppreffion.

In the year ifig, according to Mi Crawford, the Caufe of oppreffion and gievances of Ireland became altogether infupportahle. A caufe relative to an citate, betwixt Hefter Slerlock and Maurice Annefley, wats tried before the court of exchequer in Ireland. Here the latter obtained a decree in his favour; but, on an appeal, the fentence was reverfed by the lords. Ann-fley appraled from them to the Englifh peers; who liaving reverfed the judgement of thofe of Ireland, he was put in poffeffion of the fubject in difpute. Sherlock appealed again to the Itith lords, and the matter became very ferions. It was propofed to the confideration of the judges, Whether by the laws of the land an appeal lies from a decree of the court of exchequer in Ireland to the king in parliament in Britain. This quellion being determined in the negative, Sherlock was again put in poffefion of the eftate. A petition was fome time after prefented to the houfe by Alexander Burrowes theriff of Kildare, fetting forth, "That his predeceffor in office had put Sherlock in poftefion of the premiftes; that, upon his entering into office, an injunction, agrecable to the order of the Englith pects, iffued from the exchequer, requiring him toreliort Maurice Annefley to the poffeffion of the above mentioned lands; and that, not daring to act in contradiction to the order of the houfe, he was fined. In confequence of this, being afraid lett he fhould be taken into cuttody, he durft not come in to pals his accounts; and for this he was fined L. t200." His conduct was applauded by the nifpute beIrifh lords, who commanded the fines impofed upon twitt the him to be taken off; and in a fhort time after drew up eers of a memorial to be prefented to his majetty. In this and Engthey fet forth, that having fubmitted to Heary II. as land. their liege lord, they bad from him obtained the benefit of Englifh law, with many other privileges, particularly that of having a diftinct parliament. In confrquence of this conceffion, the Englifh had been encouraged to come over and fetile in lreland, where they were to enjoy the lame privileges as in their own country. They farther infited, that thongh the imperial crown of Ireland was annexed to that of Britain, yet being a diftinct dominion, and no part of the
 gard to its affairs, but fuch as were authorifed by its known laws and cuftoms, or the exprefo confent of the king. It was an invation of his majclly's prerogative for any court of judicature to take upon them to de. clare, that he could net by his authority in parliament determine all controverfies betwist his fubjects of this kingdom; or that, when they appealed to his majelty in parliament, they did not bring their caufe before a competent judicature: and they reprefented, that the practice of appeals from the Irifh parliament to the Britifh peers was an ufurped jurifdiction affumed by the latter ; the bad confequences of which they pointed out very fully.
This reprefentation being laid before his majefty in parliament, it was refolved, that the barons of exchequer in Ireland had acted with courage and fidelity, according to law, \&c. and an addrefs was prefented to his majeity, praying himto confer on them fome mark of
his royal favour as a recompenfe for the injuries they his royal favour as a recompenfe for the injuries they
had futained from the Irifh legiflatures This was folafted had fuftained from the ind lowed by a bill for the better fecuring the dependency euring of Ireland upon the crown of Great Britain. By this it was determined, "That the houfe of lords of Ireland have not, nor of right ought to have, any jurifdiction to ju'ge of, affirm, or reverfe, any judgment, fentence, or decree, given or made in any court within the kingdom; and that all proccedings before the faid houfe of lords, upon any fuch judgment or decree, are utterly null and vord to all intent: and purpofes whatever." It was alfo determined in this bill, that "the king's majefty, by and with the advice and confent of the Jords firitual and temprasal, and commons of Great Britain in parliament affembled, had, hath, and of right ought to have, full power and autho ity to make laws and itatutes of fufficient force and validity to bind the people of 1reland "

This bill was looked upon by the Irifh to be equivaIent to a total annihilation of their liberties; and they were fill father exafoe:ates in the year ${ }^{1724}$, by the patent granted to ote Wood an Englifhman to coin halfpence and farttings fur the ofe of lreland. In this affai, Wood is faid to have deted very difhonourably; infomuch that a hilling of the halfpence he made were fearcely werth a penny. Great quantities of this bafe coin were fenc over; and it was nfed not only in change, but accounts were likely to be paid in it, fo that dangerous confequences feemed ready to enfue. The Irifh parliament, in an addrefs to the king, reprefented that they were called upon by their country to lay before his majefty the ill confequences of Wood's patent, and that it was likely to be attended with a diminution of the revenue and the ruin of trade. The fame was fet forth in an application made to his majelty by the privy council. In fhort, the whole nation feemed to unite their efforts in order to remedy an evil of fuch dangerous tendency, the effects of which already began to be felt.

A mong the controverfial pieces which appeared on in this occation, thofe of Dr Swift were particularly diAinguifhed. His Drapier's letters are to this day held in grateful remembrance by his countrymen; but he was in danger of fuffering deeply in the caufe. He had been at particular pains to explain an argument
ufed by the Irifh on this occafion ufed by the Irifh on this occafion, viz. that brafs of the rebellion which raged in Scotland, his lordnhip was advifed to augment the military force of Irtland by 40.0 men. Inftead of this, however, he fent four battalions to the duke of Cumberland, and encouraged the volunteer affociations which formed in different parts for the defence of their country. Thefe battalions he replaced by additional companies to the regiments already on the eftablifhment; by which means lie faved a confiderable expence to the nation, without augmenting the influence of the clown. The fupplies anked by him were fmall, and raifed in the moit ealy and agreeable manner to the people, expending the money at the fame time with the utmolt economy. There was even a faving, which he applied to the ufe of the public. It had been a cuftom with many of the lieutenant governors of Ireland to beflow tevelionary grants, in order to purchafe the affiflance of friends in fupport of their meafures. Lond Chelterfield, how-
money, being illegal, could not be forced upon the nation by the king, without exceeding the limits of his lreland. prerogative. Hence the oppofite party took occafion to charge the Irifh with a defign of calling off their dependence on Britain altogether: but Suift having cxamined the accufation with freedom, pointed out the encroachments made by the Britifh parliament on the liberties of Ireland; and afferted, that any dependeuce on England, cxcept that of being fubjects to the fame king, was contrary to the law of reafon, nature, and nations, as well as to the law of the land. This publication was fo difagreeable to government, that they offered a reward of L. 300 for the difcovery of the author; but as nooody could be found who would give him up, the printer was profecuted in his ftead: however, he was unanimoully acquitted by a jury of his countrymen.
The Irifh continued to be jealous of their liberties, while the Britifh minilly feemed to watch every opportunity of encroaching upon them as far as poflible. Apprehenfions being entertained of a delign upon Ireland by the partifans of the pretender in 1715, a vote of credit to government was pafted by the houle of commons to a confiderable amount. This laid the Difpute foundation of the national debt of that kingdom, which with gewas quickly augmented to feveral hundred thoufand vernment pounds; for difcharge of which a fund had been pro- about the vided by adminitration. An attempr was made du- payment of ring the adminiftration of Lord Carteret (who govern. the national ed Ireland till 1730), to velt this fund in the hands debt. of his majefty and of his heirs for ever, redeemable by parliament. 'This was oppofed by the patriotic party, who infited, that it was inconfitent with the public fafety, and unconfitutional, to grant it longer than from feffion to feffion. In 1731 another attempt was made to veft the fame in the crown for 21 years; but when the affair came to be debated, the Itrength of both parties was found to be equally balanced. Immediately before the vote, however, Colonel 'Iottingham having rode poft oo the occafion, arrived in the houle, and determined the queltion againft govern. ment.

The behaviour of Lord Chefterfield, who was made Eyelt 60 governor of Ireland in 1745 , is highly extolled on ac Exeellent count of his moderation, and the favour he fhowed to the liberties of the prople. As the appiehentions of conduct of Lord chefterfield. government ware then very confiderable, on account 'Ttz
cerer,

Ircland. ever, being convinced that this practice was prejudicial to the intereft of the nation, put a flop to it; but the moft remarkable part of his adminittration was, the humanity with which he treated the Roman Ca tholics. Before his arrival, the Romifh chapels in Dublin had been fhut up; their priefts were commanded by proclamation to leave the kingdom; and fuch as difobeyed had been fubjected to imprifonment and other penalties. Lord Chefterfield, however, convinced that the affection is to be engaged by gentle ufage, permitted them to exercife their religion without diturbance. The accufations brought againft them of forming plots againt government, were difregarded; and fo much was his moderation and uprightnefs in this refpect applauded by all parcies, that, during the whole time of his adminiltration, the national tranquillity was not once interrupted by the fmalleft internal commotion. On his leaving the illand, his bult was placed at the public expence in the caltle of Dublin.

Lord Chefterfield having left Ireland in the fpring of 1746 , the illand continued to be governed by lords juttices until the 13 th of September, when William earl of Harrington came over with the powers of lord lieutenant. A conteft in the election of reprefentalives for the city of Dublin this year called forth the abilities of Mr Charles Lucas, fo much celebrated for his patriotic virtues. Having fome years before been admitted a member of the common council, he refolved to exert himfelf in behalf of the privileges of his fellow-citizens. The powers of this city-corpora-
tion, as well as of others, had been changed by authority derived from an act in the time of Charles II. and among other innovations, for the purpofe of augmenting the influence of the crown, they deprived the commons of the power of choofing the city magittrates. This was now velted in the board of aldermen; which being fubject in the exercife of its jurifdiction to the approbation of the privy council, was confequently dependent on government. Mr Lucas complained loudly of the injury; but as this law could not be altered, he fet himfelf to inquire, whether encroachments, which could not be jultified by law, lad not been made on the rights of the citizens? Having fatisfied himfelf, by fearching diligently into ancient records, that his apprehenfions were well-founded, he publifhed his difcoveries, explained the nature of the evidence refulting from them, and encouraged the people to take the proper Ateps for obtaining redrefs.
The confequence of this was a contelt between the commons and aldermen, which lafted two years. The former ttruggled in vain to recover their loft privileges; but the exertions of Lucas in every ftage of the dif. pute had rendered him fo refpectable among his counerymen, that on the death of Sir James Somerville he was encouraged to declare himfelf a candidate for a feat in parliament. This being highly agreeable to his wifhes, he was elected accordingly; and difting uifhed himfelf not only by the boldnef and energy of his fpeeches, but more efpecially by a number of addreffes to his countrymen. In fome of thefe he particularly confidered the feveral branches of the conftitution, and pointed out the encroacliments of the Britifh legillature. Government, alarmed at his boldnefs, determiaed to crufh him by the hand of power; for which
reafon the moft obnoxious paragraphs were extracted from his works, and made the foundation of a charge before parliament. The commons voted him an ene$m y$ to his country; and addreffed the 'ord licutenant for an order to profecute him by the attorney-general. The univertal efteem in which he was held could not fereen him from minifterial vengeance: he was driven from Ireland; but having fpent fome years in banifhment, he was once more enabled, through the exertions of his friends, to prefent himfelf as a candidate for the city of Dublin. Being again clected, he continued to ditinguifh himfelf by the fame virtuous principles for which he had been from the beginning fo remarkable, and died with the character which he had preferved through life, of the incorruptible Lucas.

In the year 1753, a remarkable contelt took place hetwixt government and the Irifh palliament relative with go to previous confent. As the taxes for defraying fate concern expences are impofed by the reprefentatives of the previo people, it thence naturally follows, that they have a coifen riglat to fuperintend the expenditure of them; and by an infpection of the journals of the houfe of commons, it appeared, that from the year 1692 they had exercifed a right of calling for and examining the public accounts. When any furplus remained in the tieafury, it was alfo cuftomary to difpofe of it by bill for the good of the public. In the year 1749, however, a confiderable fum having remained in the treafury, the difpofal of this money in future became an object to miniltry. In 175 I , it was intimated to parliament by the lord lieutenant, the duke of Dorfet, that his majelty would graciounly confent and recommend it to them, that fuch part of the money as then remained in the treafury fhould be applied to the reduction of the national debt." As this implied a right inherent in his majefly to difpofe of the money as he thought proper, the propofal was accounted an invafion of the privileges of the houfe of commons. No notice was therefore taken of the direction given by Dorfet, but the bill was fent over to England as ufual without any notice taken of his majefty's confent. In England, however, this very maserial alteration was made, and the word confent introduced into it. The commons at this time did not take any notice of fuch an effential alteration; but next year, on its being repeated, the bill was rejected. Government were now at the utmoft pains to defend the meafure they had adopted, and pamphlets were publifhed in which it was juttified on various grounds. The event at laft, however, was, that his majefty by letter took the money which had been the fubject of difpute out of the treafury.

In the year 1760 Ireland fuftained an inconfiderable Invafi hoftile invafion, the firft that had been experienced in Thur the kingdom for 70 years. The armament confifted $1 ; 60$ originally of five hips; one of 48 guns, two of 36 , and two of 24 ; having on board 1290 land forces. They were commanded by the celebrated 'Thurot, whofe reputation, as captain of a privateer, had advanced bim to this dignity. The fquadron, however, was driven by adverfe winds to Gottenburgh ; where having continued a few days, they fet fail for the place of their deftination. On their arrival at the coalt of Ireland, they were obliged to fhelter themfelves in Lough Foyle from a violent florm which again overtook them. The wind, however, having fhifted, and continuing to

## I R E

blow tempefuounty, they were nbliged to keep out to fea. Two of the fhips were chus feparated from the reft by the violence of the form, and returned to France; but the remaining three directed their courfe to the ifland of Ilay, where they anchored; and having repaired their danages, took in a fupply of provilions, and thence failed to Carrick fergus.
In the mean time, an officer belonging to the finall number of tronps at that time in Carrickfergus took poft on a rifing ground, with an advanced party, to obferve the motions of the enemy. A fkirnifh enfued betwixt this party and 'Thurot's men, until the former, laving expended all their ammunition, were obliged to retire into the town. Having in vain attempted to prevent the enemy fiom taking poffeffion of it, the Britifh tronps flut themfelves up in the cafte, where they were foon obliged to capitulate, after having killed about 100 of their enemies, with the lofs of only three on their own parr. The Froneh having plundered the town, fet fail on the 26 th of February; and three days after were all taken by Captain Elliot, Thurot himfelf being killed in the engagement.

Soon after the acceffion of Gcorge I11. Ireland firt began to be difurbed by a banditti who fyled themrelves $W$ bite Boys; and as thcfe were generally of the Romifh perfuafion, the prejudices again! that fect broke forth in the ufual manner. A plot was alleged to have been formed againft government ; French and Spanifh cmiffaries to have been fent over to Ireland, and actually to be employed to affift in carrying it into exceution. The real caufe of this commotion, howcver, was as follows: About the year 17.32 the murrain broke out among the horned cattle in the duchy of Holltein, from whence it foon after fpread through the other parts of Germany. From Gernany it reached Holland, from whence it was carried over to Eng. land, where it raged with great violence for a number of years. The mitigation of the penal laws againft the Papitts about this time encouraged the natives of the fouth of Ireland to turn their thoughts towards agriculture, and the poor began to enjoy the neceffaries of life in a comfortable manner. A foreign demand for beef and butter, however, having become uncommonly great, by reafon of the cattle diftemper juft mentioned, ground appropriated to grazing became more valuable than that employed in tillage. The cotters were every where difpoffiffed of their little poffeffions, which the landlords let to monopolizers who could afford a higher rent. Whole baronies were now laid open to pafturage, white the former inlabitants were driven defperate by want of fubfiftence. Numbers of them fled to the large cities, or emigrated to foreign countries, while thofe who remained took fmall fpots of land, about an acre each, at an exorbitant price, where they endeavoured if poffible to procure the means of protracting a miferable exiftence for themfelves and families. For fome time thefe poor creatures were allowed by the more humane landlords the liberty of commonage; but afterwards this was taken away, in defpite of juftice and a pofitive agreement; at the fame time, the payment of tythes, and the low price of labour, not exceeding the wages in the days of Queen Elizabeth, aggravated the diatreffes of the urihappy fufferers beyond meafure.

In fuch a fituation, it is no wonder that illegal me.
thods were purfued in expectation of redrefs. The Ircland. at night, turned up the ground, deftroyed bullocka, levelled the inclofures of the commons, and committed conftrued into a plot agathere unavailing efforts were bers of the rinters were appint the government; numLimerick, Cork, and Tipperary in the counties of condemned and executed. unhappy wretches, intead of being looked apes thele jects of compaffion, were profecuted with the ut obs. feverity. Judge Afton, however, who was fent over to try them, executed his office with \{uch humanity as did him the lighef honour. A molt extraordinary and affecting inftance of this was, that on his return from Dublin, for above ten miles from Clonmell, both fides of the road were lined with men, women, and children; who, as he pafled along, kuceled down and implored the bleffing of heaven upon $\lim$ as their guardian and protector.

In the mean time, the violences of the White Boys continued, notwithitanding that many examples were made. The idea of rebellion was fill kept up; and, without the finalleft foundation, gentlemen of the firlt rank were publicly charged with being concerned in it, infornuch that fome of them were obliged to enter bail, in order to protect themfelves from injury. The Catholics of Waterford gave in a petition to Lord Hertford, the governor in 1765 , in behalf of themfelves and brethren, protefting their loyalty and obedience to government; but no effectual ftep was taken cither to remove or even to invelligate the caule of the ditturbances.

66
About two years after the appearance of the White of the Oak: Boys, a fimilar commotion arofe in Uliter; which, Boys. however, proceeded in part from a different caule, and was of much florter duration. By an act of parliament, the making and repairing of highways in Ireland was formerly a grievous oppreffion on the lower ranks of people. An lonfekeeper who had no horfe was obliged to work at them fix days in the year; and if he laa a horle, the labour of both was required for the fame fpace of time. Befides this oppreflion, the poor complained that they were frequently obliged to work at roads made for the convenience of individuals, and which were of no fervice to the public. Nor were thefe the only grievances of which the infurgents at this time complained: the tythes exacted by the elergy were faid to be umreafonable, and the rent of lands was more than they conld bear. In 1763 , therefore, being exafperated by a road propofed to be made thro, a part of the county of Armagh, the inhabitants molt immediately affected by it rofe in a body, and declared that they would make no more highways of the kind. As a mark of diftinction, they wore oakbranches in their hats, from which circumftance they called themfelves Oak-boys. The number of their partizans foon increafed, and the infurrection became general through the counties of Armagh, Tyrone, Derry, and Fermanagh. In a few weeks, however, they were difperfed by partics of the military; and the public tranquillity was reltored with the lofs of only jwo or thiee lives. The road-act, which had been fo jutly found fault with, was repealed next feffion; and.

Ireland. be made and repaired by a tax to be equally affeffed $\int_{67}$ on the lands of the rich and poor.
Ofthe Seecl Befides thefe, another fet of infurgents called SteelBoys. boys fron made their appearance, on the following account. The eftate of an abfentee nobleman happening to be out of leafe, he propofed, inftead of an addilional rent, to take fines from his tenants. Many of thofe, who at that time poffeffed his lands, were unable to comply with his terms; while others who could afford to do fo, infifted upon a greater rent from the immediate tenants than they were able to pay. The ufual confequences of this kind of oppreffim inftantly took place. Numbers being difpoffeffed and thrown dellitute, were forced into acts of outrage fimilar to thofe already mentioned. One of thefe charged with felony was carried to Belfaft, in order to be committed to the county gad ; but his affociates, provoked by the ufage they had rectived, determined to relieve him. The defign was eagerly entered into by great numbers all over the country; and feveral thoufands, having provided themrelves with offenfive weapons, proceeded to Belfaft in order to refcue the prifoners. To prevent this, he was removed to the barracks and put under the guard of a party of foldiers quartered there : but the Steel-boys preffed forward with a determination to accomplifh their purpofe by force, and fome fhots were actually exchanged between them and the foldiers. The confequences would undoubtedly have been fatal, had it not been for a phyfician of highly refpectable character, who interpofed at the rifk of his life, and prevailed on thofe concerned ro fet the prifoner at liberty. The tumult, however, was not thus quelled. The number of infurgents daily increafed, and the violences cominitted by them were much greater than thofe of the other two partics. Some were taken and tried at Carrickfergus, but none condemned. It was fuppofed that the fear of popular reientment had influenced the judges; for which reafon an act was paffed, enjoining the trial of fuch prifoners for the future to be held in counties different from thofe where the crimes were commitied. This breach of a fundamental law of the conftitution gave fuch offence, that though feveral of the Steel-hoys were af. teiwarde taken up and carried to the catlle of Dub. lin, no jury would lind them guilty. This obnoxions law was therefore repealed; after which fome of the infurgents, being tried in their refpective counties, were condemned and executed. Thus the commotions were extinguifhed: but as no methods were taken to remove the caufe, the continued diltruffts of the people drove many thoufan so them into America in a very 68 few years.
Farliament In the mean time a very material alteration had tamade oc. iennial.
of treland ken place, in the conftitution of the kingdom, with regard to the duration of parliaments. At an carly period thefe had conunued only for a year; but afterwards they were prolonged until the death of a fovereigu, unlefs he chofe to diffolve it fooner by an excrtion of his prerogrative. 'Thus, from the moment of their election, the commeners of Ircland were in a manner totally independent of the people and under the influence of the crown; and government foon availed itfelf of this power to bribe a majority to ferve its own purpofes. Various methods were thenght of to remedy this evil; but all proved ineffectual until the
year 1768 , when, during the adminiftration of Lord lrele Townihend, a bill was prepared and fent over to Eng. land, by which it was enacted, that the $\mathrm{I}_{1}$ ifh parlia. ments thenceforth fhould be held every feven years. It was returned with the addition of one year; and ever fince the parliaments of this country have been oftennial. During this feffion an attempt was made by the Britifh miniftry to infringe the rights of the houfe of commons in a very material point. A money- An ${ }_{\mathrm{En}}^{6}$ bill, which had not originated in Ireland, was fent noney over from Britain, but was rejected in a fpirited man. rejeite ver. Its rejection gave great offence to the Lord Lieutenant, who repeatedly prorogued them till the year 1771.

The affairs of Ireland began now to draw towards that crifis which effected the late remarkable revolu. tion in favour of the liberties of the people. The paffing of the octennial bill had diminifhed, but not taken away, the influence of the crown ; and the fituation of affairs between Britain and America had inclined miniltry to make the moll of this influence they could. In 1773 Lord Harcourt, at that time governor of Ircland, exerted himfelf fo powerfully in favour of adminiftation, that the voice of oppofition in parliament was almolt entirely filenced The difficulties, however, under which the whole nation laboured began Dittreff 70 now to be fo feverely felt, that an addrefs on the fubject lane uf was prefented by the commons to his excellency. In befoet chis they told him, that they hoped he would lay before lord lie the king the flate of Ireland, reftricted in its com- uant. merce from the flort-fighted policy of former times, to the great injury of the kingdom, and the advantage of the rivals, if not of the enemies, of Great Britain. Thefe hardhips, they faid, were not only impolitic, but unjutt; and they told his excellency plainly, that they exprected to be reftored to fome, if not to all their rights, which alone could juftify them to their conflituents for laying upon them fo many burdens during the courfe of this feffion.

This reprefentation to the Lord Licutenant produced no effect ; and Ireland for fone years longer continued to groan under the burden of intolerable reItrictions. Thefe had principally taken place in the reign of Charles II. At this time it was enacted, that Acc ${ }^{71}$ beef or live cattle fhould not be exported to England ; cue reltr neither were the commodities of Ireland to be ex. the ion poited to the American colunies, nor American the trade. goods to be imported to any port in Ircland without firt unloading them in fome part of England or Wales. All trade with Afia was excluded by charters granted to particular companies; and reftrictions were impofed upon alinot every valuable article of commerce fent to the differeut ports of Europe. Towards the end of King William's reign an abfolute prohibition was laid on the exportation of Irifh wool. This refriction proved difadvantageous not only to Ireland, but to Great Britain herfelf. The French were now plentifully fupplied by fmuggling with Irifh wool ; and not only enabled to furnifh woollen thuffs fufficient for their own confunpt, but even to vie with the Britifh in foreign markets. Other reftrictions coufpired toaugment the national calamity; but that which was molt fenfibly felt took place in 1776 . "There had hitherto (fays Mr Crawford) been exported annually to America large quantities of Irefh linens: this very
confiderable fource of national adivantage was now fhut up, under pretence of rendering it more difficult for the cnemy to be fupplied with the means of fubs. fillence; but in reality, to enable a few rapacious Englifh contractors to fulfil their engagements, an embargo, which continued, was in 1776 laid upen the exportation of provifions from Iretand, by an uncontlitutional fretch of perogative. Remittances to Eng. land, on various accounts, particulally for the payment of our furces abroad, were more than ufually confiderable. Thefe immediate cilufes being combinted with thofe which were invariable and perma. nent, produced in this country very calamitous effects. Black catle fell very confiderably in theis ra. lue; notwithflanding that cultomers could not be had. The price of wool was reduced in a Atill greater proportion. Rents every where fell ; nor, in many places, was it puffible to collect them. An univerfal Alagnation of bufinefs enfued. Credit was very materially injured. Farmers sere prefled by exteme nee. Fify, and many of them failed. Numbers of manufacturers were reduced to extreme neceffity, and would have perifhed. had they not been fuppoited by publice chaity. Thofe of every rank and condition were deeply afficeted by the calamity of the times. Had the fate of the exchequer permitted, grants might have been made to promote indufry, and to alleviate the national dillefs; but it was exhanfled to a very unconmon degree. Aimok every branch of the revenue had failed. From want of money the militia law could not be carrid into execution. We could not pay our forces abroad ; and, to enable us to pay thofe at home, there was a neceffity for bortowing 50.0001 . from England. The money which partiament was furced to raife, it was obliged to borrow at an cxorbitant interefl. England, in its prefent fate, was affected with the wretched condition to which onr affairs were reduced. Individuals there, who had eftates in Ireland, were fharers of the comnon calamity; and the atten. tion of individuals in the Britift parliament was turnd to our fituation, who had even no perfonal interell in this country."
While things were in this deplorable fituation, earl Nugent, in the year 1778, undertook the caufe of the Irifh, by moving in parliament, that their affairs thould be taken into confideration by a committee of the whole houfe. This motion beirg agreed to almoft unanimoully, it was followed by feveral others, viz. llat the Irih might be permitted to expat direstly :o the Britifh plantatiuns, or to the fettements on he coaft of Africa, all goods being the produce and nanutadure of the kin dem, exctpting only wool, or voullen manufatures, \&c. That all goods, being the roduce of any of the Britifh plantations, or of the ettlements on the coall of Africa, tohacco excepted, $t$ allowed to be imported dircelly ferm lretand to all laces, Britain excepted. That contor yarn, the inaufaciure of Ireland, be allowed to be imported into ireat Britain. Thai glafis manufacturco in lrtlanc be ermitted to be exported to all phaes, Britain exapted. - With refpect to the lrini fail cloth and corage, it was eloved, that they foculd lave the fane ivilese as for the cutton yarn.
Thefe motions having paficd unanimouny, bills for ee relief of Ireland were framed upon them according-
ly. The trading and manufacturing towns of Eng. Ireland. land, however, now took the alarm, and petitions againt the Irilh indulgence were bronght forward from many different quarters, and members inltructed to oppofe it. In conifequence of this a warm contefl took place on the fecond reading of the bills. Mr Barke fupported them with all the lliength of his eloquence; and as the miniller feemed to favour them, they were committed ; though the violent oppofition to them itill continue', "hich induced many of their friends at that time to defert their caufe.

Though the efforts of thofe who favoured the caufe New at ${ }^{76}$ of Irctand thas proved unfuccefstul for the prefent, tempt in they renewed their endeavours before the Chrift mas favour of vacation. They now urged, that, independent of all the tith. claims from juitice and bumanity, the relief of Ireland was enforced by neceffity. The trade with Britifh A merica was now lolt for ever; and it was indifpenfably requali'e to unte the remaining parts of the empire in one common interell and affection. Ireland had hitheito been paffive; but there was danger that, by driving her to extremitics, fhe would cat off the yoke alhogether ; or, even if thas fhould not happen, the tyravay of Britain would be of little advantage; a, on the event of a peace, the peopie would defert a country in which they bad experionced fuch oppriffiun, and cmigrate to America, where they had a greater profpect of literty On the other hand, chey intited, that very confiderable advantages muit cufue to Bortain by the emancipation of Ireland; and every bencfit extended to that country would be returned with accurnulated intereft. The bulinefs was at lalt fummed up in a motion made by lord Newhaven, in February 1779 , that libery thoud be grantcd to the Irifh to impore fugars from the Weil Indies. This was carried ; but the New pemerchants of Glafgow and Mancheller having peti-titions tioned againlt it, it was again lut tbrongh the interfe. againnt rence of the miniftr, who now exerted his influence them. againit the reliet he hau formerly declared in favonr of. Varions other effurts, however, were made to efiect the intended purpore; but nothing more could be obtained than a kind of compromife, by which lord Gower pledged himfelf, as far as he could anfwer for the conduct of othess, that, during the recefs, fome plan fhould be fallun upon for accommodating the aftairs of Ireland to the fatisfaction of all parties.

In the mean time the affairs of this country haftened to a crifis; which forced the Britilh miniltry to give that relicif fo long folicited, and which they fo often promiled without any intention of perforning their promiles. As long as the affairs of the country were 78 under confidetation of the Britifh parliament, the in fallernent habitants preferved fome ciegree of patience; but, enfues whin they found themfelves deferted by the miniller, hroughoue their difcontent was inflamed beyond meafure. The doma laws he had paffed in their favou:, viz. an allowance to plant tobacco, and a bill for encouraging the growth of hemp, were confidered as mockery inftead of relief, and it was now refolved to take fuch meafures as fhould effectually convince the minitry that it was not their interelt to tyrannize any longer. With this view, alfo-Aforiaciations againft the impostation of Britifh commoditics, tiour tormwhich tad been entered into in fome places before, now mmanint became univerfal throughout the kingdom; and fuch sritincumas modites,

Irelatd. as prefumed to oppofe the voice of the people in this refpect, liad the mortification to find themfelves expofed to public obloquy and contempt on that account. Thus the Irifh manufactures began to revive; and the people of Britain found themfelves obliged ferionfly to take into confideration the relief of that country, and to look upon it as a matter very neceflary to their own intereft. To this alfo they were which had taken place fome time before, and now affumed a molt formidable appearance. Thefe at firft were formed by accidental caufes. The fituation of Britain, for fome time, had not admitted of any effec. tual method being taken for the defence of Ireland. Its coalts had been infulted, and the trading fhips taken by the French and American privatcers; nor was it at all improbable that an invafion might foon follow. "The minifter (fays Mr Crawford) told ns, that the fituation of Britain was fuch as rendered her incapable of protecting us. The weaknefs of government, from the following circumftance, was frikingly obvious. The mayor of Belfat having tranfmitted a memorial to the Lord Licutenant, fetting forth the unprotected thate of the coaft, and requefting a body of the military for its defence, received for anfwer, that he could not afford him any other affitance than half a troop of difmounted horfe and half a company of invalids." In this dilemma, a number of the inhabitants of the town affociated for the purpofe of felf.defence; and, on the fame principle, a few volunteer companics were formed in different parts of the kingdom. Thefe chofe their own officers, purchafed their own uniforms and arms, and, with the affiftance of perfons properly qualified, affembled regularly on the parade to acquire a knowledge in the military art. Their refpectable appearance, and the zeal they, fhowed in the fervice of their conntry, foon excited curiofity and attracted refpeet. Their number increaled every day ; and people of the firf confequence became ambitious of being enrolled among them. As no foreign enemy appeared, againft whom they might exercife their military prowefs, thefe patriotic bands foon began to turn their thoughts towards a deliverance from domeftic oppreffion. No fooner was this idea made known, than it gave new vigour to the fpirit of volunteering; infomuch that, by the end of 1778 , the military affociations were thoughe to amount at leaft to 30,000 men. But, while thus formidable from their numbers, and openly avowing their intention to demand a reftitution of their rights from the Bitifh miniftry, they profeffed the utmolt loyalty and affection to the king; and with regard to fobriety and decent demeanour, they were not only unexceptionable, but exemplary. Inftead of exciting diforders themfelves, they reltrained every kind of irregularity, and exerted themfelves with unanimity and vigour for the execution of the laws.

That fuch a body of armed men, acting without any command or fupport from government, fhould be an object of appreliention to miniftry, is not to be wondered at. In the infancy of their affociations indeed they might have been fuppreffed; but matters had been fuffered to proceed too far ; and, as they flood at prefent, all relittance was vain. As the volunteers could not be controuled, fome attempts were made to bring chem under the influence of the crown; but this being
$\mathrm{N}^{\circ} 169$.
found impoffible, miniftry thought proper to treat them with an appearance of confidence; and, accordingly; orders were iffued for fupplying them with 16,000 rhe ftand of arms.

The Irih parliament, thus encouraged by the fpirit with of the nation, and preffed by the difficulties arifing by th from the diminithed value of their eftates, refolved to exert themfflues in a becoming manner, in order to the procure relief to their country. At their meeting in liam Oetcher 1779, an addrefs to his Majefty was drawn drefs up; in which it was exprefsly declared, that "it was restie not by temporary expedients, but by a free trade alone, that Ireland was now to be faved from impending ruin." When this addrefs was carried up to the Lord Lieutenant, the Itrects of Dublin were lined with volunteers, commanded by the duke of Leinfter, in their arms and uniform. But, though a general expectation of relief was now diffufed, an anxious fear of difappointment flill continued. If the ufual fupply was granted for two years, there was danger of the difteffes continuing for all that time ; and after it was granted, the prorogation of parliament might put a flop to the expected relief altogether. The people, however, were not now to be trifled with. As the court-party fhowed an averfion to comply with the po pular meafuree, a mob rofe in Dublin, who, among Riot other acts of violence, pulled down the houfe of the vab attorney-general, and did their ntmoft to compel the members to promifc their countenance to the matter in hand. When the point therefore came to be debated, fome efpoufed the popular fide from principle, others from neceflity; fo that on the whole a majority appeared in favour of it. A fhort money bill was paffed and traufmitted to England; where, though very mortifying to the minitter, it paffed alfo.

On the meeting of the Britih parliament in Decem- Aff ber, the affairs of Ireland were firt taken into confide- Irel: ration in the houfe of peers. The neceffity of granting gaire relief to that kingdom was throngly fet forth by the the lord who introduced them. He faid, the Irifh, now parl confcious of poffeffing a force and confequence to which they had hitherto been Itrangers, had refolved to apply it to obtain the advantages of which the nation, by this fpirited exertion, now fhowed themfelves worthy. Had they for fome time before been gratified in leffer matters, they would now have received with gratitude, what they would, as affairs ftood at prefent, confider only as a matter of right. He then moved for a vote of cenfure on his Majelty's minitters for their neglect of Ireland. This motion was rejected; but Earl Gower, who had now deferted the caufe of miniftry, declared, that there did not exift in his mind a fingle doubt that the vote of cenfure was not well founded. He added, in his own vindication, that early in the fummer he had promifed that relief fhould be granted to 1 reland, and had done cvery thing in his power to keep his word; but that all his efforts had proved fruitlefs.

In the houle of commons the minifter found himfelf fo hard preffed by the arguments of the minority, and the fhore moncy-bill from Ireland, that he was obliged to declare, that in lefs than a week he intended to move for a committee of the whole houfe to take the affairs of Ireland into confideration. On the 13 th of December he accordingly brought forward his pro6
politions
twixt England and Ireland, he obferved, that, as a Ireland. more liberal fpirit had now appeared on both fides of the water, he hoped both kingdoms would be perfectly contented. Ireland would never be able to rival England in the fine woollen fabrics; but allowing the 1 rifh to manufacture their own woul, would put alt end to the contraband trade with France: and it ought to be remembered, that whatever was an advantage to Ireland, muft, fooner or later, be of fingular adrantage to Great Britain, and by the propofed regulations in their commercial conuections, the two kingdoms would be put morc upon an equality.

With regard to the glafs manufacture, his lordmip likewife obferved, that Ireland had been very injurioully treated. Before the act of igth Geo. 11. they had begun to make fome progrefs in the lower branches of the glafs manufacture; but by that act they were not only prevented from importing any other glafo than what was of Britifh manufacture, but alfo from esporting their own glais, or putting it on a horfe or carriage with a delign to be exported. This att had been com. plained of in Ireltad as a great piece of injuffice, and it was the intention of his propofition to remove that grievance.

With regard to the third propofition, his lordhip obferved, that allowing Ireland a free trade to the colonies mult be coufidered as a favour to that kingdom. Coolidering her even as an independent ftate, fhe could fet up no claim to an intercourfe with the Britifl colonies. By every principle of jultice, of the laws of nations, ano the cultom of the other Eurnpean powers who had fettlements and diffant dependencies, the mother country had an exclufive right to trade with, and to forbid all others from having any intercourle with them. Were not this the cafe, what nation under the fun would fpend their blood and treafure in eftahlifhing a colony, and protečing and defending it in its infant itate, if other nations were afterwards to reap the advantages derived from their labour, hazard, and expence. Ihut though Great Britain had a right to reftrain Ireland from trading with her colonies, his Iordfhip declared himfelf of opinion that it would be proper to allow iner to participate of the trade. This would be the only prudent means of affording her relief; it would he an unequisocal proof of the candour and fincerity of Great Eritain ; and he had not the leaft doubt hut it would be reccived as fuch in Ireland. Britain, however, ought not to be a fufferer by her bounty to Ireland; but this wonld be the cale, fhouid the colony trade be thrown open to the latter, without aceompanying it with reffrictions. fimilar to thofe which were laid upon the Britilh trade with them. An equal trade muft include an equal thare of duties and taxes ; and this was the only proper ground on which the benefits expected by the Irifl nation could be either granted or defired.

Having made fome other obfervations on the propriety of thefe meafures, they were regularly formed into motions, and pafled unanimounly. In Ireland recelved they were received with the utmolt joy and gratitude with great by both houfes of parliament. 'On the 20th of 1e- joy by the cember the following refolutions were paffed; viz. That the exportation of woollen and other manufactures from Ireland to all forcign places will materiallytend to relieve its diftreffes, increafe its wealth, promote

U «

Ireland. its profperity, and thereby advance the walfare of Britain, and the commnn ftrength, wealth, and commerce of the Britifh empire; that a liberty to trade with the Britifh colonies in Anerica and the Weft Indies, and the fettlements on the coalt of Africa, will be productive of very great commercial benefits ; will be a moft affectionate mark of the regard and attention of Great Britain to the diftreffes of the kingdom; and will give new vigour to the zeal of his Majefty's brave and loyal people of Ireland to ftand forth in fupport of his Majefty's perfon and governmert, and the intereft, the honcur, and dignity of the Britifh empire." The fame refolutions were, next day, palled in the - $S_{n}$ houle of peers.

Exceflive eulogiunss pl Lurd North 5 the difad vantage of the minority in parliament

90
They are checked by a letter from a member o the Britifi houfe of compions.

The highelt encomiums were now paffed on Lord Notth. ITis exertions in favour of Ireland were declared to have been great and noble; he was ityled " the great advocate of Ireland ;" and it was foretold, that lie would be of glorions and immortal memory in that kingdom. But while thefe panegyrics were fo lavifhly made on the minilter, the members in oppofition, in the Britifh parliament, were fpoken of in very indifferent terms. It was faid, that, while they thought the minifter did not mean to go into the bufinefs of Ireland, they called loudly for cenfure againit him for not doing it ; but when it was found that he meant lerioully to take their affairs into confideration, they had then bafely feceded, and wholly forfaken the interett of the kingdom. Thefe cenfures were foloud, that a member of the Britill houfe of commons wrote a letter to be communicated to his friends in Ireland, in which he reprefented, that however politic it might be to compliment the minifter on the prefent occalion, it was neither very wife nor generons in the members of the Irifh parliament to be fo ready in beflowing invec. tives againft their old friends in England. With regard to the minitter, it was alleged, that until he was driven to it by the meafures adopted in Ireland, his conduct had been extremely equivocal, dilatory, and indecifive. The minority had been jultly incenfed againlt him for having fo grofsly facrificed the honour of the nation and the dignity of parliament as to refufe any fubttantial relief to the Irifh, until their own exertions had made it appear that every thing which could be done for them by the Britifh parliament was not a matter of choice but of nectflity. The minority, it was faid, had carneftly and repeatedly laboured to procure relief for the people of Ireland ; and-if they had now contented themfelves with a filent acquiefcence in the minifter's propotitions. it was only until they fhould know whether thry would be fatisfastory to the people of Ireland; and becaufe what was now done, appeared to be more an act of flate than of mere parliamentary deli91 beration and difcuffion.
Alditional To the propofitions already mentioned, Lord North ernpofitions added three others. 1. For repealing the prohibition in tavatir of Ireland. of exporting gold coin from Great Britain to Ireland. 2. For removing the prohibition to import foreign hops into Ireland, and the drawback on the exportation of fortign hops. 3. For enabling his majelly's Irifh fubjects to become members of the T'urky company, and to export woollens in Britifh or lrifh bottoms to the Levant. In fupport of this latt refolution tris lurdihip urged, that it was neceflary, becaufe the
exportation of woollens having been granted to Ire. Irelin land, the Irifh would naturally expect a thare in the Turky trade, which, as matters llood, was not poffible, it having hitherto been a received opinion, that no Irifmman could be elected a member of the Purky company. Notwithitanding all the fatisfaction, how. ever, with which the news of thefe bills were received in Ireland, it was not long before thonghts of a different kind began to take place. It was fuggefted, that a free trade could be but of little ufe, if held by a cow d precarious tenure. The repeal of the obnoxious laws rin $t$. $t$ was reprefented as an act of neceffity, not of choice, place. on the part of the Britin parliament. When that neceflity, therefore, no longer exitted, the fame parliamen: might recal the benefits it had granted, and again fetter the Irih trade by rettrictions perhaps more opprefGive than before. To fecure the advantages they now poffeffed, it was neceffary that the kingdom fhould en. joy the benefits of a free conftitution. For this the people looked up to the volunteer emmpanies; and the idea of having fuch a glorions object in their power, augmented the numbers of thafe whicli had alfo been increafed from other caufes. They had now received Nunibe the thanks of both houfes of parliament, and thus had of the ob:ained the fanction of the leцiflature. Thus many lunter: who had formerly forupled to connect themfelves with a lawlefs body, made no feruple to enter their litts. Government alfo engaged feveral of their friends in the volunteer caufe. New companies were therefore raifed ; but whatever might be the political Centiments of the officers, the private men were univerfally attached to the popular caule. The national fpiit was likewife kept up by feveral patriotic publications, particularly the letters figned Owen Rue O'Niel, which in an efpecial manner attrafted the putbic attention: nor was the pulpit backward in contributing its part in the fame caule.

To give the greater weight to their determinations, They 94 the volunteers now began to form themfelves into bat themfel talions; and in a very hort time they wereall united in this manner, excepting a finall number of companies, which, from accidental caufes, continued feparaie. The newfpapers were filled with refolutions from the feveral corps, declaring Ireland to be an independent lreand kingdom, intitled by reafon, nature, and compact, to ${ }^{\mathrm{c} \text { ared a }}$ all the privileges of a free conititution ; that no power dent kir in the world, excepting the king, with the lords and dom. commons of Ireland, had or ought to have, power to make laws for binding the Irifh; and that, in fupport of thefe rights and privileges, they were deter:nined to facrifice their lives and property.

Notwith:tanding all this zeal, however, the repre• Servile fentatives of the people in Treland feem yet to have haviour behaved in a very fupine and carelefs manner, and to the Irin have been entirtly obedient to the dictates of govern. ${ }^{\text {minam }}$ ment. One of the houfe of commons declared in the monit of April 1780 , that " $n$ n power on earth, excepting the king, lords, and commons of Ireland, had a right to make laws to bind the people." "Every member in the houfe (fays Mr Crawford), one excepted, acknowledged the truth of the propofition, either in exprefs terms, or hy not oppoling it; and ye:, however allonifhing it may appear, it was evident, that had the queltion been put, it would have been carried in

## I R E [ 339 ] I R E

and. the negative. The matter was compronifed. The quettion was not put ; and nothing relating to it was entered on the journals.

This inattention, or rather unwillingnefs, of the majority to ferve their country, was more fully manifelled in the cafe of a mutiny bill, which they allowed to be made perpetual in lreland, though that in England had always been cautioully paffed only from year to year. After it was pafled, however, fome of the zealous patriots, particularly Mr Grattan, took great pains to fet forth the bad tendency of that act. He obferved, that fanding armies in the time of peace were contrary to the principles of the confticution and the
fafety of public liberty; they had fubverted the liberty of all nations excepting in thofe cafes where their number was fmall, or the power of the fovereign over them limited in fome refpect or other; but it was in vain to think of fetting bounds to the power of the chief magiftrate, if the people chofe by a flatute to bind themfelves to give them a perpetual and irrefiftible force. The mutiny bill, or martial law methodized, was direetly oppofite to the common law of the land. It fet-afide the trial by jury and all the ordinary fteps of law; eflablifhing in their flead a fummary proceeding, arbitrary crimes and punifments, a fecret fentence, and fudden execution. The object of this was to bring thofe who were fubject to it to a llate of implicit fubordination, and render the authority of the fovereign abfolute. The people of England, therefore, from a laudable jealoufly on all fubjects in which their liberty was concerned, had in the matter of martial law exceeded their ufual caution. In the preamble to the mutiny act, they recited part of the declaration of right, " that Itanding amies and martial law in time of peace, without the confent of parliament, are illegal. Having then ftated the purity and fimplicity of their ancient conftitution, and fet forth the great principle of magna charta, they admitted a partial and temporaty repeal of it : they admitted an army, and a law for its regulation, but at the fame time they limited the number of the former, and the duration of both; confining the exiftence of the troops themlelves, the law that regulated them, and the power that commanded them, to one year. Thus were the flanding forces of England rendered a parliamentary army, and the military rendered effectually fubordinate to the civil magiltrate, becaufe dependent on parliament. Yet the people of England confidered the army, even thus limited, only as a neceffary evil, and would not admit even of barracks, leit the foldier fhould be ftill more alienated from the flate of a fubject; and in this ftate of alienation have a poit of flrengtl, which would augment the danger arifing from his fituation When the parliament of Ireland proceeded to regulate the army, therefore, they ought to have adopted the maxims of the Britifh conflitution, as well as the rules of Britifh difeipline. But they had intally departed from the maxims and example of the Englifh, and that in the moll important concers, the goverument of the fword. They had omitted the preamble which declared the great charter of liberty; they had left the number of furces in the breaft of the king, and under thefe circumflances they had made the bill perpetual.

It is probable that the bulk of the Itifn nation did
not at firld perceive the dangerous tendency of the bill in quellion. The reprefentations of Mr Grattan and others, however, foon opened their eyes, and a general diffatisfaction took place. This was much increafed by two unfuccefsful attempts in the houle of commons; one to obtain an act for modifying Poyning's law; and the other for fecuring the independency of the judges. A univerfal difgut againit the fpiritlefs conduct of parliament now took place; and the hopes of the people were once more fet on the volunteers.

As it became now fomewhat probable that thefe companies might at laft be obliged to affert the rights of their countrymen by force of arms, reviews were judged neceffary to teach them how to act in larger bodies, and to give them a more exact knowledge of the ufe of arms. Several of thefe reviews took place in the courfe of fummer 1780 . The fectators in general were flruck with the novelty and grandeur of the fight; the volunteets became more than ever the objects of elteem and admiration, and their numbers increafed accordingly. The reviews in 1781 exceeded thofe of the former year; and the dexterity of the thole of the former year; and the dexterity of the
corps who had affociated more early was now obferved to be greater than that of the reft. More than 5000 to be greater than that of the reft. More than 5000
men were reviewed at Belfatt, whofe performances were fet off to peculiar advantage by the difplay of 13 pieces of cannon. They flowed their alacrity to fewe pieces of cannon. They flowed their alacrity to fenve that the kingdom was to be invaded by the combined
fleets of France and Spain; and for their Spirited behathat the kingdom was to be invaded by the combined
flets of France and Spain; and for their Spirited behaviour on this occafion they received a fecond time the thanks of both houles of parliament.

Such prodigious military preparations could not but alarm the Britif minittry in the higheit degree; and
it was not to be doubted rhat the lrifh volunteers would alarm the Britifh minitry in the higheit degree; and
it was not to be doubted rhat the lrifh volunteers would come to the fame extremities the Americans had done unlefs their wifhes were fpeedily complied with. still, unlefs their wifhes were fpeedily complied with. still,
however, it was imagined pofible io fupprefs them, and it was fuppofed to be the duty of the lord lieutenant to do fo. It was during the adminiftration of the duke of Buclingham that the voluntetrs had grown into fuch confequence: he was therefore recalled, and the earl of Carlifle appointed in his place. Though it was impoffible for the new govennor to fup. prefs the fpirit of the nation, he found it no difficalt ameful matter to obtain a majority in parliament. Thus every conduct of
redrefs was for the prefent effectually denied. Neither the Irifh matter to obtain a majanty in parliament. Thus every conduct of
redrefs was for the prefent effectually denied. Neither the Irifh the modincation of Poyning's law, nor the repeal of parliamant. the obnoxious parts of the mutiny bill, could be obtained. The volunteers, exalperated at this behaviour, refolved at once to fhow that they were refolved to do themfelves juftice, and were conferents that they had power to do fo. At a meeting of the officers of the fouthern battalinn of the Armagh regiment, commanded by the earl of Charlemunt, the following refolutions were entered into December 2 Sth 17 t . 1. That the moit vigorous and effectual me-
rhods ought to be purfued for rooting corruption out 178 t . 1. That the molt vigorous and effectual me-
thods ought to be purfued for rooting corruption out from the legiflative body. 2. For this purpofe a met. mecting of ing of delegres from all the rot neceffary; and Dangannon, as the inoft central town pointed. in the province of Uliter, feemed to be the moil properfor holding fuch a meeting. 3. That as many and latting advantages might attend the holding fuch a

Ireland meeting before the prefent feflion of parliament was much farcher advanced, the 15 th of February next fhould be appointed for it.

Thefe refolutions proved highly offenlive to the frieuds of gevernment, and every method was taken to difcourage it. On the appointed day, however, the reprefentatives of 143 volunteer corps did attend at Dungannon; and the tefults of their deliberations were as follow. I. It having been afferted, that volunteers, as fuch, cannot with propriety debate or publink their opinions on political fubjects, or on the condut of parliancut, or public men, it was refolved unanimoully, that a citizen, by learning the ufe of arms, does not abanton any of his civil rights. 2. That a claim from any body of men, other than the king, lords, and commons of Ireland, to make laws to bind the people, is illegal, unconllitutiond, and a gievance. 3. Refolved, with one diffenting voice only, that the powers exercifed by the pivy comneil of both kingdoms, under colour or pretence of the law of Poyning's, are unconititutional and a grievance. 4. Refolved unanimouly, that the ports of this country are by right open to all forcign countries not at war with the king; and that any burden thereupon, or obltruction thereto, excepting only by the porliament of Ireland, are unconflitutional, and a grievance. 5. Refolved, with one diffenting voice ouly, that a mutiny bill, not limited in point of duration from feffion to feffion, is uncoultiintional and a grievance. 6. Refolved unanimouly, that the independence of judges is equally effential to the impartial adminiftration of jutice in Ireland as in England, and that the refulal or delay of this right is in itfelf unconfitutional and a grievance. 7. Refolved, with II diffenting voices only, that it is the decided and unalterable determination of the volunteer companies to feek a redrefs of thefe grievances; and they pledged themfelves to their country, and to each other, as freeholders, fellow-citizens, and men of honour, that they would, at every enfuing election, fuppurt only thofe who had fupported them, and would flopport them therein, and that they would ufe all conftitutional means to make fuch purfuit of redrefs fpeedy and effectual. 8. Kefolved, with only one dirfenting voice, that the minority in parliament, who had fupported thole conltitutional rights, are intitled to the molt grateful thanks of the volunteer compawies, and that an addrefs to the purpofe be figned by the chairman, and pubilihed with the refolutious of the prefent mecting. 9. Refolved unanimoufly, that four nembers from each county of the province of Ulster, eleven to be a quorum, be appointed a committee till the next general meeting, to act for the volunteer eorps, and to call general meetings of the province as occalion requires. 10. The cominittee being appointed, and the time of general mectings, and fome other affairs of a fimilar nature fettled, it was refolved unanimoully, that the court of Portugal having unjuilly refured entry to certain Irifh comonodities, the delegates would not confume any wine of the grow th of Portugal, and that they would ufe all their influence to prevent the ufe of the faid wine, excepting what was then in the kingdom, until fuch time as the Irifh exports fhould be received in the kingdom of Portugal. 11. Refalved, with only two diffenting voices, that they loold the right of private juogment in mat-
ters of religion equally facred in others as in then- Irela felves; and that they rejoiced in the relaxation of the pethal laws againit the Papills, as a mealure fraught witl $l_{1}$ the happieit conlequences to the union end profperity of the inhabitants of Ireland.

While there proceedings took place at I)ungannon, the miniftry carried all beforc them in parliament. In Minif a debate concerning the exclulive legillative privileges party of Ireland, a law member, fpeaking of the arbitrary dively acts of England, afferted, that " power condlituted parias right:" and a motion that the commons fould be declared the reprefentatives of the people was carried in the negative. Thefe fcandalous proceedings could not but haten the ruin of their caufe. The refolutions cutered into at the Dunganuon meeting were received thronghout the kingdom with the utmolt applaufe. A few days after, Mr Grattan, whole patriotifm has been Mir G already taken notice of, moved in the houle of com-tan's mons for a long and fpirited addrefs to his majelty, decla ti m fo ring the rights of the kingdom, and afferting the principle clarime which now began to prevail, that Ireland could legally indepe be bound by no power out that of the king, lords, and dency commons of the country; though the Britifh parliament Irelan had allumed fuch a power. This motion was at prefent rejest rejected by a large majority; but their eyes were foon enlightened by the volunteers.

Thele having now appointed their committees of correfpondence, were enabled to communicate their fentiments to one another with the utmolt facility and quicknefs. An aftociation was formed in the name of the nobility, reprefentatives, freeholders, and inhabi- Deciay tants of the councy of Armagh, wherein they fet forth luntec the neceffity of declaring their fentiments openly re-that $p$ fpecting the fundamental and undoubted rights of the pule. nation. They declared, that, in every lituation in life, and with all the means in their power, they would maintain the conllitutional right of the kingdom to be governed only by the king and parliament of Ireland; and that they would, in every inftance, miformly and Atrenuouny oppoie the execution of any flatutes, excepting fuch as derived their authority from the parliament juit mentioned; and they pledged themelves, in the ufual manner, to fupport what they now declared with their lives and fortunes.

This declaration was quickly adopted by all the other counties, and fimilar fentiments became univerfally avowed throughout the "king. The change in the Britifh miniflry in the fpring of $t-82$ facilitated the withes of the people. The duke of Portand, who Favir came over as lord lieutenant in April that year, fent a meffa molt welcome meffage to parliament. He informed fent them, that, " his majelly, being concerned to had the diame that difcontents and jealonfics were prevailing among of Pu his loyal fubjects in lreland, upon matters of great land. weight and importance, he recommended it to parliament to take the fame into their moft ferious conlideration, in order to fuch a final adjutment as might give mutual fatisfaction to his kingdoms of Great Britain and Ircland."

Mr Grattan, whofe patriotic efforts had never been Mr nackened, now ventured to propofe a fecond time intun's parliament the addreis which had been rejected before atten On the 16 th of April he began a fpeech to this pur- 1 is a pofe with a panegyric on the voluntecrs, and the late conduct of the people. The Irif, he faid, were no longer

## I R E [ 34 I$] \quad$ I I E

Ireland. longer a divided colony, but an united land, manifefting it felf to the reft of the world in lignal inftances of glory. In the reft of Europe the ancient fpirit was expired; liberty was yielded, or enpire loll ; nations were living upon the memory of pall glory, or under the care of mercenary armies. In Ireland, however, the people, by departing from the example of other natinos, had become an example to them. Liberty, in'former times, and in other nations, was recovered by the quick feelings and rapid impulfe of the populace. But in Ireland, at the prelent period, it was recovered by an aft of the whole nation reafoning for three $\xi^{\prime}$ ars on its fituation, and then refeuing itfelf by a fettled fenfe of right pervading the land. The meeting of the delergates at Dungaunon was an original mea. fure; and, like all of that kind, continned to be matter of furprife, until at latt it became matter of admiration. Great meafures, fuch as the meeting of the Englifh at Runny Mead, and of the lrilh at Dungannon, were not the confequences of precedent, but carried in themfelves both precedent and principle; and the public caufe in both intances would infallibly have been loft had it been trufted to parliament. The meeting at Dungannon had refolved, that the claim of the Britifh parliament was illegal ; and this was a conftitutional declaration. The Irifo volunteers were affociated for the prefervation of the laws, but the conduct of the Britifh parliament fubverted all law. England, however, had no reafon to fear the Irith volunteers; they would facrifice their lives in her caufe. The two nations formed a general confederacy. The perpetual annexation of the crown was a great bond, biei magna charta was a greater. It would be eafy for lrelind to find a king; but it would be impoffible to find a nation who could communicate to them fuch a chater as magna charta; ard it was this which made their natural connection with England. The Irith nation were too high in pride, character, and power, to fuffer any other nation to make their laws. England had indeed brought forward the queftion, not only by making laws for Ireland the preceding feftion, hut by cablling his majetty to repeal all the laws which Eng. land had made for America. Had the confented to repeal the declaratory law againit America? and would the refufe to repeal that againt Ireland? The Irifh nation were incapable of fubmitting to fuch a diftinction.

Mr Grattan now found his eloquence much more powerfil than formerly. The motion whish, during this very feffion, had been rejected by a great majority, was now agreed to after a fhort debate, and the addrefs to his majelty prepared accordingly. In this, after thanking his majetly for his gracious meflige, and declaring their attachment to bis perfon and government, they alfured him, that the fuhjects of Ireland are a free people; that the crown of lreland is an Imperial crown infeparably annexed to that of Eritain, on which connection the interells and happinefs of both nations effentially depend: but the kingdom of Ireland is difinct, with a parliament of its own ; that there is no body of mea competent to make laws to bind Ireland, except the king, lords, and commons thereof, nor any ather parliament that hath any power or authority of any fort whatfoever, in this country, except the parliament of Ireland. They affured his majeity, that they
humbly conceive, that in this right the very effence of Ireland. their liberties did exilt; a right which thacy, on the part of all lyeland, do claim as their birthright, and which they cannot yield but with their lives. They aflured lis majefly, that they had feen with concern certain claims advanced by the parliament of Great Britain, in an act entitled, "For the hetter fecuring the dependency of 1 reland $; "$ an act containing matter entirely irreconcileable to the fundaneatal rights of the nation. 'They informed his majelly, that they conceived this aet, and the claims it advanced, to be the great and principal caufe of the difcontents and joalouhies in the kingdom. They affured him, that his conmons did mult fincerely wifh, that all the bills, which become law in Ireland, fhould receive the approbation of his majefty under the feal of Great Britain; but yet, that they conceived the practice of fuppreffing their bills in the comncil of Ireland, or altering them any where, to be another jult caufe of difcontent and jealonfy. They further affured his majefly, that an act intitled, "For the better accommodation of his majelty's forces," heing unlimited in duration, and defective in fome other circumftances, was another jull cauie of jealoufy and difcontent. Thefe, the principal caufes of jealoufies and difcontent in the kingdom, they had fubmitted to his majelly, in humble expectation of redrefs : and they concluded with an affurance, that they were more confident in the hope of obtaining redrels, as the people of 1 reland had been, and were, not more difpofed to thare the freedom of Eagland, than to fupport her in her difficulties, and to Mare her fate.

112
To this remarkable addrefs a moft gracions anfwer It is gracis was given. In a few days the lord lieutenant made a oufly refpeech to both houfes; in which he informed them, ceived. that, by the magnanimity of the king, and wildon of the Britith parliament, he was enabled to atture them, that immediate attention had been paid to their reprefentations, and that the legillature of Britain hat concurred in a relolution to temove the caufes of their difcontents, and were united in a delire to gratify evely with expreffed in the late addrefs to the throne; and that, in the mean time, his majelly was gracioully difpofed to give his royal affent to acts to prevent the fupprefing of bills in the irifh privy council, and to limit the mutiny bill to the term of two years.

The joy which now diffufed itfelf all over the king. Extreme dom was extreme. The warmeft addreffes were pre. joy of the fented not only to his majelly but to the lord lituie- lath. nant. The commons inltantly voted 100,0001 , to his majefty, to enable him to raife 20,000 men for the navy; and foon after, 5000 men were likewife voted from the Irifh eftablifhment. The voluntesrs became in a peculiar manner the objects of gratilude and iniverfal panegyric ; but none was placed in fo confpicuous a light as Mr Grattan. Addreffes of thanks flowed in upon him from all quarters ; and the commons addreffed his majelly to give him 50,000 l. as a re- Mr Grat compenfe of his fervices; for which they promifed to warded. make provifion.

This requett was alfo complied with ; but fill the Jealouties jealoufies of the Irifh were not completely eradicated. legin to As the intended repeal of the declaratory act was found reviven to be fimple, without any claufe exprefsly relinquifling the claim of right, feveral nembers of the houfe of

Ire'and.
commons were of opinion, that the liberties of Irelana were not yet thoroughly fecured. The majority, however, were of opinion, that the fimple repeal of the obnoxious act was fufficient ; but many of the nation at large differed in fentiments. Mr llood, a member of the houfe, and a zealous patriot, now took the lead in this matter; while Mr Grattan loft much of his popularity by efpoufing the contrary opinion. The inatter, however, was to appearance finally fettled by the volunteers, who declared themfelves on Mr Grattan's fide. Still fome murmurings were heard ; and it mult be owned, that even yet the conduct of Britain appeared equivocal. An Englifh law was paffed, permitting importation from one of the Weft India iflands to all his majefly's dominions; and of courfe including Ireland, though the trade of the latter had already been declared abfolutely free. This was looked upon in a very unfavourable light. Great offence was allo taken at a member of the Englifh houfe of lords for a fpeech in pasliament, in which he alferted, that Great Britain had a right to bind Ireland in matters of an external nature; and propofed to bring in a bill for that purpofe. The public difcontent was alfo greatly inflamed by fone circumHtances relating to this bill, which were particularly obnosious. Lord Beanchamp, in a letter addreffed to one of the volunteer corps, was at pains to thow that the fecurity of the legiflative privileges obtained from the parliament of Britain was infufficient. The lawyers corps alfo, who took the queltion into confideration, were of the fame opinion; but the circumflance which gave the greateft offence was, that the chief jualtice in the Englifh court of king's bench gave judgment in an lrifh caule directly contrary to a law which had limited all fuch judgments to the firft of June. All thefe reafons of difcontent, however, were removed on the death of the marquis of Rockingham, and the appointment of the new minittry who fucceeded him. Lord Temple came over to Ireland, and his brother and fecretary $\mathrm{M}_{1}$ Grenville went to England, where he made fuch reprefentations of the difcontents which prevailed concerning the infufficiency of the declaratory act, that Mr Townfhend, one of the fecretaries of tate, moved in the houfe of commons for leave to bing in a bill to remove from the minds of the prople of Ireland all doubts refyecting their legilative and judicial privileges. This bill contained, in the fulleft and mofl exprefs tums, a relinquilhment on the part of the Britifh legifature of all claims of a right to interfere with the judgment of the Irifh courts, or to make laws to bind Ireland in time to come. Thus the contelt was at laft ended; and ever fince this kingdom has coutinued to flourifh, and to enjoy the bleffings of tranquillity and peace, free from every kind of reltric118 tion either on its commerce or manufactures.

The climate of Ireland would almot perfectly agree with that of England, were the foil equally improved, being abundantly fruifful both in corn and grais, efpecially the latter ; in confequence of which, an infinite number of black cattle and theep are bred, particularly in the province of Connaught. Few countries produce finer grain than that which grows in the improved parts of this kingdom. The northern and eallern counties are beft cultivated and inclofed, and the molt populous.

Ireland is known to have many rich mines; and
there is no inconfiderable profpect of gold and filver in Ireland. fome pats of the king!om. No country in the world abounds more in beautiful lakes, both frefh and falt water ones; and it is alfo plentifully watered with many beautiful rivers. The commodities which Ireland exports, as far as her prefent trade will permit, are hides, tallow, beef, butter, cheele, honey, wax, hemp, metals, and fith : wool and glafs were, till December 23.1779, prohibited; but her linen trade is of late grown of very great confequence. England, in the whole, is thought to gain yearly by Ircland upwards of $1,400,0001$. and in many other refpects fhe mult be of very great advantage to that kingdom. Formerly, indeed, the was rather a burden to her elder fitter than any benefit ; but the times are changed now, and improve every day.

Mr O'Halloran fays, the linen manufacture was car- Linen 119 ried on in Ireland in very early days to a great ex. nufacture tent ; and Gratianus Lucius quotes a defeription of early intro. the kingdom, printed at Leyden in 1627 ; in which the author tells us, "That this country abounds with flax, which is fent ready fpun in large quantities to foreign nations. Formerly (fays he) they wove great quantities of linen, which was mofly confumed at bome, the natives requiring above 30 yards of linen in a thirt or thift."' So truly expenfive was the Irith fathion of making up fhirts, on account of the number of plaits and folds, that, in the reign of Henry VIII. a ftatute paffed, by which they were forbidden, under a fevere penalty, to put more than feven yards of linen in a hirt or thift.

We may form fome idea of what the trade of Ireland mult have been in former times, when, fo late as the reign of Brien Boru, who died in 1014 , notwithftanding the ravages and diftreffes which a Danifh war, of above 200 years continuance, mult have produced throughout the kingdom, the annual duties arifing from groods imported into the lingle port of Limerick, and paid in red wine, ameunted to 365 pipes! Even fo latcly as the laft century, it is fcarcely credible what riches ihis city derived from the bare manufacture of fhoes, which were exported in amazing quantities; whereas now, inftead of fhoes and boots, we fee the raw hides thipped off for foreign markets.

No country in the world feems better fituated for a maritime power than Ireland, where the ports are convenient to every nation in Europe, and the havens fafe and commodious. The great plenty of timber, the fupetior excellence of the oak, and the acknowledged akill of ber ancient artizans in wood-works, are circunittances clearly in her favour. That the Irifh formerly exported large quantities of timber, is manifeft from the churches of Gloucefter, Weftmin. Ater monaltery and palace, \&c. being covered with Irifh oak.

The government of the kingdom is in the hands of Govern. a viceroy, or lord-lieutenant, who lives in very great ment, po fplendor. In his abfence there are lords-ju:ices (tyled pulation, their excillencies), generally three in number, viz. Jord \&sc. primate, lord high chancellor, and the fpeaker of the houfe of commons. The patl:ament of Ireland meet every other winter, or oftener, according to exigencies.

Ireland is divided into four large provinces, and thofe again into 32 countries, as follows:

There are 44 charter working. fchools at prefent in Ireland, whelein 2025 boys and girls are maintained

## $\left.\begin{array}{lll}{[ } & 343\end{array}\right] \quad$ I R E

and educated. Thefe fchools are maintained by an annual bounty of 10001 . by a tax upon hawkers and pedlars, and by fubferiptions and legacies. The children admitted are thofe born of Popith parents, or fuch as would be bred Papits if neglected, and are found of limbs. Their age mult be from fix to ten; the hoys at 16, and the girls at 14, are apprenticed into Proteflant families. The firt felooll was opened in $1 / 3+$ Five pounds are given to every perfon educated in thefe fchools upous his or her marrying a Protilaati. An Englift act of parliament, lately tolerated the Catholic religion in Irtland, and by that means has relieved thoufands of ufeful fubjects.

The return of houfes in Ireland for the year 1754, was 395,439 : and for the year 1766 , it was 424,046 . Suppoling therefore the nunbers to have increafed at the fame rate, the number of houfes now cannot be lefs than 454.130 ; which, allowing five perfons to a family, will make the number of inhabitants $2,260,650$ : but as the return of houfes by hearth.collectors is rather under than above the truth, and as there are many families in every parifh who are by law excuted from that tax, and therefore not returned, the number ou a moderate eflinate will be $2,500,000$. Sir W. Petty reckoned 160,000 cabins without a chimney; and if there be an equal number of fuch houfes now, the number of people will be above $3,000,000$. Mr Molymeux fays, "I reland has certainly been better inhabited formerly; for on the wild mountains between Ardnach and Dundalk, are obfervable the marks of the plouzh, as they are alfo on the mountains of Altmore. The fame has been obferved in the counties of Londonderry and Donnegal. Mountains that are now covered with bogs have been formerly ploughed; for when you dig five or fix feet deep, you difeover a proper foil for vegetation, and firditploughed into ridges and furrows: a plough was found in a very dead bog near Donnegal; and an hedge, with fome wattles, flanding under a bog that was five or fix feet in depth. The flump of a large tree was found in a bog ten feet deep at Caftle-Forbes; the trunk had been burnt, and fome of the cinders and afhes flill were lying on the fump. Mr Molyneux further fays, that on the top of an high mountain, in the north, there were then remaining the Ireets and other marks of a lange town.
Beauty feems to be more diffufed in England, a- Ap; earance mong the lower ranks of life, than in Ireland ; which and characemay, however, be attributed to the mere modes of 1 i . ter of the in , ving. In Ergland, the meanett cottager is better fed. better lodged, and better dreffed, than the moft opulent farmers here, who, unaccufomed to what our peafants reckon the conforts of life, know no luxury but in deep potations of aquavita.

From this circumftance, we may account for a fact reported by the officers of the army here. They fay, that the young fellows of Ireland, who offer to enlift, are more generally below the given height than in England. There can be no appeal from their tellimany; for they were Irilh, and the ftandard is an infallible tefl. No reafon, indeed, can be given why the caufes which promote or prevent the growth of other animals, fhould not have timilar effects upro the human ipecies. In England, where there is no tlint of provifions, the growth is not cheeked; but, on the contrary, it is estended to the utme't bound of na-
recland. ture's original intention: whereas, in Ireland, where food is neither in the fame quantity nor of the fame quality, the budy cannot expand itfelf, but is dwarfed and ftunted in its dimenforns. 'The gentlemen of Ireland are full as tall as thofe of England ; the difference, then, between them and the commonalty, can only pracced from the difference of food.

The inhabitants, in general, of this kingdom, are very far from what they have too often and umbutly been reprefented by thofe of our country who never faw them, a nation of wild Irifh. Mifrable and oppreffed, as by far too muny of them are, an Englith. man will find as much civility in gencral, as amonglt the fame clafs in his own country ; and, for a fmall pecumiary confideration, they will exert themfelves to pleafe you as much as any people, perhaps, in the ling's dominions. Poverty and oppeffion will naturally make mankind four, rude, and unfociable, and eradicate, or at leaft fupprefs, all the more amiable principles and paffons of humanity. But it flould feen unfair and ungencrous to judge of, or decide againft, the natural difpofition of a man reduced by indigence and oppreffion almolt to defperation. Let commerce, agriculture, and arts, but call forth the dormant activity of their genius, and roufe the native fpirit of enterprize, which now lics torpid within them; let liberal laws unfetter their minds, and plenty cheer their tables; they will foon thow themfelves deferwing to rank with the moft refpectable focieties in Eurepe.

The bogs wherewith Ircland is in fome places overgrown, are not injurious to health, as is commonly inagined; the watery exhalations from thefe are nei- ther fo abundant nor fo noxions as thofe from marthes, which become prejudicial from the various animal and vegetable fubttances which are left to putrify as foon as the waters are exhaled by the fun Bogs are not, as one might fuppofe from their biacknefs, maffes of putrefaction ; but, on the contrary, they are of fuch a texture, as to refilt putrefaction above any other fubftance we know of A fhoe, all of one piece of leather, very neatly ftitched, was taken out of a bog fome yeats ago, yet entirely frefh;-from the very faShion of which, there is farce room to doubt that it had lain there fome centuries. Butter, called roufkin, lath been found in hollowed trunks of trees, where it had been hid folong, that it was become hard and al. molt friable, yet not devoid of unctuofity ; that the length of time it had been buried was very great, we learn from the depth of the bog, which was ten feet, that had grown over it. But the common phenomenon of timber-trees dug out of thefe bogs not only found, but alfo fo embalmed as afterwards to defy the injuries of time, demonltrate the antifeptic quality of them. The horns of the moofe deer mult have lain many centuries in a bog; for the Iiflh hiftories do not recognize the exifience of the animal whereon they grew. Indeed, human bodics have, in many places, been dug up entire, which mult have lain there for ages. The growth of bogs, however, is variable in different places, from the varicty of conditions in the fituation, foil, humidity, and quantity of vegetable food; in fome places it is very rapid, in fothers very flow ; and therefore their altitudes cannot alford any certain meafure of time. In the manufacturing comnties of the north, peat-fuel has becone fo fearce, that $\mathrm{N}^{\circ} 16 \mathrm{~g}$.
turburies let from five to erght guineas an acre. In fome places they are fo eradicated, there does not re. main a trace of them, the ground being now converted into rich meadows and fweet paftures.

If we truft to antharities, we mult conclude that $\mathrm{Trade}^{123}$ Ireland was not originally inferior to England, either Iretand in the fertility of the foil or falubrity of the climate. on the When this country fhall have felt the happy effects of the late conceifions and indulgencies of the Bricifn parliament, by repealing feveral acts which reftrained the trade of this kingdoin with foreign ports, and allowing the exportation of woollen manufactures and glafs, and thall have received futher iadulgencies from the fame anthority; and when the fpirit of indultry fhall be irfuled, in confequence of it, into the common people; their countiy will not be inferior to any other on the glooe ander the fame parallel. It is very difficult to fay, whether forcign or domeftic caufes have operated molt powerfully in laying wafte this fruitful country; which, by being relieved from their late unnatural prohibitions, will be enabled co furnifh a grand proportion of fupplies to Great Britain, and will unavoidably become of valt importance, by its reciprocal trade, in reftraining the increafe of that of France, who cannot cary on this important banch of traffic without the afliftance of Irih wool. The wool of France is hont and coarfe, being, in the language of the manufucturers, neither fine in the thread nor long in the ftaple. This obliges then to have recoure to the wool of Ireland, which poffeffes both thefe qualities. Affilted by a pack of Irifl wool, the French are enabled to mannfacture two of their own ; which they will no longer be enabled to procure, as the Irih will now work up their own wool which they ufed to export ; great part of which found its way to France, and enahled them to fupply other markets, to the great prejudice of liritain. The happy effects of it have been already felt; for notwithitanding it was fo late as December 23.1789 , that the royal aflent was given to the taking oft their reltraints on woolltn exports, it appears, that on January 10 ih fullowing, an exportEntiy was made at the cultom-houfe of Dublin of I 300 yards of ferge for a foreign market, by William Worthington, Efq.

IRENAEUS (St), a bihop of Lyons, was born in Greece about the year 120 . He was the difciple of lappias and St Polycarp, by whom, it is faid, he was fent into Gaul in I57. He ftopped at l.yons, where he performed the office of a prieft; and in 178 was fent to Rome, where he difputed with Valentiaus, and his two difciples Florinus and Blaftus. At his return to Lyons, he fucceeded Photinus, bihop of that city; and fuftered martyrdom in 20?, under the reign of Severus. He wrote many works in Greek, of which there only remains a barbarous Latin verfion of his five bouks againft heretics, fome Greek fragments in different anthors, and pope Victor's letter montioned by Eufebins. 'The belt editions of his works are thofe of Erafmus, in 1526; of Grabe, in 1702; and of Father Maffuet, in 1710 . St Irenæus's ityle is clofe, clear, and ttrong, but plain and timple. Dofwell has compofed fix curious differtations on the works of St Irenieus.

He ought not to be confounded with St Irenaeus the deacon, who in 275 fuffered martyrdom in Tufcany,

## i R i [ 34s j ir o

tuder the reign of Aurelian; nor with St Iræneus, billop of Sirmich, who fuffered martyrdom on the 25 th of March 304 , during the perfecution of Dio. clefian and Maximianus

I RENE, emprefs of the eaft, celebrated for her valour, wit, and beauty ; but deteftable for her cruelty, having facrificed her own fon to the ambition of reign ing alone. She died in 8 c 3 .

IRESINE, in botany : A genus of the pentandria order. belonging to the dioecia clafs of plants; and in the natural method ranking under the 5 th order, MijF cellunes. The male calyx is diphyllous, the corolla pentapetalous; and there are five nedtaria. The female calyx is diphyllous, the corolla pentapetaluns; there are two feffle fligmata, and a capfule with flocky reeds.

IRIS, in phyfiology, the rainbow. The word is Greek, ress, fuppofed by fome to be derived from expe "I fpeak, I tell;" as being a metcor that is fuppofed to foretel, or rather to declare rain. See Rainbow.

Lemar Iers, or Moon-rainboen. Sce Ralneniv (Lumar).
$I_{R I S}$, in anatomy, a friped variegated circle round the pupil of the eye, formed of a duplicature of the uvea. See Anatomy, p. 767.

Iris is alfo applied to thole changeable colours which - Cometimes appear in the glafles of telefcopes, microScopes, \&c. fo called from their fimilitude to a rainbow. The fame appellation is alfo given to that coloured fpedrum, which a triangular prifmatic glafs will project on a wall, when placed at a due angle in the \%un-beams.

Iris, the Flower de Lure, or Flag-flower, \&x. in "botany: A genus of the monogynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the fixth order, Eufatc. 'The corolla is divided into fix parts; the petals alternately reflexed: the \#igmata refembling petals

There are 44 fpecies, all herbaceous flowering perennials, both of the fibrous, tuberous, and bulbous rooted kind, producing thick annual ftalks from 3 or 4 inches to a yard high, terminated by large hexapecalous finwers, having three of the petals reliexed quite back and three erect ; moft of which are very ornamental, appearing in May, June, and July.

Culture. All the fpecies are ealily propagated by offsets from the roots, which Thould be planted in sepiember, October, or November, though almot any time from September to March will do They may alfo be raifed from feed, which is the befl method for procuring varieties. It is to be fown in autumn, foon after it ripens, in a bed or border of common tarth, and raked in. The plants will rife in the fpring, and are to be tranfplanted next autumn.

Properties. The ronts of the Flotentine white iris, when dry, are fuppofed to have a pectoral vintue. They have an agreeable finell, refembling that of violets; and hence are ufed in perfumes, and in Havuaring of liquors. When recent, thry have a bitter, acrid, nanfeous talte; and when taken into the body, prove ftrongly cathartic; on which account they have been recommended in droplies, in the dule of three or four scruples. - The juice of the fpecies called baflard aco. rus, or yellow flas flower, is alfo very acrid, and hath been found to produce plentiful evacuations from the
bowels when other means had failed. For this purpofe, it may be given in dofes of 80 drops every hour or two; but the degree of its acrimony is to uncertain, that it can hardly ever come iuto general ufe. 'The frefl roots have been mised with the food of fwine bitten by a mad dog, and they elcaped the difeafe, when others, bitten by the fame dog, died raving mad. Goats eat the leaves when freth; but cows, horfes, and fwine, refufe them. Cows will eat them when dry. The roots are ufed in the ifland of Jura for dying black. - The roots or bulbs of a fpecies growing at the Cape, are roalted in the athes and ufed as food by the natives: they are called oenkjes, and have nearly the fame tafte with potatocs. The Hottentots, with more reflection than generally falls to the fhare of favages, ufe the word ombljes in the fame fenfe in which Virgil ufed that of arifle, that is, for reckoning of time; always beginning the new year whenever the oenkjes puft out of the ground, and marking their age and other events by the number of times in which in a certain period this vegetable has made its appearance. - The Siberians cure the venereal difeafe by a decoction of the root of the Iris Sibirica, which acts by purging and vomiting. They keep the patient eight days in a fove, and place him in a bed of the leaves of the arctium lappa, or common burdork, which they fiequently change till the cure is effcted.

Iris-Stome. See Atoon-Stone.
IRON, one of the imperfect metals, but the hardef and mot ufeful as well as the moft plentiful of them all, is of a livid whitifh celour inclining to grey, and internally compofed to appearance of fmall facets; fufceptible of a fine polifh, and capable of having its liardnefs more increafed or diminifhed by certain chemical proceries than any other metal.

It is very generally diffufed thronghout the globe, Diffufed in being frequently found nixed with fand, clay, chalk, and mover all being likewife the colouring matter of a great number over the of flones and earth. It is found alfo in the afhes of regetables, and in the blood of animals, in furch abundance, that fome authors have attributed both the colours of vegetables and of the vital fluid itfelf to the iron contained in them. In confequence of this abundance the iron ores are extremely numerous.

1. Native iren, formerly thoughs not to have an Found naexiftence any where, is now certainly known to have tive in Sibeen met with in feveral places. It is, however, by heria, ses no means common, but occurs fometimes in iron mines. negal, \&o Margraaff found a fibrous kind of it at Eibenfock in Saxony, and Dr Pallas found a mafs in Siberia weighing 1600 pounds. Mr Adanfon likewife informs us, that native iron is common about Sencgal ; but fome naturalifts are of opinion that thefe pieces which have been taken for native iron, are in reality artificial, and have been accidentally buried in the earth. The large piece mentioned by Dr Pallas is of that feecies called red flort, which is malleable when cold, but brittle when red loot.-A Anafs of a fimilar nature is faid to have been lately found in South Amcrica.

This American mafs of iron was difcovered by fome Indians in the diftrict of Santiago del Eftero in the midft of a wide extended plain. It projected about a foot above the ground, and almotit the whole of its upper furface was vifible; and the news of its being found in a country where there are no mountains, nor X $x$ even even the fmalleft fone willin a circumference of 100 leagues, could not but be very furprifing. Though the journey was attended with great danger on account of the want of water, and abundance of wild beafts in thefe deferts, fome private perfons, in hopes of gain, undertook to vifit this mafs; and having accomplifhed their journey, fent a fpecimen of the metal to Lima and Madrid, where it was found to be very pure foft iron.

As it was reported that this mafs was only the extremity of an immenfe vein of the metal, a commifion was given to Dou Michael Rubin de Celis to examine the fpot ; and the following is an abftract of his account.
"The place is called Otumpa, in lat. 27.28. S. and the mafs was found almoft buried in pure clay and afhes. Externally it had the appearance of very compact iron; but internally was full of cavities, as if the whole had been formerly in a liquid flate. I was confirmed in this idea (fays our author), hy obferving, on the furface of it, the imprefion of human feet and hands of a large fize, as well as of the feet of large birds, which are common in this country. Though thefe impreflions feem very perfect, yet I am perfuaded that they are either a hif us natur, , or that impreffions of this kind were previoully upon the giound, and that the liquid mafs of iron falling upon it received them. It refembled nothing fo much as a mafs of dough; which having been flariped with impreffions of hands and feet, and marked with a finger, had afterwards been sonverted into iron.
"On digging round the mafs, the under furface was found covered with a coat of foorix from four to fix inches thick, undoubtedly oceafioned by the moifture of the earth, becaufe the upper furface was clean. No appearance of generation was obferved in the earth below or round it to a great diftance. About two leagues to the eaftward is a brackifi mineral fpring, the only one to be met with in all the country. Here there was a very gentle afcent of between four and fix feet in height, running from north to fouth; all the rett being as perfect a level as can be imagined. The earth in every part abont this fpring, as well as near the mafs, is very light, loofe, and greatly, refembling athes even in colour. The grafs of the adjacent parts is very fhot, fmall, and extremely unpalatable to cattle; but that at a dillance is long and extremely grateful to them : from all which circumftances it is probable that this mafs was produced by a volcanic explofion. Its weight might be eflimated at about 300 quintals. It is likewife an undoubted fact, that in there forefts there exifts a mafs of pure iron in the fhape of a tree with its brancheg. At a little depth in the earth are found flones of quartz of a beautiful red colour, which the honey-gatherers, the only perfons who frequent this country, make ufe of as fints to light their fircs. They liad formerly carried fonte of them away on account of their peculiar beauty, being fpotted and fludded as it were with gold. One of thefe, weighing about an ounce, was ground by the gevernor of the diftrict, who extracted from it a drachm of gold."
The native iron faid to have been found about Senegal has a cubica! form; and out of this the black inhabitants make different kinds of veffels for their own ufe. Some maffes have been found in a polyhe-
dral grany/ited form, and of a bright yellow colour ; but whick, on being polified, fhow the proper colour of the metal. Mr Bergman informs us, that the great mals of native metal found in Siberia refembles forged iron in its compotition, a centenary, or 63 grains, yielding 49 cubic inches of inflammable air; and from many experiments it appears, that ductile iron yields from 48 to 51 cubic inches of the fame kind of air. Dr Matthew Guthrie informs us, that " the pores of this iron were filled with a yellow vitreous matter, of fuch hardnefs as to cut glafs." The cells are lined with a kind of varnifh contiguous to the glaffy fubfance within.
2. The calciform ores are either compofed of the Calcitore blackifh, blackith-brown, or red calx of the metal ; the ores., former being in fome meafure magnetic, in confequence of the phlogifon it contains; the latter fhowing nothing of this property until it be roafted.
The name of calciform may be applied to all the ores of this metal, excepting the native iron already mentioned, and the native Pruffian blues, of which we fhall afterwards treat. All of them are mixed with different minerals, and generally take their colour from that of the calx of iron which is prevalent in them. Mr Kirwan enumerates a great many different fpecies.
3. Steel ore, Stachlerz, the ferrum chalybeatum Steclore Linnai, and minera ferri nigra of Cronfledt. This is of a dark colour, folid, and compact, but with diffculty friking fire with feel; reducible to a black powder, obedient to the magnet, and fomewhat malleable when red hot; affording from 60 to 80 per cent. of good iron. It is met with in Sweden, the IIle of Elbe, and North A merica. The ferrunt teffulare and ninera ferri cryfallizata of Wallerius, belongs to this fpecies, but is fomewhat lefs magnetic. Our author denominates it. cryftallized iron ore in an octohedral or cubic form.
4. The magnet, according to Fourcroy, is a muddy Magnet iron ore, which, however, fome authors fuppofe to be very near the metallic flate. Mr Kirwan fays it differs but little from the foregoing, only that it has lefs luftre. There are two kinds, the fine and the coarfe grained, of which the latter lofe their power the foonef. When heated red hot, it fmells of fulplur. Our author thinks it may contain nickel, as this femi. Suppofe metal is found to poffers a magnetic property when pu-nickel. rified to a certain degree.
5. The brown cals of iron combined with plumba- Brown go, black eifen olimmer, folbwartz, eifen baben or eifenman, confitts of black thining fcales mure or lefs magratic, affording, according to Mr Rimman, 26 per cent. of iron, the reft beiog plumbago.
6. The brown calx of iron united with che white White calx of manganefe, and mild calcareous earth in various ores. proportions. Thefe conflitute the white ores of iron, on which Mr Bergman has given a differtation."They have received (fays he) divers denominations from the fingular heat with which they are accompanied. Their texture is almof the fame with that of the calcareous flone, yet it is rarely found compact, and compofed of impalpable particles. It is fometimes fquamous, fometimes granulated with fmall diftinct particles, fome of them fhining, but in general fpathous. This defctiption, however, is not meant for their complete and perfect fate; for the figure of their parts is more or lefs deftroyed by fportaneous calcinatien

## I $R \quad O$

ron. tion ; nay, the whole mafs is at length refolved into a powder : fometimes it is found falactitic, fiftulous and ramous, cellular, or even germinating like mofs. Sunetimes, though very feldom, they have fufficient hardnefs to Itrike fire with fteel ; but though, when found mixed with fint and newly dug up, they are of this kind, yet they foon lofe the property we fpeak of. When perfeet, they generally refemble the calcarcous fone, unlefs when expofed for fome time to the air, by which the union of their parts are gradually dinis. nifhed. Their colour is white, but the furface which comes into contact with the air grows gradually brown, or even blackifh ; yet as long as the iron which is converted into an ochre remains in them, they have a ferruginous hue; but though the furface is thus clanged, the internal parts remain the fame, and, on being filed or broken, exhibit the natural colour. -This ehange is effected by the air, not upon the iron, as is commonly belicved, but on the white calx of manganefe which is dephlogificated by the atmofphere.
"The fpecific gravity of the ore, when perfect, varies between 3,640 and 3,810, and is diminifhed according to the degree of caleination. The ore whofe particles are quite feparated is from 2.5 10 2.9; but that which is not perfectly corroded, fiom 3.3 to 3.6. It is rarely attracted by the magnet, whether perfect or calcined, though the metallic part fometimes amounts to nearly one half the weight.

The white ores of iron are found, though in very Imall quartity, in Sweden. The Suart-begzer, or Black Mountain, ia Dalecarlia, has its name from its furface, which is grown black by calcination. It is high, and naked on the fummit, which is croffed by a broad calcareous vein with hining particles of fpar, and a white ore of iron, together with a galena, pleudogalena, black ore of iron, pyritcs, fchoerl, and garnct internixed. In the old mines at Halleforo, or the eaftern mines, the rock itfelf appears to confill of a white ore of iron; but in other places it is either found in fmall quantity, or very poor in metal. Many mountains about Smialkald in Germany contain thefe ores. In one called Stabllegger, a broad vein occurs almoft horizontal, and from 25 to 30 fathoms thick. It confitts of an irregular \{par, in which are difperfed quartz and pieces of the ore, which are found of a better quality in proportion as they are more deeply feated. The uppermott lide, which is pendant, confifts of a fandy ftone from 9 to 20 fathom high; but the lower is margaceous, and is found more indurated towards the lower parts; and at the very loweft is extended by a bluc mica: the fides fcarctly cohere to the vein. The whole mountain in Nauflavia confifis of a yellowifh ore of iron, certain veins of which are accompanied with copper, and others with hematites. The hill of $A r \approx b e r g$, fituated at Eifenartz in Upper Si nia, is 6000 fathoms in circuit, 900 in diancter, and 450 in height. According to fome accounts the ore is irregularly accumulated and concreted, confifing of maffes of quartz charged with argillaccous earth and white ore of iron ; but, according to others, the ore is found there not only in heaps, but in various veins."

This ore, when analyfed, gave 38 parts of the brown calx of iron, 24 of the white calx of manganefe, and 50 of mild calcareous earth. Another from Well Silvathreg, yielded 22 of the brown calx of iron,

28 of the white calx of manganefe, and 50 of mild calcareous earth. The aerial acid is ufed, and is united not only to the earth, but alfo to the metallic cals. The above proportions of the crude materials in the ore of Eifenartz, would yield, according to 2.1 I Kirwan, $3^{8}$ parts of calcareous earth, $3^{8}$ of iron in its metallic Hlate, and $2+$ of manganefe. Míany others are ponier, and fome to fuch a degree as featcely to deferve the name of an ore. They abound allo in France and Spain, and are found fonetimes in heaps, fometimes alfo firming veins, ftrata, or even whole mountains. Mr l3ergman never found them contain any organifed bodies; a mark (fays he) by which the moft ancient produations of the earth have been dißlinguifhed. When this iron ore bears a ftalactitical appearance, and is very white, it is called fus forri, and aijin iluth. Aul hundred parts of it yield $6 ;$ of calcareous earth, and 35 of calx of iron: which, according to Rinman, produce 27 of iron in its metallic flate.
7. Magnetic fand. Of this kind is the black fand $13^{10}$ ack fand of Virginia, whofe fpecific gravity is about 4.600 , of Virgi. and contaius half its weight of metal.

From an aecount inferted in the Philofophical Tranfactions for 1763 , we are informed, that there are very large quantities of this fand iron ore in Virginia; perhaps as large as of any other kinds of iron-ore. It is fo pure, that it requires a mixture of bog-ore, or of flags from other fareltings, to reduce it to a metallic form. The iron and fleel produced from it were above 60 per cent. or from 50 to 85 ; the quality of both extremely good; and two fmall bars were fent as a fample to the mufeum of the Royal Society of London. Large ftrata of black fand iron-ore are found in Portugal, even at a confiderable diftance from the feafhore, or from any running waters. A very great part of this black fand is attraced by the magnet. There is alfo found, particularly in France, a black, lieavy, unmagnetic fand, of the filiceous kiad, which is faid to contaiu iron and zinc in great quantity. Mr Kirwan, P. 143. of his Mineralogy, fpeaks of a filice ous fand confolidated by femiphlogitticated calx of iron, which does not crumble into fand when powdered. It is generally of a black or brown colour; but grows reddifh or yellowith, and moulders by expofure to the air. It does not effervefee with acids, unlefs it contains teflaceous particles, which is frequently the cafe; it is even frequently covered with fhells. He adds, that the agglutinating power of folutions of iron has been fhown by a ftony concretion of this fort that had been long buried in the fea, and is mention. ed in a paper of Mr Edward King in the Plilofophical Tranfactions for 1779. Mr Rinman, however, has found that dephlogitticated calces of iron, and particularly its folutions in mineral acids, have no binding power.
8. Red calx of iron indurated and combined with a ir fmall quantity of clay, frequently with manganefe. Indurated Fourcroy calls this a muddy iron-ore, which feems to be formed in the manner of flalactites, and deriving its name from its colour, which is commonly red, or the colour of blood, thongh not without variations. Mr Kirwan fays, that "it is generally of a red, yellow, purple, or brown colour, of a metallic luftre, and very hard, though feldom capable of giving fire with ftecl." Fourcroy tells us, that it is ufually compofed of layer which cover each other, and are themfelves formed of

## I R O

## I R O

convergent needles, the external part being covered with tubercles ; and that it is not only diftinguilhed by the colonr, but by the form, as the hematites botrytes, in the form of bunches of grapes. Mr Kirwan tclls uss, that its ffructure is either folid, granular, fcaly, or fibrous; that it occurs in thapelefs maffes, in a talacitical form; or, according to Gmelin, crytallized in regular forms, though M. de Lifle denies rhis. In fome places it forms whole mountains, and aiffords from 40 to 80 per cent. of irori. Mr Gerhard extracted alum from it, which affords a proof of its containing clay; and Mr Hilan found it alfo to contain manganefe. In its natural ftate it is not affected by the magnet ; but by torrefaction it becomes black and magnetic.
9. Hxmatitical, red, yellow, and brown ochres Thefe are, by Mr Kirwan, intitled " hamatites in a loofe form, mixed with a notable proportion of argill" (clay.) They are dillinguithed, he fays, from clays, by containing a larger proportion of marcial particles. To this fpecies belong the ores which become brown by calcination, and likewife magnetic. They are fome. times mixed with clay or calcareous earths; in which cafe thefe ores effervefce with acios. The hrmatites, or blood fones, have their names, not on account of their external colours, but becaufe, when reduced to powder, they produce a red or blood-colour. The ycliow hrmatites, however, only produce the fame colour by pulverifation. They are productive of very good iron, and are found in great abundance in the province of Galiza in Spain. The inhabitants of Compoltella, the capital, make a good commerce of thefe hrematites of the hardeft kind for the burnifhing gold leaves, and various other metals. A dark blue kind, fomewhat fimilar to black-lead, is principally employed for thefe purpofes. They are found in many parts of Europe, fonetimes forming whole mountains. The mof extraordinary ores of this kind, both on account of their forms and of their vatious and brilliant colours, are found in the ifland of Elba near the coaft of Tuf. cany. The cryftallized ores are here the moft beautiforl and the moll common, thoagh not to be met with any where elfe. They exhibit various gradations of the fineft colours, as red, violet, blue, green, yellow, brown, and black; infomuch that, according to Coudsai's expreffion, they look like fo many clufters of emeralds, fapphires, diamonds, rubies, and topazes. E. $P e n i$ and Mongez affirm, that thefe ores are mineralized only by the aerial acid; tho' Coudrai is of opinion, that they contain fulphar alfo. Befides thefe beautiful cryftllized ores, this illand contains alfo many. others; being indeed little other than a group of ironmountains. The ores in general produce the very beft kind of iron.
10. Emery, fmyris, is a grey or reddifn iron-ore found in great quantity on the iflands of Jerfey and Guernfey. It is extremely hard, yielding in this refpect to no fubftance except the diamond itfelf. It is allo very refractory, and for thefe reaions is not ufed for the fake of the metal it contains, nor indeed is it well known what proportion is contained in it. "The beft fort (fays Mr Kirwap) is of a dark grey colour, but becomes brown, and in great meafure magnetic, by calcination : other forts are of a rufty reddilh white or yellowifh colour. Its fpecific gravity is from 3.000 to
4.000. It is ufed in polifhing glafs and metals; for which purpofe it muit firit be ground down and livigated in mills.
$1+$
11. The argillaceous ores. Thefe comprehend the Bug ores. ochres, and more particularly thufe mentioned by ${ }^{\circ} \mathrm{co}$ Fourcroy under the name of bos-ores of iron, which are commonly met with difpoled in bods, and feemingly depofited by waters. Mr Fourcros informs us, that this kind of ore is very often in the form of fpherical bodies either regular cr irregular. Organic matters, fuch as wood, leaves, bark, thells, Sic. are not unfrequently forind in the flate of bog.ores. This kind of tranfition feems to indicate an analogy betwixt iron and orgmic fubtances. In the wood of Eoulogne near Auteuil there is a mine of bog-ore of iron, in whicls vegetable fubltances become nineralized almoft immediately under our eycs.

Mr Kirwan diftinguifhes two principal varieties of thefe; one found on mountains, and fuch as are met with in fwampy grotunds or low lands overflown with water; both of them very heavy, and fome abiforbing water like clays.
${ }^{r} 5$
The Highland argillaceous ochres are eitber yellow, $\mathrm{H}_{\mathrm{gh}}{ }^{\mathrm{rg}}$ Ind yed, brown, or greyih, indurated and friable, or loofe argillaccuor and powde1y, or in grains; they are compufed chetly orcs. of the red or ycllow calx of iron, or of a grey irom ore called Torfen, in a loofe form mixed with clay. Hence they often contain manganefe or fiderite, and in France are faid to be mixed with a calx of zinc. They do not obey the magnet before calcination, and rarely after it. They effervefce with acids only in conlequence of being mixed with calcareous earths; they are foluble with difficulty in the acids, but the mof foluble are the bell. The iron produced from them is of very different quality, according to the nature of the ure from whence it is produced. To this fpecies. belong the bornftone overloaded with iron, and a white iron ore mentioned by Rinman found in Kent. It is mixed with clay or marl, and is fcarcely foluble in acids. It affords 47 per cent. of brittle iron.
The fivampy argillaceous ore, according to Mr Kir- SwampJ wan, are found in itregular lumps of a brown or brow- ores. nith-black, and fometimes in round balls, porous or folid, or in flat round pieces or in grains, and fornetimes in flender triangular prifms parallel to each other, and very brittle. It is mixed with clay and estractive, and becomes magnetic by calcination; during which operation it gives out a quantity of aerated volatile alkali, and lofes one-fourth of its weight. The crude ore affords about 36 per cent. of metal, and 50 per cent. after calcination. The iron produced from it, at leaft in Sweden, is that called cold/bort. According to Mr Hialm fome forts of this ore contain 28 per cent. of manganefe.
12. Red calcarcouss iron ore is found loofe in many Rcd calca parts of England, effervefces ftrongly with acids, and is reous ores. ufed as a paint under the name of red ochre.
53. Martial calamine. Though calamine is proper-
ly an ore of zinc, it fometimes contains fuch a large Maniute. proportion of iron as to make it worth while to extract the iron. The ore confilts of a mixture of quartz and clay, with the calces of iron and zinc. It is of a moderate hardnefs, and a yellow, red, or brown colour.
14. Martial pyrites. This has its name from its Marial property of giving fire with fleel. It is conmonly in pyrites, fmall
fmall red maffes, fometimes regularly formed, and ufually cubical, 〔pherical, or dodecahedral, though their form varies confiderably. Some are brown on the outfide, others of the colour of iron, fome yellowin, and refembling the ores of copper, even on their fufface ; but all of them are yellow, and as it were coppery within, and for the moft part compofed of ricedles, or pyramids of fueral lides, whofe fummits converge to a common centre. The pyrites are commonly difperfed, and particularly in copper mines in the neighbourhood of iron mines, and in clays and coal mines, the upper ftratum of the latter being almolt always pyritous. They are all eafly decompofed, and yisld green vitriol, as is explained under the article Chemistry.
15. Iron mineralized by arfenic. This combination takes place eitlier by the combination of arfenic alone with the metal, or in conjunction wich fulphur. The former is called in Germany mi/picket, and feeifs by the Buhemiars; is of a bright white colour, founetumes, though rarely, variegated like a pigeon's neek, and is not cafly altered by expofure to the air. It is not magnetic either before or after calcination; it is foluble in acids, and affords arfenic by diftillation in the proportion of 30 or 40 fer cent, and fometimes contains a fmall proportion of copper and filver. It is frequently found in indurated elay, quartz, fpar, fchoerl, \&c. and mixed with ether metallic ores. When this metal contains lefs than $\frac{1}{18}$ th of arfenic, it is magnetic, accerding to Scheffer ; whence, if the calcinationn be pufted to a fufficient length, the ore muft remain magnetic.
That ipecies of ore which confftls of iron mineralized by fulphur and arfenic together, contains the white, grey or bluifh grey pyrites or marcafite. It is found cither in folid compact maftes of a moderate fize, or in grains, and gives fire with fteel. When burnt it affords a blue flame and the fmell of arfence, with orpiment or $r$ ealgar, inftead of pure arfenic thy ditillation in clofe veffels. It is not magnetic cither before or after calcination, and contains much more arfenic than fulphur.
16. Native Pruffan blue confifts of clay mixed with iron, and coloured with fome unknown tinging fubflance, generally found in fwampy giounds or bugs. It is at firft white, but when expofed to the air becomes either of a light or deep blue. By heat it turns greenifh, and emits a night flame, becoming afterward red and magnetic. It is foluble both in alkalies and acids; but the alkaline folution is precipitated by acids", and the acid Colution by alkalies. The precipitate at firt is greenifh, and gradually affumes a white hue, but regains its blue colour on being mixed with vegetable aftringents. Mr Woulfe found this kind of ure in Scotland on the furface of the earth. The greatefl part of marfhy grounds containing turf, likewife have fome of this.
:7. The terre verte, or green earth of Verna and Normandy, is ufed as a pigment, and contains iron in fome unknown flate, mised with clay, and fometimes with chalk and pyrites; alum and felenite being likewife accidentally mixed with it. It is foluble with difficulty in acids, is not magnetic before calcination, and becomes of a coffee-colour by heat.
18. Mr Fourcroy informs $u$ i, that "it has been difcovered fome years ago, that iron is ofter united na-
turally with the phefphoric acid. The muddy or bog ores are funetimes of this nature: a portion of this compourd remaining in the iron gives it the property of being brittle when cold. Iron in this llate was called fidurite by Bergrnan, and it has fince been called zuter-irsn.
There are feveral other kinds of iron ore enumerated by mineralogifts; but thofe already mentioned are the moll reinarkable.
The following obfervations on iron in its different flates, with an account of the methods of manufactuing it, sec. are extracted from Magellan's Notes on Cronftedt's Mineralogy.

1. Iron is cmpluyed in three different flates, eacla having its peculiar properties, by which they are eacla more particularly applicable to variuus purpofes. 'The firtt is. caff:iron, the fecond is wrought or mallsable iron, and the third is called fivel.

According to Bergman, caft iron, which may be called unripe or raw iron, contains the fralleft fhare of phrogillon. The malleable iron contains the greateft quaritity; and the fleel a mindling fhare between both, neither fo much as the malleable, nor fo little as the caft iron. This latt is called alfo pig-iron, and yetim in Englard.
2. The richett ores of iron are the compact and ponderous, of a brownifh, reddih. brown, or red colour. Some of thefe ores, in colour and appearance, do not ill refemble iron itfelf; as the grey ores of Derby hire, and the bluifh of the Forelt of Dean in Gloucefterflire. Moft of the Swedifh ores are likewife of this kind. Others are blackifh, brown, red, yellowifh, or rufty-coloured: thefe are the moft common in England and Germany. There is one very fingular Species of a flriated textyre, and of a pale yellowith or gicyih colour, oftentimes white, and in forse degree pellucid; which, although in its crude thate, promifes nothing metallic, neverthelefs, on being moderately calcined, difcovers, by the deep colour it aflumes, that it abounds in iron. Cramer informs us, that it gives. out by fufion from 30 to 60 per cent. But fome ficher ores yield no lefs than 70 and 80 on the hundred.
3. Different kinds of iron ore are found adhering in fome mines to the tops of caverns in form of icicles or ftrix, fometimes irregu'arly cluftered together, fometimes hanging down like the briftles of a brufh; from whence the name of brufb-iron-ore. Other particular forms of the iron ftone have occafioned a varitty of fanciful names, that are met with in fome of the metallurgic writers.
4. The iron of Great Britain is made from three different kinds of ores: 1. From the iron-ore called the Lancafire ore, from the country where it io found in greate it abundance. This ore is.very heavy, of a fibrous or lamellated testure; it is of a dark purple, approaching to a fhining black; and when reduced to puwder, it becomes of a deep red: it lies in veins like the ores of other metals. 2. The bog-ore, which refembles a deep yellow ochry clay, and feems to be the depofition of fome ferruginaceous rivulets, whofe curremts had formerly been over the furface of thofe flat marhy plains. It lies in beds of irregular thickneiren commonly from 12 to 20 inches, and very various in their breadths from fide to fide, never being of great: diroenfions, 3. The iron-flones, hewever, have no re-
metal in their external furface. They lie often in bods of great extcnt, like other flony matters, and are fometimes flratificd with feams of pit coal, forming alternate layers.
5. The ores of iron are commonly calcined previous to the fufion, even the harder ones, though they thould contain nothing fulphureous or arfenical, in order to calcine the hard adhering matrices, and render the maffes foft enough to be eafly broken into fragments of a convenient fize for melting. After the minetal is duly prepared, it muft be fmeled in furnaces of large capacities, from 16 to 25 feet high, and from 10 to 14 wide: the moft approved flape neatly refembles that of a hen's egg, with the largelt end undermolt, below which is a fquare cavity to contain the melted metal, and at the top a very fhort vent about $z 0$ inches in diameter. The inner wall is built of fireItone, which endures very ftrong heat with little rifk of melting, and all the joints are cemented with mortar compofed of fand and clay. This is furrounded with more building, which deviates more and more from a circular form, and becomes a fquare building of about 20 feet at the bafe, and gradually converges to the top.
6. Near the bottom is an aperture, for the infertion of the pipe of a large bellows, worked by water or by other machines that may produce a ftrong current of air. Some very powerful ones, as thofe in the iron works at Coltbrook-dale and at Carron, confift of two or more iron cylinders, about upwards of two feet wide, whofe pittons are alternately moved by a fmall fire engine or by a water whet : but Mr Wilkinfon very ingenioully adapted to his own a large vaulted receiver furrounded by water, which produces a very regular and uniform blaft. Two or more holes are alfo left ready to be occafionally opened at the bottom of the funace, to permit at a proper time the fco. ria and the metal to flow out, as the procefs may require. Charcoal, or coke with lighted brufhwood, is firlt thrown in: and when the inlide of the furnace has acquired a ftrong ignition, the ore is thrown in by fmall quantities at a time, with more of the fuel; and commonly a portion of lime-fone is thrown alfo as a flux. The ore gradually fubfides into the hottelt part of the furnace, where it becomes fufed; and the metallic parts being revived by the coal, pafs through the fcoria, and fall to the lower part or bottom of the furnace, where a paffage is open for taking off the fcum or drofs. The metal now in ftrong fulion is let out by a tap-hole into furrows made in a bed of fand : the large mals, which fets in the main furrow, is called by the workmen a fow, and the leffer ones figs of iron. Chimney-backs, ftoves, garden•rollers, \&c. are formed of this rough metal, taken out of the receiver with ladles, and caft into moulds made of fine fand."

It is proper to obferve, that the exceffive and longcontinued ignition kept up in thefe furnaces gradually waftes the materials of which they are compofed, rendering their fides thinner until at laft they become unable to fuftain the weight of the melted metal; fo that it has fomerimes been known to burft out fuddenly in a violent and moft deftruAtive ftream. At certain in-位ervals, therefore, the fire ought to be allowed to go
out, whatever may be the expence of rekindling it, and the furnace examined and repaired.
7. The quantity of fuel, the additions, and the heat, mult be regulated, in order to obtain iron of good quality; and this quality mult likewife in the firft product be neceffarily different, according to the nature of the parts that compofe the ore.
8. Tivo or three tons, viz. 4000 or 6000 pounds weight of iron, are now run off ill 24 hours, at fome large furnaces, after the application of the large bellows; whilt fcaretly an hundred weight could be obtaincd in a day before that application, becaufe a large quantity of the metal was left in the drofs; hence in fome places the nags of different ores, left by old ope. rators in former times, are now remelted to advantage along with frefh ore; and on account of the richnefs of thefe old flags of different ores, fome pcople have been mifled into the opinion, that the metal was regenerated in them.
9. Peat and turf has been found to anfwer tolerably well, mixed with charcoal, for the fmelting of iron ores; but an attempt to ufe it on a large fcale has at laft been found not to anfwer the expectations that had been conceived from the firtt trials. Pit-coal, if applied to the fame purpofe, renders the iron hard and brittle; but this iaconvenience is prevented, by previoully coaking the coal, and employing it in the ttate of true coak. Cramer, in his Art of Affaying, p. 347. fays, that pit-coals, kennel-coals, and Scotchcoals. which burn to a white afh like wood, and abound more in bitumen, may be ufed in the firf fluxion of the iron from its ore; and if the iron proves not fo malleable as requircd, this property may be given to it by melting the metal a fecond time with wood.
10. The beft calt-iron or raw-iron, as much freed from heterogeneous matters as the ufual procefs of fmelcing can effect it, is not at all malleable, and fo hard as perfectly to withftand the file.
11. In general the impure calt-iron, as run from the ore, is melted down a fecond time in another furnace, intermixed with charcoal. A ftrong blaft of air being impelled on the furface of the metal, its fufton is remarkably promoted; the iron thickens into a mafs called a loop, which is conveyed under a large hammer raifed by the motion of a water-wheel. The iron is there beaten into a thick fquare form, is then heated again until almof ready to melt, and is forged; by a few repetitions of this procefs, it becomes completely malleable, and is at length formed into bars for fale.
12. Iron in this ftate of malleability is much fofter than before, and of a fibrous texture. But if it is ftill crude and brittle after the above procefs, it hows that there have remained heterogeneous matters, being hidden in its interltices, which mult be expelled; for this purpofe the iron mutt be fratified withcharcoal-duft within a proper furnaee, heaped up in good quantity in 1trata; then the fire muft be blown pretty ftron?ly, fo as to bring it to a fufion, which is to be helped by the addition of fufible fcorias or of fand. The fire muft not be much greater than neceflary to make all thefe melt as equally as poffible; to obtain this end, the melted mals mut be agitattd here and there with poking rods of wrought iron, in order to make every

I $\mathrm{R} O$ O O
part feel alike the action of the fire and air ; and the increafing fcorias taken out once or twice.
13. In the mean time, a great many \{parkles will be thrown out from the iron, which diminifh the more as the iron comes nearer to the dcfired degree of purity, but they never ceafe eritirely. The burning coals being then removed, and the fcoria conveyed out of the fire through a channel made for that purpofe, the iron, by leffening the violence of the fire, grows folid, and mult be taken out red-hot, and tried by friking it with a hammer. If it proves crude ftill, let the melting be repeated ; and when it is at laft fufficiently purified, it is to be hammered, and extended various ways, by making it red-hot many times over; this done, it will no longer be brittle, even when cold, as Ciameraflerts.
14. Caft-iron has of late been brought into the malleable flate by paffing it through rollers inflead of forging it. Indecd this feems to be a real improvement in tbe procefs, as well in point of difpatch, as in its not requiring that fkill and dexterity which forgemen only acquire by long practice. If the purpofes of commerce fhould require more iron to be mace, it will be eafy to fabricate and erect rolling machines, though it might be impracticable to procure expert forgemen in a fhort time.
13. This method was difcovered by Henry Cort of Goiport, who obtained an exclufive privilege granted by the king's patent. By this procefs the raw or caft iron is freed from the impurities, whicb are not difcharged in the common methods of rendering this metal malleable; for iron is in itfelf a fimple homogeneous metal; and all iron mull become equally good, if it be purified from the heterogeneous and unmetallic particles that are any ways mixed with it.
16. The ordinary method of converting cafl-iron into malleable, is, as we have feen, by employing great quantities of charcoal, which furnifhes phlogifton, and remetallizes the particles, which are unmetallized and mixed with the heterogeneous matters contained in the fuled mals: but in Cort's method there is no need of charcoal, inftead of which only fea-coal is employed ; becaufe the object is not to remetallize, but only to expel what is unmetallic, intlead of endeavouring to reflore the calcined parte with charcoal at a great expence, and ftill leaving the bufinefs undone. In this method the iron is only heated and wrought firmply by the heat of the flame, intead of being mixed with the burning fuel and afhes, which are not eafly difengaged afterwards from the metal. The fqueezing it between the rollers, forces out the melted flags from the metallic pores, and brings its metallic fibres into a perfect folidity and clufe contact, fo that they are obliged to cohere much more perfectly to each other, than by the interıupted ard partial attion of the hammer. By the operation of being long flirred, the fulphureous particles are more difpofed to be difengaged, and are burned away in the form of blue fparks; the metal then begins to curdle, and to lofe its fufibility, like folder when it juft begins to fette; the metallic particles meeting and coalefcing together, much like the churning of milk, where the cream is feparated by the union formed between the fibrous particles of the cheefe. The curdles formed into a connected mafs
become what is called loops. The procefo is as fol. lows:
17. Five or fix lundred weight of raw calf-iion (and even of cold fhort iron) is brouglit into a how fufion, on a kind of hearth or low furnace, in which it lies to the depth of about 6 inches. One or two workmen continually fir this fufed mafs with long iron pokers for about 4 or 5 hours. The heat is then lowered : the men faftion the iron into narrow pieces of about $3 \frac{1}{3}$ feet long, and 3 inches $\complement_{\text {quare, }}$ with long knives or chiffels made for that purpofe. They are then heated to the welding degree, and hammered to expel and featter the unmetallic drofs. Thefe llabs are then formed to a wedge-point at one end, in order to adapt them to be reccived between the rollers: they are malleable already, but they contain fill fome drofs.
18. They are then heated again to the hotteft welding heat in the air furnacc: and immcdiately paffed through large iron-rollers, turned by a water-wheel or by horfes. If the end prefented to the rollers fhoull flip inftead of entering, a boy, who flands ready, throws fome fand upon the iron, and it goes in eaffly Much foreign and hetcrogeneous matter is fqucezed out by the rollers; and the iron comes out in a purc: malleable flate. The fame heat will ferve to pals the iron through two fets of rollers, which are grooved fo as to fafhion it into nail-rods or other forms according to the required purpores.
19. Various and repeated fevere trials have been made in the royal dock-yards of England, in the prefence of perfons of knowledge and rank, to prove the Arength, malleability, and foftnefs or toughnefs of this new iron; and it has proved to be equal, and even fometimes fuperior, to the beft Swedifh iron. But it is not tafy to conceive by what fingular fatality fo great an improvement in manufacturing this molt ufeful metal bas not yet bsen generally adopted by the iron-matiers.
20. Steel is iron in an intermcdiate fate between caft in on and malleable iron, which is foft and tough. The iron run from fome German ores is found to be a good Alecl when forged only to a certain point.
Eut the beft iteel is ufually made by cementation from the beif forged iron, witb matters chiefly of the inflammable kind. Two parts of pounded charcoal and one of wood aftes is efleemed a good cement. The charcoal duft may be made of bones, horns, lea. ther, and hairs of animals, or of any of thefe ingredients after they are burned in a clofe veffel till they are black: thefe being pulverized, and nixed with wood-afhes, mult be well mixed together. The iron fhould bc of pure metal, not over thick, and quite free from heterogeneous matters: their fexibility, both when hot and when cold, is a yery good fign thereofo A decp crucible, two or three inches higher than the bars, is to reccive part of the cement, well preffed at the bottom, the height of $1 \frac{1}{3}$ inch; and the bars are to be placed perpendicularly, about one inch dittant from the fides of the veffel and from each other. AH the interfices are to be filled with the fame cement, and the wbole covered to the top with it ; then a tile is applied to cover the veffel, flopping the joints with thin lute. nace, and a ftrong fire is to be made, that it be kept moderately red hot for fix or ten hours together; at the end of which time they will be found converted in. to fteel. If the cementation be continued too long, the fteel will become exceffively brittle, incapable of being welded, and apt to crack and fly in forging. On the contrary, feel cemented with abforbent earths is reduced to the ftate of forged iron.
22. Steel is further purfied for making the niceft kinds of inftruments, fuch as lancets, pen-knives, razors, and various pieces, for the beft kind of watches, time-keepers, or chronometers, and aftronomical regulators. This purification of teel confits in melting it again with a ftrong but regular fire in a crucible, the better to free it from the heterngeneous parts, and little flaws that may be contained in it. It is then called caff:Reel when fufed into bars: which name, however, does not imply that the pieces, for inflance the calt-Iteel razors, have been really caft in their prefent fhape; for they mult be forged from the bar after it is caft. The fufion muft have been perfect, fo that the metallic parts be rendered uniform. The metal diminifhes a little by this procefs, for a bar of common Atel $3^{6}$ inches long, will afterwards produce another only of 35 , if properly fufed and purified.
23. The call-fteel will not bear more than a red heat; otherwife it runs away, like fand under the hammer, if the heat is pufhed to the welding degree. Dr Watfon fays, that this manufacture of caft-tteel was introduced at Shefficld only about 40 years ago by one Waller. This man was flill living about the year 1765 ; he dwelt at St Dartholomew's clofe, and was a galloon-wire drawer by trade. The difficulty of procuring fmall cylinders of good fteel to flatten the wire for lace-work in his bufinefs, whofe defect proceeded from the bad texture of the feel, fet his imagination on the enquiry after a method of purifying the metal to a greater perfection: and he thought that a new fufion of it was the mof likely to accomplifh his views. After fome trials, he at lalt fucceeded; but it swas foon known to other,, who got the advantages for thenfelves; of which ill fate the real inventor wery bitterly complained till the end of his life. His own name was even forgotten, as one Huntfman practifed this art to fuch an extent, that caft iteel was known under his fole name afterwards.
24. But before this difcovery made by Waller in England, this kind of fteel was nade already in Germany, as Wation afferts; and from thence fome finall quantities were brought to England at a confiderable price. Since that time this branch of butinefs is carried on advantageoufly at Sheffield; for the manufactures there furninh a great abundance of broken tools and old bits of Iteel, at a penny a pound, which, after fution and purification, fell for 10 or 12 times as much.
25. It is a valuable property of iron, after it is reduced into the fate of fteel, that though it is fufficiently foft when hot, or when gradually cooled, to be formed without difficulty into various tools and utenfils; yet it may be afterwards readered more or lefs hard, even to an ex:reme degree, by fimply plunging it, when red-hot, into cold water. This is called tempering. The hardnefs produced is greater in proportion as the

No 169.
Ateel is hotter and the water colder. Hence arifes the fuperiority of this metal for making mechanic inttruments or tools, by which all other metals, and even itfelf, are filed, drilled, and cut. The varions degrees of hardnefs given to iron, depend on the quantity of ignition it poffeffes at the moment of being tempered, which is manifefted by the fucceffion of colours, exhibited on the furface of the metal, in the progrefs of its receiving the inereafing heat. They are the yellowifwhite, yellow, gold-colour, purple, violet, and deepblue; after which, the complete ignition takes place. They proceed from a kind of fcorification on the furface of the lieated metal.
26. A bar of clean white teel may be made to affume all the above colours at once, by placing one end in the fire, and keeping the other end out, which is fuppofed of a proper length to remain cold.
27. Thefe colours ferve as figns to dieect the artif in tempering this metal. For though ignited fteel, fuddenly quenched in very cold water, proves exceffively liard and brittle; yet it may be reduced to the required degree of temper by heating it till it exhibits a known colour. This is the method employed in this procefs by the artitts. As foon as the piece of theel is completcly ignited, they plunge it in a very cold water; and as fooo as it loofes its fiery appearance, they take it out, rub it quickly with a file, or on a plate covered with fand, that it may have a white furface. The heat, which is fill within the metal, foon begins to produce the fucceffion of colours. If a hard temper is defired, as foon as the yellow tinge appears, the piece is dipped again, and airred about in the cold water. If the purple appears before the dipping it, the temper will he lit for tools employed in working upon metals; if dipped while blue, it will be proper for fprings, and for other inftruments fit to cut all forts of foft fubltances; but if the laft pale colour be waited for, the fleel will not be hard at all.
28. It deferves notice, that a piece of iron is rendered confiderably warm by hammering, fo as even to become red hot But after the iron has been completely hammered once, it is afferted that it cannot be rendered again red hot by the fame operation, becaufe no further compreflion can then be made. Hard Iteel is the only metal that, being ftruck flant wife with the Iharp edge of a fint, or of another hard itone, produces fparks of fire.
29. Iron is often manufactured fo as to be 150 times, and even above 630 times, more valuable than gold. On weighing fome common watch pendu-lum-fprings at Mr Tho. Wright's, watch-maker to the king, fuch as are fold at half a crown by the London artits for common work, ten of them weighed but one fingle grain. Heuce one pound avoirdupois ( $=7000 \mathrm{gr}$. ) contains ten times as many of thefe prings; which, at balf a crown a.piece, amount to 87501 . sterling. The troy ounce of gold fells at 41 . Sterling, and the pound ( $=5760 \mathrm{gr}$.) at 481 . Sterling, which gives 58,33 (or 581.6 s. 7 d.) for each pound avoirdupois of gold : and of courfe $\frac{8,50}{387515}=150$. But the pendulum.fprings of the beft kiad of watches fell at half a guinea each ; and at this rate the abovementioned value muft be increafed in the ratio of x . to 4.2 ; viz. of half a crown to half a guinea: which will amount to 36,750 l. Sterling; and this fum divided.
rent. by the value of this pound of gold, gives above $G_{3} 0$ to the quotient.

Under the articic Electricity, we have taken no. tice of a curious experiment of burning iron in dephlogiticated air; of which an account is alto given under Aerology, where the experiments of Dr Prielley are related. In the lat number of the Chemical Annals we find the fubject particulanly treated of by M. Lavoifier. "The beautiful experiment of Mr Iugenhoufz (fays he) is now well known. A piece of very fine iron wise is turned into a \{piral form ; one end of it is fixed in a bottle cork; to the other a piece of agasic is faftened: when this has been done, a lootle is filled with vital air ; the agaric is lighted, and it is then, along with the iron wire, quickly iutroduced into the botele, which is fopped with the cork. As foon as the agaric is plunged into the vital air, it begins to burn with a dazzling light ; the inflammation is consmunicated to the iron, whicle alfo burns, throwing off bright fparks that f.!! to the hottom of the bottle in round globules. Thefe globules beconc black as they cool, and preferve fone remains of their metallic lull re. The iron thus burnt is more brittle than glafs itfelf; it powders eafily; is attractable by the magnet, but lefs fo than before the peration."
M. Lavoilier, in order to obfcrve more fully the changes which happened to the metal on this occafion, repeated the experiment upon a fale confiderably larger. He immerfed chips of iron turned into a firal form into a veffel filled with pure air which contained about iz quarts; fixing to the end of each chip a fmall hit of agaric, and a particle of phofphorns weigling fearce stoth of a grain. Hasing fet fire to the phoiphorus and agaric, the iron is wholly confumed to the very laft paticle with a bright white light refembling thars in rockets. The heat in this combuflion melts the iron, which falls down in globules of different fizes. In the firt inflant of the combultion there is a flight dilatation of the air; but this is fucceeded by a very rapid diminution; and when the quantity of iron is fufficient, and the air very pure, alinoft the whole gas is abforbed. Our author recommends only fimall quäntities of iron to be burnt at a time; hecaufe the heat produced by its combuftion is fo great, that the glafs is apt to fly. A dram, or a dram and an half, is fufficient for a jar holding fourgalions, which ought to be very flong in order to refift the weight of the mercury with which it is to be filled. The increafe of weight in the iron, by being hurnt in this manner, is, according to nur author, about 35 per cent. It is then in a flate of ethiops, and may be powdered in a mortar. When the air in which the combution has been performed is very pure, there is no great difference betwist that in which the iron has been burnt and the original quantity, excepting only a fmall mixture of fixed air from the little portion of chareoal contained in the iron.

In his work alfo we find fome olfervations on the folubility of iron in pure water from Crell's Annals for the year 17-98. It has generally been fuppofed that pure water is incapahle of diffolving or holding irnn in folution: hut the fact feems now to be ellablifien by the following experiment. A pound of freth diltilled water was proured upon two ounces of iron-filings into narrow-necked glais retort ; the veffel was then put
Vol. IX. Part I.
in a fand heat, and the liquid evaporated to one lialf; after which the mouth was llightly fopped witha cork, and the matter left to digeft in a gentle heat. ()n opening the vefltl it was found that the water had becone ftyptic, and had a ferruginous tate; whence it appeared that part of the netal was diffolved. Phlogifticated alkali hat no effect upon this folution until a fow drop: of pure difilled acetous acid were alded, when a little Pruflian blue fell to the bottom. Soon after making this experiment, our author met with a natural mineral water which contained iron in folution, thougl it would not precipitate any thing until a few drops of acid were added. This folubility of iron in pure water has been alfo taken notice of by M. Landriani and M. Monnet.
Iron is eafily calcinable by fire, and is foluble in all $\mathrm{It}^{25}$ to the acids, even that of fixed air. $1_{j}$ expofure to the preferve atmofphere it is attacked by the pure part of the fur- rulting. rounding fuid, which thus becomes converted into fix. ed air, the metal in the mean time being changed into: a yellowinh brown powder called ruft. Common iron is much more fubject to rull than fleel ; and this facility of calcination renders it a matter of great irrpartance to cifcover fome effectual method of preventing it from taking place. Various compofitions lave been reenmmended, but none have been found more effectual than common oil. As the ufe of thic, however, mult te on many oceafions troublefome and difagreeable, a Rill more commodious method has been fallen upon. It is known that the metal, after laving undergone that kind of calcination in which it combines with the bafe of dephlogilicated air, or begins to combline with it, is nnt fubject io rult. By giving it a coating of this kind, therefore, it is efiectually preterved from any action of the air; and this is done by beating it till it aflumes a bluc colour, which indicates a partial calcination on the outfide: and thus utenfils are made capable of being. preferved from rult for a long time; though even thefe, when expofed wet, or even a long time to the atmofphere, will be covered with ruft and decay like others. For the chemical properties of iron, fee CuEMistry ; for its eleCtrical and magretical ones, fec E. lectricity and Magnetism.

Irov-Moulds, and fpots of ink in linen, may be taken out by dipping the flained part in water, fprinkling it with a little of the powdered efiential falt of woorlforrel, thet rubbing on a pewter plate, and wafhing the fpot out with warm water.

IroN-Sick, in the fea-language, is faid of a thip or boat, when her bolts or nails are fo eaten with rull, az.d fo wern away, that they occation holluws in the planks, wherchy the veffiel is rendered laky.
Iron-I Wood, in botany. See the article Sideroxylum.

Ironv-Work, in botany. See the artiele Siderifis.
IRONY, in rhetoric, is when a peifon fpeahs contrary to his thnurgts. in order to add force to his difcourfe; whence Quintilian calls it diverfloguitum.

Thus, when a notorious villain is fcornfully complimented with the titles of a very honeft and excellent perfon; the character of the perfon conmended, the air of contempt that appears in the fecaker, and the exorbitancy of the commendations, fufficiently difcover the diffimulation of irony.

Ironical exhortation is a very agreeable kind of trope; Y. y which,
fren, Irong.

## $I R R$

Iroquois which, after having fet the inconveniences of a thing in the cleareft light, concludes with a feigned encouragement to purlue it. Such is that of Horace, when, having beautifully deferibed the noife and tumults of Rome, he ados ironically,
" Go now, and fuly tuneful verfe at Rome!"
IROQUOIS, the name of five nations in North America, in alliance with the Britifh colonies. They are bounded by Cinada on the north, by the Britinh plantations of New York and Pennfylvania on the eaft and fouth, and by the lake Ontario on the weft.

IRRADIATION, the act of emitting fubtile effuwia, like the rays of the fun, every way. See Effluvia.

IRREGULAR, fomething that deviates from the common forms or rules: thus, we fay an irregular fortification, an irregular building, an irregular fgrure, \&e.

Irregular, in grammar, fuch inflections of words as vary from the general rules; thus we fay, itregular nouns, irregular verbs, \&c.

The diftinction of irregular nouns, according to Mr Ruddiman, is in:o three kinds, viz. variable, defective, and abundant ; and that of irregular verbs into anomalons, defective, and abundant.

IRRITABILITY, in anatomy and medicine, a term firl invented by Gliffon, and adopted by Dr Haller to denote an effential property of all animal bodies; and which, he fays, exills independen:ly of and in contradilinction to fentibility. This ingenious author calls that part of the human body irritable, which becomes fhoter upon being touched; very irritable, if it contraets upon a fight touch; and the contrary, if by a violent touch it contracts but little. He calls that a fenlible part of the human body, which upon being touched tranfmits the impreffion of it to the foul; and in brutes, he calls thofe parts fenfible, the irritation of which oceafions evident figns of pain and difquiet in the animal. On the contrary, he calls that infenfible, which being burnt, tore, pricked, or cut till it is quite defroyed, occafions no fign of pain nor convullion, nor any fort of change in the fituation of the body. From the refult of many cruel experiments he concludes, that the epidermis is infenfible; that the fino is fenfible in a greater degree than any other part of the body; that the fat and cellular membrane are infenfible; and themuicular fleth fenfible, the fenfibility of which he afcribes rather to the nerves than to the flefh itfelf. The tendons, he fays, having no nerves difributed to them, are infenfible. 'The ligaments and capfulw of the articulations are alfo concluded to be infenfible; whence Dr IJaller infers, that the fharp pains of the gout are not feated in the capfulx of the joint, but in the flin, and in the nerves which ereep upon its external furface. The bones are all infenfible, fays Dr Haller, except the teeth; and likewife the marrow. Under his experiments the periofteum and pericranium, the dura and pia mater, appeared infenfible; and he infers, that the fenfibility of the nerves is owing to the medulla, and not to the membranes. The arteries and veins are held fufeeptible of little or no fenfation, except the carotid, the lingual, temporal, pharyngal, labial, thyroidal, and the aorta near the heart ; the feufibility of which is afcribed to the nerves that accompany them. Senfibility is allowed to the internal membranes of the ftomach, inteftines, bladder, $^{\text {uncters, }}$ vagina, and womb, on account of
their being of the fame nature with the fkin : the heart Irritahil is alfo admitted to be fenfible: but the lungs, liver, trrogat fpleen, and kidneys, are poffeffed of a very imperfect, if any, fenfation. The glands, having few nerves, are endowed with only an obtufe fenfation. Some fenfibility is allowed to the tumica choroidis and the iris, tho? in a lefs degree than the retina; but none to the cornea. Dr Haller concludes, in general, that the nerves alone are fenfible of themfelves; and that, in proportion to the number of nerves apparently diftributed to particular parts, fuch parts poffefs a greater or lels degree of fenfibility.

Irritability, he fays, is fo different from fenfibility, that the mott irritable parts are not at all fenfible, and vice verfa. He alleges facts to prove this pofition, and alfo to demonftrate, that irritability does not depend upon the nerves, which are not irritable, but upon the original formation of the parts which are fufceptible of it. Irritability, he fays, is not propurtioned to fenlibility ; in proof of which, he oblerves, that the inteftines, though rather lefo fenfible than the fomach, are more irritable; and that the heart is very irritable, though it has but a linall degree of fenfation.

Irritability, according to Dr Haller, is the diftinguifhing charafteriftic between the mufcular and cellu. lar fibres; whence he determines the ligaments, periofteum, meninges of the brain, and all the membranes compofed of the cellular fubftance, to be void of irritability. The tendons are unirritable; and though he does not abfolutely deny irritability to the arteries, yet his experiments on the aorta ploluced no contraction. The veins and excretary ducts are in a fmall degree irritable, and the gall bladder, the ductus chole-dochus, the ureters and urethra, are only affected by a very acrid corrofive; but the latteal veffeis are conliderably irritable. The glands and mucous finufes, the uterus in quadrupeds, the human matrix, and the genitals, are all irritable; as are alfo the mufcles, particularly the diaphragm. The ofophagus, ftomach, and intertines, are inritable: but of all the animal organs the heart is endued with the greatelt irritability. In general, there is nothing irritable in the animal body bur the mufcular fibres; and the vital parts are the moft irritable. This power of motion, arifing from irritations, is fuppoled to be different from all other properties of bodies, and probably refides in the glutinous mucus of the mufcular Gbres, altogetlier independent of the influence of the foul. The irritability of the mufcles is faid to be deAtroyed by drying of the fibres, congealing of the fat, and mure efpecially by the ufe of opium in living animals. The phyfiological fyltem, of which an abtract has been no:v given, has been adopted and confirmed by Catell and Zimenermann, and alio by Dr Brock. lefoy, who fuggefts, that imitability, as difinguifhed from fenfibility, may depend upon a feries of nerves different from fuch as ferve either for voluntary motion or fenfation. This doctine, however, has been controverted by M. le Cat, and particularly by Dr Whytt in his Phyfiological Effays. See alfo Anatomy, $n^{\circ} 86$, ot feq. and $n^{0} 136$.

IRROGATIO, a law term amongt the Romans, fignifying the inftument in which were put down the punifments which the law provided againlt fuch offences as any perfon was accufed of by a magittrate before the people. Thefe punifhments were firf proclaimed viva voce by the acculer, and this was calied Inquifito:
argo The fame, being immediately after expreffed in writing, took the name of Regatio, in refpcét of the people, who were to be confulted or afked about it, and was called Irrogatio in refpect of the criminal, as it imported the mulet or punifhment afligned him by the accufer.

IRROMANGO, or Erramongo, one of the New Hebijes intands, is about 24 or 25 leagues in circuit; the middle of it lies in E. Long. 169. 19. S. Lat. 18. 54. The inhabitants are of the middle fize, and have a good hape and tolerable features. Their colour is very dark; and they paint their faces, fome with black, and others with red pigment : their hair is curly and crifp, and fomewhat woolly. Few women were feen, and thefe very ugly: they wote a petticoat made of the leaves of fome plant. The men were quite naked, excepting a belt tied about the waif, and a piece of cloth, or a leaf, ufed for a wrapper. No canoes were feen in any part of the ifand. They live in houles covered with thatch; and their plantations are laid out by line, and fenced round. An unlucky fcuffe bctween the Britifh failors and thefe people, in which fou: of the latter were defperately wounded, prevented captain Cook from bcing able to give any particular information concerning the prodace, \&c. of this inand.

IRTIS, a large river of Afia, in Siberia, which rifes among the hills of the country of the Kalmucks, and, running nosth eaft, falls into the Oby near Tobolik. It abounds with fifh, particularly furgeon, and delicate falmon.

IRVINE, a fea port and parliament town of Scothand, in the bailiewick of Cunningham; feated at the mouth of a river of the fame name on the frith of Clyde, in W. Long. 2. 55. N. Lat. 55. 36. This port had formerly feveral bulfes in the herring.fifhery. At prefent that branch is given up; but the inhabitants ltill cm . ploy a number of brigs in the coal-trade to Ireland. Irvine had a vifcount's title, now extinct.

ISAAC, the Jewifh patriarch, and example of filial ohedience, died $1716 \mathrm{~B} . \mathrm{C}$. aged 180.

1S.EUS, a Greek orator, born at Colchis, in Sytia, was the difciple of Lyfias, and the matter of Demodthenes: and taught cloquence at Athens, about $3+7$ years B. C. Sixty four orations are attributed to him; but he compofed no more than 50 , of which only 10 are now remaining. He took Lyflas for his modd, and fo well imitated his fyle and elegance, that we might eafily confound the one with the other, were it not for the figures which Ifieus firft introduced into frequent ule. He was allo the hirlt who applied eloquence to politucs, in which he was followed by his difciple Demollhenes.

He ought not to be confounded with Ifus, another celebrated orator, who lived at Rome in the time of Pliny the Jounger, about the year 97.

1SAIAH, or the Protheyy of Isalah, a canonical bcok of the Old I'ciament. Ifaiah is the firt of the four greater prophets; the other thrce being Jeremah, Ezekiel, and Daniel. This prophet was of royal bluod, his father Amos being brother to A zariah kiug of Judah. The five firf chapters of his prophecy relate to the reign of Uzziah; the vifion in the fixth clapter happened in the time of Jotham: the next chapters, to the fifteenth, include his prophecies under the reign of Ahaz; and thofe that were made un-
der the reigns of Hezekiah and Manaffeh, are related in the next chapters to the end. Ifaiah foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred ycars before it came to pals. But the moft remarkable of his predictions are thofe concerning the Meffiah, which deferibe not only his defcent, but all the remarkable circumitances of his life and death. The ftyle of this prophet is noble, ner. vous, fublime, and florid, which he acquired by converfe with men of the greate it abilities and elocution: Grotius calls him the Demolthenes of the Hebrews. However, the profoundnefs of his thoughts, the loftinefs of his expreffions, and the extent of his prophecy, render him one of the mofl diffienlt of all the prophets; and the commentaries that have been hitherto written on his prophecy fall fhurt of a full explication of it. Bifhop Lowth's new tranflation, \&c. publifhed in 1778 , throws confiderable light on the compofition and meaning of Ifuiab.

ISATIS, woAD: A genus of the filiquofa order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, the Siliquofa. The filiqua is lanceolated, unilocular, monofpermous, bivalved, and deciduous; the valves navicular or canoc-fhaped. There are four fpecies; but the only one worthy of notice is the tinctoria, or com. mon woad, which is cultivated in feveral parts of Britain for the purpofes of dyeing ; being ufed as a foundation for many of the dark colours. Sce Colour Making, $n^{\circ} 37$; and Woad.

The plant is biennial ; the lower leaves are of an oblong oval figure, and pretty thick confiftence, ending in obtufe roundifh points; thicy are entire on their edges, and of a lucid green. The flalks rife four feet high, dividing into feveral branches, garnifhed with arrow. Thaped leaves fitting clofe to the flalks; the branches are terminated by fmall yellow flowers, in sery clofe clufters, which are compofed of four fmall petals, placed in form of a crofs, which are fncceedsd by pods thaped like a bird's tongue, which, when ripe, turn black, and open with two valves, having oue cell, in which is fituated a fungle feed.

This fort is fown upon freth land which is in good hrart, for which the cultivators of woad pay a large rent. They generally choofe to have their lands fituated near great towns, where there is plenty of drefling ; but they never flay long on the fame ipot: for the beft ground will not admit of being fown with woad more than twice ; and if it is oftener repeated, the crop feldom pays the charges of culture, \&c. Thofe who cultivate this commodity have gangs of people who have been bred to the employment; fo that whole families travel about from place to place wherever their principal fixes on land for the purpofe. As the goodnefs of woad confits in the fize and fatnefs or thicknefs of the leaves, the only method to obtain this, is by fowing the feed upon ground at a proper feafon, and allowing the plants proper roam to grow; as alfo to keep them clean from weeds, which, if pamitted to grow, will rob the plants of their nourifhment. After having made choice of a proper fpot of land, which Thould not be too light and fandy, nor over fliff and moil, but rather a gentle hazel loam, whofe parts will eafily feparate, the next is to plough this up jut before winter, laying it in narrow high ridges, that Y y 2 the frof may penetrate through the ridges to mellow and foften the clods; then in the fpring plough it again croffwife, laying it again in narrow ridges. Afrer it has lain for fonctime in this manner, and the weeds begin to grow, it fnould be well harrowed to deftroy them: this hould be repeated twice while the weeds are young; and, if there are any roots of large perennial weeds, they muft be harrowed out, and carried off the gronnd. In June the ground fhould be a third time ploughed, when the furrows fhould be narrow, and the ground Itired as deep as the plough will go, that the parts may be as well feparated as poflible; and when the weeds appear again, the ground fhould be well harrowed to deftroy them. Thoward the end of July, or the beginning of Augut, it Thould be plon:rhed the laft time, when the land fould be laid fmooth; and when there is a profpect of fhowers, the ground mult be harrowed to receive the feeds, which thould be fown in rows with the drill-plough, or in broad-calt after the common method ; but it will be proper to theep the feeds one night in water before they are fown, which will prepare them for vegetation : if the feeds are fown in drills, they will be covered with an inftument fixed to the plough for that purpnie, but thofe which are fown broad calt in the conmon way inuf be well harrowed in. If the feeds are good, and the feafon favourable, the plants will appear in a fortnight, and in a month or five weeks will be fit to hot; for the foomer this is performed whell the plants are ditinguifhable, the better they will thrive, and the weeds being then young will be foon dell royed. The method of hoeing thefe plants is the fame as for turnips: with this difference only, that thefe plants need not be thinned fo much; for at the firlt hoeing, if they are feparated to the diflance of four inches, and at the laft to fix inches, it will be fpace enough for the growtl of the plants; and if this is carcinlly performed, and in dry weather, molt of the weeds will be detlroyed: but as fome of them may efcape in this operation, and young weeds will rife, fo the ground flould be a fecond rime hoed in the beginning of O-Zober, always chuofing a dry time for this work; at this fecond operation, the plants fhould be fingled out to the diflance they are to remain. After this, if carefully performed, the ground will be clean from weeds till the fpring, when young weeds will come up : therefore about the middle of March will be a good time to loe the ground again ; for while the weeds are young, it may be pelformed in lefs than half the time it would require if the weeds were permitted to grow large, and the fun and wind will much fooner kill them: this hoeing will alfo tir the furface of the ground, and greatly promote the growth of the plants ; if this is performed in dry weather, the ground will be clean till the frit crop of woad is gathered, after which it mult be again well cleaned; if this is carefully repeated after the gathering each crop, the land will always lie clean, and the plants will thrive the better. The expence of the firlt hoeing will be about lix fhillings per acre, and for the after hoeings half that price will be fufficient, provided they are performed when the weeds are young, for if they are fuffered to grow large, it will require more labour, nor can it be fo well perfurmed.

If the land, in which this feed is fown, fhould have
been in culture before for other crops, fo not in good heart, it will require drefling before it is fown, in which cafe rotten lable dung is preferable to any other; but this fhould nut be laid on till the latt ploughings jult before the feeds are fown, and not fpread till the land is ploughed, that the fun may not exhale the goodnefs of it, which in fummer is foon lofl when fpread on the ground. The quantity fhould not be lefs than 20 loads to each acre, which will keep the ground in heart till the crop of woad is fpent.

The time for gathering of the crop is according to the feafon: hut it flould be performed as foon as the leaves are fully grown, while they are perfectly green: for when they begin to change pale, great part of their goodnefs is over, for the quantity will be lefs, and the quality gieatly diminithed.

If the land is good, and the crop well hubanded, it will produce three or four gatherings; but the tivo firt are the belt. Thefe a:e commonly mixed together in the manufacturing of it: but the after cropss are always kept feparate ; for if thefe are mixed with the other, the whole will be of little value. 'The two firlt crops will fell from 25 l. to 301 . a ton ; but the latter will not bring more than 71 . or 81 . and fometimes not fo much. An acre of laud will produce a ton of woad, and in good feafons near a ton and an half.

When the planters intend to fave the feeds, they cut three crops of the leaves, and then let the plants fland till the next year for feed; but if only one crop is cut, and that only of the outer leaves, letting all the middle leaves fland to nourifh the falks, the plants will grow Atronger, and produce a much greater quan. tity of feeds.
'I'hefe feeds are often kept two ycars, but it is always beft to fow new feeds when they can he obtained. The feeds ripen in Augult; and when the pods turn to a dark colour, the feeds fhould be gathered. It is beft done by reaping the ftalks in the fame manner as wheat, fpreading the talks in rows upon the ground : and in four or five days the feeds will be fit to threfh out, provided the weather is dry ; for if it lies long, tlie pods will open and let out the feeds.

There are fome of the woad planters who feed down the leaves in winter with theep; which is a very bad method: for all plants which are to remain for a future crop thould never be eaten by cattle, for that greatly weakens the plants; therefore thofe who eat down their wheat in winter with fleep are equally blameable.

Is atis, in zoology, a fynonyme of the canis lagopus. See Canis.

ISAURA, or Isaurus (anc. geog.), a flrong city at mount Taurus, in lfauria, twice demolifhed; firlt by Perdiccas, or rather by the inhabitants, who, thro" defpair, deftroyed themfelves by fire, rather than fall into the hand of the enemy; again by Servilius, who thence took the furname Ifouricus. Strabo fays there were two Ifauras, the old and the new, but fo near that other writers took them but for one.

ISAURIA, a country tonehing Pamphyliaand Cilicia on the north, rugged and mountainous, fituated almoit in mount Taurus, and taking its name from Ifaura; according to fome, extending to the Mediterranean by a narrow תip. Stephanus, Prolemy, and Zufimus, make no mention of places on the fea; though Pliny
urica does, as alfo Straho ; but doubtful, whether they are places in Ifauria Proper, or in Pamphylia, or in Cilicia.
ISAURICA, a pait of Lycaonia, bordering en mount Tantus.

1SCA Dumpiorum (anc. geng.) ; a town in Bitain. Now Exeter, capital of Devonfhire. IV. Long. $3^{\circ}$ 40, Lat. $5^{\circ} 4+$. Called Caer- $/ \mathrm{J} k$ in Brithth, (Camº den.)

I CA Silurum (anc. geog.) ; the flation of the Legin 1I. Augulta, in Britain. Nuw Caerkon, a town of Monmonthnire, on the Unke.

ISCFIALIS, or Iscalis (anc. gcog.); a town of the Bulgre in Britain. Now Ilcheller, in Somerfethire, on the river 111.

ISCHAEMUM, in botany: A genus of the monocia orler, belonging to the polygania clafs of plants ; and in the natural inethod ranking under the $4^{\text {th }}$ order, Gramina. The calys of the hermaphrodite is a biforous ghume; the corolla bivalved; there are three flamina, two llyles, and oue fecd. The caly:: and corolla of the male as in the former with tincee illamina.

ISCHIUM, in anatony, one of the bones of the pelvis. See Anatinim, $\mathrm{n}^{\mathrm{D}} 41$.

ISCHIAA, an inand of ltaly, in the kingdom of Naples, about is miles in circumference, lying on the coalt of the Terra di Lavoro, from which it is three miles diftant. It is full of agreeable valleys, which produce excellent fruits. It hath alfo mountains on which grow vines of an excellent kind: likewife fountains, rivulets, and fine gardens.

Ischfa, a town of Italy, and capital of an iffand of the fame nanie, with a tinhop's fee and a flomeng fort. Bo:h the city and fortrefs lland upos a rock, which is joined to the ifland by a Itrong bridge; the rock is about feven furlongs in circumference. The city is like a pyramid of houfes piled upon one another, which makes a very lingular and friking appeatance. At the end of the bridge next the city are iron gates, which open into a fubterraneous paffage, through which they enter the city. They are always guarded Iy foldiers who are natives of the ifland. E. Long. 13. 55. N. Lat. 40. 50.

ISCHURIA, wxppix (formed from ${ }^{\circ} \chi$ " "I ftop," and ugov "urine," in phyfic), a difeafe confiling in an entire fuppreffion of urine. See Medicine Index.

It is occafioned by any thing which may oblruet the paffages of the reins, ureters, or the neek of the bladder, as fand, ftone, mucus, \&ic. It may alfo arife from an obfluction of the nerves which pafs to the reins or blayder, as we fee it does in a palfy of the parts below the diaphragm. The too great dilitenfion of the bladder may alfo produce the fame effeet: for the fibres being much lengthened, and confequently condenfed, the fpirits neceflary for their contraction cannot get admittance; whence it is that perfons who have retained their urine a long time, find a great deal of dificulty in difcharging it.

ISELASTICS, a kind of games, or conibats, celebrated in Greece and Afia, in the time of the Ro. man emperors.
The victor at thefe games had very confiderable privileges conferred on him, after the example of Auguftus and the Athenians, who did the like to con-
querors at the Olympic, l'ythian, and Ithmian games. They were crowned on the fpot imenediately after their victory, had penfions allowed them, were furnifhed with provifions at the pablic coft, and were carried in triumph to their country.

ISENACH, a town of Germany, in the circle of Upper Saxony, from whence one of the Saxon princes takes the title of duke. 'There are iron mines in the neighbourlund. E. Long. 9. 17. N. Lat. 5 1. 0 .

ISENARTS, or EIsENARTs, a conficlerable town of Germany in Autria and in Styria; famous for its iron mines. E. Long. 15.25. N. Lat. 46.56.

ISENBURG, a large town of Germany, capital of a co:3ty of the fame name, with a handfome caltle, feated on the river Seine, in E. Long. 7. 14. N. Lat. 50.28. The county belongs to the elector of Treves.

ISENGHEIN, a town of the Auftrian Netherlands, with the title of a principality, feated on the river Mandera, in E. Long. 3. 18. N. Lat. 50. 44.

ISERNIA, a town of Italy, in the kingdom of Naples, and in the county of Molife, with a bifhop's fee. It is feated at the foot of the Appenines, in E. Lang. 14. 20.
ISH, in Scots law, fignifies expiry. Thus we fay "the i/b of a leafe." It fignifies alfo to go out ; thus we fay "free i/fand entry" from and to any place.

ISIA, IJsia, fealts and facrifices anciently folemnized in lionour of the goddefs Ifis.- The Ifia were full of the mot abominable impurities; and for that reafon, thofe who were initiated into them were obliged to take an oath of fecrecy. They held for nine days fucceffively, but grew fo fcandalous, that the fenate abolifhed them at Rome, under the confulate of Pifo and Gabinius. They were reeeftablifhed by Augulfus, and the emperor Cominodus himfelf affilted at them, appearing amorg the priets of that goddefs with his head fraven, and carrying the Anubis.

ISIAC table is one of the moof confiderable monuments of antiquity, difcovered at Rome in 1525, and fuppofed by the various figures in bas relief upon it, to reprefent the fealts of Ifis, and other Egyptian deities. There have been various opinions as to the antiquity of this monument : Come have fuppofed that it was engraved long before the time when the Egyptians worfhipped the figures of men and women. 0 . thers, among whom is bifhop Warburton, apprehend, that it was made at Rome by perfons attached to the worlhip of Ifis. Dr Warburton confiders it as one of the molt modern of the Egyptian moruments, on account of the great mixture of hieroglyphic charactere which it bears.

ISIACI, prief of the goddefs Ifis.-Diofcorides tells us, that they bore a branch of fea-wormwood in their hands inflead of olive. They fung the praifes of the goddefs twice a.day, viz. at the riling of the fun, when they opened her temple; after which they begged alms the reft of the day, and returning at night, repeated their orifons, and thut up the temple.

Such was the life and office of the IFiaci; they never covereed their feet with any thing but the thin bark of the plant papyrus, which occafioned Prudentius and otbers to fay they weut bart-footed. They

## I S L

finkrus wore no garments but linen, becaufe This was the firt
II who taight mankind the culture of this commodity.
ISIDORUS, called Damiatensis, or Pelusiota,
from his living in a folitude near that city, was one of the mof famous of all St Chryfoftom's difciples, and fourifhed in the time of the general council held in 42t. We have 2012 of his epittles in five books. They are fhort, but well written, in Greek. The beft edition is that of Paris, in Greek and Latin, prinied in 1639 , in folio.

ISIGNI, a town of France, in Lower Normandy, with a fmall harbour, and well known on aceount of its falt works, its cyder, and its butter. W. Long. 0. 50. N. I.at. 49. 20.

ISINGLASS. See Ichthyocolla.
ISIS, a celebıated deity of the Egyptians, daughter of Saturn and Rhea, according to Diodorus of Sicily. Some fuppofe her to be the fame as Io, who was changed into a cow, and reftored to her human form in Egypt, where the taught agiculture, and governed the people with mildnefs and equity, for which reafons the received divine honours after death. According to fome traditions mentioned by Plutarch, Ifis married her brother Ofiris, and was pregnant by him even before the had left her mother's womb. Thefe iwo ancient deities, as fome authors obferve, compre. hended all nature and all the gods of the heathens. lfis was the Venus of Cyprus, the Minerva of Athens, the Cybele of the Phrygians, the Ceres of Eleulis, the Proferpine of Sicily, the Diana of Crete, the Bellona of the Romans, \&ee. Ofiris and Ifis reigned conjointly in Egypt; but the rebellion of Typhon, the brother of Ofiris, proved fatal to this fovereign. The ox and the cow were the fymbols of Ofiris and Ifis; becaufe thefe deities, while on earth, had diligently applied themfelves in cultivating the earth. As Ifis was fuppofed to be the moon as Ofiris the fun, fhe was reprefented as holding a globe in her hand, with a veftel full of ears of corn. The Egyptians believed that the yearly and regular inundations of the Nile proceeded from the abundant tears which Ifis thed for the lols of Ofinis, whom Typhon had bafely murdered. "The word $I / 1 s$, according to fome, fignifies "ancient," and on that account the inferiptions on-the flatues of the coddefs were often in thefe words: "I am all that has been, that fhall be, and none among mortals has hitherto taken off my veil." The worthip of Ifis was univerfal in Egypt, the priefts were obliged to oblerve perpetual clialtity, their head was clofely Chaved, and they always walked barefooted, and clothed themfelves in linen garments. They never eat onions, they abflained from falt with their meat, and were forbidden to eat the flefh of theep and of hogs. During the night they were employed in continual devotion near the llatue of the goddefs. Cleopatra, the beautifnd queen of Eg gpt, was wont to drefs herfelf like this godders, and aficcted to be called a feecond Ifis.

Ists, or Thames, a river that has its rife in Gloucefterfhire, and fows through only a fmall part of Wiltfhire. It enters this county near its fource, and begins to be navigable for boats at Crieklade ; but after sunning in a ferpentine manner about four miles, it leaves Gloucefterthire at a village called Cafle Eaton.

ISLAM ; the true faith, according to the Mahometans. See Mahometanism.

ISLAND, a traEt of dry land encompaffed with water; in which fenfe it Alands contraditin ruithed from Continent, or Terra Firma

Several naturalifts are of opinion, that the illands were formed at the deloge; others think, that there have been new illands formed by the calling up of valt heaps of clay, mud, fand, \&e ; others think they have been feparated from the continent by violent florms, inundations, and earthquakes. Thefe laft have obferved, that the Ealt Indies, which abound in illands more than any other part of the warld, are likewife more annoyed with earthquakes, tempells, lightnings, volcanoes, \&ic. than any other part. Others again conclude, that illands are as ancient as the world, and that there were fome at the beginning ; and, among other arguments, fupport their opinion from Gen. x. 5. and other paflages of Scripture.

Varenius thinks that there have been illands produced each of thefe ways. St Helena, Afcenfion, and other fteep rocky iflands, he fuppofes to have become fo by the fea's overflowing their neighbouring champaigns: but by the heaping up huge quantities of fand, and other terrettial matter, he thinks the illands of Zealand, Japan, \&e. were formed. Sumatra and Ceylon, and molt of the Eaft India iflands, he thinks, were rent off from the main land; and concludes, that the illands of the Archipelago were formed in the fame way, imagining it probable tbat Deucalion's flood might contribute towards it. The ancients had a notion that Delos, and a few other iflands, role from the bottom of the fea; which, how fabulous foever it may appear, agrees with later obfervations. Seneca takes notice, that the illand Therafia rofe thus out of the 压gean fea in his time, of which the mariners were eye-witndfes.

It is indeed very probable, that many illands have exifted not only from the deluge, but from the creatirn of the world; and we have undoubted proofs of the formation of iflands in all the different ways ahovementioned. Another way, however, in which illands are frequently formed in the South Sea, is by the coralline infects. On this fubject the following curious differtation by Alexander Dalrymple, Efq; hath appeared in the Plilofophical Tranfactions for the year 1767.
"Thefe illands are generally long and narrow: they are formed by a narrow bar of land, inclofing the fea within it; generally. perhaps always, with fome ingrefs at leaft to the tide; commonly with an opening capable of receiving a cance, and frequently fufficient to admit even larger veffels.
"The origin of thefe inands will explain their nature. What led me firl to this deduction was an obfervation of Abdul Roobin, a Sooloo pilot, that all the illands lying off the north-eaft coall of Borneo had fhoals to the eaftward of them.
"Thefe illands being covered to the weftward by Dorneo, the winds from that quarter do not attack them with violence. But the north-eaft winds, tumbling in the billows from a wide ocean, heap up the coral with which thofe feas are filled. This, obvious after ftorms, is perhaps at all other times imperceptibly effected.
" The coral banks, railed in the fame manner, become dry. Thefe banks are found of all depths, at
all diftances from floore, entirely unconneeted with the land, and detached from each other: although it often happens that they are divided by a carrow gut with. out bottom.
"Coral banks allo grow, by a quick progreffion, towards the furface; but the winds, heaping up the coral from deeper water, chiefly accelerate the formation of thefe into floals and iflands. They become gradually thallower ; and. when once the fea meets with refiflance, the coral is quickly thrown up by the force of the waves-breaking againft the bank; and hence it is, that, in tt. open fea, there is fearee an inftance of a coral bank laving fo little water that a large fhip cannot pafs over. hut it is alfo fo mallow that a boat would ground on it.
" I have feen thefe coral banks in all the flages ; fome in deep water, others with few rocks appearing above the furface; fome jutt formed into iflands, without the leat appearance of vegetation; and others from fuch as have a few weeds on the higheft part, to thofe which are covered with large timber, with a bottomlefs fez at a pifol-hhot diflance.
"The loofe coral, rolled inward by the billows in large pieces, will ground; and the reflux being unable to carry them away, they become a bar to coagulate the fand, always found intermixed with coral; which fand, being eafielt raifed, will he lodged at top. When the fand bank is raifed by violent ftorms beyond the reach of common wavee, it becomes a refling-place to vagrant birds, whom the fearch of prey draws thither. The dung, feathers, \&-c. increafe the foil, and prepare it for the reception of accidental roots, branches, and feed, caft up by the waves, or brought thither by birds. Thus iflands are formed: the leaves and rotten branches intermixing with the fand, form in time a light black mould, of which in general thefe inlands confift; more fandy as lefs woody; and, when full of large tiees, with a greater propor tion of mould.
" Cocoa nuts, continuing long in the fea without lofing their regetative powers, are commonly to be found in fuch iflands; particularly as they are adapted to all foils, whether fandy, rich, or rocky.
"The violence of the waves within the tropics, mulf generally be directed to two points, according to the monfoons.
"Hence the iflands formed from coral banks mur be long and narrow, and lie nearly in a meridional direction. For even fuppofing the banks to be round, as they feldom are when large, the fea, meeting moft refintance in the middle, mult heave up the matter in greater quantities there than towards the extremitics: and, by the fame rule, the ends will generally be open, or at leaf lowet. They will alfo comnonly have foundings there, as the remains of the bank, not accumulated, will be under water.
"Where the coral banks are not expofed to the common monfoon, they will aleer their direction; and be either rourd. exiending the parallel, or be of irregular forms, according to accidental circumftances.
"The interior paits of thefe iflands being fea, fometimes form harbuurs capable of receiving veffels of fome burthen: anc, I believe, always abound greatly with finh; and, fuch as I have feen, wirh turtle-
grafs and other fea-plants, particularly one feccies, called by the Sooloos gamme, which grows in little globules, and is fomewhat pungent, as well as acid, to the tafte.
" It need not be repeated, that the ends of thofe iflands only are the places to expect founding ; and they commonly have a fhallow Spir running out from each point.
"Abdul Roobin's obfervation points out anotler circumftance, which may be ufeful to navigators; by confideration of the winds to which any iflands are moft expofed, to form a probable conjecture which fide has deepeft water; and from a view which fide has the floals, an idea may be formed which winds rage with mofl violence."

Illands from their fituation enjoy many great advantages, the principal of which are thefe. In the init place, many benefits are derived to the inhabitants of an inand from its unity. The very larget country on a continent is fill but a part, which implies dependence, and is neceffarily attended with a train of imperfections; from all of which, by the unerring and unalterable laws of nature, the people who live in an ifland are or may be entirely free. All countries on the continent are expofed to continual dangers, againtt which their inhabitants mult be perpetually upon their guard. This renders a large military force requifite. It involves them in continual negociativns, leagues, and alliances ; all of which, however, cannot exempt them from frequent wars, or the miferies that attend them, and which have commonly bad effects on their internal policy. In the next place, the climate is generally mild and falubrious from the vapours of the furrounding fea, which aceording to the latitude abates the violence of heat, and moderates the rigour of cold, both which are fenfibly and conftantly lefs than on consinents under the fame elevation of the pole. We have a remarkable intlance of this in the iflands called anciently Stabales, in the modern Latin Infuta Arearum, by us the inlands of Hieres. They are three in number, lying in $43^{\circ}$ north latitude, before the port of Toulon. In them, the fruits of France and Italy arrive at the highefl perfertion, and all the medical herbs of Italy, Grecee, and Egspt, grow wild. Yet the climate is wonderfully temperate and pleafant in all feafons*.-There is alfo commonly a greater variety, • Sce Ameand always a greater fertility, in the foil, occafioned rica, $\mathrm{L}^{\circ} \mathrm{C}_{-}$ chiefly by the warmth of the circumambient air, fre- $\mathrm{z}_{3}$. quent flowers, and, in confequence of both, being cortinually impregnated with vegetable falts. Anocher confiderable advantage arifes from its acceffibility on every fide, by which it is open to receive fupplies from other countries, and has the conveniency of exporting its commodities and manufactures to all markets, and, in comparifon of the continent, at all feafons. The oppofite fides of an ifland may in regard to commerce be confidered as two countries; each has its ports, its proper commodities, its proper corref ${ }_{F}$ ondencies; in confequence of which, it promotes the cultivation, and procures vent for the manufactures, of a large diltrict behind it; while the intermediate nidiand fpace finds a profit in that inland trade, which the fe two dillritts fi:pply. The winds contrary on one fide are favourable on the other; and the fea, the common road ta
botts
hiand. both coafts, is cuntinually plonglied by veffels outward and homeward bound, which keeps up that active and enterprizing fpirit which eharacterizes iflanders. An inland has at once the molt extenfive and the moft effectual frontier, and this on all fides, fubfilling for ever, without repairs, and without expence: and, which is fill more, detives fion this very frontier a great part of the fubfiftence of its inhabitants, and a valuable article in its commerce, from its fifherits. It is commonly faid the fea is a mine, but in truth it is better; its treafures are more lafting and more certain, procured by labour folely, and fit for ufe or for fale as foon as procured, quickly confumed, and thereby the fource of continual employment to a flout, hardy, laborions race of men, who likewife find employment for numbers, and are in various refpects otherwife beneficial members of the community. The defence of this natural barrier, which, as we have faid, colts nothing, but on the contrary yields much, is not only permanent, but in every refpect more to be relied on than any that could be raifed by the fill and indultry of men at the greateft expence. All there bleffings and benelits are infured by the leflon that Nature dictates, fome would fay the law which the prefcribes, to the inhabitants of every ifland, to place all their hopes in the affirnous cultivation of their own country, to bend all their endeavours to raifing and extending their commerce, and to put their trult in, Providence, and in the fafeguard which fhe directs; men accultomed to robuft and hardy exercifes, and in what necefiarily arifes from their way of life, a maval force. The firt inhabitants come in veffels, are for a time dependent on the country from whence they came, arrive at independence by enlarging their correfpondence: and thus commerce is natural and effential to the people of an ifland; which is the rea. fon that they thrive fo long as they poffefs it, and gradually decline in the fame proportion in which that deeays.

Islands of Ice. See Ice. Iffand.
Floating-IsLANDS. Hittories are full of accounts of floating iflands; but the greatelt part of them are either falle or exaggerated. What we generally fee of this kind is no more than the concretion of the lighter and more vifeons matter floating on the furface of the water in cakes: and, with the roots of the plants, forming congeries of difierent fizes, which, not being fixed to the flore in any part, are blown about by the winds, and float on the furface. Thefe are generally found in lakes, where they are confined from being carried too far; and, in procefs of time, fome of them arquire a very confiderable fize. Seneca tells ${ }^{11} 3$ of many of thefe floating iflands in Italy; and fome later writers have deferibed not a fetr of them in other places. Bat, however true thefe accounts might have beer at the time when they were writen, very few proofs of their authenticity are now to be found ; the flozting iflands havints either dilappeared again, or been fixed to the fuds in fuch a manner as to make a part of the fhore. Pliny teils us of a great illand which at one time fwam about in the lake Cutilia in the country of Rearinum, which was difeovered to the old Romans by a mirack ; and Pomponius tells us, that in I.ydia there were feveral iflands fo loofe in their founNo 16.
dations, that every little accident thook and removed them.
Istann (or Icelind) Cryital. See Crrstal (Ice- $\underbrace{\text { Iting }}$ lund).

ISLE-ADAM, a town of France, with a bandfome caftle, and the title of a baron; feated on the river Oife, three miles from Beaumont, and 20 fiom Paris. E. Long. 2. 13. N. Lat. 49 7.

Isle-de. Dieru, a fmall ifland of France in the fea of Gafcony, and on the coall of Poitou, from which it is 14 miles. W. Long. 2. 5. N. Lat. 46.45 .
IsLE-de-France, is one of the 12 general governments of France; bounded on the north by Picardy, on the wefl by Normandy, on the fouth by the government of Orleannois, and on the ealt by that of Champagne. It is about 90 milcs in lengelt, and as much in breadtlr; and is watered by the rivers Seine, Marne, Oife, and Aifne. The air is temperate, and the foil fertile; and it abounds in wine, corn, and fruits. It contains 10 fma!l difricts, and Paris is the eapital city.

ISLEBIANS, in ecclefiaftical hiltory, a name given to thofe who adopted the fentiments of a Lutheran divine of Saxony, called John Agricola, a difciple and companion of Lather, a native of Ifleb, whence the name; who inter preting literally fome of the precepts of St Paul wich regard to the Jewih law, declaimed againt the law and the necefity of good work. See Antinomians.

ISLINGT'ON, a village of Middlefex, on the north fide of London, to which it is almofl contiguous. It appears to be of Saxon origin ; and in the conqueror's time was written Ifedon, or Ifendon. The church is one of the prebends of St Paul's; to the dean and chapter of which a :ertain precinct here belongs, for the probate of wills, and granting adminiftrations. The church was a Gothic itructure. erected in 1503, and food till :751, when the inhabitants applied to parliament for leave to rebuild it, and foon after crected the prefent flructure, which is a very fubtantial. brick edifice, though it does not want an air of lightnefs. Its houfes are above 2000, including the Upper and Lower Holloways, three fides of NewingtonGreen, and part of Kingfland, on the road to Ware. The White Conduit-houfe in this place, fo called from a white lione condnit that ftands before the entrance, has handfome gardens with good walks, and two large rooms one above the other for the entertainment of company at tea, \&c. In the S. W. part of this village is that noble refervoir, improperly called NewRiver Head; though they are noly two bafons, which receive that river from Herrfordfhire, and from whence the water is thrown by an enerire into the company's pipes for the fnpply of London. In the red-moat on the north fuxe of thefe bafnen, called Six-Acre-Field, from the contents of it, which is the third field beyond the White Conduit, there appears to have been a fortrefs in former days, inklofed with a rampart and ditcl, which is fuppofeed to have been a Roman camp made ufe of by Suctonius Yaulinus after his retecar, which 'Cacitus mentions, from London, before he fallicil thence, and routed the Gritons under their queen Biosdicea; and that which is vulgariy, but erronenufly, called Jack Straw's caftle, in a fq:are place in the S. W. angle of the field, fuppofed to have been the feat
feat of the Roman general's pretorium or tent. In this parifh are two charity-fchools; one founded in 1613 by Dame Alice Owen, for educating 30 children. This foundation, together with that of a row of alms-houfes, are under the care of the brewers company. Here is an hofpital with its chapel, and a workhoufe for the poor. There is a fpring of chalybeate water, in a very pleafant garden, which for fome years was honoured by the conltant attendance of the princcfs Amelia, and many perfons of quality, who drank the waters. To this place, which is called New Tunbridge Wells, many people refort, particularly during the fummer, the price of drinking the waters being 10s. 6 d . for the feafon. Near this place is a boufe of entertainment called Saddler's Wells, where, during the fummer feafon, people are amuled with balance mafters, walking on the wire, rope-dancing, tumbling, and pantomime enteriainments.

ISLIP, a town of Oxfordihire, 56 miles from London, is noted for the birth and baptifm of Edward the Confffor. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oule, Trent, Darwent, Severn, Humber, Thames, Avon, \&cc. which navigation, including its windings, extends above 500 miles, in the counties of Liucoln, Nottingham, York, Lancafter, Weftmoreland, Chefter, Stafford, 'Warwick, Leicefter, Oxford, Worcefter, \&c. It has a good market for theep, and fome remains of an ancient palace, faid to lave been king Ethelred's. Here is a chatity-fchool. The chape! wherein Edward was baptized flood at a fmall diftance north from the church, is fill called the king's chapel, was entirely defecrated during Cromwell's ufurpation, and converted to the meaneft ufes of a farm-yard; at prefent it has a roof of thatch. It is built of fone 15 yards long and 7 broad, and retains traces of the arches of an oblong window at the eaft end. This manor was given by Edward the Confeflor to Weftminfter abbey, to which it dill belongs.
ISMAELITES, the defcendants of Ifmael; dwelling from Havila to the wildernefs of Sur, towards Egypt, and thus overfpreading Arabia Petræa, and therefore Jofephus calls Ifmael the founder of the Arabs.

ISMARUS (anc. geog.), a town of the Cicones in Thrace, giving name to a lake. In Virgil it is called Ifmara. Servius fuppofes it to be a mountain of Thrace ; on which mountain Orphcus dwelt.

ISNARDIA, in botany: A genus of the monogynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 17 th order, Calycanthema. There is no corolla; the calyx is quadrifid ; the capfule quadrilocular, and girt with the calyx.

ISNY, an imperial town of Germany, in Suabia, and in Algow; feated on the river Ifny, in E. Long. 9. 10. N. Lat. 47. 33.

ISNIC, a town of Turky in Afia, and in Natolia, with a Gıeek archbihop's fee. It is the ancient Nice, famous for the firft general council held hare in 325 . There is now nothing remaining of its ancient fplendor but an aqucduct. The Jews inhabit the greateft part of it; and it is feated in a country fertile in corn and excellent wine. E. Long. 30. 9. N. Lat. 47.15 .
ISOCHRONAL, is applied to fuch vibrations of Vol. IX. Part I.
a pendulum as are performed in the fame fpace of Ifochronal time ; as all the sibrations or fwings of the farme pendulum are, whetber the arches it defcribes are chorter

Ifpahan. or longer.

Isochronal-Line, that in which a heavy body is fuppofed to defcend without any acceleration.

ISOCRATES, one of the greateft orators of Greece, was born at Athens, 436 B . C. He was the fon of 'Theodorus, who had cariched himfelf by making mufical inftruments, and gave his fon a liberal education. Ifocrates was the difciple of Prodicus, Gorgias, and other great orators. He endeavoured at fift to declaim in public, but without fuccefs; he therefore contented himfelf with inftructing his fcholars, and making private orations. He always thowed great love for his country ; and being informed of the lofs of the battle of Cheronea, he abitained four days from eating, and died, aged 98 . There are fill extant 25 of his difcourfes or orations, which are excellent performances, and have been tranflated from the Greck into Latio by Wolfus. Ifocrates particularly excelled in the juftuefs of his thoughts, and the ele. gance of his exprcffions. There are alfo nine letters attributed to him.

ISOETES, in botany; a genus of the natural order of filices, belonging to the cryptogamia clafs of plants. The anthere of the male flower are within the bafe of the frons or leaf. The capfule of the female flower is bilocular, and within the bafe of the leaf.
ISOLA, a town of Italy, in the kingdom of Naples, and in the Farther Calabria, with a bifhop's fee. It is a fea port town, and is feated 15 miles fouth-eaft of St Severina. E. Long. 7•33. N. Lat. 39. I.

ISOPERIMETRICAL FIGURES, in geometry, are fuch as have equal perimetcrs or circumferences.
ISOPYRUM, in botany : A genus of the polygynia order, belonging to the polyandria clafs of plants ; and in the natural method ranking under the 26 th order, Multifligue. There is oo caly x, but five petals ; the nectaria trifid and cubular; the capfules recurved and polyfpermous.
ISOSCELES triakgle, in geometry, one that has two equal fides
ISPAHAN, or, as the Perfians pronounce it, Staubawn, the capital of Peifia, is fituated in the province of Irac, Agemi, or Perfia Proper, upon the ruins, as generally fuppofed, of the ancient Hecatompylos, or, as others think, of the Afpa of Ptolemy. Mof of the eattern aitronomers and geographers place it in N . Lat. 32. 25. E. Long. 86. 40. It flands in a very extenfive plain, furrounded hy mountains; and has tight diffricts belonging to it , that contain about 400 towns and villages. The fertility of the foil, the mildnefs of the feafons, and the fine temperature of the air, all confpire to render Ifpahas one of the moft charming and delightful cities in the world. It is unanimoully agreed, that the prefent city is of no great antiquity ; and the two parts into which it is divided, preferve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of thefe, netwithftanding their neighbourhocd, bear an inveterate antipathy to each other; which they difcover on all public occafions. Spaulawn

1pahan. owes the glory it now poffelfes to the great Shah $A$. bas; who, after the conqueft of the kingdnms of Lar and Ormus, charmed with the fituation of this place, made it the eapital of his empire, between the years 1620 and 1628 . The mountains, with which this city is furrounded, defend it alike from the fultry heats of fummer and the piercing winds of the winter feafon; and the plain on which it flands is watered by feveral rivers, which contribute alike to its ornament and ufe. Of thefe rivers, the Zenderoud, after being joined by the Mahmood, paffes by Spauhawn; where it has three fine bridges over it, and is as broad as the Seine at Paris. The waters of thefe united Atreams are fweet, pleafant, and wholcfore, almoft beyond comparifon; as, indeed, are all the fprings found in the gardens belonging to the houfes of Spauhawn. The extent of Spauhawn is very great ; not lefs, perhaps, than 20 miles within the walls, which are of earth, poorly built, and fo covered with houfes and fhaded with gardens, that in many places it is difficult to difcover them. The Perians are wont to fay, Spaubawn nifpigehon, i. e. Spauhawn is half the world. Sir John Chardin fays, that though fome reckoned I I, 000,000 inhabitants in it, he did not himfelf look upon it as more populous than London. At a diflance, the city is not eafily diltinguifhed; for many of the Atreets being adorned with plantains, and every houle having its garden, the whole looks like a wood. The fleeets in general are neither broad nor convenient ; there being three great evils which attend them : the firt is, that being built on common fewers, thefe are frequently broke up, which is very dangerous, confidering that moft people are on horfeback; the fecond is, that there are many wells or pits in them, which are not lefs dangerous; the third atifes from the people's emptying all their ordure from the tops of their houles : this laft, indeed, is in fome meafure qualified by the drynefs of the air, and by its being quickly removed by the peafants, who carry it away to dung their grounds. Some reckon eight, and others ten gates, befides pofterns; but all agree that there is no difficulty of entering at any hour of the day or night. 'The three principal fuburbs annexed to it are, Abbasabad, built by Shah Abas, and belonging to the people of 'l'auris ; Julfa, inhabited by a colony of Armenians, called by fome $N_{e}$ zu 7 ulfa, to diftinguifh it from the ancient city of that name, fituated in Armenia, upon the Araxes, whence the original inhabitants of Ntw Julfa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr-Abad, the Areet of the magians, occupied entirely by the profeffors of magifm, or the religion of the ancient Perfians. The river Zenderoud feparates the city of If. palian and Abas-Abad from Julfa and Ghebr-Abad. This city has fuffered greatly fince the commencement of the dreadful rebellion in 1721 ; the whole kingdom from that period, till a few years ago, having been almoll a continued fcene of blood, ravages, and confufion. A celebrated modern traveller, who was on the fpot, tells us, that the inhabitants of Julfa, not many years before the above revolution happered, amounted to 30,000 fouls; had 13 churchies, and above 100 priells; and paid the Perfian court 200 tomans yearly for the free exercife of their religion : that fome of the freets were broad and handfome, and planted with
trees, with canals and fountains in the middle; others narrow and crooked, and arched a top ; others again, though extremely narrow, as well as turning and winding many ways, were of an incredible length, and refembled fo many labyrinths: that, at a fmall diftance from the town, there were puhlic walks adorned with plane-trees on either hand, and ways paved with ftones, fountains, and cifterns: that there were above 100 caravanferas for the ufe of merchants and travellers, many of which were built by the kings and prime nobility of Perfia: that, as little rain fell there, the freets were frequently full of duft, which rendered the city difagrecable during a confiderable part of the fummer ; that the citizens, however, to make this inconvenience more tolerable, ufed to water them when the weather was warmer than ufual : that there was a caftle in the eaftern part of the town, which the citizens looked upon as impregnable, in which the public money, and moft of the military ftores, were faid to be kept : that, notwithflanding the baths and caravanferas were almoft innumerable, there was not one public hofpital : that mot of the public buildings were rather neat than magnificent, theugh the great meydan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated Toher-bag adjoining to it, made a very grand appearance: that the formet contained the royal mofque; the building denominated kayfirich, where all forts of foreign commodities were expofed to fale: and the mint, fyled by the Perfians ferraa-kboneh, where the current-money of the kingdom was coined: that, befides the native Perfian , there were then in Ifpahan above 10,000 Indians all fuppoited by trade; 20,000 Gcorgians, Circaffans, and T'artars of Dagheftan or Lefgees, with a confiderable number of Englifh, Dutch, Portugucle, and a few French : that the Caprechins, difcalceated or bare-footed Carmelites, Jefuits, Dominicans, and Auftin friars, had likewife their convents liere, tbough they were unable to make any converts; and that there were above 100 molques and public calleges. But fince the fatal period abovementioned, the fuburb of Julfa was almolt totally abandoned by the Armenians, The government of Ifpahan, 23 leagues long and as many broad, compre. hending feveral diftricts, molt of them formerly well peopled, appeared not many years ago little better than a defert; moft of the inhabitants of that fertile and delightful tract being fled and difperfed. Multitudes of them had taken a precarious refuge in the mountains of Lorittan, lying between Ifpahan and Sufter, whofe lands were left untilled, and their houfes mouldered into ruins. In fhort, all the ditreffes of an unfuecefsful war, or the invalion of a barbarous enemy, could not have plunged the people of Ifpahan into greater mifery than the victories of their tyramical king Nadir Shah, who feemed more folicitous to humble his own fubjects than his enemies. See Persia.

ISPIDA, in ornithology. See Alcedo.
ISRAEL, the name which the angel gave Jacob, after having wreflled with bim all night at Mahanaim or Penuel (Gen. xxxii. 1, 2, and 28, 29, 30. and Hofea xii. 3.) It fignifies the conqueror of God, or a prince of God, or, according to many of the ancients, a man who fees God.

By the name of Ifrael is Cometimes underfood the perfon
perfon of Jacob; fometimes the whole people of Ifrael, or the whole race of Jacob; andfometimes the kingdom of Ifracl, or of the ten tribes, ditinet from the king. dom of Jutah.
ISRAELITES, the defcendants of Ifrael; who were at firt called Hebrezus, by reafon of Abraham, who came from the other fide of the Euphrates; and afterwards I/raelites, from Ifrael the father of the twelve patriarchs; and laftly Fczus, particularly after their return from the captivity of Babylon, becaufe the tribe of Judah was then much ftronger and more numerous than the other tribes, and foreigners had fcarce any knowledge of this tribe.

ISSACHAR, one of the divifions of Paleftine by tribes; lying to the fouth of Z abulon, fo as by a narrow nip to reach the Jordan, between Zabulon and Manaffeh, Jofh. xix. But whether it reached to the fea, is a queftion; fome holding that it did: an affertion not tafy to be proved, as Jofhua makes no mention of the fea in this tribe, nor does Jofephus extend it farther than to mount Carmel ; and io Jofh. xvii. 10. Afher is faid to touch Manaffeh on the north, which could not be if Iffachar extended to the fea.

ISSOUDUN, a confiderable town of France, in Beriy. It carrics on a great trade in wood, cattle, cloth, hats, and fockings; is feated partly on a plain, and partly on an eminence. E. Long. 2. 5. N. Lat. 46. 57.

ISSUE, in common law, has various applications; being fometimes taken for the children begotten between a man and his wife-fometimes, for profits growing from amerccments or fines - fometimes, for profits of lands and tenements-but more frequently for the point of matter depending in fuit, whereupon the parties join, and put their caufe to the trial of the jury.

In all thefe occafions, iffue has but one fignification, which is, an effect of a caufe preceding; as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punifhment of any man's offence, are the effect of his tran!greffion; the point referred to the trial of twelve men, is the effect of pleading, or procefs. See Plea and Iffue.
ISSUES, in furgery, are little ulcers made defignedly by the furgeon in various parts of the body, and kept open by the patient, for the prefervation and re. covery of his health.

ISSUS, now Ajazo, a town of Cilicia in Natolia, with a harbour on the Levant Sea, a little to the north of Scanderoon. E. Long. 36. 25 . N. Lat. 36. 56.

Near this place, in a difficult pafs between the mountains and the fea, Alexander the Great fought his fecond battle with Darius. One great caufe of the defeat which the Perfians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was fo much furprifed when he firlt received the news that Darius was behind hinn, that he could fcarce believe it to be true : but when he was thoroughly fatisfied of the fact, and that Darius had again pafied the river Pinarus, he called a council of war, wherein, without anking any body's advice, he only told them, that he hoped they would remember their former actions; and that they,
who where always conquerors, were about to fight people who were always beat. He further obferved, that Darius feemed to be infatuated, fince he had with fuch expedition quitted an open and champaign country, where his numbers might have acted with advan. tage, to fight in a place inclofed, where the Macedonian phalanx might be well drawn up, and where his numbers could only incommode him. Ile then made the neceffary difpofitions for repaffing the mountains, potted guards where he found them neceffary and then commanded his troops to refrefh themfelves, and to take their tell till morning.

At break of day he began to repals the mountains, obliging his forces to move in clofe order where the road was narrow, and to extend themfelves as they had more room ; the right wing keeping always clofe to the mountain, and the left to the fea-fhore. On the right there was a battalion of heavy-armed troaps, befides the targeteers under the command of Nicanor the fon of Parmenio. Next thefe, extending to the phalanx, were the corps of Conus and Perdiccas; and on the left, the refpective bodies commanded by $A$ myntas, Ptolemy, and Meleager. The foot appointed to fupport them were commanded by Craterus; but the whole left wing was committed to Parmenio, with Itrif orders not to decline from the fea-fhore, left the Perfians fhould furround them. Darius ordered 20,000 foot and 30,000 horfe to retire, finding that he already wanted room to draw up the reft. His firt line confifted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmott the ground would allow. On the left, towards the mountain, he pofted 20,000 men, which, from the hollow fituation of the place, were brought quite behind Alexander's right wing. The relt of his troops were formed into clofe and ufelef3 lines behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he fuddeuly recalled the horfe who had retired, fending part of them to take polt on his right againit the Macedonians commanded by Parmenio; and the reft he ordered to the left towards the mountain : but, finding them unferviceable there, he fent the greatelt part of them to the right; and then took upon himfelf, according to the cultom of the Periaza kings, the command of the main body. As foon as Alexander perceived that the weight of the Perlian horfe was difpofed againtt his left wing, he difpatched, with as much fecrecy as he could, the Theffalian cavalry thither, and fupplied their places on the right by fome brigades of horfe from the van, and light-armed troops. He alfo made fuch difpofitions, that, notwithltanding the mighty advantage of the hollow mountain, the Perfians could not furround him. But, as thefe precautions had confiderably weakened the centre of his army, he ordered thofe advanced pofts on the enemy's left, of which he was moft apprehenfive, to be attacked at the very begianing of the fight; and, when they were cafly driven from them, he recalled as many troops as were necefiary to ftrengthen his centre.

When all things were in order, Alexander gave Atrict command, that his army fhould march very howly. As for Darius, he kept his troops tixed in their polts, and in fome places threw up ramparts; whence the already a prifoner. Alexander at the head of the right wing engaged firt, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to pafs the river Pinarus after them, his troops in fonme meafure loting their order, the Greek mercenaries fell upon then in flank, and made them light, not only for viEtory, but for their lives. Ptolemy the fon of Seleucus, and 120 Macedonians of iome rank, were killed upon the fot. But the foot next to Alexander's right wing coming in feafonably to its relief, fell upon the mercenaries in flank, amonglt whom a dreadful carnage was made; they being in a manner furrounded by the horfe and light-armed troops, which at firlt purfued the left wing, and the foot that now paffed the river. The Perfian horfe ou the right ftill fought gallantly; but, when they were throroughly infurmed of the rout of theirleft wing and of the deflruction of the Greek mercenaries, and that Darius himfelf was fied, they began to break, and betake themfelves to flight alfo. The Theffalian cavalry purfued them clofe at the heels; and the narrow craggy roads incommoded them exceedingly, fo that vaft numhers of them perimed. As for Darius, he fled, foon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain and open, he efcaped well enougli ; but, when the roads became rocky and narrow, he quitted it, and, mounting a horfe, rode all the night : his chariot, in which were his cloak and lits bow, fell into the hands of Alexander, who earried them back to his camp.

In refpect to the battle of Ifus, Diodorus informs us, that Alexander looked every where about for Darius; and, as foon as he difcovered him, with his handful of guards attacked him and the flower of the Perfian ariny which was about him; being as defirous of obtaining this vi\&tory by his perfonal valour, as of fubduing the Perfian empire by the courage of his foldiers. But when Oxathres, the brother of Darius, faw Alexander's defign, and how fiercely he fought to accomplifh it, he threw himfelf, with the horfe who were about him, between his brother's chariot and the enemy, where an obitinate fight was maintained, till the dead hodies rofe like an entrenchment about the chariot of Darius. Many of the Perfian nobility were flain, and Alexander himfelf was wounded in the thigh. At laft, the horfes in the chariot of Darius flarted, and became fo unruly, that the king himfelf was forced to take the reins; the enemy, however, preffed fo hard up n him, that he was conftrained to call for another chariut, and mounted it in great danger. This was the beginning of the rout, which foon after became general. According to this author, the Perfians loft 200.000 foot, and 10,000 horfe; the Macedonians 300 foot, and 150 horfe.

Juftin informs us, that the Perfian army confifted of $\$ 00,000$ foot, and 100,000 horfe. He fays, that the battle was hard fought ; that both the kings were wounded; and that the Perlians fill fought gallantly when their king fled, but that they were afterwards fectily and totally routed: he is very particular as to their lofs, which he fays amounted to 61,000 foot, 10,000 horre, and 40,000 taken prifoners ; of the Maeedonians be fays there fell no more than 130 foot, and

150 borfe. Curtius fays, that of the Perfians there fell 100,000 foot, and 10,000 horfe: of Alexander's army 504, he fays, were wounded; 32 foot and 150 horfe killed. That we may not fufpect any error in tranfcribers, his own obfervation confirms the fact: Tantulo inpendio ingens vid̈oria fletit," So fmall was the coft of fo great a victory."

ISTHMIA, or Isthmian Games; one of the four folemn games which were celebrated every fifth year in Greece. They had the name from the Ithmus of Corinth, where they were celebrated. In their firlt inftitution, according to Paufanias, they contifted only of funeral rites and ceremonies in honour of Melicertes: but Thefeus afterwards, as Plutarch inforins us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated thofe to Neptunc, his reputed father, who was regarded ad the particular protector of the Ithmus and commerce of Corinth. The fame trials of ikill were exhibited here as at the other three facred games; and particularly thofe of mufic and poetry. Thefe games, in which the victors were only rewarded with garlands of pine-leaves, were celebrated with great magnificence and fplendor as long as paganifm continued to be the eftablifhed religion of Greece; nor were they omitted even when Corinth was fackela and burnt by Mummius the Roman general; at whicis time the care of them was transferred to the Sicyonians, but was reftored again to the Curinthians when their city was rebuilt.

ISTHMUS, a narrow neck, or nlip of ground, which joins two continents; or joins a peniufula to the terra firma, and feparates two feds. See Pexin. sula.

The moft celebrated ifthmufes are, that of Panama or Darien, which joins North and Suuth America; that of Suez, which connedts Afia and Africa; that of Corinth, or Peloponuefus, in the Morea; that of Crim-Tartary, otherwife called Taurica Cherfonefus: that of the peninfula Romania, and Eriffo, or the itthmus of the Thracian Cherfonefus, twelve furlongs broad, being that which Xtrxes undertook to cut through. The ancients had feveral defigns of cutting the ifthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all in vain, the invention of fluices being not then known. There have been attempts too for cutting the ithmus of Suez, to make a communication between the Red Sea and the Mediterranean : but thefe alfo failed; and in one of them, a king of Egypt is faid to have loft 120,002 men.

ISTRIA, a peninfula of Italy, in the territory of Venice, lying in the north part of the Adriatic fea. It is bounded by Carniold on the north; and on the fouth, eatt, and weft, by the fea. The air is unwholefome, efpecially near the coaft ; but the foil produces plenty. of wine, oil, and paftures ; there are alfo quarries of fine marble. One part of it belougs to the Venetians, and the other to the houfe of Auftria. Cabo d'Iltria is the capial town.

ITALIAN, the language fpoken in Italy. See the article Language.
This tongue is derived principally from the Latin; and of all the languages formed from the Latin, there is

## 1 T A

ginal than the Italian.

It is accounted one of the moft perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and fuperlatives, or rather aug. mentatives; but without any gieat reafon: for if thofe words corivey nothing farther to the mind than the juft ideas of things, they are no more faulty than our pleonafms and hyperboles.

The language correfponds to the genius of the people, who are fow and thoughtful: accordingly, their language run3 heavily, though fmoothly; and many of their words are lengthened out to a great degree. They have a great tafte for mufic ; and to gratify their paffion this way, have altered abundance of their primitive words; leaving out confonants, taking in vowels, foftening and leng theuing out their termina. tions, for the fake of the cadence.

Hence the language is rendered extremely nufical, and fucceeds better than any other in operas and fume parts of poetry : but it fails in itrength and nervoufhefs; and a gieat part of its words, borrowed from the Latin, become fo far difguifed, that they are not tafily known again.

The multitude of fovereign fates into which Italy is divided, has given rife to a great number of different dialects in that language; which, however, are all good in the place where they are ufed. The Tufcan is ufually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the Italian proverb, Lingua Tofoana in bocca Romana.

The Italian is generally pretty well undertood ilhroughout Europe; and is frequently fpoken in Germany, Poland, and Hungary. At Conflantinople in Greece, and in the ports of the Levant, the Itelian is ufed as commonly as the language of the country: indeed in thofe places it is not fpoken fo pure as in Tuf. canry, but is currupted with many of the proper words and idioms of the place; whence it takes a new name, and is called Frank Italian.
italic character, in printing. See Letter.
ITALICA (anc. geog.), a town of Baetica in Spain, built by Scipio Africanus, after finifhing the Spa nifh war, for the reception of the wounder foldiers. At frif it was a mufticipium; afterwards a colony : which was a matter of wouder to the emperor Adrian, the privileges of a municipium being beyond thofe of a colony (Gellius). Famous for being the birth-place of the emperors Trajan and Adrian, and of the poet Silius Italicus. Now Sevill. Vieja, fcarce fcur miles fiom Seville; a fmall village of Andalufia on the Guadalquivir.-Ciorfinium in Italy was thus alfo called.

ITALY, one of the finef countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north, north-weft, and north-eaft, it is bounded by France, Switzerland, the country of the Grifons, and Germany ; on the eaft, by the Adriatic fea or gulf of Venice; and on the fouth and weft, by the Mediterranean; its figure bearing fone refemblance to that of a hoot. Its length from Aofta, at the foot of the Alps in Savoy, to the utmoll verge of Calabria, is about 600 miles; but its breadth is very untqual,
being in fome places near 400 miles, in others not above 25 or 30 .
Italy was anciently known by the names of Saturnia, Oenotria, Hefperia, and Aufonia. It was called Saturnia from Saturn; who, being driven out of Crete by his fon Jupiter, is fuppofed to bave taken refuge here. The nanies of Oenotria and Auforia, is borrowed from its ancient inhabitants the Oenotrians and Aufones; and that of Hefperia or IVeflern was given it by the Greeks, from its fituation with refpect to Greece. The names of Italia or Italy, which in procefs of time prevailed over all the reft, is hy fome derived from Italus, a king of the Siculi : by others, from the Greek word Italos, fignifying an ox; this country abounding, by reafon of its rich paftures, with oxen of an extraordinary fize and beanty. All thefe names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole country.

This country, like noof others, was in ancient times Divifion is divided into a great number of petty ftates and king. ancien: doms. Afterwards when the Gauls fettled in the times. weftern, and many Greek colonies in the eaftern parts, it was divided, with refpect to its inhabitants, into three great parts, viz. Gallia Cifalpina, Italy properly fo called, and Magna Grecia. The molt weftern and northern parts of Italy were in great part poffeffed by the Gauls; and hence took the name of Gallia, with the epithets of Cifalpina and Citerior, becaufe they lay on the fide of the Alps next to Rome; and Togata, with relation to the Roman gown or drefs which the inhabitants ofed: but this laft epithet is of a much later date than the former. This appellation was antiquated in the reign of Auguftus, when the divifion of Italy into eleven provinces, introfuced by that prince, took place. Hience it is that the name of Ci/\% alpine Gaul frequently occurs in the authors who flourithed before, and fcarce ever in thofe who wrote after, the reign of Auguftus. This country extended from the Alps and the river Varus, parting it from Tranfalpine Gaul, to the river Aefus; or, as Pliny will have it, to the eity of Ancona, m the ancient Pi. cenum. On the north, it was divided from Rtretia by the Alps, called Alpes Rhaitice: and from lllyricum by the river Formio : but on this lide, the borders of Italy were, in Pliny's time, extended to the river Arfia in Ittria. On the fouth, it reached to the Li gutic fea, and the Apennines parting it fiom Etruria; fo that under the common name of Cijalpine Gaul were comprehended the countries lying at the foot of the Alps, called by Pliny and Scrabo the Subalpine cointries, Liguria, Gallia Cifpadana, and Tranโpadana. Italy, properly fo called, extended, on the coalt of the Adriatic, from the city of Ancona to the river Trento, now the Forture; and on the Mediterranean, from the Macra to the silarus, now the Sele. Magna Grecia comprifed Apulia, Lucania, and the country of the Brutii. It was called Grecce, becanfe molt of the cities on the coalt were Greek colonies. The inhabitants gave it the name of Great, not as if it was larger. than Greece, bat merely out of oltentation, as Pliny. informs us.

All thefe countries were inhabited by a great number of different nations fettled at different times, and from many different parts. The names of the molt.

## I T A [ 366 ] I T A

tealy. remakable of them were the Aborigines, or thofe whofe origin was utterly unknown, and confequeutly were thought to have noae; the Sabines, Hetrurians or Tuf. cans, the Umbri, Sannites, Campani, Apulii, Calabrii, Lucanii, the Brutii, and the Latins. From a colony 3 of the latter proceeded the Romans, who gradually fubdued all thefe nations one after another, and held them in fubjection for upwards of 700 years. All thefe nations were originally brave, hardy, temperate, and well fkilled in the art of war; and the Romans much more fo than the refl. Their fubjection to Rome, bowever, inured them to flavery; theis oppreffion by the emperurs broke their fpirit; and the vaft wealth which was poured into the country from ali parts of the world, during the time of the Roman profperity, corrupted their mannets, and made them degenerate fron their former valour. Of this degeneracy the barbarous nations of the north took the advantage to invade the empirc in innumerable multitudes. Though often repelled, they never failed to return ; and it was found neceffary to take great numbers of them into the Roman Service, in order to defend the empire againd the reft of their countrymen. Bythe He- In the year 476 , the Heruli, prefuming on the ferviruli. ces they had done the enpire, demanded a third part of the lands of ltaly; and being refufed, chofe one Odoacer, a man of low birth, but of great valour and experience, for their king; and having totally deflroyed the remains of the Roman empire, proclaimed Ozoacer king of Italy. The new monarch, however, did not think proper to alter the Roman form of govcrnment, but fuffered the people to be governed by the fenate, confuls, \&c. as before. He enjoyed his dignity in peace till the year 488 , when Zeno, emperor of Conflantinople, being hard preffed by Theodoric king of the Ollrogoth3, advifed him to turn his arms againit Odoacer, whon he could eafily overcome, and thus make himfelf fovereign of one of the fineft countries in the world.

Ynvaded by
Theoderic the Oftrogoth.

Theodoric accepted the propofal with great joy, and fet out for Italy, attended by an infinite number of people, carrying with them their wives, children, and effects, on waggoris. Several Romans of great diftinction attended him in this war; while, on the other hand, many of his countrymen chofe to remain in Thrace, where they hecame a feparate nation, and lived for a long time in amity with the Ramans. The Goths, being detlitute of fhipping, were oblised to go sound the Adriatic. Their march was perfurmed in the depth of winter; and during the whole time, a violent famine and plague raged in their army. They were alfo oppofed by the Gepidx and Sarmatians; but at laft having defeated thefe enemics, and overcome every other obftacle, they arrived in Italy in the year 489. Theodoric advanced to the river Sontius, now Zonzo, near Aquileia, where he halted for fome time to refrefh his troops. Here he was met by Odoacer at the head of a very numerous army, but compofed of many different nations comnanded by their refpective chiefs, and confequently without fufficient union or zeal for the common caufe. Theodoric therefore Odancerde-gained an eafy viltory, cut many of his enemies in pie-
feated. ces, and tuok their camp. Odoacer retired to the plains of Verona, and encamped there at a fmall diflance from the city; but Theodoric purfued him clofe,
and foon forced him to a fecond engagement. The Goths obtained another victory; but it coft them dear. Odoacer's men made a much better refiftance than before, and great numbers fell on both fides. The vietory, however, was fo far decifive, that Odoacer was obliged to thut himfelf up in Ravenna; fo that Theodoric having now no enemy to oppofe him in the field, befieged and took feveral important places, and among the rell Milan and Pavia. At the fame time, Tufa, commander in chiief of Odoacer's forces, deferted to the enemy with the greatelt part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in purfuit of his fovereign. Odoacer had left that city, and was advanced as far as Faenza, where he was clofely belieged by T'ufa; but the traitor, declaring again fur his old matter, joined him with all his troops, and de. livered up feveral officers that had been appointed by Theodoric to ferve under him. Thefe were fent in irons to Ravenna; and Odoacer being joined by Frideric, one of Theodoric's allies, with a confiderable body of troops, once more advanced againft his enemies. He recovered all Liguria, took the city of Milan, and at laft befieged Theodoric himfelf in Pa via. The Goths, having brought aht their families and effects along with them, were greatly diftreffed for want of room; and mult have undoubtedly fubmitted, if their enemies had continued to agree among themfelves. The quarrels of his followers proved the ruin of Odoacer. Theodoric, finding that the enemy remitted the vigour of their operations, applicd for fuccours to Alaric king of the Vifigoths, who had fettled in Gaul. As the Viligoths and Oltrogoths were originally one and the fame nation, and the Vifigoths had received among them fome years before a great number of OAtrogoths under the conduct of Videmer coufin gecriman to Theodorie, the fupplies were readily granted. The inaction of the enemy gave thefe fuccours tine to arrive ; upon which Theodorce inflantly joined them, and marching againl his enemies gave them a total overthrow. Odnacer again touk refuge in Ravenna, but was clofely befieged by Theodoric in 490. The fiege lafted three years; during which O doacer defended himfelf with great bravery, and greatly annoyed the befiegers with his fallies. Theodoric, however, inpatient of delay, leaving part of his army to blockade the city, marched with the rell againtt the itrong holds which Odoacer had garrifoned. All thefe he reduced with little difficulty; and in 492 returned to the fiege of Ravenna. The belieged were now reduced to great fraits both by the eneny without and a famine within, the price of wheat being rifen to fix pieces of guld per buhel. On the other hand, the Goths were quite worn out with the fatigues of fuch a lung fiege; fo that both parties being willing to put an end to the war, Odoacer fent John bifinop of Ravenna to Theodoric with terms of accomnodation. Jornandes informs us, that Udoacer only begged his life; which 1 heodoric bound himfelf, by a folemn oath, to grant him: but Procopius fays, that they agreed to live together on equal terms. This laft feems very improbable: but whatever were the terms submite of the agreement, it is certain that Theodoric did not and isp keep them; for having a few days after invited Odod-todeath cer to a banquet, he difpatched him with his own hand.

## 1 T A [ 367 ] I T A

hand. All his fervants and relations were maffacred at the fame time; except his brother Arnulphus, and a few more, who had the good luck to make thcir efcape, and retired beyond the Danube.

Thus Thendoric became mafter of all Italy, and took upon himfelf the title of king of that country, as Odoacer had done before ; though, with a pretended diference to the emperor of Conflantinople, he fent meffengers anking liberty to affume that title after he had actually taken it. Having fecured his new king. dom as well as he could by foreign alliances, Theodoric next applied himfelf to legillation, and enacted many falutary laws befides thofe of the Romans which he retained. He chofe Ravenua for the place of his refidence, in order to be near at hand to put a fop to the incurfions of the barbarians. The provinces were governed by the fame magiflrates that had prefided over them in the times of the emperors, viz. the confulares, correciores, and prafides. But befides thefe, he fent, according to the cultom of the Goths, inferior judges, diftinguifhed by the name of counts, to each city. Thefe were to adminitter juftice, and to decide all controverfies and difputes. And herein the polity of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a confularis, a corrector, or a prefes, who refided in the chief city, and to whom recourfe was to be had at a great charge from the moft remote parts: but Theodoric, befides thefe officers, appointed not only in the principal cities, but in every fmall town and village, inferior magiftrates of known integrity, who were to adminifter juftice, and by that means fave thofe who had law-fuits the trouble and expence of recurring to the governor of the whole province; no appeals to diflant tribunals being allowed, but in matters of the greatelt importance, or in cafes of manifefl injuftice.

Under the adminiffration of Theodoric Italy enjoyed as great happinefs as had been experienced under the very beft emperors. As he had made no alteration in the laws except that above mentioned; fo he contented himflif with the fame tributes and taxes that had been levied by the emperors; but was, on all occafions of public calamity, much more ready to remit them than mot of the emperors had been. He did not treat the natives as thofe of the other Roman provinces were treated by the barbarians who conquered them. Thefe fripped the ancient proprietors of their lands, eflates, and poffeffions, dividing them among their chicfs; and giving to one a province with the title of duke, to another a frontier country with the title of marquis; to fome a city with the title of count, to others a caftle or village with the title of baron. But Theodoric, who piqued himfelf upon goverming after the Roman manner, and obferving the Roman laws and inflitutions, left every one in the full enjoyment of his ascient property. As to religion, though he himfelf, like moft of his countrymen, profeffed the tentets of Arius, he allowed his fubjects to profefs the orthodox doctrine without molftation, giving liberty even to the Goths to renounce the docirines in which they had been educated, and embrace the contrary opinions. In fhort, his many vittues, and the happinefs of his fubjects, are celebrated by all the hiftorians of thofe times. The end of his reign, however, was fullied by
the death of the celebrated philofopher Bocthius, and Italy. his father-in-law Symmachus. 'They were both beheaded in Pavia, on an unjuft fufpicion of treafon; Beheads and fcarce was the fentence put in execution when the B ethus king repented, and abandoned himfelf to the molt and sympungent forrow. The excefs of his grief affected his machus, underftanding: for not long after, the head of a large and dies of fifh being ferved $\because \rho$ to fupper, he fancied the head of grief. the fifh to be that of Symmachus threatening him in a ghaflly manner. Hercupon, feized with horror and amazement, he was carried to his bed-chamber, where he died in a few days, on the 2 d of September 526.

After the death of Theodoric, the kingdom devolved to Athalric his grandion; who being at that time only cight years of age, his mother Amalafuntha took upon hes the regency. Her adminittration was equally upright with that of Theodoric himfelf; but the barbarians of whom her court was compofed, finding fault with the encouragement the gave to learning, forced her 10 to abandon thic education of her fon. The latterthe refents thereupon plunged into all manner of wickednefs, and governis behaved to his mother with the greateft arrogance; and equitably. the faction finding themfelves thus ftrengthened, at laft commanded the queen to retire from court.

Amalafuntha, exerting her authority, feized three of the ringleaders of the fedition, whom fhe confined in the moft remote parts of Italy. But thefe maintaining a fecret correfpondence with their friends and relations, never ccafed to fir up the people againt her; infomuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Juftinian, begging leave to take refuge in his dominions. The emperor readily complied with her requeft, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time caufed the three ringleaders to be put to death, and no new difturbances arifing thereupon, fhe did not accept of the cm peror's offer. In 533, Athalric having contracted a lingering diftemper by his riotous living and debancheries, Amalafuntha, to avoid the calamities with which Italy was threatened in cafe of his death, formed a defign of delivering it up to Juftinian : but before her fcheme was ripe for execution, Athalric died. Upon which the queen took for her colleague one Theodotus her coufin; obliging him, however; to fwear that he would fuffer her to enjoy and exercife her former power. This he very readily did, but foon forgot his promife; Is treacherand when the took the liberty to remind him of it oully imprio caufed her to be feized and confined in an inand of the put to. lake Bolfena in Tufcany. But as Theodotus had great death.s reafon to believe that this conduct would be refented by Juftinian, he obliged her to write to him that no injury or injuftice had been done her. Along with this letter he fent one written by himfelf, and filled with heavy complaints againft Amalafuntha. The emperor, however, was fo far from giving credit to what Theodotus urged againit her, that he openly efpoufed her caufe, wrote her a moft affectionate letter, and affured her of his protection. But before this letter could reach her, the unhappy princefs was ftrangled in the bath by the friends of thofe whom in the reign of: lier fon the had defervedly put to death for raifing difturbances in the Aate.

On the news of Amalafuntha's death, Juftinian reo
folved
flaty. folved upon an immediate war with the Goths; and, to facilitate the enterprife, ufed his utmof endeavours toinduce the Franks to affit him. To his folicitations he added a large fum of money; which laft was very acceptable to his new allies. They promifed to affilt the emperor to the utmof of their power; but inftead of performing their promife, while Juftinian's arms were employed againft the Goths, Thierri, the eldeft fon of Clovis, feized on feveral cities of Liguria, the Alpes Cottix, and great part of the prefent tertitory of Venice, for himfelf. Juftinian, however, found fulficient refources in the valour of Belifarius, notwithftanding the defection of his treacherous allies. This celebrated general was vefted with the fupreme command, and abfolute atithority. His influctions were to pretend a vojage to Carthage, but to make an attempt upon Sicily; and if he thought he could fucceed in the attempt, to land there; otherwife to fail for Africa, without difcovering his intentions. Another general, named Mundus, commander of the troops in Illynicum, was ordered to march into Dalmatia, which was fubject to the Coths, and attempt the reduction of Salonse, the better to open a paffage into Italy. This he accomplifined without difficulty, and Helifarius made. himfelf mafter of Sicily fooner than he himfelf had expected. The ifland was reduced on the laft of December 535 ; upon which Belifarius, without lofs of time, paffed over to Reggio, which opened its gates to him. From Reggio he purfued his march to Rone, the provinces of Abrutium, Lucania, Puglia, Calabria, and Samnium, readily fubmitting to him. 'The city of Naples endured a fiege: but Belifarins entered in through an aqueduct, and gave it up to be plundered by his fuldiers.

Theodotus, alarmed at thefe fucceffes, and having neither capacity nor inclination to carry on the war, fent ambaffadors to Jutinian with propofals of peace. He agreed to renounce all pretenfions to the illand of Sicily; to fend the emperor yearly a crown of gold weighing 300 pounds; and to fupply him with 3000 men whenever he fhould think proper to demand them. Several other atticles were contained in the propofal, which annunted to the owning of Jußtinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that thefe offers might not yet be fatisfactory, he recalled his ambaffadors for further orders. They were now de.

## Thendo

 cus offers to refigns the Eingdom. fircd to inform Juftinian, that Theodotus was willing to refign the kingrom to him, and content himfelf with a penfion fuitable to his quality. But he obliged them by an oath not to mention this propolal, till they found that the emperor would not accept of the other. The firft propofals were accordingly rejected as they had fuppofed; upon which the ambaffadors produced the fecond, figned bs Theodotus himfelf, who in his letter to the emperor told him, among other things, that being unacquainted with war, and addicted to the fudy of philofopby, he pieferred his quiet to a kingdom. Juttinian, tranfported with joy, and imagining the war alrcady finithed, anfwered the king in a motl obliging manner, extolling his wifdom, and giving him befides what he demanded the greatelt honours of the empire. The agreement being confirmed by mutual oaths, lands were affigned to 'lheodutus out of the king's domain, and orders were dif$\mathrm{N}^{\mathrm{B}} 170$.patched to Belifarius to take poffeffion of Italy in his name.

In the mean time, a body of Goths having entered Dalmatia, with a defign to recover the city of Salonx, were encountered by an inferior army of Romans, commanded by the fon of Mundus above mentioned. The Goths proved victorious; and the young general of the Romans was killed, and moft of his army cut in pieces. Mundus marched againt the enemy to revenge the death of his fon ; but met with no better fuccefs, his troops being defeated, and he himfelf killed in the engagement. Upon this the Romans abandoned Salorre and all Dalmatia; and Theodotus, ela- Theoito ted with his fuccefs, refufed to fulfil the aticles of the refures treaty. Jultinian difpatched Conftantianus, an officer of fulfil the great valour and experience, into lllyricum, with orders to raife forces there, and to enter Dalmatia; at the fame time he wrote to Belifarius to purfue the war with the utmof vigour.

The Goths were now reduced to the greate ft ftraits. Conftantianus drove them out of Dalmatia; and Belifarius having reduced all the provinces which compofe the prelent kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, a[fembled without his confent, and difpatched ambarfadors to Belifarius with propofals of peace. Thefe propufals were rejected; and Belifarius returned for anfwer, that he would hearken to no terms, nor theatl? his fword, till Italy was reannexed to the empire to which it belonged. The Guths finding Theodotes He is ftill inactive, unanimoufly depofed him ; and chofe in pofed, a his itead one Vitiges, a man of great valour, but of a Vitiges mean defcent. Theodotus fled to Ravenna; but the fen in hi new king difpatched after him a meffenger, who foon overtook him and cut off his head.

Vitiges began liis government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome; but not thinking himfelf able to defend that city againft the Roman forces, he abandoned it to Belifarius, and arriving at Ravenna was joined by the Goths from all parts, fo that be foon fuund himfelf at the head of a confiderable army. Belifarius in the mean time entered Rome without oppofition, on the gth or 1oth of December 537. The Gothic garrifon retired by the Porta Flaminia, while Belifarius entered by the Porta Afinaria. Leudaris, governor of the city, who faid behind, was fent, together with the keys, to the emperor. Belifarius immediately applied himfelf to the repairing of the walls and other fortifications; filled the granaries with corn, which he caufed to be brought from Sicily ; and ftored the place with provifions, as if he had been preparing for a fiege; which gave no fmall uneafinefs to the inhabitants, who chofe rather that their city fhould lie open to every invader, than that they fhould be liable to the calamities of a fiege. While Belifarius was thus employed at Rome, the city of Benevento, with great part of the territory of Samnium, was delivered up to him: at the fame time the cities of Narnia, Spoleto, and Perulia, revolting from the Goths, received Roman garrifons; as did moft of the cities of Telcany.

## $1 \mathrm{~T} A$

In the mean time, Vitiges having collected an army of 150,000 men, refolsed to march directly to Rome, and engage Belifatius; or, if he declined an engagement, to lay fiege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the fame time, he fent ambaffadors to them, with offers of all the Gothic poffeftions in Gail, befides a confiderable fum of money, provided they joined lim againft the emperor. The Franks with their ufual treachery confented to the propofal, received the money and the territories agreed on, and then refufed to fulfil the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would coft him too much trouble. Belifarius, whofe army, reduced by the many towns he had garrifoned, did not now amount to above 5000 men, difpatched meflengers to Conftantianus in lufcany ; and to Beffas, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all poffible expedition; writing at the fame time to the emperor himfelf for fupplies in the molt preffing manner. Conftantianus joined him purfuant to his orders; and foon after, Beflas, falling in with part of the enemy's vanguard, billed a confiderable number of them, and put the reft to fight. Belifarius had built a fort upon a bridge about a mile from Rome, and placed a ftrong garrifon in it to difpute the paffage with the enemy; but the garrifon, feized with a panic at the approach of the Goths, abandoned their poft in the night, and fled into Campania. Early in the morning Vitiges paffed over great part of his army, and marched on till he was met by Belifarius, who, knowing nothing of what had hap. pened, came with 1000 horfe to view the ground about the bridge. He was greatly furprifed when he beheld the enemy marching up againft him : however, left he thould heighten their courage by his flight or retreat, he ftood his ground, and received the enemy at the head of his frall body, expoling himfelf, without his ufual prudence and difcretion, to the greatef dangers. Being bnown by fome fugitives, and difcovered to the enemy, they all aimed at him alone, which made his own men the more folicitous to defend him; fo that the whole contell was for fome time about his 'perfon. At laft the Goths were driven back to their camp, which the Romans with great temerity attemp. ted to force. In this attempt, however, they met with fuch a vigorous refiltance, that they foon abandoned the enterprife, and retired with precipitation to a neighbouring eminence; whence they were forced down by the enemy, put to flight, and purfued to the very gates of the city. Here they were in greater danger than ever; for thofe within, fearing that the enemy might in that confufion enter with them, refufed to admit them. The general himetelf cried out earnefly to them, telling who he was, and commanding them to open the gates; but as they had been informed by thofe who firft fled, that he was nain, and they could not ditinguin him on account of the blood and dutt with whici his face was covered, they gave no ear to what he faid. In this extrennity, having encouraged his men, who were now driven iuto a narrow compafs, to make a latt effort, he put himfelf at their head, and Voz. IX. PartI.

## 359 ] I T A

attacked the enemy with fuch fury, that the Goths, imagining frefh troops were fallying out upon them, began to give ground, and at latt retieed to their camp. The Roman general did not purfue them; but entered the city, where he was received with loud acclamations.
fials.

A few days after, the city was clofely invefted by ${ }^{18}$ Vitiges; who, to diffrefs the inhabitants, pulled down firged by the aqueducts by which water was conveved into the the Gotheo city, and which liad been built at an immenfe charge hy the Koman cinperors. Belifarius on his part omitted nothing for his defence; infomuch that the cowardly citizens affembled in a tumultuous manner, and railed at the general on account of his fuppofed temerity. Vitiges, to encourage this mutnous difpofition, difpatched ambaffadors to the fenate with propofals of peace. Thefe ambafladors, however, were difmiffed withoat any anfwer, and the fiege was tegun with great vigour. Belifarius made a gallant defence; and in feven months is faid to have deftroyed 40,000 of the Goths. Ahout this time he received a fupply of 1600 archers from the emperor; and thefe, in licveral fuccefsful fallies, are faid to have killed 4000 more of the enemy.

The Romans, elated with their fuccefies, now became impatient for an engagement ; and at lalt, notwithttanding all the remonilrances of their general, forced him to lead them out againtt the enemy. The fuccefs was anfwerable to the rafh attempt. The Romans were defeated, with the lofs of fome of their braveft officers, and a great many of their common foldiers; after which they contented themfelves with fallying out in fmall parties, which they commonly did with the greateft fuccefs.

But though the Romans had the fatisfaction of thus cutting off their enemies, they were moft grievoufly aflicted with a famine and plague; infomuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Belifarius to venture a fecond battle, when a feafonable lupply of troops, vir. 3000 Ifaurians, 800 Thracian horfe. and 1300 horfe of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Belifarius immediately fallied out by the Flaminian gate, and fell upon the Goths in order to give his allies time to enter by the oppofize fide of the city, which they did without the lofs of a man.-The Goths hearing of the arrival of thefe troops, and their numbers being magnified as is ufual in fuch cafes, began to defpair of becoming mafters of the city; efpecially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambaffadors were therefore difpatched to Belifarius with propofals of peace; but the only thing they could obtain was a ceffation of arms for three months, during which time they might fend ambaffadors to the emperor. The negociations with the emperor, however, proved ur. fuccefsful; and the fiege was purfued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city was but a day's jonrney from Ravenna, the Goths were to much alarmed, that they immediately raifed the fiege of Rome, after it bad continued a year and nine days. Belifarius fell upon their rear as they pafied the bridge of the Tiber, and

Franks.

Italy, cut great numbers of them in pieces, while others,
19
The fiege
gaifed. fruck with a panic, threw themfelves into the river and were drowned.

The firlt enterprife of Vitiges, after railing the fege of Rome, was an attempt upon Rimini : but while he was employed in this fiege, the Romans made themfelves mafters of Milan; upon which a Gothic general, naned Uraia, was immediately difpatehed with a powerful army to retake $i t$. In the mean time, hewever, a fupply of 7000 Romans arrived from the emperor, under the comniand of Narles, a celebrated general. The immediate confequence of this was the raifing of the fiege of Rimini; for Vitiges perceiving the two Roman armies coming againft him, and concluding, from the many fires they made, that they were much more numesous than they really were, fied in fuch hafte, that the greateft part of the baggage was left behind. The confufion of the Goths was fo great, that, had not the garrifon been extremely feeble, they might have eafily cut them off in their retreat, and thus put an end to the war at once. The fuccefs of the Romans, however, was now retarded by fome mifunderftandings between the two generals: fo that, though Belifarius made himfelf mafter of Urhinum and Urbiventum, while Narfes reduced fome other places, yet the important city of Milan was fuffered to fall into the hands of the Goths, who maffacred all the inhabitants that were able to bear arms, to the number of 300,000 , and fold the women for flaves. The city was allo totally demolihed; and this difatter made fuch an impreffion on the mind of Juftinian, that he immediately recalled Narfes, and gave the command of his troops to Belifarius.

Vitiges, who had promifed himfelf great advantages from the difagreement of the two generals, was much difappointed by the recall of Narfes; and thercfore dreading the power of Belifarius when at the head of a formidable army, thought of engaging in alliance with fome foreign prince. In his choice, however, he was fomewhat at a lofs. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large fum of money, they continued inviolably attached to the Roman interell. At latt he found means to perfuade Chofroes king of Perfia to make war upon Juftinian, which he thonght would infallibly procure the recall of Belifarius. But the Roman general, undertanding his defign, puthed on the war in the moft vigorous manner; while, in the mean time, the treacherous Franks, thinking both nations fufficiently weakened by their mutual hollilities, refolved to attack both, and feize upon the country for which they contended. Accordingly, Theodebert, unmindful of the oaths he lad taken both to the Goths and Romans, paffed the Alps at the head of 150,000 , or, as fome will have it, 200.000 men, and entered Liguria. As no hoftilities were committed by them on their march, the Goths concluded that they were come to their affiftance; and therefore took care to fupply them with provifions. Thus they crofsed the Po without oppofition; and having fecured the bridge, marched towards the place where a body of Goths were encamped; who, looking upon them as friends, admitted them without helitation. But they were foon convinced of theis miftake; for the Franks
falling unexpectedly upon them, drove them out of the camp with great flanghter, and feized on their baggage and provifions. A body of Romans that lay at a fmall diftance from the Goths concluding that they had been defeated by Belifarius, advanced with great joy to meet bim as they imagined; but the Franks falling unawares upon them, treated them as they had done the Goths, and made themfelves malters of their camp. Thus they acquired a very confiderable booty and ftore of provifions: but the latter being foon confumed, and the country round about quite exhaulted, valt numbers of the Franks perified; fo that Tlisodebert at lant found himfelf obliged to return. In his way he deftroyed Genoa and feveral other places, and arrived in his own dominions loaded with booty.

In the mean time. Belifarius was making great pro-Succels grefs. He took the cities of Auximum and Fæfulæ Beliarn after an obftinate fiege; the inhabitants of the former having for fome time fed on grafs before they would furrender. After this he invelted Ravenna, the capital of all the Gothic dominions in ltaly. The place was defended by a, very numerous garrifon, commanded hy the king in perfon, who exerted all his bravery in the defence of his metropolis. As the fiege, however, was pufhed on with great vigour, it was evident that the city mult at lalt fubmit ; and the great fucceffes of the Romans began to give jealoufy to the neighbouring potentates. Theodebert king of the Franks offered to affilt Vitiges with an army of 500,000 men ; but Belifarius, being informed of this negociation, fent ambaffadors to Vitiges, putting him in mind of the treachery of the Franks, and affured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counfellors, rejected the alliance of the Franks, and fent ambaffadors to Condtantinople; but in the mean time, Belifarius, in order to bring the citizens to his own terms, bribed one of them to fet fire to a magazine of corn, by which means the city was foon traitened for want of provifions. But, notwithtanding this difafter, they Atill continued to hold out, till the arrival of the ambaffadors from Conltantinople, who brought very favourable terms. Thefe were, That the country beyond the Po, with refpect to Rome, hould remain to the Goths ; but that the reft of Italy fould be yielded to the emperor, and the royal treafure of the Goths fhould be equally divided between him and the king. To thefe conditions, however, Belifarius pofitively refufed to affent ; being defirous of leading captive the king of the Goths, as lie liad formerly done the king of the Vandals, to Conflansinople. He therefore purfued. the fiege with more vigour than ever, without hearkening to the eomplaints of his foldiers and officers, who were quite tired out with the length of the fiege: he only obliged fuch of the officers as were of opinion that the town could not be taken, to exprefs their opinion in witing, that they might not deny it afterwards.

The Goths were as weary of the fiege as the Ro-* mans; but fearing left Juftinian fhould tranfplant them to Thrace, formed a refolntion, without the confent of their king, of furrendering to Belifarius himlelf, and declaring him emperor of the weft. To this they were the more encouraged by the refufal of Belifarius to agree to the terms propolid by the emperor;
whence they concluded that he defigned to rovolt, and make himfelf emperor of Italy. Of this, however, Belifarius had uo defigu; but thought proper to accept of the title, in order to accclerate the furrender of the city, after acquainting his principal officers with what hat paffed. Vitiges at laft difcovered the plot; but finding himfelf in no condition to oppofe it, he commended the refolution of his people, and eveu wrote to Belifarius, encouraging him to take upon him the title of king, and affuring him of his affitance. Hereupon Belifarius preffed the Goths to furrender: which, however, they fill refufed, till he had taken an oath that he would treat them with humanity, and maintain them in the poffeflion of all their rights and privileges. Upon this he was admitted into the city, where he behaved with great moderation towards the Goths; but feized on the royal treafure, and fecured the perfon of the king. The Roman army, when it entered Ravenna, appeared fo very inconfiderable, that the Gothic women on beholding it could not forbear fpitting in the faces of their hufbands, and reviling them as cowards.

The captivity of Vitiges, and the taking of Ravenna, did not put an end to the war. Belifarius was foon after recalled to take the command of the army in the eaft. The Goths were gieatly furprifed that he fhould leave his new kingdom out of regard to the orders of the emperor ; but, after his departure, chofe one Ildebald, a man of great experience in affairs both civil and military, for their king. He revived the drooping fpirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a Mort time murdered, and Eraric, a Rugian, fucceeded to the throne. He was farce invefted with the fovereignty, when his fubjects began to think of depoling him, and raifing Totila to the throne; which the latter accepted, upon condition that they previouny difpatclicd Eraric. This was accordingly done; after which Totila was proclaimed king of Italy in the year 542.

The now ling proved a very formidable enemy to the Romans, who now loft ground every-where. They made an attempt on the city of Verona; in which they mifcarried through their own avarice, having difputed about the divilion of the plunder till the opportunity of taking the town was palt. They were next defeatcd in two bloody engagements ; the conlequence of which was, that the Goths made themfelves matters of all the ftrong places in Pufcany. From thence marching into Campania and Samnium, they reduced the Itrong town of Beneventum, and laid fiege to Naples. During the liege of this laft place, feveral detachments were fent from the king's army, which took Cumz. and recovered all Brutia, Lucania, Apulia, and Calabria, where they found confiderable fums which had been gathered for the emperor's ufe. The Romans, in the mean time, difheartened by their loffes, and deprived of thofe fums which thould have paid their wages, refufed to take the field. A confiderable fleet was thcrefore fent by Juftinian to the relief of Naples : but Totila, having timely notice of this defign, manned, with incredible expedition, a \%rear number of light veffels; which, falling unexpectedly on the Roman fleet, took or funk every fhip,
and made prifoncrs of all on board, excepting a few who efeaped in cheir boats. A fimilar fate attended another fleet difpatcled from Sicily for the fane purpofe. They put to fea in the depth of winter; and, meetiug with a violent Rorm, were driven athure near the enemy's camp; who funk the fhips, and made what naughter they pleafod of the famen and foldiers. Upon this feeond difatter, the Neapulitans, defpairing of further relief, fulomitted to Cotila; who granted them honomable terms, and treated them with great humanity. As they lad been long piuched with famine, Totila, apprehending they migbt endanger their lives by indulging their apoctites too much at firf, placed guards at the gates to prevent their going out, taking care at the fame time to fupply them fparingly with provifions, but increaling their allowance every day. Being thus by degrees re:lored to their former Arength, he urdered the gates to be fet open, and gave every one full liberty to fay in the city or remove as he thaught fit. The garrilon he treated with extraordinary kindncfs. They were full fupplied with fhips to carry them to Cunfantinople; but the king laving difcorered that their real defign was to fail to Rome, in order to reinforce the garrifon of that city (which they knew he was foon to beflege), he was fo far from punifhing them as they expeeted, that he furnifh. ed then with horfes, waggons, and provifions, and ordered a body of Goths to efcort them to Rome by land, as the winds had proved unfavourable for their pallage by fea.

Totila having thus become mater of Naples and molt of the other fortreffes in thefe parts, began to think of reducing Rome alfo. He firit attempted to perfuade the citizens to a furrender: but finding his perfuafions ineffectual, he fent a detachnent of his army into Calabria to reduce Otranto, which had not yet fubmitted; after which, he marched with the reft of lis forces againt the towns in the neighbourhond of Rome. The city of Tibur, now Tivoli, about is miles from Rome, was betrayed to him ; and all the inhabitants, together with their bifhop, were put to the fword. Several other ll rong-holds in the neighbourhood of that city he took by Etorm ; fo that Rome was in a manner blocked up by land, all communication with the neighbouring country being cut off.

Jultinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy, recalled Belifarius from Perlia, notwithtanding the fuccefs which attended him there. To fave Rume, however, was now impoffible even for Belifarius himfelf. As foun as he arrived in Italy, fiading himfelf unable either to relieve the towns which were befieged, or to fop the progrefs of the Gochs, lie difpatched letters to Jultinian, informing him, that being deftitute of men, arms, and money, it was impofifible for him to profecute the war; upon which the emperor ordcred new levies to be made, all the veterans being engaged in the Perfian war. In the mean time, however, Totila purfued bis good fortune; took the cities of Firmum, Afculum, Auximum, Spoletum, Evc. and at length advanced to Rome, which he inveited on all fides. As he drew near the city, two officers, whom Belifarius had fent into the city, ventured to make a -fally, though contrary to the exprefs orders of their

Taly, general, thinking they fhould Surprife the Goths; but they were themfelves taken in an ambufcade, and, moft of their men being cut in pieces, narrowly efcaped falling into the hands of the enemy. Belifarius made feveral attempts to selieve the city : but all of them, however well concerted, by fome accident or other proved unfuccefsful; which gave him fo much uneafinefs, that he fell into a feverifh diforder, and was for fone time thought to be in danger of his life. The city was foon reduced to great traits; a dreadful famine enfued; and the unhappy citizens liaving confumed every thing that could be fuppofed to give them nourifhment, even the grafs that grew ncar the walls, were obliged, it is faid, to feed on their owa excrements. Many put an end to their lives, in order to free themfelves from the intolerable calamities they fuffered. The reft addreffed their governor Beffas in the moft pathetic manner, intreating him to fupply them with food; or if that weas not in his power, either to give them leave to go ont of the town, or to terminate their miferies by putting them to death. Beffas replied, that to fupply them with food was impoffible; to let them go, unfaft; and to kill them, impious. In the end, however, he fuffered thofe who were willing to retise, to leave the city, upon paying him a fum of money; but molt of them eith died on the road, or were cut in pieces by the enemy. At latt, the befieged, unable to bear their miferies any longer, began to mutiny, and to prefs their governor to come to an agreement with Totila. This, however, he ftill refufed; upon which, four of the Ifaurians who guarded one of the gates, admit him into the city. The king received this pro- polal with great joy; and fending four Goths of great trength and intrepidity into the town along with them, he filently approached the gates in the nighttime with his whole army. The gates were opened by the lfaurians, as they had promifed; and upon the fitt alarm, Beffas with mott of the foldiers and off. cers fled out of the town. The inbabitants took fanctuary in the churches; and only 60 of them and 26 foldiers were killed after the town was taken. Totila, however, gave his foldiers full liberty to plunder the city: which they did for feveral days together, fripping the inbabitants of all their wealth, and leaving nothing in their houfes but naked walls; by which means many perfons of diftinction were reduced to beğ their bread from door to door. In the houle of Beffas was found an immenfe treafure, which he had fcandalounly amafted during the frege, by felling to the people, at an exorbitant price, the corn which had been fored up for the ufe of the garrifon.

Totila, thus become mafter of Italy, fent ambaffadors to Juftinian with very refpectul letters, defiring to live on the fame terms with him that Theodoric had done with bis predeceffor Anaftafius; promifing in that cafe to refpect him as his father, and to affit him, when he pleafed, with all his force, againit any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole fenate to the fword, and to carry the war into Illyricum. The emperor returned no other anfwer, than that he referred the whole to Belifarius, who had full power to manage all things of that nature. Upon this Totila refolved to deftroy the city ;
and had actually thrown down a third part of the wall, when he received a letter from Belifarius, diffuaning him from his intertion. After having ferioully confidered this letter; Totila thought proper to alter his refolution with regard to the deftruction of the city; but fenc every one of the inhabitants into Lucania, without leaving a fingle perfon in the metropolis. Belifarius hearing of this, immediately returned to the capital, and undertook to repeople and repair it. He cleared the ditch which had been filled by Totila, but was for the prefent obliged to fill up the breaches in the walls with fones loofely heaped upon one another: and in this fituation the city was again attacted by the Goths. Belifarius, however, had taken care to fupply the inhabitants with plenty of provilions, fo that they were now in no danger of fuffering by famine ; and the aflau'ts of the enemy were vigotoully repelled, notwithftanding the bat fituation of the fortitications, fo that Totila at laf abandoned the enterprife.

In the mean time the Perfians gained great advan- B -lifiri tages over the Romans in the Eaft, lo that there was a recaled neceflity for recalling Belifarius a fecond time. He was no fooner gone, than 'Iotila renewed his efforts with greater vigour than ever; and at the fame time the Franks, concluding that buth Romans an 1 Guths would be much weakened by fuch a deltruetive war, feized upon Venetia, which belonged to both nations, and made it a province of the French empire. Totila did not oppofe them ; but having obtained a reinforcement of 6000 Lombards, returned inmediately befure Rome, fully intent on making himfelf matter of that metropolis. Having clofely invelted it by fea and land, he hoped in a fhort time to reduce it by famine: but againft this the governor wifely provided, by caufing corn to be fown within the walls; fo that he could probably have defied the power of Totila, had not the city been again betrajed by the Ifaurians, who opened one of the gates and admitted the eneny.

Thus the empire of the Goths was a third time eftablifned in Italy; and Totila, immediately on his becoming mafter of Rome, difpatched ambaffadors to Juftinian, offering to affit him as a faithful ally againit any nation whatever, provided he would allow him the quiet poffeflion of Italy. But Jutinian was fo far from hearkening to this propofal, that he would not even admit the ambaffadurs into his prefence; upon which Totila refolved to purfue the war with the utmoft vigour, and to make himfelf ma. Ater not only of thofe places which tbe Romans pofferfed in Italy, but in Sicily alfo. This he fully accom. Narfes ${ }^{23}$ plifhed; when Narfes, who had formerly been joined in into it the command with Belifarius, was appointed general, with abfolute and uncontrouled authority. But wbile this general was making the neceffary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, fent them to pillage the coafts of Greece, where they got an immenfe booty. They made a defcent on the ifland of Corfu; and baving laid it wafte, they failed to Epirus, where they furprifed and pluna dered the cities of Nicopolis and Anchialus, taking many hips on the coaft, among which were fome laden with provifions for the army of Narfes.. After thefe fucceffes they laid fiege to Ancona in Dalmatia. Being defeated, however, both by fea and land, Totila once more fent ambaffadors to Conftactisople, offering to yield

Sicily

Sicily and all Dalmatia, to pay an annual tribute for neceflarily expofed for a moment, a dare fruck him in Italy, and to affit the Romans as a faithful ally in all their wars ; but Joftinian, bent upon driving the Goths out of Italy, would sot even fuffer the ambafladors to appear in his prefence.

Tutila finding that no terms could be obtained, beganto levy new forces, and to make great preparations by fes and land. He fron reduced the iflands of Colfica and Sardinia ; but this was the latt of his fucceffes. Narfes arrived in Italy with a very formidable a: my, and an immenfe treafure to pay the troops their arrears, the want of which had been one great caufe of the bad fucc.fs of Belifarius in his latt expedition. He irmediately tock the road to Rome; whife Totila affembled all his forces, in order to deside the fate of Italy ty a general engagemert. The battle proved very obilinate ; but at latt the Gothic cavaly being pot to the rout, and retiring in great confufion among the infantry, the latter were thereby thrown into fuch diferder, that they could never afterwards rally. Nirfes, obferving their confufion, encouraged his men to make a laft effort; which the Goths not being able to withtand, betook themfeives to flight, with the lofs of 6oco men killed on the \{pot. Totila finding the day irrecoverably loft, fled with only five horfemen for his attendants; but was purfued and mortally wounded by a commander of one of the bodies of barbarians who followed Narfes. He continued his flight, however, for fome time longer; but was at laft obliged to halt in older to get his wound dreffed, foon after which he expired.
This difafter did not yet entirely break the fipirit of the Goths. They chofe for their king one Teia, defervedly eifeemed one of the moft valiant men of their nation, and who had on feveral occafions diftinguifhed himfelf in a moft eminent manner. All the valour and experience of Teia, however, were now infufirient to ftup the progrefs of the Romans. Narfes made him. felf matter of a great number of cities, and of Rome itfelf, before the Goths could affemble their forces. The Roman general next proceeded to invelt Cume; which Teia determined at all evenzs to relieve, as the royal treafure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the molt bloody that ever was fought. The Roman army confifted of vatt multitudes brought from different nations: the Goths were few in comparifon; but, animated by defpair, and knowing that all was at itake, they fought with the utmoft fury. Their king placed himfelf in the firf rank, to encourage his men by his cxample ; and is faid to have given fuch proofs of his valour and conduct as equalled him to the molt renowned heroes of antiquity. The Romans difcovering him, and know. ing that his death would probably fut an end to the battle, if not to the war itfelf, directed their whole force againft him, fome attacking him with fpears, and others difcharging againit him flowers of darts and arrows. Teia mairtained his ground with great intrepidity, reccived the miffive weapons on bis field, and killed a great number of the enemy with his own hand. When his field was fo loaded with darts that he could not eafily wield it, he called for another. Thus he fhifted his fhield three times; but as he atsempted to change it another time, his brealt being
that moment with fich foree, that he immediately fell down dead in the place where he had thood from the beginning of the batcle, and upon heaps of the enemy whom he had killed. The Romans, feeing him fall, cut off his head and expofed it to the fight of the Gotis, not doubting but they would be iminediately difheartened and retire. In this, however, they were difappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and coninued till night : but on the third day, the Goths defpairing of being ahle to overcome an enemy fo nuch fuperior to them in numbers, fent deputies to Narfes, offering to lay down their arms, provided fuch of them as chofe to remain in I. taiy were allowed to enjoy their ellates and poffeffions withont moleftation, as fubjects of the empire; and thofe who were willing to retire elfewhere, were fuf. fered to carry with them all their goods and effects. To thefe terms Narfes readily affented; and thus the empire of the Goths in Italy was finally deftroycd, the country now becoming a province of the eattern Roman enipire.

In this conquelt Narfes had been affited, as already obferved, by many barbarous natious, among whom were the Lombards, at that time fettled in Pannonia. On the conclution of the war, they were difmiffed with rich prefents, and the nation for fome time continued faithful allies to the Romans. In the mean time Juttinian dying, Narfes, who governed Italy with an abfolute fiway, was aecufed to the emperor Jutio II. 'and to the emprefs Sophia, of afpiring to the fovereignty of the country. Hicreupon he was recalled, and Longinus fent to fucceed him. As Narfes was an eunuch, the emprefs is reported to have faid, that his employment at Conitantinople fhould be to diftribute in the apartment of her women the portion of wool which each was to fpin. Narfes, enraged at this farcafm, replied, that he thould begin fuch a web as The thould never be able to finith; and immediately dif. Fatched meffengers to Alboinus king of the Lombards, itw fincers hembards fengers he fent fome of the beft fruits the country afforded, in order to tempt him the more to become mafter of fuch a rich kingdom.

Alboinus, highly pleafed with the opportunity of invading a country with which his futjects were already well acquainted, began without lofs of time to make the neceffary preparations for his journey. In the month of April 568 , he fet out with his whole nation, men, women, and children; carrying with them all their moveables. This promifeuons multitude arrived by the way of Itria; and advancing through the province of Venetia, found the whole country abandoned, the inhabitants having fled to the neighbouring iflands in the Adriatic. The gates of Aquileia were opened by the few inhabitants who had courage to llay : moit of them, however, had fled with all their valuable effeits ; and among the reft the patriarch Paulinus, who had carried with him all the facred utenfils of the churches. From Aquileia, Alboinus proceeded to Forum Julii, of which he likerife became mafter without oppofition. Here he fpenc the winter; during: which time he erećted Friuli into a dukedom, whica:

vites the
Lombarde,
$\qquad$
roly．has continued ever fince．In 569 ，he made limfelf malter of Trivigi，Oderzo，Monte Selce，Vicenza， Verona，and Trent ；in each of which cities he left a frong garrifon of Lombards under the command of an officer，whom he dittinguifhed by the title of duke： but thefe dukes were only officers and governors of ci－ ties，who bore the title no longer than the prince thought proper to contihue them in their command or government．Padua and fome other cities Al－ boinus left belind him without attempting to re－ duce them，either becaufe they were too well！garri－ foned，or becaufe they lay too muck out of his way． In 570，he entered Liguria．The inhabitants were io terrified at his approach，that they left their habita－ tions with fuch of their effects as they could carry off， and fied into the mort mountainous and inacceffible parts of the country．The citics of Brefcia，Barga－ mo，Lodi，Como，and cthers quite to the Alps，being Ieft alrooft without inhabitants，fubmitted of courfe； after which he reduced Milan，and was thereupon pro－ claimed king of Italy．

But though the Lombards had thus conferred the title of king of Italy on their fovereign，he was by no means poffeffed of the whole country，nor indeed was it ever in the power of the Lombards to get poffeflion of the whole．Alboinus having made limfulf matter of Venetia，Liguria，Emilia，Hetruria，and Umbria， applicd limfelf to legiflation and the civilifation of his fubjects．But before he could make any prourefs in this work，he was taken off by the treachery of his wife；and Clephis，one of the nobles，chofen king in his ftead．Clephis rebuilt fome cities which had been ruined during the wars between the Goths and Ro－ mans，and extended his conquetts to the very gates of Rome；but as he behaved both to the Romans and Lombards with the greateft cruelty，he was murdered， after a thort reign of 18 months．His cruelty gave the Lombards fuch an averfion againtt regal power，that they changed their form of government，being govern－ ed only by their dukes for the fpace of ten years．Du－ ring this interregnum，they proved fuccersful in their wars with the Romans，and made themfelves matters of feveral cities：but perceiving that their kingdom， thus divided，could not fubfit，they refolved once more to fubmit to the authority of one man；and ac－ cordingly，in 585 ，Autharis was chofen king of the Lombards．

The great object of ambition to the new race of Lombard monarchs was the conqueft of all Italy；and this proved at tafl the ruin of their empire by Charles the Great，as related under the article Francf， $\mathrm{n}^{\circ} 27$ ． As the Lombards，however，had not been punfened of the whole territory of Italy，fo the whole of it never came into the poffeflion of Charlemagne：neither．fince the time of the Guths，has the whole of this country been under the dominion of any fingle fate．Some of the fouthern previnces were fill poffeffed by the em． perors of Conftantinople；and the liberal grants of Pe． pin and Charlemagne himfelf to the pope，had invefted him with a confiderable fhare of temporal power．The territories of the pope indeed were fuppofed to be held in vaffalage from France；but this the popes them－ felves always flifly denied．The undifputed territory of Charlemagne in Italy，therefore，was reflricied to Piedmont，the Milanefe，the Mantuan，the territory
of Genoa，Parma，Modena，Turcany，Bologna，the
dukedoms of Friuli，Spoleto，and Benevento ；the laft dukedoms of Frinin，Spoleto，and Benevento ；the lant of which contained the greateft part of the prefent lingdom of Naples．

The ferdal government which the Lombards had in－ troduecti into Italy，naturally produced revolts and commotions，as the different dukes inclined either to change their mafters or to fet up for themfelves．Se－ veral revolts indeed happened during the life of Char－ lemagne himfelf；which，however，he always fourd means to crufh ：but after his death，the fovereignty of Italy became an object of contention between the kings of France and the emperors of Germany．That great monerch had divided his extenfive dominions a－ mong his children；but they all died during his life－ time，except Louis，whom he affociated with himelt in the empire，and who fueceeded to all his dominions after his death．From this time we may date the trou－ bles with which Italy was fo long overwhelmed；and of which，as they proceeded from the ambition of thofe called kings of Italy and their nobles，of the kings of France，and of the emperors of Germany，it is difficult to have any clear idea．The following flort fketch， however，may perhaps give fome fatisfaction on this perplexed fubject．

At the time Louis the fon of Charlemagne was de－Hind clated emperor of the Weft，Italy was held by Ber－the nard the fon of Pcpin，brother to Louis．Though this ance Bernard bore the title of king，yet he was only ac－the counted a vaffal of the emperor．His ambition，how－Chat ever，foon prompted him to rebel againtt his uncle；mag hut being abaudoned by his troops，he was taken pri－ foner，had his eyes pulled out，and died three days after．As the difturbances fill continued，and the nobles of Lombardy were yet very refractory，Lo－ thaire，eldett fon to the emperur，was in the year 823 rent into Italy；of which country he was firt crowned king at Rome，and aftewards emperor of the Weft，during his father＇s lifetime．But though his abilities were fufficient to have fettled every thing in a ftate of tranquillity，his unbounded ambition promp－ ted him to engage in rebellion againt his father； whom he more than once took prifoner；though in the end he was obliged to fubmit，and afl pardon for his offences，which was obtained only on condition of his not palfing the Alps without leave obtained from his father．

In the mean time，the Saracens，taking advantage of thefe inteftine wars，landed on the coalts of Italy， and committed fuch ravages，that even the bifhops were obliged to arm themfelves for the defence of the country．Lothaire，however，after returning from his unnatural war with his father，was fo far from attempt－ ing to put an end to thefe ravages，or to reflore tran－ quillity，that he feized on fome places belonging to the fee of Rome，under pretence that they were part of his kingdom of Lombardy；nor would he forbear thefe encroachments till exprefsly commanded to do fo by his father．After having embroiled himfelf，and alnof loft all his dominions，in a war with his brothers after the death of Louis，and declared his fon，alfo called Louis，king of Italy，this ambitious prince died，leaving to Louis the title of emperor as well as king of Italy，with which he had before invefted him．

## I $\mathrm{T} \quad \mathrm{A}$

The new empcror applied himfelf to the reftoration of tranquillity in his dominions, and driving out the Saracens from thofe places which they had feized in Italy. This he fully accomplifined, and obliged the infidels to retire into Africa; but in 875 he died withont naming any fucceflor. After his death, fome of the Italian nobles, headed by the duke of 'Tufcany, reprefented to the pope, that as Louis had left no fucceffor, the regal dignity, which had folong been ufurped by foreigners, ought now to return to the Italians. The pope, however, finding that Charles the Bald, king of France, had fuch an ambition for the imperial crown, that lie we.uld flick at nothing to obtain it, refolved to gratify him, though at as high a price as pofible. He accordingly crowned him emperor and king of Lombardy, on condition of his owning the independency of Rome, and that he himfelf only held the empire by the gift of the pope. This produced a confpiracy among the difcontented nobles; and at the fame time the Saracens renewing their in. curfions, threatened the ecclefialtical tentitories with the utmoft danger. 'The pope folicited the emperor's a fiftance with the greate:t earnefnefs; but the latter died before any thing effectual could be done: after which, being difteffed by the Saracens on one hand, and the Inmbard nobles on the other, the unhappy pontiff was forced to fly into France. Italy now fell into the ut.moft confution and anarchy; during which time many of the nobles and Itates of Lombardy affumed an independence, which they have ever fince retained.
In 879, the pope was reconducted io Italy with an army by Bofon fon-in-law to Louis Il. of France: but though he inclined very much to have raifed this prince to the dignity of king of ltaly, he found his intereft infufficient for that purpofe, and matters remained in :heir former fituation. The nobles, who had driven out the pope, were now indeed reconciled to him: but notwithftanding this reconciliation, the flate of the country was worfe than ever; the great men renouncing the authority of any fuperior, and every one claiming to be fovereign in his own territorits. To add to the calanities which enfued through the ambition of thefe defpots, the Saracens committed evcry where the moll terible ravages; till at laft the Italian nobles, defpifing the kings of the Carlovingian race, who had weakened themfelves by their mutual difentions, began to think of throwing off even all nominal fubmiffion to a fortign yoke, and retaining the inperial dignity among thenifelves. Thus they hoped, that, hy being more united among themfelves, they might be more able to refitt the common enemy. Accordingly in 885 they went to pope Adrian; and requelting him to join them in afferting the independency of Italy, they obtained of him the two following decrees, viz. That the popes, after their election, might be confecrated without waiting for the prcfence of the king or his ambaffadors; and that, if Charies the Grofs died without fons, the kingdem of Italy, with the title of eniperer, Thould be conferred on fome of the latian nobles.

Thefe decrecs were productive of the wortt confequences inaaginable. The emperor complained of being deprived of his right ; and the difientions between the Italian nobles themfelves became more fatal than ever. The two moft powerful of thefe noblemen, Be-
rengarius duke of Friuli, and Guido or Vitio duke of Spoleto, entered into an agreetnent, that on the death of the emperor the former Mould feize on the kingdom of ltaly, and the latter on the kingdom of France. Berengarius fuccecded without oppofition ; but Vido was difappointed, the French having already chofen Eudes or Otho for their king. Upon this he returned to Italy, and turned his arms againt Ecrengarius. Vido proved victerious in an engagemert, and drove his risal into Gcrmany; where lee fought the affiftance of Arnolphus, who had fucceeded to the crown after the death of Charles. Hiaving thus obtained the kingdom of Italy, Vido cmployed his time in reforming the abufes of the flate, and confirming the grants formerly given to the pope, out of gratitude for his having fanctified his ufurpation and declared him lawful king of Italy. This tranquillity, however, was of fhort duration. Arnolphus fent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and getting poffifion of a caftle near the Alps, helld it for many years after, to the great diftrefs of the neighbouring parts, which were expofed to their continual incurfions; and at the fame time Berevento was befieged and taken by the forces of the eallern cmperor, fo that Vido found his empire very confiderably circumforibed in its dimenfions.

The new king, diftreffed by fo many enemies, affociated his fon Lambert with him in the government, and bribed the Germans to return to their own country. In 893, however, they again invaded Italy; but were fuddenly obliged to leave the country, after having put Berengarius in poffefion of Pavia. In the mean time, Vido died, and his fon Lambert drove ont lierengarius: but having joined a faction, headed by one Sergins, againt pope Formofus, the latte: offered the kingdom of Italy to Arnolphus; who theriupon entered the country with an army, befieged and took Rome, maflacring the faction of Sergins with the moft unrelenting cruelty.

Arnolphus thus matter of Italy, and crowned emperor by the pope, began to form fchemes of firengthening himfelf in his new acquifitions by putting out the eyes of Berengarius: but the latter having timely notice of this treachery, fled to Verona; and the Italians were fo provokec at this and the other cruelties of Arnolphus, that they drove him out of the country: $H$ is departure occafioned the greateft confufion at Rome. Formofus died foon after; and the fucceffors to the fapal dignity, having now no army to fear, excited the grearefl diftur bances. The body of Form fus was dug up and thrown into the Tiber by one pope; after which that pope was ftrangled, and Formofus's body buried again in the Vatican, by order of another. At latt the coronation of Arnolphus was declared void, the Sergian faction entirely demolifhed, and the above mentioned. decrees of Adrian were annulled; it being now determined that the elected popes fhould not be confecrated but in prefence of the emperor or his ambalfadors.

During thefc confufions Lambert enjoycd the kingdom in quiet; but the nobles hating him on account of his arbitrary and tyrannical government, began. again to think of Berengarius. In the mean time, however, another faction offered the crown to Louis king of Arles. I'bis new competitor entered Italy. with:

## I T A

Iraly. with an amy in 899 ; but was forced by Berengarius to renounce his claim upon oath, and to fwear that he would never again enter Italy, even though he floould be invited to be clowned emperor. - This oath, however, was foon forgot. Louis readily accepted of another invitation, and was crowned king of Italy at Pavia in gor. The following year he forced Berengarius to fly into Bavasia ; but having unadvifedly difbanded lis army, as thinking himfelf now fecurely feated on the throne, Berengarius, who watched every opportunity, furprifed him at Verona, and put out his eyes.

Thus Berengarius at laft became king of Italy without a rival; and held his kingdom for 20 years afterwards, without any oppofition from his futjects, who at laft became fenfible of the mifchiefs arifing from civil difcords. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a fmall diftance of Pavia. Berengaritis armed the whole force of his dominions; and came againft them with fuch a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were lolt in pafling a river; upon which they fent deputies to Berengarius, offering to reltore all their bonty, and never to come again into Italy, provited they were allowed a fafe retreat. Thefe conditions were imprudently denied; upon which the Hungarians attacked the army of Berengarius in defpair, and defeated them with great naughter. After this they .over-ran the whole country, and plundered the towns of Trevifo, Vicenza, and Padua, without refiftance, the inhabitants flying every where into fortified places. This devaltation they continued for two years; nor could their departure be procured without paying them a large fum of money: which, however, proved of little avail; for the following year they returned and ravaged the territory of Friuli without controul. Scarcely were thefe invaders departed, when the Saracens, whe had fetted at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Acqui in the neighbourhood of Pavia; while the inhabitants, inttead of oppofing them, fled to fome furts which had been erected in the time of the firlt irruption of the Hungarians. In 9:2, however, John, prefoyter of Ravenna, having attained the papal dignity hy means of Theodora wife of Alderbert count of Tufcany, applied himfelf to regulate the affairs of the church, and to reprefs the infults of the Saracens. While he was confidering on the moft proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invafions, if the pope would but allow him a fmall body of men. His propofals being accepted, 60 young men were chofen, all well armed; who being conducted by the Saracen into bry-paths, attacked the infidels as they were returning from their inroads, and feveral times defeated great paties of them. Thefe lofies affecting the Saracens, a general alliance was concluded amongat all their cities; and having fortified a town on the Garigliano, they abandoned the reft, and retired hither. Thus they became much more formidable than before; which alarming the gope, he confulted with Arnulphus prince of Bene$\mathrm{N}^{\mathrm{p}} \mathrm{N}_{170}$
vento and Capua, fending at the fame time ambaifadors to Conflantine the Greek emperor, inviting him to an alliance againft the infidels. The Saracens, unable to withtand fuch a powerful combination, were belieged in their city : where being reduced to great ftraits, they at laft fet fire to it, and fallied out into the woods; but being purfued by the Italians, they were all cut off to a man.
In this expedition it is probable that Berengarius gave great affitance; for this very ycar, 915 , he was crowned emperor by the pope. This gave difpleafure to many of the ambitious nobles; confpiracies were repeatedy formed againt him; in 922 , Rodolphus king of Burgundy was crowned alfo king of Italy; and in 924 , Berengarius was treacheroufly affaffinated at Verona; of which diffurbanecs the Hungarians taking the advantage, plundered the cities of Mantua, Brefcia, and Bergamo. Marching afterwards to Pavia, they invelled it clofely on all fides; and about the middle of March 925 , taking advantage of the wind, burn they fet fire to the houfes next the walls, and during the 1 the confufion broke oper the gates, and getting pof raan feffion of the city treated the inhabitants with the greateft barbarity. Having burnt the capital of the kingdom, they next proceeded to Placenza, where they plundered the fuburbs; and then returned to Pannonia laden with booty.

The affairs of Italy now fell into the utmoft confufion. A faction was formed againft Rodolphus in fao vour of Hugh count of Aries. The latter prevailed, and was crowned king at Pavia in 927 . The Italians, however, foon repented of their choice. The Romans firf invited him to be their governor, and then drove him out with difgrace; at the fame time choofing a conful, tribunes, \&c. as if they had defigned to affert their ancient liberty. One faction, in the mean time, offered the crown to Rodolphus, and the other to Arnold duke of Bavaria, while the Saracens took this opportunity to plunder the city of Genoa.

Hugh, in the mean time, was not inactive. Having collected an army, he marched directly againft Arnold, and entirely defeated him. Rodolphus delivered him from all apprehenfions on his part, by entering into an alliance with him, and giving his daughter Adelaide in marriage to Lotharius, Hugh's fon. Being thus free from all danger from foreign enemies, he marched againft the Romans; but with them he alfo came to an agreement, and even gave his daughter in marriage to Alberic, whon they had chofen conful. In the mean time the country was infefted by the Hungarians and Saracens, and at the fame time depopulated by a plague. Endlefs confpiracies were formed againlt Hugh himfelf; and at latl, in 947, he was totally deprived of the regal power by Berengarius, grandfon to the firlt king of that name; foon after which he retired into Burgundy, and became a monk.

Though Berengarius was thus poffeffed of the fupreme power, he did not afume the title of king till after the death of Letharius, which happened in 950 ; but in the mean time Italy was invaded by Henry duke of Bavaria, and the Hunvarians. The former took and plundered the city of Aquileia, and ravaged the neighbouring country; after which he returned without-molettation into Germany : the latter made a
furious

## I T A [ 377 ] I T A

furious irruption; and Berengarius being unable to oppofe them, was at laft obliged to purchafe their departure hy money. In raifing the fum agreed upon, however, Berengarius is faid to have been more oppreflive than even the Hungarians themfelves. Every individual, without dittinction of age or fex, was obliged to pay fo much for their head, not excepting even the poor. The churches were likewife robbed; by which means the king raifed an immenfe fum of money, 10 bufhels of which he gave to the Hungarians, but kept the much greater part to himfelf.

Berengarius, not yet fatisfied, wanted to he put in poffeffion of Pavia, which was held by Adelaide, the widow of Lotharius. In order to obtain his purpofe, he propofed a maniage between her and his fon Adelbert. This propofal was rejetted; upon which Berengarius befieged and took the city. The queen was confined in a neighbouring caftlc, from whence fhe made her efcape by a contrivance of her confeffor. With him and one female attendant fhe concealed herfelf for fome days in a wood; but being obliged to remove from thence for want of food, the applied for protection to Adelard hifhop of Reggio. By him the was recommended to his uncle Atho, who had a ftrong cafle in the neighbourhood of Canoza. Here fhe was quickly bcficged by Berengarius; upon which meffengers were difpatched to Otho king of Germany, acquainting him, that, by cxpelling Berengarius, and marrying Adelaide, he might eafily obtain the kingc'rm of Italy. This propofal he readily accepted, and mariied Adelaide; but allowed Berengarius to retain the greatefl part of his dominions, upon condition of his doing homage for them to the kings of Germany. He deprived him, however, of the dukedom of Friuli and marquifate of Verona, which he gave to Hen'y duke of Bavaria.

Berengarius, thus freed from all apprehenfion, not only oppreffed liis fubjects in a moft tyrannical manner, but revolted againf Otho himfelf. This at latt procured his ruin: for, in 961 , Otho returned with an army into Italy, where he was crowned king by the archbithop of Milan ; and the year following was crown. ed emperor by the pope. On this occation he received the imperial crown from his holinefs, and kiffed his feet with great humility: after which they both went to the altar of St Peter, and bound themfelves by a folemn oath, tbe pope to be always faithful to the emperor, and to give no affiflance to Berengarius or Adelbert his enemies; and Otho, to confult the welfare of the church, and to reftore to it all its patrimony granted by former emperors. Otho, befides this, beftowed very rich prefents on the church of St Peter. He ordained that the election of popes fhould be according to the canons; that the tlected pope fhould not be confecrated till he had publicly promifed, in prefence of the emperor's commiffaries, to obferve every thing formerly fpecified with regard to the rights of the emperors; that thefe cormimiflaries flould conftantly refide at Rome, and make a report every year how juftice was adminiftered by the judges; and in cafe of any complaints, the commiffaries fhould lay them before the pope; but if he negleetcd to intimate them, the imperial commiffaries might then do what they pleafed.

Thus we fee that Otho, however much he might Vot. IX. Part I.
allow the pope's fupremacy in fpiritual matters, plainly affumed the fovercignty in temporals to himfelf; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means relifhed this fuperiority of the emperor. The latter was hardly departed, when the pope (Jobn XII.) broke the oath which he had juit be. fore fworn with fo much Solemnity; and entered firft into an alliance with Adelbert count of Tufcany to expel the Germans, and then folicited the Hungarians to invade Italy. This treachery was foon punihed by Otho. He returned with part of his army, and aftembled a council of bifhops. As the pope did not appear, Otho pretended great concern for his abfence. The bifhops replied, that the confcioufnefs of his guilt made him afraid to fhow himfelf. The emperor then inquired particularly into his crimes; upon which the bifhops accufed him of filling the palace with lewd women, of ordaining a bifhop in a ftable, caAtrating a cardinal, drinking the devil's health, \&c. As the pope Alll refufed to appear in order to juftify $\mathrm{Hc}{ }^{40}$ himfelf from thefe charges, he was formally depofed; the pope, and Leo the chief fecretary, though a layman, elected in his flead.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his fucceffors fhould have a right of appointing the popes and invefting archbifhops and bithops; and that none fhould dare to confecrate a bilhop without leave obtained from the emperor. Thus were the affairs of the Italians till kept in the utmoft confufion even during the reign of Otho I. who appears to have been a wife and active prince. He was no fooner gone, than the new pope was depofed, all his decrees annilled, and John replaced. The party of Leo was now treated with great cruelty: but John was foon ftopped in his career; for about the middle of May, the fame year ( 964 ) in which he had been retlored, being furprifed in bed with a Roman lady, he received a blow on the head from the devil (according to the authors of thofe times), of which he died eight days after. After his death a cardinal-deacon, named Benedia, was elected by the Romans, but de. pofed by Otho, and banifhed to Hamburgh.
The emperor was fcarce returned to Germany, when The It 4 It his fickle Italians revolted, and fent for Adelbert, who lians revol?, had fied to Corfica. But being foon reduced, they con- but are retinued quiet for about a year; after which they re- duced. volted again, and imprifoned the pope. Otho, however, provoked at their rebellious difpofition, foon returned, and punifhed the rebels with great feverity; after which he made feveral laws for the better regulation of the city of Rome, granted feveral privileges to the Venetians, and caufed his fon Otho, then only 13 years of age, to be crowned emperor.
This ceremony being over, Otho difpatched an ambaffador to Nicephorus, emperor of Conftantinople, demanding his Ilep daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumftances of the molt atrocious perfidy, Otho inflantly invaded the countries of Apulia and Calabria, and entirely defeated the Greek army in thofe parts. In the mean time, however, Nicephorus being killed, and his throne ufurped by John Zinifces, Otho immediately entered
${ }_{3}$ B
into
ftaly. into an alliance with the litter, and eafily obtained Theopharia for his fon. She was crowned with great folemnity on the 8th of April 969 : at the fame time it is pretended by fome authors, that the Greeks re. nounced their rights to Calahria and Apulia; though this is denied hy others. After the celebration of this nartiage, the emperor undertook an expedition againft the Saracens, who itill refided at the foot of the Alps; but being iifurmed of the death of feveral nobles in Germany, he thought proper to return thither, where be died of an apeplexy in the year 973.

At the tine of Otho's death Italy was divided into

State of
Italy at the death of Wilho. the provinecs of Apulia, Calabria, the dukedom of Benevento, Compania, Terra Romana, the dukedom of spoletu, 'lufcany, Rumagua, Lombardy, and the marquifates of Acona, Verona, Friuli, Trevifo, an 1 Genoa. Apulia and Calabria were itill claimed by the Greeks; but all the re? were cither immedia:ely fubject to, or held of, the kings of Italy. Otho conferred Denevento (inclading the ancient Samnium) on the duke of that name. Campania and Lacania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spolito, with Tuicany, and the narquifate of Ancona, he granted to the pope; and retained the relt of laly under the form of a kingdon. Some of the cities were left free, but all tributary. He appointed feveral herediary marquifates and counties, but referved to himfelf the fovereign jurifdiction in their terricories. The liberty of the cities confilled in a freedom to choofe their own magittrates, to be judged by their own laws, and to difpofe of their own revenues, on condition that they took the oath of allegiance to the king, and paid the cultomary tribute. Thle cities that were not free were governed by the conmiffaries or lieutenants of the emperor; but the free cities were governed by two or more confuls, afterwards called potellates, chofen annually, who took the oath of alliegiance to the emperor before the bithop of the city or the emperor's cominiffary. The tribute exacted was called fodirnm, parata, et manionaticuin. By the follcrum was meant a certain quantity vi corn which the cities were obliged to furnim to the king when marching with an army or making a progrefs through the country; though the value of this was frequently paid in money. By the parata was undertiood the expence laid out in keeping the public roads and bridges in repair; and the manfionaticum included thofe expences which were required for lodging the troops or accommodating them in their camp. Under pretence of this lalt article the inhabitants were fometimes Atripped of all they pofieffed except their oxen and feed for the land. Befides regulating what regarded the cities, Otho diltributed honours and poffeffions to thofe who had ferved him faithfully. 'The honours confifled in the titles of duke, marquis, count, captain, valvafor, and valvafin; the pofieflions wele, befides land, the duties ariting from harbours, ferries, roads, fifh-ponds, mills, falt-pits, the ufes of rivers, and all pertaining to them, and fuch like. The dukes, marquifes, and counts, were thofe who received dukedoms, marquifates, and counsies, from the king in fiefs; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count ; the valvafurs
were fubordinate to the captains, and the valvainas to them.

Nu fonner was the death of Otho I. known in Italy, Gre than, as if they had been now freed from all reftraint, Gurb, the nobles declared war again!t each other : [ome ci- happ ties revolted, and chofe to themfelves confuls; while the the dominions of ethers were feized by the nobles, who Oth conflimed their power by erceting citadels. Rome efpecially was haraffed by tumults, oceafioned chiefly by the feditious practices of o:e Cincius, what preffed his fellow-citizens to reftore the ancient republic. As the pope continued firm in the interefts of the enperor, Cincius caufed him to be Arangled by one Franco a cardinal deacon; who was foon after rewarded with the pontificate, and took upon him the name of Poniface VII. Another Pupe was chofen by the faction of the count of Tufcany; who being approved by the emperor. drove Cincius and Bonifare out of the city. Diturbances of a fimilar kind tonk place in other cities, though Silan continued quict and loyal in the midt of all this uproar and confin. fion.
In the mean time Boniface fled for refuge to Conftantinople, where he excited the emperor to make wat again!t Otha 1T. In g,g an army was accordingly fent int., Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidabie arms; and laving taken a fevere revenge on the anthors of the difurbances, drove the Greeks entirely out of the provinces they had feized. Having then caufed his fon Otho III. at that time a bny of ten years of age, to be proclaimed emperer, be died at Rome in the year 983. Amone the regulations made by this emperor, one is very remarkable, and mult give us a Arange idea of the inhabitants of Italy at that tince. He made a law, That no Italan thould be believed upon his oath; and that in any difpute which could not be decided otherwife than by witneffes, the parties fhould have recourle to a duel.
O:ho III. fucceeded to the empire at twelye years of age; and during his minority the dilurtances in Italy revived. Cincius, called alfo Crefcentius, renewed his fcheme of reftoring the repuslic. The pope (John XV.) oppofing his fchemes, was drivea out of the city; but was fonn after recalled, on hearing that he had applied to the emperor for affifitance. $\AA$ few years after Crefentins argain revoled, and expelled Gregory V. the fucceffor of John XV.; raifing to the papal dignity a creature of his own, under the name of $\mathcal{F}$ obn $X V I$. Otho, enraged at this infult, retumed to Rome with a powerful army in $9 y^{9}$, befieged and took it by affault; after which he caufed Ocho Crefcentius to be beheaded, and the pope he had fet up to be thrown headiong from the caftle of St Ant gelo, after having his eyes pulled out, and his nore cut off. Four years after, he himfelf died of the fmall-pox: or, according to fome, was poifoned by the widow of Crefcentius, whom he had debauched under a promife of marriage, juft as hc was about to punifh the Romans for another revolt.

Ocho was fucceeded in the imperial throne by Hen. ry duke of Bavaria, and grandfon to Otho II. Henry had no fooner fettled the affairs of Germany, than he found it neceffery to march into Italy againft Ardouin marquis of Ivrea, who had affumed the title of $K i n_{g}$
of Itai,y. Him the defeated in an engagement, and bation of the reigning emperor, Henry proceeded to Italy. was himfelf crowned king of Italy at Pavia in 1005 ; but a few fears after, a nciw contelt arofe about the papal chair, whici agaia required the prefence of the emperor. Before he arrived, however, one of the competitors (Benedict VIII.) had got the better of lis rival, and buth tienry and his queen receivad the imperial crown frŏm his hands. Before the cmperor entcred the chu:ch, the pope propofed to him the following queltion: "Will you obferve your fidelity to me ard my fucceffors in every thing?" To which, though a kind of homage, he fubmitted, and anfwered in the afirmative. Alter his coronation, he confirmed the privileges beftowed on the Roman fee by his piedecefiurs, and adjed fome others of his own; Hill, however, referving for himfelf the fovereignty and the pover of fending commiffaries to hear the grievances of the people. Having repelled the incurfions of the Saracens, reduced fome more rebellions of his fubjects, and redised the greateft part of Apulia and Calabria, he died in the year 1024.

The death of this emperor was, as ufual, followed by a comptrition for the crown. Conrad being chofen emperor of Germany, was declared king of Italy by the archbifhop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his fon Hugh. But this offer being declined, and likewife anothcr to William du'se of Guienne, Conrad enjoyed the dignity conferred on him by the archbithop without moleffation. He was crowned king of Italy at Monza in 1026; and the next year he received the imperial crown from pnpe John XX. in prefence of Canute the Great, kug of England, Denmark, and Norway, and Rodolph III. king of Burgundy. His reign was fimilar to that of his predecefiors. The Italians revolted, the pope was expelicd, the malecontents were fubdued, and the pope reitored; after which the emperor returned to Germany, and died in $1039^{\circ}$

Under Henry III. who fucceeded Conrad, the dif. turbances were prodigiouny auginented. Pope Sylvelter II. was driven out by Benedict; who in his turn was expelled by John bifhop of Sabinum, who aTuned the title of Sylerfer 111. Three inonths after Benedict was rellored, and excommunicated his rivals; but foon after refigned the pontificatc for a funs of money. In a flort time he reclaimed it; and thus there were at once three popes, each of whom was Supported on a branch of the papal revenue, while all of tiem made themfelves odious by the feandalous lives they led. At latt a prieft called Gratian put an end to this fingular triumvirate. Partly by artifice, and Fartly by prefents, he perfuaded all the three in $^{\prime}$ renounce their pretentions to the papacy; ard the pecply of Rome, out of gratitude tor fo lignal a ferwice to the church, chof him pope, under the name of Gregry $l^{\prime} I$. Henry HI. took umbrage at this election, in which he had not been cormited, and marched with an army into Italy. He depeled Gre. grory, as having been guilty of fimony ; and filled the papil char with his own chancellor Heidiger, bithop of Bamberg, who alfumed the name of Climent 11 . and efterwards confecrated Henry and the emprefs Agnes. This ceremony being over, and the Komans having fworn never to elect a pope without the appro-

Capua, where he was sifited by Drago, Rainulphas, and other Norman adventurers.; who loaning their country at different times, had made themfelves maAers of great part of Apulia and Calabria, at the expence of the Grecks and Saracens. Henry enterdife inverts into treaty with them; and not only folemuly invated the Northem with thofe territories which they had acquired by mane with conquelt, but prevailed on the pupe to excommuni turss in catc the Beneventines, who had refufed to open their .lpuha and gates to him, and betlowed that city and its depend. Culabria. ences, as fiefs of the empire, upon the Normans, provided they took poffefinon by force of arms. The emperor was farce returned to Germany when he received intelligence of the death of Clement II. He was fucceeded in the apoftotic fee by Damafus II.; who alfo dying foon after his tlevation, Henry noninated Bruno bifhop of Toul to the vacant chair. This Diuno, who was the emperol's relation, immediately aflumed the pontificals; but being a modelt and jious prelate, he threw them off on his journey, by the perfuation of a monk of Cluny, name Hildewran!, afterwards the famous Gregory VII. and went to Rome as a private man. "The emperor alone (faid Haldebrand) has no right to create a pope." He accompanied Jruno to Rome, and fectetly retarded hiselection, that he might arrogate to himfelf the merit of obtaining it. The fcheme fuecoeded to his wih: Bruno, who took the name of $f_{\text {aro }} / X$. believing himfelf indebted to liildebrand for the pontilicate, favoured him with his particular friendmip and conlidence; and hence originated the power of this enterprining monk, of oblcure birth, but boundefs anmition, who governed Rome folong, and whofe real for the exaltation of the church occafioned fo many troubles to Europe.

Leo foon after his elevation waited on the cmperor at Worms, to ctave antitance againt the Norman princes, who were become the terror of Italy, and treated their fubjects with great Ceverity. Henry furnithed the pope with an army; at the head of which lic marched againit the Normans, after having excommunicated them, accompanied by a great number of biftops and other celefiallics, who were all cither killed or taken prifoners, the Germans and ltalians being totally routed. Leo himielf was led captive tw Bencrento, which the Vormans wele now mallers of, and which Henry had granted to the pope in exclange for the ficf of Bamberg in Germany ; and the apotlolic fee is to this day in poffifion of henevento, by vitue of that donation. 'The Nommans, however, who had a right to the city; by a prior gant, retlored it, in the mean time, to the princes of IomUariy ; and Leo was treated with fo match refpect by the cony:crors, that he revoked the fentence of excommbatcation, and joined his fanction to the imperial inveltiture for the lands which they held in Apulia and Cuiabrid. Leo died foon after his relisfe; and the einperor about the fame time caufed his infant fon, afterwards $\mathrm{He}{ }^{47} \mathrm{IV}$ the famous Henry IV. to be dec.ared king of the Ro- deelared mans, a title laill in ufe for the ackuonledged heir of king of the the empire. Gebelard, a German bihtop, wàs clett- Romans. ed pope, uncer the name of Victor 11. and consinmed by the addrefs of Hildebrand, who waited on the emperor in perfon for that purpofe, though he difdained

## I T A [ 380 ] I T A

Italy, to confult him beforehand. Perhaps Hildebrand would not have found this takk fo ealy, had not Henry been involved in a war with the Hungarians, who preffed him hard, but whom he obliged at laft to pay a large tribute, and furnifh him annually with a certain number of fighting men.

As foon as the emperor had finifhed this war and others to which it gave rife, he marched into Italy to infpect the conduct of his filter Beatrice, widow of Boniface marquis of Mantua, and made her prifoner. She had married Gozelo, duke of Lorrain, without the emperor's confent ; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and 'rufcany, Gozelo's fon by a former marriage. This furmidable alliance jully alarmed Henry ; he therefore attempted to diffolve it, by carrying his filler into Germany, where he died foon after his return, in the 39th year of his age, and the 16 th of his reign.

This emperor, in his laft journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchifed in the year 998 , from the tributc of a mantle of cloth of gold, which it formerly paid, as a mark of fubjection to the emperors of ConItantinople. Genoa was the rival of Venice in power and in commerce, and was already in poffeffion of the ifland of Corfica which the Genoefe had taken from the Saracens. Thefe two cities ingroffed at this time almolt all the trade of Europe. There was no city in any refpect equal to them either in France or Gerthe pope"s death. The popes made ufe of the refpite given them power. by his minority, to fhake off in a great meafure their dependence upon the emperors. After a variety of conteffs about the pontificate, Nicholas II. a creature of Hildebrand's, was elected; who, among others, paffed the following celebrated decree, viz. That for the future, the cardinals only fhould elect the pope; and that the election fhould afterwards be confirmed by the reft of the clergy and the people, "faving the honour (adds he) due to our dear fon Henry, now king; and who, if it pleafe God, hall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above mentioned; who, though they had lately fworn to hold their poffeffions from the emperor, now fiwore to hold them from the pope; and hence arofe the pope's claim of fovereignty over the kingdom of Naples and Sicily.

Thus was the power of the German emperors in Italy greatly diminihed, and that of the popes proportionally exalted; of which Henry foon had fuffcient evidence. For having affumed the government into his own hands in the year 1072, being then 22 years of age, he was fummoned by Alcxander II. to appear before the tribunal of the holy fee, on account of his loofe life, and to anfwer the charge of ha- ving expofed the invefliture of bihops to fale; at the fame time that the pope excited his German fubjects to rebel againft him. The rebels, however, were defeated, and peace was reftored to Germany: but foon after, Hildebrand above mentioned being elected so the pontificate under the name of Gregory, VII. operily aflumed the fuperiority over every earthly mo-
narch whatever. He began with excommunicating every ecclefiaftic who fhould receive a benefice from the hands of a layman, and every layman who fhould take upon him to confer fuch a beneficc. Henry, inAtead of refenting this infolence, fubmitted, and wrote a penitential letter to the pope: who, upon this, condefcended to take him into favour, after having feverely reprimanded him for his loofe life; of which the emperor now confeffed himielf guilty.

The quarrel between the church and the emperor was, however, foon brought to a ctifis by the following accident. Solomon, king of Hungary, being depofed by his, brother Geyfa, had fled to Henry for protcetion, and renewed the homage of Hungary to the empire. Gregory, who favoured Geyfa, exclaimed againit this act of fubmiflion; and faid in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman cturch; and learn that you will incur the indignation of the holy fee, if you do not acknotwledge that you hold your dominions of the pope and not of the emperor." Henry, though highly provoked at this declaration, thouglit proper to treat it with neglect ; upon which Gregory refumed the difpute about inveftitures. The predeceflors of Henry had always enjoyed the right of nominating bilhops and abbots, and of giving them inveftiture by the crofs and the ring. This right they had in cemmon with almoft all princes. The predeceflors of Gregory VII. had been accultomed, on their part, to fend legates to the emperors, in order to intreat their affillance, to obtain their confirmation, or defire them to come and receive the papal fanction, but for no other purpofe. Gregory, however, fent two legates to fummon Henry to appear before him as a delinquent, becaufe he till continued to beftow invellitures, notwithllanding the apoftolic decree to the contrary ; adding, that if he fhould fail to yield obedience to the church, he mult expect to be excommunicated and dethroned. Incenfed at this arrogant meflage from one whom he confidered as his vaflal, Henry difmiffed the legates with very little ceremony, and in 1 yob convoked an affembly of all the princes and dignified ecclefialtics at Worms; where, after ma- Th ture deliberation, they concluded, that Gregory ha-ror ving ufurped the chair of St Peter by indirect means, the infetted the church of God with a great many novelties and abufes, and deviated from his duty to his fovereign in feveral fcandalous attempts, the emperor, by that fupreme authority dcrived from his predeceffors, ought to divelt him of his dignity, and appoinc another in his place. In confequence of this determination, Henry fent an ambaffador to Rome, with a formal deprivation of Gregory ; who, in his turn, convoked a council, at which were prefent 110 bifhops, who unanimoufly agreed that the pope had juft caufe to depofe Henry, to diffolve the oath of allegiance which the princes and ftates had taken in his favour, and to prohibit them from holding any correfpondence with him on pain of excommunication; which was immediately fulminated againt the emperor and his adhe- A: rents. "In the name of Almighty Cod, and by ourem authority (faid Gregory), I prohibit Henry, the fon of our emperor Henry, from governing the Teutonic kingdom and Italy : I releafe all Chritians from their oath of allegiance to him ; and Arictly forbid all perfons from ferving or attending him as king!" The cir-

Culas
cular letters written by this pontiff breathe the fame Spirit with his fentence of depofition. He there repats feveral times, that " hihops are fuperior to kings, and made to judge them !" expreffions alike artful and prefumptuous, and calculated for bringing in all the churchmen of the world to his flandard.

Gregory knew well what confequences would follow the thunder of the church. The German binops came immediately over to his party, and drew along with them many of the nobles: the flame of civil war fill lay fmothering, and a bull properly directed was fufficient to fit it in a blaze. The Saxons, Henry's old enemies, made ufe of the papal cifpleafure as a pretence for rebelling againt him. Even Guelfe, to whom the emperor had given the duchy of Bavaria, fupported the malcontents with that power which he owed to his fovereign's bounty: nay, thole very princes and prelates who had affilled in depofing Gregory, gave up their monarch to be tried by the pope; and his holinefs was folicited to come to Augfourg for that purpofe.

Willing to prevent this odious trial at Augiburg, Henry took the unaccountable refolution of fuddenly palling the Alps at Tirol, accompanied only by a few domettics, to alk absolution of Pope Gregory his oppreffor; who was then in Canoza, on the Apennine mountains, a fortrefs belonging to the countefs or duchefs Matilda above mentioned. At the gates of this place the emperor prefented himfelf as an humble penitent. He alone was admitted without the outer court ; where, being flipped of his robes, and wrapped in lack cloth, he was obliged to remain three days, in the month of January, bare footed and farting, before he was permitted to kifs the feet of his holinefs; who all that time was hut up with the devout Matilda, whole firitual director he had long been, and, as forme fay, her gallant. But be that as it may, her attachment to Gregory, and her hatred to the Germans, was fo great, that the made over all her eftates to the apofolic fee; and this donation is the true cafe of all the wars which fince that period have raged between the emperors and the popes. She poffefled in her own right great part of Tufcany, Mantua, Parma, Reggio, Placentia, Ferrara, Modena, Verona, and almost the whole of what is now called the patrimony of St Peter, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.

The emperor was at length permitted to throw himSelf at the pontiff's feet; who condefcended to grant him absolution, after he had fworn obedience to him in all things, and promifed to fubmit to his folemn de. cifion at Augsburg : fo that Henry got nothing but difgrace by his journey; while Gregory, elated by his triumph, and now looking upon himself (not altogethe without reason) as the lord and matter of all the crowned heads in Chiftendom, faid in Several of his lItters, that it was his duty " to pull down the pride of kings."

This extraordinary accommodation gave much difgut to the princes of Italy. 'They never could forgive the infolence of the pope, nor the abject humility of the emperor. Happily, however, for Henry, their indignation at Gregory's arrogance overbalanced their deteftation of bis meannefs. He took advantage of this temper; and by a change of fortune, hitherto unknown
to the German emperors, he found a flong party in Italy, when abandoned in Germany. All Lombardy took up arms againtt the pope, while he was railing all Germany againtt the emperor. Gregory, on the other hand, made ufo of every art to get another emperor elected in Germany ; and Henry, on his part, left no. thing undone to perfuade the Italians to elect another pope. The Germans chore Rodolph, duke of Suabia, Roth ph who was folemnly crowned at Menz; and Gregory, chosen errhefitating on this occafion, behaved truly like the fu- peron of preme judge of kings. He had dipofed Henry, but fill it was in his power to pardon that prince: he therefore affected to be difpleafed that Rodulph was confecrated without his order; and declared, that he would acknowledge as eniperor and king of Germany, him of the two competitors who fhould be nooft fubmiffive to the holy fee.

Henry, however, trufting more to the valour of his troops than to the generality of the pope, let out tm. mediately for Germany, where he defeated his enemies in feveral engagements: and Gregory, fleeing no hopes of fubmiffion, thundered out a fecoud fentence of ex. communication again him, confirming at the fame time the election of Rodolph, to whom he lent a golden crown, on which the following well-k known verfe, equally haughty and puerile, was engraved:

Petra cledit Retro, Petrus diadem Rodolpbo.

- This donation was alfo accompanied with a molt enthufiallic anathema againft Henry. After depriving him of length in combat, and condemning him never to ie viliorious, it concludes with the following remarkable apoltrophe to St Peter and St Paul : "Make all men fenfiblc, that as you can bind and loofe every thing in heaven, you can alfo upon earth take from or give to every one, according to his defers, empires, kingdoms, principalaies-let the kings and the princes of the age then inflantly feel your power, that they may not dare to defile the orders of your church ; let your jultice be fo Speedily executed upon Henry, that nobody may doubt but he falls by your means, and not by chance."

In order to avoid the effects of this fecond exeom. munication, Henry affembled at Brixen, in the county of Tirol, about 20 German bishops: who acting alto for the bifhops of Lombardy, unanimouly refolved, that the pope, inftead of having power over the emperot, owed him obedience and allegiance : and that Gregory V1I. having rendered hinifelf unworthy of the papal chair by his conduct and rebellion, ought to be depofed from a dignity he fo little deferved. They accordingly degraded Hildebrand; and elected in his room Guibert, archbishop of Ravenna, a pcrfon of undoubted merit, who took the name of Clement $11 I$. Henry promised to put the new pope in poffefion of Rome : but he was obliged, in the mean time, to employ all his forces againit his rival Rodolph, who bad reaflembled a large body of troops in Saxony. The two armies met near Merfurg, and both fought with Defeated great fury; but the fortune of the day feened inclined and killers to Rodulph, when his hand was cut off by the famous Godfrey of Bouillon, then in the fervice of Henry, and afterwards renowned for his conquest of Jerufalcm. Difcouraged by the misfortune of their chief, the rebels immediately gave way ; and Rudolph perceiving his end approaching, ordered the hand that was cur

\end{array}\right] \quad \mathrm{I} \mathrm{~T} A
$$

Italy: off to be bronght him, and made a fpeech to his officers on the occation, which cound not fail to have an imlluence on the cmperor's affairs. "Behold (faid he) the land with which I touk the oath of allegiance to Henry ; and which oath, at the inltigation of Rome, I have violated, in perfidioufly afpiring at an honour that was not my due."

Thus delivered from this formidable antagonift, Henry foon difperfed the rett of his enemies in Germany, and fet out for Italy in order to fettle Clement in the papal ehair. But the gates of Rome being flut
againt him, he was obliged to attack it in form. The fiege continued upwards of two years; Henry during that time being obliged to quell fome infurrections in Germany. The city was at length carried by affault, aand with difficulty faved from being pillaged; but Gregory was not taken : he retired into the cafle of St Angelo, and thence defied and excommunicated the conqueror. The new pope was, however, confecrated with the ufual ceremonics: and expreffed his gratitude by croxning Henry, with the coneurence of the Roman fenate and people. Mean while the fiege of St Angelo was going on; but the emperor being called about lome affairs into Lombardy, Robert Guifcard took advantage of hits abfence to reieafe Gregory, who died foon after at Salerno. His Latt words, borrowed from the Scripture, were worthy of the greatent Saint: "I have loved juftice, and hated iniquity; therefore I die in exile !"

Henry, however, did not enjoy all the advantages which might have been expected from the deatio of Gregory. The fubfequent popes trod in the paths of their preducefor. In 110, P'afcal Il. excited young Heary to rebel againft his father. The empcror did all in his power to diffuade him from proceeding to extremities, but in vain. The young prince perfifted in his rebellious intentions; and having by feigned fubmiftions prevailed om the eciperor to difoand his arny, he treacheroully fcized and confined him. Henry, however, found means to (fcape from his confinement, and attempted to engage all the fovereigns of Europe in his quarrel: but before any thing effecto:l could be done, he died at Liege in the year ıгб. Difpute be. The difpute about inveltitures was not terminated
tween the -hy the depolition and deatio of Henry IV. His fon pipe and Heary $v$.

Henry V. purfued the very fame conduct for which he had depofed his father. Pafeal nppofed him with violence ; upon which Heary cove him an iavitation into Germany, to end the difpute in an anicable manner. Pafal did not think proper to accept of this invitation ; but put himeif under the protection of Philip I. king of France, who undertook to melliate between the contending parties. His mediation, however, proved ineffectual, and Herry was prevented by the wars in Hungary and Poland from paying any further attention to the affair of invelitures. At hat, having futhed h:s affairs in Germany, he took a re felution of gning to Rame, in order to fette the diffute perfonally with the pope. To give his arguments the greater weight, hovecer, he marched at the head of ant amy of 80,000 rasu. Patcal received him with gre:t appearance of frienithip, but would not renounce the chain of inveltitures; ana! ILenry, linding himelf deceived in his expectations, ordered the pope to be
feized. The confor put the citizens in arms to defend the pope, and a battic was fought within the walls ot Rome. Ihbe flaughter was fo great, that the waters of the Tiber were tinged with blond. The Romans were defeated, and Pafcal was taken prifoner. The Iatter renounced his right of inveltiture; folemnly fwore never to refume it, and broke his oath as foon as Henry was gone, by fulminating the fentence of excommunication againf him. In 11r4 died the countefs Matilda, who had bequeathed all her dominions to the pope, as we have already obferved; but Henry thinking himfelf the only lawful heir, alleged, that it was not in Matilda's power to alienate her eftates, which depended imnediately on the empire. He therefore fet out for Lombardy, and fent ambaffadors to the pope, befeeching him to revoke the fentence of excommunication abovementioned. Pafcal, however, would not even favour the ambafladors with an audience; but dreading the approach of Henry himfelf, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117 ; but being foon after obliged to leave it in order to fettle fome affairs in Tufcany, the pope returned to Rome, but. died in a few days. On the third day after his deceaie, cardinal Cajetan was elected his fucceffor, without the privity of the emperor, under the name of Gelaffus 11. The new pope was inftantly depoled by Henry; who fet up the arelbihop of Prague, under the name of Gregury VIII. Gelafius, though supported by the Norman princes, was obliged to take refuge in France, where he died; and the archbifhop of Vienna was elected by the cardinals then prefent under the name of Calixtus $/ I$.

The new pope attempted an accommodation with Henry; which not fucceeding, he excomnunicated the emperor, the antipope, and his adherents. He nest fet out for Rome, where he was honourably received; and Gregory VIII. was furced to retire to Sutri, a llrong town garifoned by the emperor's troons. How be was befiegred by Calixtus and the Norman princes. The city was foon taken; and Gregory thrown into prifon by his competitor; but at laft, the fates of the cmpire being quite wearici out with fuch a lung quarrel, unanimoully fupplicated Henry for peace. He referred himfelf entirely to their decifion ; and a diet bein! affembled at Wurtzburg, it was decreed that an embafly fhould be imnediately font to the pope, defiring that he would convoke a general council at Rume, by which all difputes might be determined. This was accordingly done, and Deterni: the affair of inveltitures at length regulate: in the fol- tion of it lowing manner, viz. That the eniperor flyould leave the affars of communities and chanters at libenty to fill up their own vacancies, withont betowing invellitures with the crois and ring: that he fould reftore all that he had unjulliy taken from the church; that ail elections fluald be made in a canonical manner, in prefence of the emperur or his commifaries : and whatever diîputes might happen, thould be refereed to the decition of the emperot, affiled by the metropolitan and his fuffregraas: that the perfon elected thond receive from the emperor the inveltiture of the fiefs and fecular rights, not with the crofs, but with the fceptre; and fiould pay allegiance to him for thefe rights only.
After the death of Henry, the ufual diforders took

## IT A

place in Italy; during which, Roger duke of Apulia conquered the inland of Sicily, and allumed the right of creating popes, of whom there were two at that time, viz. Innocent 1I. and Abacletus. Roger drove out the former, and Lothario emperor of Germany the latter, forcing Roger himself at the fame time to retire into Sicily. The emmer or then conducted Innocent back to Rome in trip" ash; and having fubdued all Apulia, Calabria, and the reft of Roger's Italian dominie: ns, erected them into a principality, and beflowed it, with the title of duke, ron Rensud a German prince, and one of his com relations.
In the reign of C nod 11 I , who fucceaded Lethario, the celebrated factions called the Gudphs and Gibelines*, arofe, which for many years deluged the and cities of Italy with blood. They took their orig, cine Juring a civil war in Germany, in which the enemies of the emperor wore Alyled Guethe, and his friends Gibelines; and the fe names were quickly received in It :Ty as wail as other parts of the emperor's dominions. Or this civil war many of the cities in Italy took the advantape to jet up for themfeives; neither was it in the power of Conrad, who during his whole reign was employed in unfuccefful crufades, to reduce them; but in 1158 Frederic Barbaroffa, fucceffor to Conrad, entered Italy at the head of a very numerous and well difciplined army. His army was divided into feveral columns for the convenience of entering the country by as many different romes. Having paled the Alps, he reduced the tomes of Brefcia; where he made feveral falutary regulations for the prefervation of good order and military difuipline. Continuing to advance, lie belieged Milan, which furrendered at diperection. He was crowned king of Lombardy -at Monza; and having mattie binfelf mater of all the other cities of that country, be ordered a minute inquinsy to be fat on foot concerning the rights of the empire, and exacted homage of all thole who held of it, without excepting even the hifhops. Grievances were redreffed; magiftracice reformed; the rights of regality difcuffed and afcertained; new lavs enacted for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the fehool of Bologna; and, above all, Cubvalfals were not only prohibited from alienating their lands, but alfo compelled, in their oath to their lords paramount, to except the emperor nominally; when they fore to ferve and affilt them against all their enemies. The pope took umbrage at this behaviour towards the ecceffialtics: but Frederic jullified what he had done, telling his deputies it was but reafonable they should do homage for the fiefs they poffeffed; as Jefus Chrilt limfelf, though the lord of all the fovereigns upon earth, had deigned to pay for himfelf and St Peter the tribute which was die to Cæiar.

Frederic having font commiffaries to fuperintend the election of new magiftrates at Milan, the inhabitants were fo much provoked at this infringement of their old privileges, that they infulted the imperialits, revoted, and refused to appear before the emperor's sribinal. This he highly refented, and refolved to chatfife them feverely: for which purpofe he font for a reinforcement from Germany, which foo after arrived with the emprefs, while he himfelf ravaged Liguria,
declared the Milanese rebels to the empire, and plumdered and burnt the city of Crema which was in allance with that of Milan.

In the mean time, pope Adrian IV. dying, two opposite factions elected (wo) perform known by the names of Viator 1/. and Alexander III. The impsroo's allies nectfarily acknowledged the pope chosen by him; and thole princes who were jealous of the emperor, acknowledged the other. Victor 1I. Freesic's pope, had German*, 13ohemia, and one half of Italy: on his file; while the ref fubnitted to Ale\%adder III. The emperor took a Severe revenge on his He rake enemies; Mils was razed from the foundation, and and deflt lirewed on its ruins; Brefuia and Placenta were frays Min difmantled; and the other cities which had taken part with them were deprived of their privileges. Alexander ill. however, who had excited the revolt, returned to Rome after the death of his rival ; and at his return the civil war was renewed. The emperor caufed another pope, and after his death a third, to be fected. Alexander thea Red to France, the ammonfylan of every pope who was opprefled by the emperoes; but the flames of civil difcord which te had ratfed continued daily to fipreat. In :168, the cities of Italy, fupported by the Greek emp tor and the hing of Sicily, entered into an affosiation for the defence of their liberties : and the pope's party at length prevailed. In 1176, the imperial army, worn out by fatigues and difeafes, was defeated by the confederates, and Frederic himself narrowly efcaped. Abut the fame time, he was defeated at lea by the Venetians; and his eldefl fun Henry, who commanded his feet, fell into the hands of the enemy. The pope, in honour of this victory, failed out into the open fa, accompanied by the whole enate; and after having pronounced a thousand benedictions on that element, threes into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is ammaliy performed by the Venetians, under the notion of eposfig the Adriatic. There misfortunes difpofed the emperor towards a reconciliation with the pope: but, reckoning it below his dignity to make an advance, le rallied his troops, and exerted limfelf with fo much vigour in repairing his loft, that the confederates were defeated in a battle; after which he made propofals of peace, which were now joyfully accepted, and Venice was the place appointed for a reconciliation. The em- Submits perot, the pope, and a great many princes and cardio- to the popes nabs, attended; and there the emperor, in 1177, put an end to the difpute, by acknowledging the pope, kiffing his feet, and holding his stirrup while he mounted his mule. This reconciliation was attended with the fubmifion of all the towns of Italy which had entered into an alfociation for their mutual defence. They -obtained a general pardon, and were left at liberry to ute their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their fuperior lord. Calixtus, the antipope, finding limfelf abandoned by the emperor in confequence of this treaty, male aldo his fubmifirion to Alexander, who received him with great humanity; and in order to proven: for the future those diturbanes which bad fo often attended the elections of the popes, he called a general council, in which it was
decreed,

## I T A $\quad\left[\begin{array}{lll}384\end{array}\right]$

## 1 T A

decreed, that no pope thould be deemed duly elected without having two thirds of the votes in his favour.

The affairs of ltaly being thus fettled, Barbaroffa returned to Geımany ; and having quieted fome dif. turbances which lad arifen during his ablence in Italy, at laft undertook an expedition into the Holy Land; where laving performed great exploits, he was drowned as he was fwimming in the river Cydnus, in the year 1190 . He was fucceeded by his fon Hen. ry VI. who at the fame time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After fettling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the fucceffion of Sicily, which was ufurped by Tancred his wife's natural bruther. For this purpofe, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Pifa, and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celeftin III. on the day after Eafter in the year 1191. The pope, then in the 86th year of his age, had no fooner placed the crown upon Henry's head than he kicked it off again, as a'teftimony of the power reliding in the fovereign pontiff to make and unmake emperors at his pleafurc.

The coronation being over, Henry prepared for the conquen of Naples and Sicily; but in this he was oppofed by the pope: for though Celeftin confidered Thancred as an ufurper, and defired to fee him deprived of the crown of Sicily, which he claimed as a fief of the fee, yet he was much more averfe to the emperor's being put in peffeffion of $i t$, as that would render him too powerful in Italy for the intereft of the church. Henry, however, without paying any regard to the threats and remonftrances of his holinefs, took almoft all the towns of Campania, Calabria, and Apulia; invelted the city of Naples; and fent for the Genoefe fleet, which he had before engaged, to come and form the blockade by fea: but before its arrival, he was obliged to raife the fiege, in confequence of a dreadful mortality among his troops : and all future attempts upon Sicily were ineffectual during the life of Tan. cred.

The whole reign of Henry from this time feems to have been a continued train of the mof abominable perfidies and cruelties. Having treacheroufly feized and imprifoned Richard I. of England, in the manner related under that article, no 128-130. he had no fooner received the ranfom paid for his royal captive, than he made new preparations for the conqueft of Si cily. As Tancred died about this time, the emperor, with the affitance of the Genoefe, accomplithed his purpofe. The queen-dowager furrendered Salerno, and her right to the crown, on condition that her fon William thould poffefs the principality of Tarentum; but Heny no fooner found himfelf mafter of the place, than he ordered the infant king to be caftrated, to have his eyes put out, and to be confined in a dungeon. The reyal treafure was tranfported to Germany, and the gueen and her daughter confined in a convent.

In the mean time, the emprefs, though near the age of 50 , was delivered of a fon, named Frederic; and Nu 170.

Henry foon after affembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent thofe dilturbances which ufually attended the election of emperors. A decree paffed for this purpofe; and Frederic, yet in his cradle, was declared king of the Romans. Soon after, the emperor being folicited to undertake a crufade, obeyed the injunctions of the pope, but in fuch a manner as to make it turn out to his own advantage. He convoked a general diet at Worms, where he folemnly declared his refolution of employing his whole power, and even of hazarding his life, for the accomplifment of fo holy an enterprife; and he expatiaced upon the fubject with fo mush eloquence, that almof the whole affembly took the crofs. Nay, fuch multitudes from all the provinces of the empire enlifted themfelves, that Henry divided them into three large armies; one of which, under the command of the bifhop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herfelf in this pious expedition, and actually ended her days in Paleftine : the fecond was affembled in Lower Saxony, and embarked in a fleet furnifhed by the inhabitants of Lu: bec, Hamburg, Holttein, and Friezland: and the emperor in perfon conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily who had rifen againft his government.

The rebels were humbled; and their chiefs were condemned to perifh by the molt excruciating tortures. One Jornandi, of the houfe of the Norman princes, was tied naked on a chair of red hot iron, and crowned with a circle of the fame burning metal, which was nailed to his head. The emprefs, hocked at fuch cruelty, renounced her faith to her huband, and encouraged her countrymen to recover their liberties. Refolution fprung from defpair. The iuhabitants betook themfelves to arms; the emprefs Conftantia headed them; and Henry, having dilmiffed his troops, no longer thought neceffary to his bloody purpofes, and fent them to purfue their expedition to the Holy Land, was obliged to fubmit to his wife, and to the conditions which the was pleafed to impofe on him in favour of the Sicilians. He died at Meffina in 1197, fonn after this treaty; and, as was fuppofed, of poifor adminiftered by the emprefs.

The emperor's fon Frederic had already been de. Dithi clared king of the Romans, and confequently became ces in emperor on the death of his father; but as Frederic II. be rinn tho was yet a minor, the adminiftration was committed to of tho his uncle the duke of Suabia, both by the will of Frede Henry and by an affembly of the German princes. $O$. ther princes, however, incenfed to fee an elective empire become hereditary, held a new diet at Cologne, and cbofe Otho duke of Brunfwick, fon of Henry the Lion. Frederic's title was confirmed in a third affembly, at Arnburg ; and his uncle, Philip duke of Suabia, was elected king of the Romans, in order to give greater weight to his adminiftration. Thefe two clections divided the empire into two powerful factions, and involved all Germany in ruin and defolation. Innocent III. who had fucceeded Celeftin in the papal chair, threw himfelf into the fcale of Otho, and excommunicated Philip and all his adherents. This able and ambitious pontiff was a fworn enemy of the houfe

## $\begin{array}{llllll}\text { I T A } & {\left[\begin{array}{lll}885 & ]\end{array} \quad \text { I T A }\right.}\end{array}$

 eare to be amply paid both in money and territory. clefiaftical jurifdiction in Sicily; billed up vacantThe Chritian city of Zara, in Dalmatia, had with- and benefices; and expelled fome bifhups, who w
drawn itfelf from the government of the republic: the creatures of the pope, on pretence of their bein.
of Suabia; not from any perfonal animofity, but out of a principle of policy. That houle had long been terrible to the popes, by its continual poffeffion of the imperial crown; and the acceffion of the kingdom of Naples and Sicily made it fill more to be dreaded: Innocent, therefore, gladly feized the prefent favourable opportunity for divelling it of the empire, by fupporting the election of Otho, and fowing divitions among the Suabian party. Otho was alfo patronifed by his uncle, the king of England; which naturally inclined the king of France to the fide of his rival. Faction clafhed with faction; fiendfhip with intereft; caprice, ambition, or refentment, gave the fway; and nothing was beheld on all hands but the horrors and the miferies of civil wars.

Meanwhile, the emprefs Conftantia remained in Sicily, where all was peace, as regent and guardian for her infant fon Frederic II. who had been crowned king of that illand, with the confent of pope CeleAtin III. But the alfo had her troubles. A new invelliture from the holy fee being neceffary, on the death of Celeftin, Innocent III. his fucceffor, took advantage of the critical fituation of affairs for aggrandizing the papacy, at the expence of the kings of Si cily. They poffeffed, as has been already obferved, the privilege of filling up vacant benefices, and of judging all ecclefiaftical caufes in the laft appeal : they were really popes in their own ifland, though vaffals of his holinefs. Innocent pretended that thefe powers had been furreptitioully obtained; and demanded, that Conftantia fhould renounce them in the name of her fon, and do liege, pure and fimple homage for Sicily. But before any thing was fettled relative to this affair, the emprefs died, leaving the regency of the kingdom to the pope; fo that he was enabled to prefcribe what conditions he thought proper to young Frederic. 'The troubles of Germany fill continued; and the pope redoubled his efforts, to detach the princes and prelates from the caufe of Philip, notwithltanding the remonfrances of the king of France, to whom he proudly replied, "Either Philip mutt lofe the empire, or I the papacy." But all there diffentions and troubles in Europe did not prevent the formation of another crufade, or expedition into Afia, for the recovery of the Holy Land. Thofe who took the crofs were principally Erench and Germans: Baldwin, count of Flanders, was their commander ; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furnifhed them with hips, for which they took eare to be amply paid both in money and territory. drawn itfelf from the government of the republic: the army of the crofs undertook to reduce it to obedience; and it was befieger and taken, notwithtanding the threats and excummunications of the pope.

While the crufaders were fpreading defolation through the eaft, Philip and Otho were in like manner defolating the weft. At length Philip prevailed; and Otho, obliged to abancion Germany, took refuge in England. Philip: elated with fuccefs, confirmed his election by a fecond corunation, and propofed an ac commodation with the pope, as the means of finally ettablifhing his throne ; bus before it could be brouglit about, he fell a facuifice to private revenge, heing dfaffinated by the count Palatine of Bavaria, whole daugh-

$\qquad$ 8
was afterwards held at Ferentino, where both the pope and the emperor were prefent, together with John de Brienne, titular king of Jerufalem, who was come to Europe to demand fuccours againt the foldan of Egypt. John had an only daughter named Tolandz, whom he propofed as a wife to the emperur, with the kingdom of Jerufalem as her dower, on condition that Frederic Mould within two years perform the vow lie had made to lead an army intu the Huly Land. Frederic married liet on thefe terme, becaufe he chofe to pleafe the pope; and fince that time the kings of Sicily have taken the title of king of Ferufalern. But the emperor was in no hurry to go and eonquer his wife's portion, having bulinefs of more importance on his hands at home. The chief cities of Lombardy had entered into a fecret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian nublemen were fummoned to attend. A variety of fubjects were there difcuffed; but nothing of confequence was fettled. An accommodation, however, was foon after brought about by the mediation of the pope; who, as umpire of the difpute, decreed, that the emperor fhould lay afide his refentment againlt the confederate towns, and that the towns fhould furnifh and maintain 400 knights for the relief of the Holy Land.

Peace beins thus concluded, Honorius reminded the emperor of his vow; Frederic promifed compliance: but his holinefs died hefore lie could fee the execution of a project which he feemed to have fo much at heart. He was fucceeded in the papal chair by Grezury IX. brother of Innocent III.; who, pur. fuing the faine line of policy, urged the departure of Frederic for the holy land; and finding the emperor still backward, declared him incapable of the imperial dignity, as having incurred the fentence of excommanication. Frederic, ineenfed at fuch infolence, ravaged the parrimony of St Peter; and was actually excommunieated. The animofity between the Guelphs and Gliberlines revived; the pope was obliged to quit Rome; and Italy became a fcene of war and defolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the refentment of the Italian prinees, accuftomed them but too much to the horrid practices of poifoning and affaffination.

During thefe tranfactions, Frederic, in order to remove the caufe of all thefe troubles, and gratify the prejudices of a fuperfitions age, by the advice of his friends refolved to perform his vow: and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spulete. The pope prohibited his departure before he fhould be abfolved from the cenfures of the church; but Frederic went in contempt of the church, and fucceeded better than any perfon who had gone before him. He did not indeed defolate Afia, and gratify the barbarous zeal of the times by fpilling the blood of infidels; but he concluded a treaty with Miliden, foldan of Egypt and matter of Syria; by which the end of his expedition feemed fully anfwered. The foldan ceded to him Jervfalem and its territory as far as Joppa ; Bethlehem, Nazareth, and all the country between Jerufalem aud Ptolemais; Tyre, Sidon, and the neighbouring territuries: in return for which, the emperor granted the Saracens a truce of ten years; and in 1230
prudently returned to Italy, where his prcfence was much wanted.

Frederic's reign, after bis return from the eaft, was one continued quarrel with the popes. The cities of Lombardy had revolted during his abfence, at the infligation of Gregory IX.; and before they could be reduced, the fame pontiff excited the emperor's fun Henry, who had been elected king of the Rnmans, to rebel againf his farher. The rebellion was fupprefied, the prince was confined, and the emperor obtained a complete victory over the affociated towns. But his troubles were not yet ended. The pope excommunicated him anew, and fent a bull, filled wilh the moft abfurd and ridiculous language, into Germany, in order to fow divifion between Frederic and the princes of the empire.

Frederic retorted in the fame ftrain, in his apology to the princes of Germany, calling Gregory the Great Dragon, the Antichrift, \&c. The emperor's apology was fultained in Germany; and finding he had nothing to fear from that quarter, he refolved to take ample vengeance on the pope and lis affociates. For that purpole he marched to Rome, where he thought his party was ftrong enough to procure him admiffion ; but this favourite fcheme was defeated by the activity of Gregory, who ordered a crufade to be preached againf the emperor, as an enemy of the Chriftian faith; a ftep which incenfed Firederic fo much, that he ordered all his prifoners who wore the crofs to be expofed to the moft cruel tortures. The two factions of the Gnelphs and Ghibellines continued to rage with greater violence than ever, involving cities, diftricts, and even private families, in troubles, divifions, and civil butchery; no quarter being given on either fide. Meanwhile Gregory IX. died, and was fucceeded in the fee of Rume by Celeftin IV. and afterwards by Innocent IV. furmerly cardinal Fiefque, who had always expreffed the greateft regard for the emperor and his interefl. Frederic was accordingly congratulated upon this occafion: but having more penetration than thofe about him, he fagely replied, "I fee little reafon to rejoice; the cardinal was my friend, but the pope will be my enemy." Innocent foon proved the juftice of this conjecture. He attempted to negotiate a peace for Italy ; but not being able to obtain from Is Frederic his exorbitant demands, and in fear for the by fafety of his own perfon, he fled into France, affem-pog bled a general council at Lyons, and in 1245 depofed the emperor.

Conrad, the emperor's fecond fon, had already been declared king of the Romans, on the death of his brother Henry, which foon followed his confinement: but the empire being now declared vacant by the pope, the German bifhops (for none of the princes were prefent), at the infligation of his holinefa, proceeded to the election of a new emperor; and they chofe Henry landgrave of Thuringia, who was Ayled in derifion, The king of priffs. Innocent now renewed the crufade againtt Frederic. It was proclained by the preaching friars, fance called Dominicans, and the minor friars, known by the name of Cordeliers or Francijcans. The pope, however, did not confine himfelf to there meafures only, but engaged in coofpiracies againtt the life of an emperor who had dared to refilt the decree of a council, and oppofe the whole body of the monka and

## I T A [ 387 ] I T A

zealots. Frederic's life was feveral times in danger from plots, poifonings, and affaffinations; which induced him, it is faid, t.) make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing fuperftition.

About this time the landgrave of Thuringia dying, the fame prelates who had taken the liberty of creating one emperor made another; namely, William count of Holland, a young nobleman of 20 years of age, who bure the fame contemptuous title with his predeceflor. Fortune, which had hitherto favoured Frederic, feemed now to defert him. He was defeated before Parm shich he had long befieged; and to corgplete his misfortune, he foon after learned, that his natural fon Entius, whom he had made king of Sardinia, was worfted and taken prifoner by the Bolognefe.

In this extremity Frederic retired to his kingdom of Naples, in order to recruit his army ; and there dicd of a fever in the year 1250. After his death, the affairs of Germany fell into the utmot confufion, and Italy continued long in the fame diftracted itate in which he had left it. The clergy took arms againft the laity; the weak were oppreffed by the ftrong; and all laws divine and human were difregarded. After the death of Frederic's fon Conrad who had affumed the imperial dignity as fucceflor to his father, and the death of his competitor William of Holland. a variety of candidates appeared for the empire, and feveral were eleeted by different factions; among whom was Richard earl of Cornwall, brother to Henry II. king of England : but no emperor was properly acknouledged till the year 1273, when Rodolph, count of Hapfburg, was unanimoufly raifed to the vacant throne. During the interregnum which preceded the eletion of Rodolph, Denmark, Holland, and Hungary, entirely freed themfelves from the homage they were wont to pay to the empire; and much about the farne time feveral German cities ereEted a municipal form of government, which Atll continues. Lubec, Cologne, Brunfwic, and Dantzic, united for their mutual defence again!t the encroachments of the great lords, by a farnous afociation, called the Hanfectic league; and thefe towns were afterwards joined by 80 others, belonging to different flates, which formed a kind of commercial republic. Italy alfo, during this period, allumed a new pian of goverument. That freecon for which the cities of Lombardy had folong ftraggled, was confirmed to them for a fum of money: they were emancipated by the fruits of their induftry. Sicily likewife changed its government and its prince ; of which revolution a particular account is given under the article Sicily.

From the time of Frederic II. we mav date the ruin of the German power in Italy. The Florentines, the Pilans, the Genoefe, the Luccans, \&cc. became independent, and could not again be reduced. The power of the emperor, in fhort, was in a manner annihilated, when Henry VII. undertook to refore it in the beginning of the $14^{\text {th }}$ century. For this purpofe a diet was held at Francfort, where proper fupplies being granted for the emperor's journey, well known by the name of the Roman experitition, he fet out for Italy, accompanied by the dukes of Auftria and Bavaria, the archbihop of Triers, the bifhop of Liege, the counts
of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was Atill divided by the factions of the Guelphs and Ghibelines, who butchered one another without humanity or remorfe. But their conteft was no longer the fame: it was not now a ltruggle between the empire and the priefthood, but between faction and faction, inflamed by mutual jealoufies and animofities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnas, the Urfini, and the Roman barons, divided the city; and this divilion was the caufe of a long abode of the popes in France, fo that Kome feemed equally loll to the popes and the emperors. Sicily was in the poffeflion of the houfe of Arragon, in confequence of the famous maffacre called the Sicilian vefpers, which delivered that ifland from the tyranny of the French *. Carobert, king of Hungary, difputed the kingdom of Naples with his uncle Robert, fon of Charles 1I. of the houfe of A njou. The houfe of Elte had eftabliflaed itfelf at Ferrara; and the Venetians wanted to make themfelves mafters of that country. The old league of the Italian cities no longer fubfilted. It had been formed with no other view than to oppofe the emperors; and fince they had neglected Italy, the cities were whoily employed in aggrandizing themfelves, at the expence of each other. The Florentines and the Genoefe made war upon the republic of Pifa. Every city was alfo divided into factions within itfelf. In the middt of thefe troubles Henry VHI. appeared in Italy in the year 1311, and caufed hinfelf to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as if the right of reigning were attached to a fmall circlet of metal. Henry ordered a new crown to be made, with which the ceremony of inauguration was peiformed.
Cremona was the firtt place that ventured to oppofe the emperar. He redheed it by force, and laid it under heavy contributions. Parma, Vicenza, and Placentia, made peace with bim on reafonable conditions. Padua paid :00,000 crowns, and received an imperial officer as governor. The Venetians preferted Henry with a large fum of money, an imperial crown of gold enriched with diamouds, and a chain of very curious workmanfhip. Brefcia made a defperate refiltance, and futtained a very fevere fiege; in the courfe of which the emperor's brother was flain, and his army diminifhed to fuch a degree, that the intabitants marched out under the command of their preiect Thibault de Druflati, and gave him battle: but they were repulfed with gueat lofs, after an oblinate engagement ; and at laft obliged to fubmit, and their city was difmantled. From Brefcia Henry marched to Genoa, where he was received with expreffions of joy, and fplendidly entertained. He next proceeded to Rome: where, after much blondhed, he received the imperial crown from the hands of the cardinals. Clement V. who had originally invited Henry into Italy, growing jealous of tris fuccefs, had leagued with Robert king of Naples and the Urfini faction, to oppofe his entrance into Rome. He entered it in ipite of them by the amfitance of the Colonnas. Now mafter of that ancient city, Henry appointed it a governor ; and ordered, that ail the cities and itates of 1 . ${ }_{3} \mathrm{C}$ z tals

Italy. taly fhould pay Lim an annual tribute. In this order be comprehended the kingdom of Naples, is which he was going to make good his claim of fuperiority by arms, when he died at Beocvento in 1213 , as is commonly fuppofed, of poifon given him by a Dominican friar, in the confecrated wine of the facrament.
The efforts of Henry VII. were unable to reftore the imperial power in Italy. From this time the authority of the emperor in that country confifted in a great meafure in the conveniency which the Ghibelines found in oppofing their enemies under the fanction of his name. The power of the pope was much of the fame nature. He was lefs regarded in Italy than in any other country in Chriftendom. There was indeed a great party who called themfelves Guelphs; but they affected this diltinction only to keep themfelves independent of the imperialifts ; and the flates and princes who called themfetves Guelphs paid little more acknowledgment to his holinefs than theltering themfelves under his name and anthority. The molt defperate wars were carried on by the different rities againlt each other; and in thefe wars Caftuccio Callraccani, and Sir John Hawkwood an Englifhman, are celebrated as heroes. A detail of thete tranfactions would furnifh materials for many volumes; and after all feems to be but of little importance, fince nothing material was effected by the utmolt efiurts of valour, and the belligerent itates were commonly obliged to make peace without any advantage on either lide. By degrees, however, this martial fpirit fubfided; and in the year 1492 , the Italiaus were fo little capable of refifting an enemy, that Charles Vill. of France conquered the whole kingdom of Naples in fix weeks, and might eafily have fubdued the whole country had it not been for his own imprudence. Another attempt on Italy was made by Louis XII, and a third by Francis I. as related under the article France. In the reigns of Lonis XIII. and XIV. an obllinate war was carried on between the French and Spaniards, in which the Italian Itates bore a very confiderable thare. The war concluded in 1660 , with very little advantage to the French, who have been always unfucceffful in their Italian wars. The like bad fuccefs attended them in that part of the world, in the war which commenced between Britain and Spain in the year 1740 . But the particulars of thefe wars, with regard to the different flates of Italy, naturally fall to be confidered under the hittory of thofe flates into which the country is now divided ; viz. Sardinia, Milan or the Milanefe, Genoa, Venice, Tufcany or Florence, Lucca, St Marino, Parma, Mantua, Moderia, Rome, and Naples.

## 79 <br> Air, \&cc. of

Fi: $y$.
The air of Italy is very different, according to the different fituations of the feveral countries contained in it . In thofe on the north of the Apennines it is more temperate, but on the fouth it is generally very warm. The air of the Campania of Rome, and of the Ferrisrefe, is faid to be unhealthful; which is owing to the lands not being duly cultivated, nor the marfhes drained. That of the other parts is generally purc, dry, and healhy. In fummer, the heat is very great in the kingdom of Naples; and would be almolt intolerable, if it was not fomewhat alleviated by the fea-breezes. The foil of Italy in general is very fertile, being watared by a great number of rivers. It produces a great
variety of wines, and the bell oil in Europs; excellent filk in abundance; corn of all forte, but wot in fuch plenty as in fome other connties; oranges, lemons, citrons, pomegranates, almonds, raifns, fugar, mulberry.trees without number, figs, peaches, nectarines, apricots, pears, apples, filberts, chefnuts, \&c. Molt of thefe fruits were at firft iuported by the Romans from Afia Minor, Greece, Africa, and Syria, and were not the natural products of the foil. The tender plants are covered in winter on the north fide of the Apeunines, but on the fonth fide they have no need of it. This country alfo yields good pallure ; and abounds with cattle, fheep, goats, buffalues, wild boars, mules, and horfes. The foretts are well ftured with game; and the mountains yield not only mines of iron, lead, alum, fulphur, marble of all forts, alabatter, jafper. porphyry, \&c. but alfo gold and filver ; with a great variety of aromatic herbs, trees, fhrubs, and ever greens, as thyme, lavender, laurel, and bays, wild olive-trees, tamarinds, juniper, oaks, and pincs.

A very extentive trade is carried on in many places in Italy, particularly at Leghorn, Genoa, Bolugna, Venice, and Naples; the councry having a great variety of commodities and manufatures for exportation, efpecially wine, oil, perfumes, fruits, and filks. Travellers alfo bring large fums of money into Italy, befides what they lay out in pistures, curiofties, relics, antiquities, \&c.

The Italians are generally well proportioned, though Drei their complexions are none of the hett. As to drefs, poofiti they follow the fafhians of the conntries on which they \&e., border, or to which they are fubject ; namely, thofe of in France, Spain, and Germany. With refpect to their genius and tafte in architecture, painting, carvin.j, and molic, they are thought to excel greatly, and to leave the other nations of Enrope far behind then; but their mulic feems too foft and effeminate to deferve all the praife bellowed on it ; and their houfes are far inferior to thofe of England in reiptet of convenience. No country hath produced better politicians, hittorians, poets, painters, and fculptors; widmesi fince the revival of the arts and fciences, exclufive of thofe of ancient times. The Italians are very affable, couteous, ingenious, fober, and ready witted; but extreme$l_{y}$ jealous, vindictive, lafcivious, ceremonious, and fupertitious. In refpect to jealonfy, indeed, we are told, that a very extraordinaty change has lately taken place; and that the Italians are now no lefs indulgent and complaifant to their wives than the mut polite huflands in France itfelf. In their tempers, the Italians feem to be a good medium between the Frencl2 and Spaniards; neither fo gay and volatile as the one, nor fo grave and fulemn as the other. Boiled fnails, ferved up with oil and pepper, or fried in oil, and the linder parts of frogs, are reckoned dainty difhes. Kites, jackdaws, lawks, and magpies, are alfo eaten nut only by the common ptople but by the better furt. Wine is drank here both in fummer and winter cooled by ice or fllow. The women affea yellow hair, as the Roman ladies and courtezans formerly did. They alfo ufe paint and wafhes, both for their hands and faces. The day here is reckoned from fun-fet to fun-fet, as the Atlienians did of old.

ITCH, a cutaneous difeafe, appearing in fmall

## I T E

watery pufules on the fkin; commonly of a mild nature, though fometimes attended with obflinate and dangerous fymptoms. Sce Medicine-Ioutri.

## Itch-Infer. See Acarus.

In fpeakiag of the manner of finding thefe infects in the itch, Fabricius obferves, that the failure of many who have fought for them has been owing to their having expected to meet with them in the larger veficles that contain a yellowih fuid like pus; in thefe, however, he tells us, he has never found them, but in thofe puftules only which are recent, and contain only a watery fluid. We mult therefore, he obferves, not expect to find them in the fame proportionate number in patients who for many months have been afflicted with the difeafe, as in thofe in whom its appearance is recent, and where it is confined to the fingers or wrifts. The caure of this diference with refpect to the puftules, he conjectures, may be owing to the death of the infect atter it has defolited its eggs.

A fuall tranfparent veficle being found, a very minute white point, diftinct from the furrounding fluid, may be difcovered, and very often ceen without the aflitance of a glafs; this is the infect, which may be ealily taken out on the point of a needle or penknife, and when placed on a green cloth may be feen much more diffinctly, and obferved to move.

The author remarks, that even before fuch a $\operatorname{tran}$. parent velicle is formed, we may often difcover traces of the infect on the fingers or hands, in a reddifh ftreak or furrow, which is occafioned by the acarus; and he adds, that it is even more ufual to find it in thefe furrows than in the putules themfelves. He tellis us, that a friend of his at Hanover (who had the itch in a night degree, and to whofe accurate inquiries with an excellent microfcope he acknowledges himflelf much indebted) found feveral infects in fuch furrows. Two of the longeft of the furrows were about an inch in extent. They feemed to be thorougbly dry, but exhibited here and there very minute fhining and tranf. parent ipots. Thefe fpots, however, were not at all slevated abuve the furface of the fiin; and although fexcral of them were opened and examined, no infect was found in them. Thele furrows he has obferved only on the hands and fingers, having in vain fought for them on the lega and other parts of the bady, in his children, who had the itch in a bigh degree.

ITEA, in botany: A genus of the monogynia order, belonging to the pentandria clais of plants; and in the natural method ranking with thofe of which the order is doubtful. The petals are long, and inforted into the calyx ; the capfinle unilocular and bivalved. 'There is but one fpecies, a native of North America. It grows by the fides of rivers, and in other parts where the ground is moilt. It rifes to the height of eight or ten feet, fending out many branches garnifhed with fpear-fhaped leaves placed alternately, and fightly fawed on their edges, of a light green colour. At the extremity of the branches are pioduced fine fpikes of white flowers three or four inches long, Ilanding erect. When thefe thrubs are in vigour, they will be entirely covered with flowers, fo that they make a beautiful appearance during the flowering feafon, which is in July. They are propagated by layers, and are not injured by the cold of this climate; but are ant to die in fummer, if they are planted on a dry
gravelly foil. The thoots fhould be laid down in antumn, and will be rooted in one year.

ITHACA (anc. geog.), an illand in the lonian fea, on the coall of Epirus; the country of Ulyffes, near Dulichium, with a town and port fituated at the foot of mount Nems. According to Pliny it is about 25 miles in compals; according to Artemidorus orly 10 ; and is now found to be only eight miles round. It is now uninhabites, and called farbouco.
ifinerary, Itinerarium; a journal or an account of the diftances of places. The moll rennarkable is that which goes under the names of Antonimus and Ethicus; or, as Barthius found in his copy, Antonimus Atbicus ; a Chriftan writer, pollerior to the times of Conftantine. Anoller, called Hierofolynitanun, from Bourdeaux to Jerufalem, and from Heraclea through Aulona and Rome to Milan, under Conltantine.Itinerarium Jenotes a day's march.

ITIUS portus (anc. geog.), the crux zeographonrum, fuch being the difficulty of afcertaining its polition. It would be endiefs to recite the feveral opinions concerning it, with the feveral reafons advanced in fupport of them. Three ports are mentioned by Cxfar; two without any particular name, viz, the Higher and the Lower, with refpect to the Porrus Itius. Calais, Boulogne, St Omer, and Whitfand, have each in their turn had their feveral advocates. Cafar gives two diftinctive characters or marks which feem to agree equally to Boulo sne, and Whit fand, namely, the thortnefs of the paffage, and the fituation between two other ports; therefore nothing can with certainty be determined about the fituation of the Portus Itius.

ITTIGIUS (Thomas), a learned profeflor of divinity at Lecipfic, and forn of John Ittigius, profefor of phytic in the fame uriverfity. He firt publithed A Treatife upon Burning Mountains; after whith he became a minitter, and exercifed that function in various churches there. He furnifhed feveral papers in the Leipfic acts, befides publifhing fome hitorical works and differtations. He died in 1710 .

ITYS (fab. hit.), a fon of Tereus king of Thrace, by Procne daughter of Pandion king of Athens. He was hilled by his mother when lie was about fix years old, and ferved up before his father. He was changed into a pheafant, his mother into a fivallow, and his father into an owl.
ITZECUINTEPOTZOTLI, or Hunch-backed Plate Dog, a Mexican quadruped fimilar to a dog. It is CCXLIE as large as̀ a Maltelan dog, the fizin of which is varied with white, tawny, and clack. Its head is frall in proportion to its body, and appears to be joined directly to it on account of the fhortnefs and greatners of its neck; its eyes are plealing, its ears loofe, its nofe tas a culfiderable prominence in the middle, and its tail fo fmall, that it hardly reaches half way down its leg ; but the characterillic of it is a great hunch wh.ch it bears from its neck to its rump. The place where this quadruped mott ahounds is the kingdom of M1chuacan, where it is called Alora.

ITZEEHOA, an ancient and hanfome town of Germany, in the circle of Lower Sax^ny, and duchy of Holltein. It belongs to the king of Denmark, and is feated on the river Stoer, in E. Long. 9. 25 . N. Lat 54.8 .
IV. $1_{2}$.

IVA, in botany: A geaus of the peutandria order, belonging to the monectia clafs of plants; and in the matural method ranking under the 49th order, Comprfite. The male calyx is cominon and triphyllous; the fiorets of the dife moropetalons aad quinquefid ; the receptacle divided by fmall hairs. There is no female calyx nor corolla; but five florets in the radius; two long flyles; and one waked and obtufe feed.

IVAHAII is the name of one of the canoes or boats nfed by the inanders of the South fea for hort excurlions to fea: it is wall-fided and flat-bottomed. Thefe boats are of differerit fizes, their length being from 72 feec to 10 : but their breadth is by no means in proportion; for thofe of ten feet are about a foot wide, and thofe of more than 70 are fearcely two. The fighting ivahah is the longefl, with its head and ftern confiderably raifed above the body in a femicircular form: the flern is fometimes 17 or 18 feet high. When they go to fea, they are fallened together fide by fide, at the dillance of about three fect, by frong poles of wood laid acrofs and lafhed to the gun-whales. On thefe, in the fore-part, a tage or platform is raifed, about 10 or 12 feet long, fomewhat wider than the boats, and fupported by pillars about fix feet high: on this flage are ranged the fighting men, whofe miffile weapons are fings and Spears; and below the ftage the rowers fit. The fifhing ivahahs are fiom 40 fect long to 10 ; thofe of 25 fect and upwards occafionally carry fail. The travelling ivahah is alw:ys double. and furnifhed with a fmall neat houfe about five or fis feet broad, and fix or feven feet long.

JUAN (St) de la Frontera, a town of SouthAmerica, in Chili, in the province of Chiquito, near the lake Guanacho. The territory of this town is inhabited by 20,000 native Americans, who are tributary to spain. It contains minces of gold, and produces a kind of almonds that are very delicate. It is feated at the foot of the Andes, in W. Long. 66.35. S. Lat. 23.25.

Foan de Porto Ricco, an ifland of America, and one of the Caribbes, being 100 miles in length and 50 in breadth. It belongs to the Spaniards; and is full of very high mountains, and extremelv fettile valleys, intel fperfed with woods, and well watered with fprings and rivulets. It produces fugar, rum, ginger, corn, and fruits; partly proper to the climate, and partly introduced from Spain. Befides, there are fo many cattle, that thry often kill them for the fake of the fkins alone. Here are a great number of uncommon trees, and there is a little gold in the north part of the ifland. It is commonly feid that the air is healthy ; and yet the earl of Cumberland, when he had taken this inand, loft moft of his neen by ficknefs; and for that reafon was forced to abandon it. This happened in the reign of Queen Elizabeth. It is fubject to formis and hurricanes, like the relt of thefe iflands. It lies to the eaft of Hifraniola, at the diftance of 50 miles.

Forn de Porto Ricco, the capital tnwn of the ifland of Porto Riceo, with a good harbour defended by feveral forts, and a bifhop's fee. It is feated on the north coaft of the inand, in W. Long. $65 \cdot 35$. N. Lat. 18. 30 .

GUAN Fernandez, an ifland in the great South Sea, in S. Lat. 33.40. and W. Lung. 78. 30. from Lon-
don. It was formerly a place of refort for the bucca. neers who annoyed the weftern coaft of the Spaninh continent. They were led to refort hither from the multitude of goats which it nourifhed; to deprive their enemies of which advantage, the Spaniards tranfported a confiderable number of digs, which increaling greatly, have almoft extirpated the goats, who now only find fecurity among the itecp mountains in the northern parts, which are inacceffible so their purfuers. There are inflances of two men living, at different times, alone on this illand for many years; the one a Mufquito Indian; the other Alexander Selkirk, a Scotch. man, who was, after five years, tiken on board an Englifh hip, which touched here in about 1710 , and brought back to Europe. From the hiftory of this reclufe, Daniel de Foy is faid to have conceived the idea of writing the adventures of Robinfon Crufoe. This ifland was very propitious to the remains of commodore Anfon's \{quadron in 1741, after having been buffeted with tempefts, and detilitated by an inveterate fourvy, during a three months paflage round Cape Horn: they continned here three months; during which time the dying crews, who on their arrival could fcarcely with one united effort heave the anchor, were reftored to perfect health. Captain Carteret, in the Swallow, in 1767 , having met with many difficulties and impediments in his paffoge into the South Sea, by the Straits of Magelhaens, attempted to make this infand in order to recruit the health of his meu; but he found it fortified by the Spaniards, and therefore chofe rather to procced to the innand of Mafafuero. But M. de Bougainville chat fame year is faid to have touched here for refreflments, although in the narrative of the voyage the fact is cautionfly fuppreffed. Thisifland is not quite is miles long and about fix broad; its only fafe harbour is on the north fide. It is faid to have plenty of excellent water, and to abound with a great variety of efculent vegutables highly antifcorbutic ; befides which, com rodore Anfon fowed a varicty of garden. feeds, and planted the ftones of plums, apricots, and peaches, which he was many years afterwards informed had thriven greatly ; and now douhtlefs furnith a very valuable addition to the natural productions of this fpot. Vatt fhoals of fifh of various kinds frequent this coaft, particularly cod of a prodigious fize; and it is faid in not lefs abundance than cn the banks of Newfoundland. There are but few birds here, and thofe few are of fpecies well known and common.

Yliqn Blanco. See Platina.
JUBA, a king of Numidia and Mauritania. He had fucceeded his father Hiempfal, and he favoured the caufe of Pompey againit Julius Crelar. He defeated Curio whom Cefar had fent to Africa, and after the battle of Pharfalia lie joined his forces to thofe of Scipio. He was conquered in a battle at Thaplus, and totally abanduned by his fubjects. He killed himfelf with Petreius, who had flared his good fortune and his adverfity, in the year of Rome 707. His kingdom became a Roman province, of which Sallult was the firft governor.

Juba 11. fon of the former, was led among the cap. tives to Rome to adorn the triumph of Cæfar. His captivity was the fource of the greatef honours, and his application to ftudy procured hinı more glory than

## J U B

he would have obtained from the inheritance of a king. dom. He gained the heart of the Romans by the courteoufnefs of his manners, and Auguftus rewarded his fidelity by giving him in marriage Clcopatra the daughter of Antony, and conferring upon him the title of king, and making him mafter of all the territories which his father once poffeffed, in the year of Rome 723. His popularity was Co great, that the Mauritanians rewarded his benevolence by making him one of their gods. The Athenians raifed him a flatue, and the Eithiopians worfhipped him as a deity. Juba wrote an hiftory of Rome in Greek, which is often quoted and commended by the aneients. Of it only few fragments remain. He alfo wrote on the hiftory of Arabia, and the antiquities of Affyria, chiefly collected from Berofus. Befides thefe he compofed fome treatifes upon the drama, Roman antiquities. the nature of animals, painting, grammar, \&c. now lof.

JUBILEE, among the Jews, denotes every fiftieth year; being that following the revolution of feven weeks of years; at which time all the flaves were made free, and all lands reverted to their ancierst owners. The jubilees were not regarded after the Babylonifh captivity. -The word, according to fome authors, comes from the Hebrew, jobel, which liguifies fifty: hut this mult be a miftake, for the Hebrew 'יוב jobel does not fignify fifty ; neither do its letters, taken as cyphers, or according to their numerical power, make that number; being $10,6,2$, and 30 , that is 48 . - Others fay, that jobel fignifies a ram, and that the jubilee was thus called, becaufe proclaimed with a ram's horn, in memory of the ram that appeared to Abrahan in the thicket. Mafius choofes to derive the word from $\mathcal{F}_{u}$ bal, the firt inventor of mufical inftruments, which, for that reafon, were called by his name; whence the words jobel and jubilee came to fignify the year of deli. verance and remiffion, becaufe proclaimed with the found of one of thofe inftruments which at firlt was no more than the horn of a ram. Others derive jobel from 3z, jabal, in hiphill han, bobil, which fignifies to recal or return; becaufe this year reftored all flaves to their liberty, \&c. The inftitution of this fettival is in Lev. xxv. $8,17$.

The learned are divided about the year of jubilee; fome maintaining that it was every forty-ninth, and others that it was every fifticth, year. The ground of the former opinion is chiefly this, that the forty-ninth year being of courfe a fabbatical year, if the jubilee had been kept on the tifticth, the land mult have had two fabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the othier hand, it is alleged, that the Scripture exprefsly Heelares for the fiftieth year, Lev. xxv. 10, 11. And beficies', if the jubilee and fabbatical year had been the fame, there would have been no nced of a prolibition to fow, reap, \&cc. becaufe thiskind of labour was prokibited by the law of the fabbatical year, Lev. xxv. 4 . 5 . The authors of the Univerfal Hiftory, book i. chap. 7. note $R$, endeavour to reconcile thefe "ppinions, by obferving, that as the jubilee began in the firt month of the civil year, which was the feventh of the ecclefialtical, it might be faid to be either the forty-ninth or fiftith, according as one or other of thefe computations were followed. The political defign of the law of the jubilee was to prevent the too great opprefions of the poor,
as well as their being liable to perpetual flavery. By Jubilee, this mean a kind of equality was preferved through Jucutan. all the families of 1 fracl, and the diftinction of tribes was alfo preferved, that they might he able, when there was occation, on the jubilee-year, to prove their right to the inheritance of their ancefors. It ferved alfo, like the Olympiads of the Greeks, and the Lutira of the Romans, for the readier computation of time. The jubilee has alfo been fuppofed to be typical of the gofpel ftate and difpenfation, defrribed by Ifaiah, lxi. ver. $\mathbf{I}, 2$. in reference to this period, as the "aceeptable year of the Lord."
Jubilee, in a more modern fenfe, denotes a grand church folemnity or ceremony, celclorated at Rome, wherein the pope grants a plenary indulgence to all finners; at leaft to as many as vifit the churclies of St Peter and St Prul at Rome.
The jubilee was firt eltabliffed by Boniface VII. in 1300, in favour of thofe who thould go ad liminaz apofolorum; and it was only to return every hundred years. But the firft celebration brought in fuch ftore of wealth to Rome, that the Germans called this the golden year; which occafioned Clement VI. in I 343 , to reduce the period of the jubilee to fifty years. Urban VI. in 1389 , appointed it to be held every thirtyfive years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every perfon might have the benefit of it once in his life. Boniface IX. granted the privilege of holding jubilees to feveral princes and monafleries: for inflanec, to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to vilit the tomb of Thomas a Becket. Jubilees are now become more frequent, and the pope grants them as often as the church or himfelf have occation for them. There is ufually one at the inauguration of a new pape. To be intitled to the pri:vileges of the jubilee, the bull enjoins faltings, alms, and prayers. It gives the prielts a full power to abbolve in all cafes even thofe otherwife referved to the pope: to make commntations of vows, \&cc. in which it differs from a plenary indulgence. During the time of jubilee, all other indulgences are fufpended.
One of our kings, viz. Edward III. caufed his birth-day to be obferved in manner of a jubilee, when he became fifty years of age, in 1362 , but never before or after. This he did by releafiug prifoners, pardoning all offences except treafon, making good laws, and granting many privileges to the people.
There are particular jubilees in certain citics, when feveral of their fealis fall on the fame day: at Puey en Velay, for inftance, when the feaft of the Annunciation happens on Good-Friday; and at Lyons when the fealt of St John Baptift concurs with the feaft of Corpus Chrifti.
In $1 \sigma_{40}$, the Jefuits celebrated a folemn jubilee at Rome; that being the centenuary or hundredth year from their inllitution, and the fame ceremony was obferved in all their houfes throughout the world.
JUCATAN, or Yucatan, a large province of Nouth-America in New Spain, whieh is a peninfula. It is over againft the inand of Cuba, and contains a large quantity of timber, proper for building hips $\%$. as alfo fugar, caffia, and Indian corn. The original inhabitants are few, they having been very ill ufed by

JUDAH, the fourth fon of Jacob, and father of the chief of the tribes of the Jews, dittinguifhed by his name, and honoured by giving birth to the Meffiah, died 1636 B. C.
$\mathcal{F} \cup D A H$ Hakkadofb, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us, that rabbi Judah, who was very rich, collected about 26 years after the deftruction of the temple, in a book which he called the Miffia, the conftitutions and traditions of the Jewih magiftrates who proceded lim. But as this book was fhort and obfcure, two Babylonifh rabbis, Rabbina and Afe, collected all the interpretations, difputes, and additions, that had been made until their time upon the Mifnia, and formed the book called the Babyloni/b Talmud or Gemara; which is preferable to the Jerufalem Talnud, compofed fome years before by rabbi Jochanan of Jerufalem. The Mifnia is the text of the Talmud; of which we have a grood edition in Hehrew and Latin by Surenhufius, with notes, in 3 vols folio. It were to be wifhed the fame had been done to the Gemara.

The Kingdom of $\mathcal{F}^{\text {UD } A H}$ was of fmall extent compared with that of the kingdom of Ifrael; confifting only of two tribes, Benjamin and Judah: its eaft boundary, the Jordan ; the Mediterranean its weft, in common with the Danites, if we except fome places recovered by the Philiftines, and others taken by the kings of Ifracl ; on the fouth, its limits feem to have been contracted under Hadad of the royal progeny of Edom, (1 Kings xi. 14.)

Tribe of $Y_{V D A H}$, one of the 12 divifions of Paleftine by tribes (Jofh. xv.), having Idumea on the fouth, from the extremity of the Lacus Afphalites, alfo the Wildernefs of Zin, Cadefbarnea, and the brook or river of $\mathrm{Egyl}_{\mathrm{g}}$; on the eaft, the faid lake; on the weft, the Mediterranean ; and on the north, the mouth of the faid lake; where it receives the Jordan, Buthfemes, Thimna, quite to Ekron on the fea.

JUDA ISM, the religious ductrines and rites of the Jers. Jndaifm was but a temporary difpenfation, and was to give way, at leall the ceremonial part of it, at the coming of the Meffias. For a complete fyltem of Judaifm, fre the books of Mofes. Judaifm was ancien:ly divided into feveral fects ; the principal whereof were the Pharifees, Sadducees, and Effenians.

At prefent there are two fects among the Jews, viz. the Caraites, who admit of no rule of religion but the law written by Mofes; and the Rabbinilts, who add to the law the traditions of the Talmud.

JUDAS Maccabeus, a celebrated general of the Jews, renowned for his many victories over his ene mies, at laft fain in battle, 261 B. C. See (Hiffory of the) Jews, $\mathrm{n}^{\circ} 13$.

Judas. Tree. See Cercis.
JUDE (St), brother of St James the younger, and fon of Jofeph (Mat. xiii. 55.). He preached in Mefopotamia, Arabia, Syria, Idumea; and died in Berytus for the confeffion of Chritt. He wrote that cpitle which goes under his name, and after the death of molt of $\mathrm{N}^{\prime} 1$ º.
ving the fupertition of the Magi.
JUDE, or the General Epiflle of Fude, a canonical book of the New Tettament, written againft the heretics, who. by their diforderly lives and impious doctrines, corrupted the faith and good morals of the Chriftians. St Jude draws them in lively colours, as men given up to their paffions, full of vanity, conducting thenifelves by worldly wifdom, and not by the fpirit of God.

JUDEA (anc. geog.), taken largely, either denotes all Palefline, or the greater part of it ; and thas it is generally taken in the Roman hiflory: Ptolemy, Rutilinus, Jerome, Origen, and Eufebius, take it for the whole of Paleftine. Here we conlider it as the third part of it on this fide the Jordan, and that the fouthern part is ditinct from Samaria and Galilee ; under which notion it is often taken, not only in Jofephus, but alfo in the New Teftament. It contained four tribes ; Judah, Denjamin, Dan, and Simeon, together with Philitia and Idumea; fo as to be comprifed between Sanaria on the north, Arabia Petrea on the fonth, and to be bounded by the Mediterranean on the weft, and by the Lacus Arphaltites, with part of Jordan, on the eatt. Jofephus divides it into 11 toparchies; Pliny into to; by which it has a greater extent than that juft mentioned. See Palestine.
JUDENBURG, a handiome and contiderable town of Germany, in the circle of Aultria, and capital of Upper Styria, with a handfome cattle; the public buildings with the fquare are very magnificent. It is feated on the river Meur. E. Long. 15.20. N. Lat. 47. 20.

JUDEX (Matthew), one of the principal writers of the Centurics of Magdeburg, was born at Tipplefwolde in Mifnia, in 1528 . He tanght theology with great reputation ; but met with many difquiets in the exercife of his minittry from party-feuds. He wrote feveral works, and died in $15^{5} 4$.
JUDGE, a chief magittrate of the law, appointed to hear caufes, to explain the laws, and to pafs fentence.
Judges, in Jewifh antiquity, certain fupreme magiltrates who governed the Ifraelites from the time of Jothua till the reign of Saul. Thefe judges refembled the Athenian archons or Roman dictators. The dig. nity of judge was for life, but not always in uninterrupted fucceffion. God himfelf, by fome exprefs declaration of his will, regularly appointed the judges : But the Ifraelites did not always wait for his appointment, but fometimes chofe themfelves a judge in times of danger. The power of the judges extended to affairs of peace and war. They were protectors of the laws, defenders of seliginn, avengers of all crimes; but they could make no laws, nor impofe any ntw burdens upon the people. They lived without pomp or retinue, unlefs their own fortunes enabled them to do it; for the revenues of their office confifted in voluntary prefents from the people. They continued from the death of Jofhua till the beginning of the reign of Saul, being a fpace of about 339 years.

JUDGEs, for ordinary affairs, civil and religious, werc appointed by Mofes in every city to terminate differences; in affairs of greater confequence, the differences

## J U D

eq, ferences were referred to the priefts of Aaron's family, ent. and the judge of the people or prince at tha time efla. blifhed. Mofes likewife fet up two courts in all the cities, one confifing of priefts and Levises, io determine paints concerning the law and religion: the other conlitling of heads of famities, to decile in civil matters.

Book of Yunars, a canonical book of the Old Teftament, fou called from its relating the tate of the Ifraelites under the adminitration of many illuftrions perfons who were called judges, from bein, ${ }_{5}$ both the civil and military governors of the people, and whe were reifed up by God upon fpecia! occations, after the death of Johnua, till the time of their making a king. In the time of this peculiar polity, there were feveral remarkahle occurrences, which are recorded in this book. It acquaints us with the grofs inpiety of a neiw generation which fprung up after the death of Jofnas; and gives us a flort view of the difpenfations of heaven towards this people, fometimes relieving and delivering them, and at whers feverely chaftifing them by the hands of their enemies.
 perfons fummoned by the prator to give their verdict in criminal matters in the Roman courts, as juries do in ours. No perfon could be regularly admitted into this number till he was 25 years of age. The Sortitio Tulicum, or impannelling the jury, was the office of the Fude. Quefionis, and was performed after both parties were come into court, for each had a right to reject or challenge whom they pleafed, others being fubltituted in their room. The number of the Judices felecti varied, according to the nature of the charge. When the proper number appeared, they were fworn, took their places in the fubfellia, and heard the trial.

JUDGMENT, among logicians, a faeulty or rather act of the human foul, whereby it compares its ideas, and perceives their agreement or difagreement. See Metaphysies; and Logic, Part II.

Judgnent, in law, is the fentence pronounced by the court upon the matter contained in the record. Judgments are of four forts. Firlt, where the facts are confffed by the parties, and the law determined by the court ; as in cafe of judgment upon demurrer: Secondly, where the law is admitted by the parties, and the facts difputed; as in the cafe of judgment on vier. diat: thirdly, where both the fact and the law ariing thereon are admitted by the defendant; which is the cafe of judgments by confeffion or default: or, laflly, where the plaintiff is convinced that either fact, or law, or both, are infufficient to fupport his attion, and therefore abandons or withdraws his profecution; which is the cafe in judgments upon a nonfuit or retraxit.
The judgment, though pronounced or awarded by the judges, is not their determination or fentence, but the determination and fentence of the lazv. It is the conclufion that naturally and regularly follows from the premiffes of law and fact, which flands thus: Againft him who hath rode over my corn, I may recover damages by law; but A hath rode over my corn; therefore I fhall recover damages againft $A$. If the major propofition be denied, this is a demurrer in law: if the minor, it is then an iffue of fact : but it both be confeffed or determined to be right, the conclufion or judgment of the court cannot but follow. Which
$393]$ J U D
juds, ment or conclufion depends not therefore on the Jutgment: anbirary caprice of the judge, but on the fetted and invariable pruciules of jutice. The judgment, in flort, is the remedy precicribed by law for the redrefs of iujuries; and the fuit or action is the vehicle or means of adminitening it. What that remedy may be, is indeed the refult of deliberation and furiy to point out ; and thersfore the flyle of the judgment is, not that it is decreed or refolved by the eourt, for then the judgment might appear to be their own ; but, " it is confiderd," confichratum of per curcium, that the plaistiff do recover his damayes, his debt, his pofiethon, and the like: which implies that the judgment is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry. See Black/l. Comment: iii. 396.
Judgment, in criminal cafes, is the next llage of profecution, after trial and convietion are pail, in fuch crimes and midemeanors as are either too ligh or tuo low to be incluced within the benefit of clergy. For when, upon a capital charge, the Jury have brought in their verdict guilly in the prefence of the prifoner ; he is either immediately, or at a convenient tine foon after, afked by the court, if he has any thing to offer why judgment the uld not be awarded againd him. A tid in cafe the defendaut be found guilty of a mifdemeanor (the trial of which may, and dues ufually, happen in his abfence, after he has once appeared), a capias is awarded and iffued, to bring: him in to receive his judgment ; and if he abfoonds, he may be profecuted even to outlawry. But whenever he appears in perfon, upon cither a capital or inferior conviction, he may at this period, as well as at his arraign. ment, offer any exceptions to the indictment, in arreg or Ilay of judgment : as for want of fufficient certainty in fetting forth either the perfon, the time, the place, or the offence. And if the otijections be valid, the whole proceedings thall be fet afide; but the party maty be indicted again. And we may take notice, t. That none of the thatutes of joofails, for amendment of errors, extend to indictments or proceedings in eriminal cafes; and therefore a 4 fective indictment is not aided by a verdict, as defective pleadings in civil cafes are. 2. That, in favour of tife, great Arietnefs has at all Btac\% times been obferved, in every point of an indictment. Comments Sir Mathew Hale indeed complains, "that this itrict. nefs is grown to be a blemifh and inconvenience in the law, and the adminill ration thereof: for that more offenders efcape by the over eafy ear given to exceptions in indiatments, than by their own innocence; and many times grofs murders, burglaries, robberies, and other heinous and crying offences, remain unpunimed by thefe unfeemly niceties: to the reproacin of the law, to the fhame of the government, to the encouragenent of villaing, and to the difhonour of God." And yet, notwithtanding this laudable zeal, no man was more tunder of life than this truly execllent judge.

A pardon alfo may be pleaded in arreft of judgment: and it has the fame advantage when pleaded here as when pleadej upor arraigament; viz. the faving the attainder, and, of courfe, the corruption of blood: which nothing can reftore but paliament, when a pardon is not pleaded till after fentence. And certainly, upon all accounts, when a man hath
$\underbrace{\text { Judgment. obtained a pardon, he is in the right to plead it as foon }}$ as pollible. Sce Pardon.
I'raying the benefit of clergy may allo be ranked a. mong the motions in arreft of judgment. Sce Baneft of CLERGY.

If a!! the fe refources fail, the court mult pronounce that judgrient which the law hath annexed to the crime. Of thefe fome are capital, which extend to the life of the offender, and confift generally in being hanged by the neck till dead; though in very atrocious crimes other circumflancea of terror, plain, or difgrace, are fuperadded: as, in treafons of all kinds, being drawn or dragged to the place of execution; in high trcafon afecting the king's perfon or government, embowelling alive, beheading, and quarteling; and in murder, a public difection. And in cafe of any treafon committed by a female. the judgment is to he burned alise. But the humanity of the Englifh mation has authorifed, by a tacit confant, an almolt general mitigation of fuch parts of thefe judgments as §avour of torture or cruelty: a fledge or hurdle be ing ufually allowed to fucl. traitors as are condemned to be drawn; and there being very few intances (and thofe accidental or by negligence) of any perfons being enbowelled or burned, till previonlly deprived of feafation by Alrangling. Some punifhments confiat in exile or banifiment, by abjuration of the realm, or tranfportation to the American colonies : others, in lofs of 1 l berty, by perpetual or temporary imprifonment. Sume extend to confifcation, by forfeiture of lands, or move ables, or both, or of the profits of lands for life: others induce a difability of holding offices or cmployments, being heirs, executors, and the like. Some, though rarely, oceation a mutilation or difimenibering. by cutting off the hand or ears : others fix a lafing ftigma on the offendcr, by flitting the noftrils or branding in the hand or face. Some are merely pecuniary, by Hated or difcretionary fincs: and, lafly, there are others that confit principally in their ignominy, though molt of them are mixed with fome degree of corporeal pain; and thefe are inflicted chiefly for fuch crimes as either arife from indigence, or render even opulence difgraceful. Such as whipping, hard labour in the houfe of correction, the pillory, the flocks, and the ducking- flool.

Difgufting as this catalogue may feem, it will afford pleafure to a Britifh reader, and do honour to the Bri tifh laws, to compare it with that fhocking apparatus of death and torment to be met with in the crimival codes of alnoft every other nation in Eurepe. And it is moreover one of the glories of our law, that the nature, though not always the quantity or degree, of puniflument is afcertained for every offence; and that it is not left in the breaft of any judge, nor even of a jury, to alter that judgment which the law has beforehand ordained for every fubject alike, without refpect of perfons. For, if judgments were to be the private opinions of the judge, men would then be Glaves to their magifrates; and would live in fociety, without knowing exartly the conditions and obligations which it lays them under And, befides, as this prevents oppreffion on the one hand; fo. on the other, it flifes all hopes of impunity or mirigation, with which an offender might 月atter himfelf if his punifhment depended on the humour or difcretion
of the court. Whereas, where an eftablifhed penalty Ju is annexed to crimes, the criminal may read their certain coafequence in that law, which ought, to be the unvaried rule, as it is the inflexible judge, of his actions.
Fudgament of Gor. See Funtions Dei.
JUDICATURE, the quality-w profdion of thofe who adminitter juttice.
Judicature is alfo ufed to fignify the extent of the jurifdiction of the judge, and the court wherein he lits to render jullice.
JUDiCla centumviralia, in Roman antiquity, were trials before the Centumuiri, to whom the protor commuted the decifion of certain naters of inferior natare, like our juitices of peace at the quarter fetfonns. During the judicia centumuirailu, a lpear was Auck up iu the forum to fignify that the court was litting.

JUDICIUM calumnia, was an action brought againt the plaintiff for talfe accufation. The punitr. ment, upon conviction, was inullio frontis, or brandin. in the forehead. See Isusun.

Fudiciund Dei, Yudgment of God, was a term anciently applied to all extraordiuary trials of fectet crimes: as thote by arms, and fugle cumbat, and the ordeals ; or thofe ly fire, or red hot phough hares; by plunging the arm in boiling water, or the whole body in coll water; in hopes God would work a miracle, rathes than fuffer truth and innocence to perith. Si fuper defendere non poffit, judicio Dei, fail. aqua vel ferro, fierel de co juftitio. - Thefe cuttoms were a long time kept up even among Chriltians; and they are ftill in ufe in fome nations. Sec Battel, Ordeal, \&ec. - Trials of this fort were wfually held in churches in prefence of the bilhups, priclls, and Cecular judges; after three day ${ }^{3}$ fafting, conff from, communion, and many adjurations and ceremonies deferibed at layge by $\mathrm{D} u$ Cange.

Fudicins Parium denotes a trial by a man's ecquals, i. e. of peers by peers, and of commoners by com. moners. In magna charta it is more than once infated on as the principal bulwath of out liberties, but efpecially by chap. 29. that no freeman fhall be hurt in either his perfon ar property, nifi per legale judicium parium fiorum vel per legem terra. And this was ever eltecmed in all countries a privilege of the highett and molt beneficial nature.

Fudiciun Falf, was an action which lay againf the judges for corruption or unjult proceedings.

Fiodicius Praverricationis, was an action brought againt the profe utor, after the criminal was acquitted for fuppreffing the evidence of, or extenuating his guilt, rather than urging it home, and bringing it to light.
JUDOIGNE, a town of the Autirian Nerherlands, is Brabant. Near this town the duke of Marlborough gained that fignal victory over the French in 1706 , called the battle of Ramillies. It is feated on the river Gete, 13 miles fouth-eaft of Louvain, and 16 north of Namur.
IVEACH, the name of two baronies of Ireland, in the county of Down, and province of Ulter. They are diftinguifhed into Upper and Lower Iveach, and the former is by much the largett barony in that county. The name of Iveach, or Hy I'each, is faid to be taken from Achizius, in Irith called Eachach, grandfather to king Coullfaig, as much as to fay "the

## JUG

"ternitory of Eachach;" for $k y$, in the Irik language, is a common adjective, denoting not only the heads and founders of fanilies, but alfo the territories poifeffed by them. I veach (including both baronies) was otherwife called the Mayennifes country, and in queen Elizabeth's time was governed by Sir Hugh Magemis, ellecmed to have been one of the moll polite of all the natives in thofe parts. Through part of this barony runs a chain of mountains confiderably high, kuown by the name of livach mo:ntains.

IUERNUS (anc. geog.), a town in the fouth-wett of Ireland. Now D:zhkeram, (Camden); called Derte. kyne by the natives, fituated on the rive: Maire, in the province of Muniller.

Iuervus, or Icrnus ; P'olemy ; a river in the fouthweft of Ireland. Now called the Mraire, or Kenmare, yunning from ealt to weft, in the province of Munfter.

IV eS, or Yives (St), a celebrated bithop of Chartres, born in the territory of Beanvais in the tith century. His merit procured his clection to the fee of Chartres in 1092, or 1093, under the pontificate of Urban II. who kad depored Geoffroy his predeceffor for fundry accufations againft him. Ives particularly fignalized himfelf by his zeal againft Philip I. Who had put away his wife Bertha of Holland, and had taken Bertrade of Montford, wife of Fouques count of A njou. Afterward he devoted himiflf whol. ly to the functions of his minifry; made feveral religious frundations; and died in 1115 . Pupe Pius V. permitted the monks of the congregation of Lateran to celebrate the feltival of St Ives on the 20 th of May. The have a collection of decrees of his compiling, E.xceptiones eccleffificarumt resularum, a Cbroriton, and 22 fermons; all very valuable pieces, which were collected and publifhed in one volume folio in $16_{47}$, by John Baptift Souciet, canon of Chartres.

Ires (St), a fea port town of Cornwall, in England, Feated on a bay of the fame name; which being unfafe, it is chiefly frequented by fifhermen, for the taking of pilchards. By this trade, however, and that of Cornifh nates, it has thriven greatly, and 20 or 30 fail of thips belongs to its harbour. It is a corporation, governed by a mayor, 32 capital and $2_{4}+$ inferior burgeffes, with a recorder, town clerk, \&e and it fends two inembers to parliament. Here is a handfome Spacious church, which is often buffeted by the waves of the fea; but the mother church is at Unilalant There is a granimar-fchool here, which was founded by Charles I. It has two markets in the week, and an annual fair.

Ives (St), is alfo the name of a town in Huntingdonfhire, $6 \not+$ miles from London. It has a fine thone bridge over the Oufe, had in the rinth century a mint, and was noted for its medicinal waters. Great part of it was burnt down fome $y$ cars ago, but it was rehuilt. Here is a very good market on Monday for fatted cattle brough from the north; and there are two fairs in the year. Here Oliver Cromwell rented a farm before he was chofen a burgefs for Cambridge.

JUGERUM, in Roman antiquity, a fquare of 120 Roman feet ; its proportion to the Englifh acre being as to. COC to 16.097.
JUGIANS, in botany: $A$ genus of the monæcia older, belonging to the polyandria clafs of plants; and
in the natural method ranking under the 5oth order, Amentaces. The male calyx is monophyllous, and fquamiforn ; the corolla divided into fix parts; there are 18 filaments: the female calyx is quadifid, fuperior ; the corolla quadripartite; there are two ly les, and the fruit a plumb with a furrowed kerael. There are five fecies, the moft remarkable of which is the regia or common walnat. This rifes 50 feet high or more, with a large upright trumk, branching into a very large fpreading head, with large pinnated laves, of two or three pair of oval, finooth, fomewhat ferrated lobes, terminated by an odd one; and moriceciow: flowers, fucceeded by clufters of large green fruit, iacloling furrowed russ of different fhapes and fizes in the varieties, ripening in September and October. Other two ipecies, called the nigra and alba, or black and wbite Virginian walnut, are alfo cultivated in this country, though they are lefs proper for fruit, having very fmall kernels.

Calture. All the forts are propagated by planting their nuts, which will grow in any common fiil. Tire nuts being procured in the proper feafon, in their outer covers or hulks if poffible, they fhould be prefersed in dry fand until February, and then plauted. After two years growth in the feed bed, they are to be taken out, and planted in the nurfery, where they muft remain till grown tive or fix feet high, when they mull be tranfplanted where they are finally to remain ; but if interaded for timber as well as fruit trees, they ought to be finally tranfplanted when they have attained the height of three or four feet.
Ufis. The fruit is ufed at two different flages of growth; when green to pickle, and when ripe to eat raw. As a pickle, the nuts may be ufed when about half or three-fourths grown, before the outer coat or fhell becomes hard; fuch nuts fhould be chofen as are moll free from fpecks, and for this purpofe they munt be gathered hy hand. Walnuts are ready for pickling in July and Augult. They are fully ripe in September and OAtober; and are then commonly beat dowa with long poles, efpecially on large trees; for as the walnuts grow mofly at the extremities of the branches, it would be troublefome and tedious to gather them by hand. As foon as gathered, lay them in heaps a few days to heat and freeat, to caufe their outer hufks, which adhere clofely, to feparate fion the fhell of the nats; th:n clean them from the rubbuth, and depofit them in fome dry room for ufe, covering them over clofe with diy fraw half a foot thick, and they will keep three or four months. They are always readily fold at market, efpecially in London; where, at their firlt coming in, they are fold with the hufkg on, by the fack or bufhel; but afterwards are bought clean, and fold botlt by meafure and by the thoufand. The wood of the walnut-tuee is alfo very valuable; not indeed where ftrength is neceffary, it being of a very brittle nature ; but the cabinet-makers and joners etteem it higlaly for feveral forts of houfeholl furniture and other light works; for heing beautifully veined, it takes a fine pol:h, and the more knotty it is, the more it is valued for particular purpofes. Walnuttrees are alfo well adapted for planting round the borders of orchards, where, by their lange fpreading leads, they will alfo guard the lefer fruit-trees from

Jugora boifterous winds. The kernels of the nuts are fimilar ing the plant in a marble mortar, and then by putting in quality to almonds; but are not like them ufed in medicine.

JUGORA, a confiderable province of Mufcovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are vely favage, and much of the fame difpofition with the Samoiedes.

JUGULAR, among anatomits, is applied to certain veins and glands of the neck. See Anatomy.

JUGULARES, in the Linnxan fyltem, is the name of an order or divifion of fifh, the general character of which is, that they have ventral fins before the pectoral fins. See Zoology.

JUGUM, an humiliating mode of punifhnent inflicted by the victorious Romans upon their vangquifhed enemies. It was thus: They fet up two fpears, and laying a third acrofs, in the form of a gallows, they ordered thofe who had furrendered themfelves to pafs under this igmominious erection, without arms or belts. None fuffered the difgrace of paffing fub jugo but fuch as had been obliged to furrender.

JUGURTHA, the illegitimate fon of Manaflabal the brother of Micipfa. Micipfa and Manaflabal were the fons of Mafnifla, king of Numidia. Micipfa, who had inherited his father's kingdom, educated his nephew with his two Cons Adherbal and Hiempfal ; but as he faw that the former was of th afpiring difpofition, he fent him with a body of troops to the affiftance of Scipio, who was befieging Numantia, hoping to lofe a youth whofe anbition feemed to threaten the tranquillity of his children. His hupes were fruftraied; Jugutha ftowed himfelf brave and active, and he endeared himfelf to the Roman geveral. Micipfa appointed him rucceffor to his kingdom with his two fons, but the kinduefs of the father proved fatal to the children. Jugartha deftroyed Hiempfal, and Itripped Adherbal of his poffeffions, and ohliged him to fly to Rome for fafety. The Romans liftened to the wellgrounded complaints of Adherbal ; but Jugurtha's gold prevailed among the fenators, and the fuppliant monarch, forfaken in his dilleefs, perifhed by the fnares of his $\epsilon$ nemy. Crecilius Metellus was at laft fent againf Jugurtha; and his firmnefs and fuccefs foon reduced the crafty Numidian, obliging him to fly among his favage neighbours for fupport. Marius and Sylla fucceerled Metellus, and fonght with equal fuccefs. Jugurtha was at laft betrayed by his father-in-law Bocchus, from whum he claimed affitance; and he was delivered into the hands of Sylla 106 years before the Chrifian era. He was expofed to the view of the Roman people, and diagged in chains to adorn the triumpl, of Marius. He was afterwards put in a prifon, where he died fix days after of hunger.

IVICA, or Yrica, the name of an ifland in the Mediterranean. See Irica.

IUICE, denotes the fap of vegetables, or the liquirs of animals. See Anaromy, Blood, Plants, SAP, \& Cc .

The juices of feveral plants are expreffed to obtain their effential falto, and for feveral medicinal parpofes, with intention either to be ufed without further preparation, or to be made into fyrups and extracts. The Teneral method of cxtracting thefe juices is, by pound-
liquor, which generally requires to be clarified, as we fhall foon obferve. The juices of all plants are not extiacled with equal eafe. Some plants, even when frefh, contain fo little juice, that water mult be added while they are pounded, otherwife fcarcely any juice would be sbtained by expreffion. Other plants which contain a confiderable quantity of juice, furnifh by expreffion but a fmall quantity of it, becaufe they contain alfo mucls mucilage, which renders the juice fo vifcid that it cannot flow. Watcr muft alfo be added to thefe plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly fpeaking, one of their principles, but rather a collection of all the proximate principles of plants which are foluble in water; fuch as the faponaceous extractive matter, the mucilage, the odoriferous principle, all the faline and faccharine fubitances; all which are diffolved in the water of the vegetation of the plants. Befides all thele matters, the juice contains fome part of the refinous fubllance, and the green colouring matter, which in almolt all vegetables is of a refinous nature. Thefe two latter fubftances, not being fuluble in water, are only interpoisd between the parts of the other principles which are diffolved in the juice, and confequenly difturbs its tranfparency. They neverthelefs adhere together in a certain degree, and fo ttrongly in molt juices, that they cannot be feparazed by filtration alone. When therefore thefe juices are to be clarified, fome previous preparations muft be ufed by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous; are fpontaneoully clarified by reft and gentle heat. The juices of molt antifcorbutic plants abounding in faline volatile principles, may be difpofed to filtration merely by immerfion in boiling water; and as they may bc contained in clofed bottles, while they are thus heated in a water-bath, their faline volatile part, in which their medicinal qualities chiefly confift, may thus be preferved. Fcrmentation is alfo an effectual method of clarifying juices which are fufceptible of it ; for all liquors which have fermented, clarify fpuntancoully afs ter fermentation. But this method is not ufed to clarify juices, becaule many of them are fufceptible of on. ly an imperfect fermentation, and becaufe the qualities of moft of them are injured by that procefs. The method of clarilication moit generally ufed, and indifpen. fably neceflary for thofe juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling watcr, and of uniting with mucilage, does accordingly, when added to the juice of plants, mite with, and coagulate their mucilage, and reparates it from the juice in form of feum, together with the greatelt part of the refinous and earthy matters which dillurb its tranfparency. And as any of thefe refitm ous matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may eafily be feparated by iiltration. See Filtration.

The juices, efpecially before they are clarified, contain almolt all the fame principles as the plant itfelf; becaule in the operation by which they are extracted,

## $\left.\begin{array}{llll}\text { J U } 1 & {[397}\end{array}\right] \quad$ J U I

no decompofition happens, but every thing remains, as to its nature, in the fame fate as in the plant. The principles contained in the juice are only feparated from the grofler oily, earthy, and refinous parts, which compote the fold matter that remains under the profs. Thefe juices, when well prepared, have therefore the fame medicinal qualities as the plants from which they are obtained. They mut evidently differ from each other as to the nature and proportions of the princeples with which they are impregnated, as much as the plants from which they are extracted differ from each other in thole reflects.

Moot vegetable juices coagulate when they are expoled to the air, whether they are drawn out of the plant by wounds, or naturally run out; though what is called naturally running out, is generally the effect of a wound in the plant, from a fort of canker, or forme other internal cause. Different parts of the fame plant yield different juices. The fame veins in their courfe through the different parts of the plant yield juices of a different appearance. Thus the juice in the root of the cow parfinep is of a brimstone colour ; but in the flak it is white.

Among tho fe juices of vegetables which are clammy and readily coagulate, there are forme which readily break with a whey. The great wild lettuce, with the fuel of opium, yields the greaten plenty of milky juice of any known British plant. When the Italk is wounded with a knife, the juice flows ready out like a thick cream, and is white and ropy; but if thee wounds are made at the top of the talks, the juice that flows out of them is dallied with a purple tinge, as if cream had been fprinkled over it willa few drops of red wine. Some little time after letting this out, it becomes much more purple, and thickens; and finally, the thicker part of it feparates, and the thin whey swims at top. The whey or thin part of this separated matter is eafily preffed out from the curd by fqueczing between the fingers, and the curd will then remain white; and on walling with water, it becomes like rags. The purple whey (for in this is contained all the colour) ion dries into a purple cake, and may be crumbled between the fingers into a powder of the fame colour. The white curd being dried and kept for forme time, becomes hard and brittle. It breaks with a timing Surface like refine, and is inflammable; taking fire at a candle, and burning all away with a flong flame. The fane thick part being held over a gentle heat, will draw out into tough long threads, meling like wax. The purple cake made from the whey is quite different from this; and when held to a candle farce flames at all, but burns to a black coal. The whole virtue of the plant feems alfo to confift in this thing part of its juice: for the coagulum or curd, though looking like wax or refine, has no tate at all; whereas the purple cake made from the forum is extremely bitter, and of a tate fomewhat refembling that of opium.

Of the fame kind with the wild lettuce are the throatwort, fpurge, and many other plants. . There are ail replete with a milky juice which feparates into curds and whey like that already defribed. But this, though a common law of nature, is not univerfal; for there are many plants which yield the like milky juices without any feparation enfuing upon their exisavafation. The white juice of the fonchus never fethe heads or capfuls of feed bleed not lets freely than the reft of the plant, even after the flower is fallen. This juice, on being received into a fell or other frail veffel, foo changes its white $t 0$ a deep yellow colour. and dries it into a cake which rems refinous and oily, but no whey feparates from it. The tragopogon, or goat's beard, when wounded, bleeds freely a milky juice; it is at frt white, but becomes immediately yellow, and then more and more red, till at length it is wholly of a duffy red. It never fiparatcs, hut dries together into one cake; and is oily and refinour, but of an infipid tate. The great bindweed aldo bleeds freely a white juice; the flowers, as well as the flanks and leaves, affording this liquor. It is of a harp table ; and as many of the purging plants are of this class, i: would be worth trying whether this milk is not purgative.

There juices, as well as the generality of others which bleed from plants, are white like milk; but there are fine of other colours. The juice of the great celandine is of a fine yellow colour ; it flows from the plant of the thicknefs of cream, and from dries into a hard cake, without any whey leparating from it. Another yellow juice is yitlded by the feedveffels of the yellow centaury in the month of Jul? when the feeds are full grown. This is very clammy: ; it foo hardens altogether into a cake without any whey feparating from it. It ticks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than foft wax if dried in the fade; but if laid in the fun, it immediately becomes hard like rein. 'Clue cakes burn like wax, and emit a very pleafant fuel. The great angelica aldo yields a yel. lowish juice on being wounded; and this will not larden at all, but if kept feveral years will till be fort and clammy, drawing out into threads or half melted refine.

Another kind of juices very different from all thefe, are thole of a gummy nature. Some of there remain liquid a long time, and are not to be dried without the affiflance of heat ; the others very quickly harden: of themfelves, and are not inflammable. The guin af the juice of rhubard-leaves foot hardens; and is afterwards fuluble in common water, and fparkles when pot into the flame of a candle. The clutters of the common honeysuckle are full of a liquid'gurn. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the pos folis are all terminated by large bladders of a thin watery fluid. This is alfo a liquid gum ; it flicks to the fingers, draws out into long threads; and flands the force of the fun all day.. In the centre of each of the le dew drops there is a fall red bladder, which thanes immediately on the fummit of the red hair, and contans a purple juice which may be fqueezed out of it. The pinguicula, or butter-woft, has aldo a gummy matter on iss leaves in much greater quantity than the nos Solis.

Some plants yield juices which are manifefly of an oily nature. Thee, when rubbed, are not at all of a clammy nature, but make the fingers glib ard slippery, and do not all harden on being expofed to the air. If the talk of elecampane be wounded, there flows

## T U I

out an olly juice fwimming upon a watery one. The Atalks of the hemlock allo afford a fimilar oily liquor fwimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog berry tree, and the fruit of the olive, when wounded, flow their oil floating on the watery juice. Some of thefe oily juices, however, harden into a kind of refin. Our ivy yields fuch a jaice very abundantly ; and the juice of the fmall parple-berried juniper is of the fame kind, being hard and fat, and not very gum. my. If the bark of the common iry is wounded in March, there will ooze out a tough and greafy matter of a yellowifh colour, which, taken up between 'ie fingers, feels not at all gummy or fticking, but melts in handling into a foit of oil, which in procefs of time hardens and crufts upon the wounds, and looks like brown furar. It burns with a lating flame, and fmells very llrong. The tops of the wild lettace, and the leaves growing near the tops, if examined with a magnifying glafs, thow a great number of fmall bladders or drops of an nily juice of a brownith colour, hardening into a kind of refin; they are eafily wiped off when of any fize, and are truly an oily juice a little hardened. It is probable allo, that the fine blue flour or powder, cailed the bloom, upon the furface of our common plums, is no other than fuch an oily juice exfudating from their pores in fmall particles, and hardening into $z$ fort of refin.

JUJUBES, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnaxus makes a fpecies of thamus. See Rhamnus.
The jujubes have been made a general ingredient in pectoral decoctions; but they are now feldom ufed on thefe occafions, and are fcarce at all heard of is prefcription, or to be met with in our hops.
JUL, or JoL, a Gothic word fignifying a "fump. quous treat ;" and particularly applied to a religions feftival firlt among the heathens and afterwards amnng Chriflians. By the latter it was given to Christmas; which is Rill known under the nime of Iul , or Yaol, in Denmark, Norway, Iceland, and siweden; nay, even in the north of Britain, and whence the month of Januarius by the Saxnns was flyled Giuli, i.e. "the Fer. tival." As this feaft had originally been dedicated by our heathen anceflors to the fun, their fupreme deity; fo the Chritians, for the purpofe of engaging the minds of their Ethnic (gentile) brethren, ordered it flould be celebrated in memory of the birth of Chrift : and thus it has been through ages a fealt of joy and entertzinment. We are indebted to Procopius for the firt account of this fealt.

JULEP, in pharmacy, a medicine compofed of fome proper liquor and a fyrup or fugar, of extemporaneous preparation, without decoetion. Sce Pharmacy.

JULIAN, the famous Roman emperor, fyled the Apofate, becaufe he profefed the Chriftian religion before he afcended the throne, but afterwards openly embraced Paganifm, and endeavourcd to abolifh Chriftianity. He made no ufe of violence, hovever, for this purpofe; for he knew that vislent meafures had nlways rendered it more flourihing: he therefore behaved wils a politic mildnefs to the Chritians; recailed all who had been banifhed on account of religion tunder the reign of Conflantius; and undeatook to per-
vert them by his carefles, and by temporal advantages fuliz and mortifications covered over by artful pretences: but he forbad Chriltians to plead before 'courts of jurtice, or to enjoy any public employments. He even prohibited their teaching polite iteratnre; well kunwing the great advantages they drew from profane autthers in their attacks upon Paganifn and irreligior. Though he on all occafions thowed a fovereign contempi for the Chriltians, whom he always called Galileans. yet he was fenfibie of the advantage they obtained by their vitue and the purity of their manners; and tberefore iuceffiantly propofed their example to the Pagan prielts. At latt, however, when he found that all other methods failed, he gave public employments to the molt cruel enemies of the Chrilians, when the cities in moft of the provinces were filled with tumults and feditions, and many of them were put to death: Though it has been pleaded by Julian's apologits, that the behavicur of the Chrittians furnifhed fufficient pretence for moot of his proceedings againt them, and the auimofities among themfelves furnifhed him with the means; that they were continually prone to fedition, and made a merit of infulting the public worthip; and, finally, that they made no feruple of declaring, that want of numbers alone prevented them from engaging in an open rebellion. Hiftorians mention, that Julian attempted to prave the falfeliood of our Lord's prediction with refpect to the temple of Jerufalem; and refolved to have that edifice rebuilt by che Jews, about 300 years after its deftruction by Titus: but all their endeavours ferved only the more perfectly to verify what had been foretold by Jefus Chritt; for the Jews, who had affembled froin all parts to Jerufalem, digging the foundations, flames of fire burft forth and confumed the workmen*. However, the Jews, who *See ? were obitinately bent on accomplifhing that work, ruy/dem made feveral attempts ; but it is faid, that all who endeavoured to lay the foundations perifhed by thefe flames, which at latt obliged them entirely to abandon the work. Julian being mortally wounded in a battle with the Perfians, it is faid, that he then catched in his hand fome of the blood which fowed from his wound; and throwing it towards heaven, cried, "Thon Galilean haft conquered." But notvithftanding this popular report, Thendoret relatcs, that Julian difcovered a different difpofition; and employed his lait moments in converfing with Maximus the philofnpher, on the dignity of the foul. He died the following night, aged 32. For a particular account of his reign and exploits, fee (Hifory of) Constantinople, $\mathrm{n}^{\circ} 7$. 33-66
No prince was ever more differently reprefented by d: Werent authors ; on which account it is difficult to form a true judgment of his real character. It muft, however, be acknowledged. that he was learned, liberal, temperate, brave, vigilant, and a lover of juAlice: but, on the other hand, he had apoftatifed to Paganifm ; was an euemy to the Chrillian religion: and war, in fat, a perfecutor, though not of the molt fanguinary clafs. We have feveral of his difcourfes or orations; fome of his letrers ; a treatife intitled $M$ ifupogon, which is a fatire on the inhabitants of Antioch; and fome other pieces, all written in an elegant tyle. They were publifhed in Greek and Latin by father Petau in 1630 is quarto; and of which
 Spanheimius gave a fine edition in folio in 1696 . His moft famous work was that compofed againit the Chrillians, of which there are fome fragmeats in Cy ril's refutation of it.

Yev an Period, in chronology, a period fo cailed, as being adapted to the Julian year.

It is made to comrence 'refore the creation of the world. Its priscipal advantage lies here, that the \{ane years of the cycles of the fun, moon, and indicsion, of which three cycles it was made to mnfilt hy IV feph Scaliger in 1580 , belonging to any year of this ptriod, will never fall together again till after the expiration of 7980 years. There is taken for the firlt year of this period that which hath the firt of the escle of the fun, thie firlt of the cycle of the moon, and the firtt of the indistion cycle, aud fo reckoning on.

The firft year of the Chrifian era is always, in our fyilems of chronology, the $4714^{\text {th }}$ of the Julian perino.

To tind what year of the Julian period any given year of Clurift aniwers to: To the given year of Clirit add 4713 , hecaufe fo many years of the Julian period were expired A. D. $t$; and the fum gives the year of the Julian period fought.
On the contrary, having the year of the Jnlian period gime to find what year of Cliriी anfwers thereto: From the year of the Julian period given fubtract $4 i 13$, and the remainder will be the year fought.

Julian (St), a harbour on the fouth of Patagonia, in South America, where fhips ufuelly touch that are bound to the fouth feas. S. Lat. 48. 15 .

JULIERS, a duchy in the circle of Wettphalia, in Germany, feated between the rivers Maefe and Rhine, and bounded by Puffian Guelderland on the north, by the electorate of Triers on the fouth, by the electorate of Cologrie on the eall, and by the Netherlands on the weft. It is about 60 miles long, and 30 broad; and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well fupplied with wood; but it is moft remarkable for a fine bretd of horfes, and woad for dying, which is gathered here in abundance. The chief towns are Juliers, Aix-laChapelle. Duren, Munfler-Eiffl, Bedbur, WefinBurgh, and Lafieren. It is fubje हt to the elector Palatine, with the confert of the kings of Piuflia and Puland.

Juliers, a city, capital of the duchy of Juliers in Wellphalia; fome think this city was founded by JuIius Cerfar or Julia Agrippina; but this is much queAioned by cthers, becaufe it is not mentioned before Antoninus's Itinerary and Theodofius's Tables. The town is fmall but well fortified, and neatly built ; the boufes are of brick, and the flreets broad and regular. The citadel is large and very ftrong, containing a palace of the-ancient dukes, and a fpacious piazza. In the fuburbs there is a monat!ery of Carthulians, nobly endowed by feveral dukes of Juliers. The town is but poorly inhabited, theugh they have a fine woolIen manufactory in this country, and likewife another of linen. It was taken by prince Maurice of Naffau in 1610 , and by the Spaniards in 1622 . It is feated en the river Roer, it E Long. 6. 35. N. Lat. 50.55 . jUlio ronaho. See Romano.

julius casar. See Casar.
Jurius II. (Julian de la Rovere), pope, renarkable for his warlike difpofition, and his political negociations: by the latter, he engaged the priacipal powers of Europe to league with him againtt the republic of Venice, called the League of Cambray, fignitied in 1503. The Venetians having purchafed peace by the ceffion of part of Romania, Julius tund his arms againt Louis XII. king of France, and apprared in perfon, armed capa-pee, at the fitge of Mirandola; which place he took by affault in 151 f . Rut proceeding to excommunicate Louis, the king wifely turned his own weapons againft him, by calling a general council at Pifa: at which the pope refufing to appear, was declared to be fufpended from the holy fee; and Louts, in his turn, excommunicated the pope, who dicd foon after in 5512 . He built the fannous church of St Peter at Rome, and was a patron of the polite arts.

Juerus ITicus (anc. geog.), a town of the Nemetes in Gallia Belgica; filuated between the Tres 'Tabernae and Noviomagus. Now Germerbein, a town of the Lower Palatinate, on the wett fide of the Rhinc. E. Long. 8. 15. Lat. 49. 12.

Tulies Pollua:. See Pollux.
IULUS, a fon of Afcanius, born in Lavinium. In the fucceffion to the kingdom of Alba, AEneas Sylvius, the for of eneas and lavinia, was preferred to himi. He was, however, made chief pricfl.

Iulus, in zoology; a genus of infects of the order aptera. The fect are very nunierous, being on each fide twice as many as the fergments of the body; the antennx are moniliform; there are two articulated palpi; and the body is of a femicylindrical form. r. The terreftris is a fmall $\int_{\text {pecies, }}$ having on each fide 100 very fhort clofely fet feet. The body is cyliudrically mond, confiling of foity fegments, each of which gives rife to two pair of feet; by which means the feet fland two and two by the fide of each other, fo that between every two there is a little more fpace. Its colour is blackifh, and the aninal is very finooth. It is met with under flones, and in the earth. 2. The fabulofus is of an aften colour, fmooth, and fomctimes has two longitudinal bands of a duncolour upen its back. The body is compored of about fixty fegments, which appear double: one part of the fegment being quite fmooth, the other charged with longitudinal ftrize very clofe-fet together, which caufes the cylindric body of the infect to apprar interfected alternately with fmooth and flriated fegments. Each fegment gives rife to two pair of fett, which makes 240 , or 120 feet on each fide. 'Thefe feet are flender, fhort, and white. The antenna are very fhort, and confift of five rings. The infest, when louched, rolls itfelf up into a fpiral; fo that its feet are inwards, but yet turned towalds the ground. It is found together with the preceding one, to which it bears a refemblance, though it is much larger. There are 10 other fpecies.

JULY, the feventh month of the year: during which the fun enters the lign Leo. The word is derived from the Latin $\wp$ fulius, the furname of C . Crefar the dictator, who was born in it. Mark Autuny firls gave this month the name ofuly, which before was cal!ed 2 uintilius, as being the lifth month of the year in

Iu'y the oid Roman kalenciar elablifhed by Romulus, which began ia the month of March. For the fame reafon, Avguft was called Sextilis; and September, October, November, and December, ftill retain the name of their firit tank.

且ue fequitur, numero turlia notata fuo. Ovid. Fal.
On the 1 gth day of this month the dog-days are commonly luppofed to begin; when, according to Hippocrates and Pliny, the Sea boils, wine turns four, dogs go mad, the bile is increaftel and irritated, and all animals decline and languifh.

Folz-Floners. See ihanthus.
IUMilege, a town of Norman'ly in France, and in the terriony of Caux, with a celcbrated Benedictine abbey. It is feated on the river Seine, in E . Long. O.55. N. Lat. 49.25 .

JUNCI LAPIDEI, in natural hiftory, the name given by authors to a fpecies of fofile coral, of the tubulasia kind, and compored of a congeries of finall tubules, which are ufully round and ftriated within. See llate CC.

JUNCTURE, any joint or clofing of two bodies. See Joint.

Juncture, in cratory, is a part of compofition, particularly recommended by Quintilan and denotes fuch an attention to the nature of the vosels, confonants, and fyllables, in the connection of words, with regard to their found, as will render the pronunciation most eafy and pleafant, and belt promote the harmony of the fentace. Thus the coalition of two vowels, occafioning an hollow and obfcure found, and likewife of fome confonants, sendering it harfi and rough, trould be avoided: nor fhould the fame fyllable be repeated at the beginning and end of words, becaufe the found becomes hercby harfh and unpleafant. The following verfe in Virgil's Rncid is an example of junčure.

Arma virumque cano, Troja qui primus ab oris.
JUNCUS, the rush, in botany: A genus of the monogynia order belonging to the hexandria clals of plants; and in the natural method ranking under the 5th order, Tripeletoidece. The calyx is hexaphyllous; there is no corolla; the capfule is unilocular. There are many fpecies which ale univerfally known, being very troublefome weeds, and difficult to be eradicated. The pith of two kinds, called the conglomeratus and efufus, or round-lieaded and foft rumes, are

- See Rub.
$\boldsymbol{z}_{\text {ights }}$. ufed for wicks to lamps and rufh-ligbts*. The conglomeratus, and aculus or marine rufl2, are planted with great care on the banks of the fea in Holland, in order to prevent the water from walhing away the earth; which would otherwife be removed every tide, if it were not for the routs of thofe rulhes, which fatten very deep in the ground, and mat themfelves near the furface in fuch a manner as to hold the earth clofely together. Thecrefore, whenever the intrabitants percetve that the roots of thefe rufhes are deltroyed, they are very affiduous in repairing them. In the fummer time when the rufhes are fully grown, they are cut and tied up in bundks, which are dried, and afterwards carried into the larger towns and cities, where they are wrought into bafkets, and feveral uther ufeful things, which are frequently fent intu England. Thefe forts do not grow fo flrong in this country as on $\mathrm{NO}^{17}{ }^{2}$
the Maefe, where they ometimes arrive af the height of four feet and upwards.
A fpecies of rufh termed jurcus odoratus, "fweet rufh, or camel's hay," is fometimes brought to us from Turkey and Arabia, tied up in bundles sbout a foot long. The Aalk, in fhape and colour, fonewhat refembles a barley. ftraw; it is full of fungous pith like that of our conimon rufles: the leaves are like thofe of wheat, and furround the falk with feveral cuats, as in the reed. The flowers are of a carnation colour, ifriped with a lighter purple. The whole plant, when in perfection, has a het, bitterifh, not unplafant, aromatic talte, and a very fragrant imell: by long keeping it lofes greatly its aromatic flavour. Diftilled with water, it yields a confiderable quantity of an cflential oil. It was formerly often ufed in medicine as an aromatic, and in obltructions of the vifcera, \&cc. but is very little employed at prefent.
JUNE, the fixth month of the year, during which the fun enters the fign of Cancer. The word comes from the latin $7^{\prime}$ unius, which fome derive it $y_{\text {unone }}$ Ovid, in the 6th of his Fufti, makes the goddefs 「ay, Funius is noffro nomine nomen buber.
Others rather derive it $\grave{j}$ junioribus, this being for young people as the month of May was for old ones.

Yunius efl juvenum; qui fuit antè finum.
In this month is the fummer follitice.
JUNGERMANNIA, in botany: A genus of the matural order of algre, belonging to the cryptogamia clafs of plants. The male fower is peduculated, and naked; the anthera quadrivalved: the female flower is feffile, naked, with roundifu feeds. There are 29 fpecies, all uatives of Britain, growing in woods, hady places, by the fides of ditches, \&c. Many of them are beautiful ohjects for the microfcope.

JUNGIA, in botany: A genus of the polygamia fegregata order, belonging to the fyngenefia clafs of plants; the common receptacle is ciafly ; the perianthium three flowered; the florets tulular, two-lipped; the exterior lipligulate; the interior one bipartite.
jUNIPERUS, the juniper tree: A genus of the monodelphia order, belonging to the monuccia clars of plants; and in the natural method ranking under the 5 at order, Conferis. The male amentum is in calyx of feales ; there is no corolla; three Itamina : the female calyx tripartite ; there are three petals; and as many dyles; the berry is trifpermous, and equal by means of three tubercles of the indurated calyx adhering to it.

Species. 1. The communis, or common juniper, grows naturally in many parts of Britain upon dry barren commons, whese it feldom rifes above the height of a low flrub. Mr Evelyn aflures us, that " the juniper, though naturally of the growth of England, is very little known in many parts of the country: for it grows naturally ouly in dry, chalky, or fandy land; anc, where the foil is oppofite to this, the plant is rareiy found. Thufe who have been ufed to fee it in its wild ftate, on fandy barren commons, \&c. will have little inducement to plant it ; as there they will fee it procumbent, feldom thowing a tendency to afpire: but when planted in a qood foil, it will aife to the height of 15 or 16 feet, and produce numerous branches from
perus. the bottom to the top, forming a well-looking buthy plant. Thefe branches are exceeding tough, and covered with a fmooth bark of a reddifh colour, having a tinge of purple. The leaves are narrow and fharppointed, growing by threes on the branches: their upper furface has a greyifh freak down the middle; but their under furface is of a fine green colour, and they garnifh the flrub in great plenty. The flowers are fmall, and of a yellowifh colour. They are fucceeded by the berries, which are of a bluifh colour when ripe." Of this fpecies there is a varicty called Swedifh juniper, which grows 10 or 12 feet high, very branchy the whole length, with the branches growing more erect, and leaves, flowers, and fruit, like the former. But Mr Miller affirms the Swedifh juniper to be a diftinct fpecies. A proftrate and very dwarfifh variety is mentioned by Mr Lightfoot, under the name of dwarf Alpine juniper. It is frequently found in the mountains in the Highlands of Scotland, and has broader and thicker leaves than the former; the berries are alfo larger, or more oval than fpherical. 2. The oxycedrus, or Spanifh juniper, rifes from 10 to 15 fect high, clofely branched from bottom to top; having fhort, awl-fhaped, fpreading leaves by threes, and fmall diœccious flowers, fucceeded by large reddifh-brown berries. 3. The thurifera, or blue-berried Spanifh juniper, grows 20 feet high or more, branching in a conic form, with acute imbricated leaves growing by fours, and findll dicecious flowers, fucceeded by large blue flowers. 4. The Virginiana, or Virginia cedar, grows 30 or 40 feet high, branching from bottom to top in a conic manner, fmall leaves by threes adhering at their bale; the younger ones imbricated, and the old ones fpreading; with dicecious flowers, fucceeded by fmall blue berries. 5. The Lycia, Lycian cedar, or olibanum tree, grows 20 feet high, branching erect; garnifhed with fmall obtufe oval leaves, every-where imbricated; having diœcious flowers, fucceeded by large oval brown berries. It is a native of Spain and Italy. 6. The Pbavicia, or Phenician cedar, grows about 20 feet high, branching pyramidally ; adorned with ternate and imbricated obtufe leaves; and dice. cious flowers, fucceeded by fmall yellowith berries. It is a native of Portugal. 7. The Bermudiana, or Bermudian cedar, grows 20 or 30 feet high, has fmall acute leaves by threes below, the upper ones awlflaped, acute, and decurrent, by pairs or fours, fpreading outward, and diœcious flowers, fucceeded by purplim berries. It is a native of Bermudas. 8. The Salina, or fasin tree; of which there are the following varieties, viz. fpreading, upright, and variegated favin. The firt grows three or four feet high, with horizontal and very fpreading branclice; with hoort, pointed, decurrent, erect, oppofite leaves; and dicecious flowers, fucceeded by bluifh berries, but very rarely producing eithes flowers or fruit. The fecond grows eight or ten feet high, with upright branches, dark-green leaves like the former, and dioccious flowers, fucceeded by plenty of berries. The third has the ends of many of the fhoots and young branches variegated with white, and the leaves finely Ariped; fo that it makes a beautiful appearance. There are two other fpecies; the Barbadenfis, with leaves all imbricated fourways, the younger ones ovate, the clder acute; and the Clinenfis, with leaves decurrent imbricate-expandVoz. 1X. Part II.
ing crowded, the ftem-leaves threcfold, the branch- Juniperus. lcaves fourfold.

Culture. The propagation of all the junipers is by feed, and of the favins by layers and cuttings; but thefe laft may alfo be raifed from the berries, if they can be procured. They may all be fowed in beds of common light earth; except the cedar of Bermudas, which mult be fowed in pots, to have helter in winter. When the hardy kinds have had two or three years growth in the feed.bed, they may be planted out in autumn or in fpring, in nurfery-rows two feet afun. der, there to remain till of due fize for final tranfplantation into the fhrubbery. The Bermudas cedar muit be fheltered under a frame for the firlt year or two ; when they muft be Separated into fmall pots, to be fheltered alfo in winter for three or four years, till they have acquired fome fize and ftrength; then turned out into pots in the full ground, where they are to remain in a warm fituation; theugh a thelter of mats for the firt winter or two during bard frofts will be of great fervice. The feafon for tranfplanting all the forts is either in autumn, Oetober, or November, or in March, and early in April.

Ufes, \&cc. Juniper-berries have a ftrong, not difagreeable fmell; and a warm, pungent, fweet tafte; which, if they are long chewed, or previounly well bruifed, is followed by a bitterifh one. The pungency feems to refide in the bark; the fweet in the juice; the aromatic flavour in oily veficles fpread through the fubftance of the pulp, and diftinguifhable even by the eye; and the bitter in the feeds. The frefl berries yield, on expreffion, a rich, fweet, honcy-like aromatic juice; if previoully pounded fo as to break the feeds, the juice proves tart and bitter. - Thefe berries are ufeful carminatives and fomachics: for thefe purpofes a fpirituous water and effential oil are prepared from them, and they are alfo ingredients in various medicines. The liquor remaining after the diftillation of the oil paffed through a Arainer, and gently cxhaled to the confiftence of a rob, proves likewife a medicine of great utility, and in many cafes is perhaps preferable to the oil or the berry itfelf. Hoffman is exprefsly of this opinion, and recommends the rob of juniper in debility of the fomach and inteftines; and fays it is particularly ferviceable to old people who are fubject to thefe diforders, or labour under a difficulty with regard to the urinary fecretion. This rob is of a dark brownifh-yellow colour, a balfamic fweet tafte, with a little of the bitter, more or lefs according as the feeds in the berry have been more or lefs bruifed. But perhaps one of the beft forms under which they can be ufed is that of a fimple watery infufion. This, either by itfelf or with the addition of a fmall quantity of gin, is a very ufeful drink for hydropic patients. An infufion of the tops has alfo been advantageoully employed in the fame manner. The Swedes prepare an extract from the berries, probably of the nature of the rob above mentioned, which fome cat for breakfalt. In Germany the berries are bruifed and put into the fauce made ufe of for a wild boar; and are frequently alfo eaten with other pork, to give it a vild-boar flavour. In Carniola, and fome other diftricts, the inhabitanto make a kind of wine of them fteeped in water; but it is difficult to prevent this liquor from growing four. The Laplanders, as we are told by Linnrus, drink
$3 E$
infulions

Juniu. infulinns of the juniper berries as wre do tea and coffee. Thrufhes and grous feed on the berries, and difeminate the feed in their dung. It is remarkable that the berries of the juniper are two years in ripening. They fometines appert it an uncommon form ; the leaves of the cup grow donele the ufual fize, approachine, but not cloling : and the three petais fit exactly ciofe, fo as to ktep the air from the sipule jumperi which inhabit them. - The whole plant has a Atrong aromatic finell. The wood when burnt emits a fragrant odour like incenle. It is of a roddifi colour, very hard and duratle ; and when large enough, is ufed in marquetry and veneering, and in naking cups, cabinets, \&c. Grals will not grow bereath juniper, but this tree itfolf is fitid to be deftroyed by the meadow oat. The oil of juniper mised with that of nuts makes an excellent varnifi for pietures, wood work, and preferving fron from rulting. The efin powdered and rubbed into paper prevents the ink from linking through it, for which it is freguently ufed under the nane of Porner.-The charcual made from this woud endures longer than any other, infomuch that live embers are faid to have been found in the alhes after being a year covered. - Fur the properties of fome other fecies, see the articles Sandaxach (Gum), and OlibaN:":

JUNIUS (Adian), one of the mos iearmed men of the age in which he lived, was born at Hurn in Hoiland in $151 \%$. He travelled into all parts of Essrope, and pravired phytic with reputation in Ensland; where, among voler works, he compoled a Greck any Latin Lexicon, in which he added above 6500 words: an lepithalumium on the mariage of queen Mary with king Philip of Spain; and Ahnimolver fa © d Coma Commentariur, which is the mult applauded of all his works. He died in 1575.

Juvius (Francis), profulor of divinity at Leyden, was born at Buorges in 1545, of a noble family, and fudied fome time at Liyous. Barthelomew Ancau, who was pincipal of the c silegre in that city, gave him excellent infuctions with regard to the right method of fudying. He was remarkahte for being pronf againft all temptations to lewduefs; but a libertine fo far overpowered him by his fophiftry, that he ma? him an atheif: husvever, he fwon returned to his filf faith; and, everfe as he "is to mulawful love, he had no averfion to matrinnoy, but was married wo lefs than four times. He wa.i employed in public affairs l,y Hemry IV.; and at laft was invited to Leyden to be profeffor of divinity, which employment he difcharged with honour, till be was fnatched away by the plague in 1602. Du Pin fays, he was a learned and judicious critic. He wrote, in conjunetion with Emmanuel Tremellius, a Latin verfinn of the Hebrew teat of the Bible. He alfo publifhed Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

Junius (Francis), or Francis du Fon, the fon of the preceding, was born at Heidelberg in 1589 . He at firlt defigned to devoie himfelf to a military life; but after the truce concluded in 1609 , he applied himfelf entirely to fudy. He came to England in 1620, and lived 30 years in the earl of Arundel's family. He was greatly ettemed not only for his profourd ertadition, but alfo for the purity of his manners; and was

402 J J U N
fo paffionately fond of the ftudy of the northern lan. guares, that, being info:med there were fome villages in Friefland where the ancient language of the Saxois was preferved, he went and lived two years in that country. He returned to Ensland in 1675 ; and after fpending a year at Oxford, retired to Windfor, in order to vifit Voffus, at whofe houfe be died in 677. The univerfity of Oxford, to which he bequeathed his manufcripts, erected a very handfome monument to his memory. He wrote, 1. De Piaura Peterum, which is admired by all the learned; the belt edition of it is that of Rotterdam in $169+$. He publaflied the fame work at Lonndon in Englifh. 2. An explication of the old Gothic manuleript, "called the Silver one, becaufe the four Golpels are there written in filver Gothic letters ; this was publefzed with notes by 'Thomas Marefchall, or Marflat. 3. A large Commentary on the Harmony of the four Gofpels by Tatian, which is flill in manufeript. + A Glofiary in five languages, in worch he explaine the origin of the Northern languares: publoneed at Oxford in 1745 , in folio, by Mr Edward Lee.

J(JNK, in fea-language, a name given to any remnants or pieces of old cable, whicin is utially cut into fmall pentions, for the pu pofe of making puinte, matta, gafkets, femit, Sic.

JUivo, in pagan workhip, was the fitter and wife of fopiter, and the goddefs of kingdoms and tiches; and alfo ityted the queen of heaven: the prefided over marriage and child birth, and was reprefented as the daughter of Saturn and Rlsea. She married Jupiter; b it was sut the moft compinant wife: for. according to Homer, that got wä fometimes obliged to make ufe of all his amhority to keep her in due fubjection; and the fame author obferves, that on her entering into a con!piracy aşain! him, he punifhed her by lulp ading her in the air with $t$ so anvils faftened to her feet, and golden manacles on her hands, which all the other deities lnoked on without a poffibility of helping her. However, her icaloufy made her frequeatly find oppor:tanities of interrapting her haband in the cuarle of his amours: and prompted her to punith with unrclenting fury Europa, Semele, In, Latona, and the rell of his mitrefies. Jupiter himfelf having conceived without any comnerce with a female, Juna, in revenge, conceived Vulcan by the wiad, Mars by touchiner a lluwer pninted uut to her by the goddefs Flora, and Hebe by eating greedily of letures.

Juno, as the queen of heaven, preferved great Atate: her ufual attendants were Terror and L. lunefs, Canor, Pollux, and 14 nymphs; but her moll faithful attendant was the beautiful Iris, or the rainbow. Homer deferibes her in a chariot adorned with precions ftones, the wheels of which were of ebony, and which was drawn by horfes with reins of gold. Bat the is mure commonly painted drawn by peacocks. She was reprefented in her temple at Corinth, feated on a throne, with a crown on her head, a pomegranate in one hand, an 1 in the other a fceptre with a cuckoo on its top, This itatue was of gold and ivory.

Some mythologitts fuppofe that Juno fignifies the air: others, that the was the Egyptian Jis; who being reprefented under various figures, was by the Greeks and Romans repreiented as fo many diftinct deities.
onalis JUNONALIA, a felival obferved by the Romans in honour of Juno. It was inflituted on account of certain prodigies that happened in Italy, and was celebrated by matrons. In the folemnity two white cows were led from the temple of Apollo into the city thro' the gate called Carmentulis, and two images of Juno, made of cyprefs, were born in proceffion. Then marched 27 girls, habited in long robes, finging an hymn to the goddefs; then -came the Decemviri, crowned with laurel, in velments edged withipurple. This pompous company, going through the Vicus Jugarius, had a dance in the great field of Rome; from thence they proceeded through the Foriam Boarium to the temple of Juno, where the victims were facrificed by the Decenviri, and the cyprefs images were left tlanding. This feftival is not mentioned in the fafli of O . vid, but is fully defcribed by Livy, lib. 7. dec. 3. The hymn ufed upon the occation was compofed by Livius the pret.

JUNTO, in matters of government, denotes a felect council for taking cognizance of affairs of great confequence, which require fecrecy.

In Spain and Portugal, it lignifies much the fame with convertion, affembly, or board among us: thus we meet with the junto of the three eftates, of commerce, of tobacco, \&cc. Ste Board, \&c.

IVORY, in natural hiftory, \&c. a hard, folid, and firm fubftance, of a white colour. and capalle of a very good polifh. It is the tufis of the elephant *; and is hollow from the bafe to a certain height, the cavity being filled up with a compact niedullary fubitance, feeming to have a great number of glands in it. It is oblerved, that the Ceylon ivory, and that of the ifland of Aeliem, do not become yellow in the wearing, as all other ivory does; for this reafon the teeth of thele places bear a larger price than thofe of the coaftof Guinea. Hardering, Softetring, and Staintig, of Ivorr. See Bones and Hozns.

JUPITER, the fupreme god of the ancient pagans. The theologits, according to Cicero, reckoned up three Jupiters; the filft and fecond of whom were born in Arcadia; of thefe two, thie one fprang from Ether, the other from Coclus. The third Jupiter was the fon of Saturn, and born in Crete, whene they pretended to fhow his fepulchre. Cicero in other places fpeaks of feveral Jupiters who reigned in different comntrics. The Jupiter, by whom the poets and divines undertand the fupreme god, was the fon of Saturn king of Crete. He would have been deveured by his father as foon as born, had not his motber Rhea fubtituted a flone infead of the child, which Saturn immediately fwallowed. Saturn took this method to deftroy all his male, children, becaule it had been foretold by Coelus and Terra, that one of his fons thould deprive him of his kingdom. Jupiter, being thus faved from his father's jaws, was brought up by the Curetes in a den on mount Ida. Virgil tells us, that lie was fed by the bees; ont of gratitude for which, he changed thicm from an iron to a golden colour. Some fay, that his nurfes were A malthea and Meliffa, who gave him goats milk and honey; and others, that Amalthrea was the name of the goat which nourifned him, and which, as a reward fur her great fervices, was changed into a conftellation. Aecording to others, he was fed by wild pigeons, who brought
him ambrofia from Occanus; and by an eagle, who Jupiter. carried neetar in his beak from a lleep rock: for which he rewarded the former, by making them the foretellers of winter and fummer: and the lat by giving him immortality, and making him his thunderbearer. When grown up, he drove his father out of heaven, and divided the empire of the world with his hrothers. For limfelf, he had heaven and earth. Neptune lad the fea and waters; and Pluto hell. The Titans undertook to deftroy Jupiter, as he had done his father. Thefe Titans were giants, the fons of Titan and the Earth. They deelared war againt Jupiter, and heaped mountains upon mountains, in order to fale heaven : but their efforts were unfuccefsful. Jupiter overthrew them with his thunder, and fhut them up under the waters and mountains, from which they were not able to get out.
Jupiter had feveral wives: the firf of whom, named Mectis, he is faid to have devoured when big with eliild, by which he himfelf became pregnant ; and Minerva iffued out of his head, completely armed and fully grown. His feeond was Themis ; the name of his third is not known ; his fourth was the celebrated Juno, whom he deccived under the form of a cuckoo, which to fhun the violence of a florm fid for fhelier to her lap. He was the father of the Mufes and Graces; and had a prodigions number of children by his miftrefles. He metamorphofed himelf into a fatyr to enjoy Antiope; into a bull, to carry off Europa; into a fiwan, to abufe Leda; into a fhower of gold, to corrupt Danäe; and into feveral other forms to gratify his paifions. He had Bacchus by Semele, Diana and Apollo by Latona, and was the father of Mercury and the other gods.

The heathens in genera! believed that there was but one fupreme God: but when they confidered this one great being as influencing the affairs of the world, they gave him as many different names; and henec proceeded their variety of nominal gods. When he thundered or lightned, they called him Jupiter; when he calmed the fea, Neptune; when he guided their councils, Minerva; and when he gave them flrength in battle, Mars. In procefs of time they ufed different reprefentations of this Jupiter, \&e and confidered them, vulgarly at lealt, as fo many different perfons. They afterward regarded each of them in different views: e. $\sigma$. The Jupiter that howered down bleffings, was called the Kind yupiter; and when puniphing, the Terrible Jupiter. There was alfo one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the fpecial pro. tectnr of the Romans: nay, there was fearee
or hamlet perhaps, in Italy, that had not a Jupiter of its uwn ; and the Jupiter of Terracina or Jupiter Anxur, reprefented in medals as young and beardlefs, with rays round his head, more refembled Apello than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almoft every where: at Carthage, he was called Ammon; in Egypt, Scrapis; at Athens, the great Jupiter was the Olympian Jupiter ; and at Rome the greatelt Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the " belt and greateft Jupiter;" Fupiter optimus

Jupiter. maximus. The figure of this Jupiter was reprefented in his chief temple on the Capitoline hill, as fitting on a curule chair, with the fulmen or thunder, or rather lightning, in one hand, and a feeptre in the other. This falmen in the figures of the old artifts was always adapted to the character under which they were to reprefent Jupiter. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of flames wreathed clofe together, held down in his hand: When punifhing, he holds up the fame figure, with two tranfverfe darts of lightning, fometimes with wings added to each fide of it, to denote its fwiftnefs; this was called by the poets the threeforked bolt of Jove : and when he was going to do fome exemplary execution, they put in his hand a handful of dlames, all let loofe in their utmoft fury; and fometimes filled both his hands with flames. The fuperiority of Jupiter was principally manifefted in that air of majefty which the ancient artifts endeavoured to exprefs in his countenance: particular attention was paid to the head of hair, the eye-brows, and the beard. There are feveral heads of the mild Jupiter on ancient feals; where his face has a mixture of dignity and eafe in it, admirably defcribed by Virgil, An. i. v. 256. Tbe flatues of the Terrible Jupiter were generally of black marble, as thofe of the former were of white: the one fitting with an air of tranquillity; the other flanding, more or lefs difturbed. The face of the one is pacific and ferene; of the other angry or clouded. On the heads of the one the hair is regular and compofed; in the other it is fo difcompofed, that it falls half. way down the forehead. 'The face of the Jupiter Tonans refembles that of the Terrible Jupiter; he is reprefented on gems and medals as holding up the triple bolt in his right hand, and flanding in a chariot, which feems to be whirled on impetuonfly by four horfes. Thus he is alfo deferibed by the poets. Ovid. Deian. Herc. v. 28. Horace lib. i. od. 4. v. 8. Jupiter, as the intelligence ${ }_{8}$ prefiding over a fingle planet, is reprefented only in a chariot and pair : on all other occafions, if reprefented in a chariot, he is always drawn by four horfes. Jupiter is well known as the chief ruler of the air, whofe particular province was to direct the rains, the thunders, and the lightnings. As the difpenfer of rain, he was called Fupiter Pluvius : under which character he is exhibited feated in the clouds, holding up his right hand, or extending his arms almoft in a ftraight line each way, and pouring a ftream of hail and rain from his right hand upon the earth ; whilft the fulmen is held down in his left. The wings that are given him relate to his character of prefiding over the air : his hair and beard in the Antonine pillar are all โpread down by the rain, which defcends in a fheet from him $_{2}$ and falls for the refrefhment of the Romans; whilft their enemies are reprefented as Atruck with the lightnings, and lying dead at their feet.
Some confider a great pait of the fable of Jupiter to include the hiftory of Noah and his three fons; and that Saturn is Noah, who faw all mankind perifh in the waters of the deluge; and who, in fome fort, fwallowed them up, by not receiving them into the ark. Jupiter is Ham; Neptune Japheth; and Shem, Pluto.
The Titans, it is thought, reprefent the old giants, who built the tower of Babel, and whofe pride an
prefumption God had confounded, by clanging their Jupit language, and pouring out the firit of difcord and divifion among them. The name of $\mathscr{F u p i t e r}$, or $\mathcal{F o v i s}$ Pater, is thought to be derived from Jehovah, pronounced with the Latin termination Yovis inflead of $\mathscr{F}_{0}$ $v a$; and in medals we meet with Fovis in the nominative, as well as oblique cafes: for example Fovis cuftos, Fovis propurgator, Yovis flutor. To the name $\mathcal{F}_{0}-$ vis was added pater; and afterwards inftead of " Jovis pater", 耳upiter was ufed by abbreviation.

The name Fupiter was not known to the Hebrews till the reign of Alexander the Great, and the kings his fucceffors. Antiochus Epiphanes commanded the idol of Jupiter Olympius to be placed in the temple at Jerufalem ; and that of Jupiter the defender of flrangers in the temple on mount Gerizim. 2 Macc. vi. 2. While St Paul and St Barnabas were at Lyftra, they were taken for gods, becaufe they cured one who had been lame from his birth, and that by an expreffion only : St Paul was taken for Mercury, by reafon of his eloquence; and St Barnabas for Jupiter (Acts xiv. 11,12.), on account probably of his good mein.
Jupiter, 4 , in aftronomy, one of the fuperior planets, remarkable for its brightnefs; and which by its proper motion feems to revolve round the earth in about twelve years. See Astronomy-Index.

JURA, one of the Hebrides, or Weftern Inands. of Scotland, lying oppofite to Knapdale in Argylefhire is fuppofed to be about 34 miles long and 10 broad. It is the moit rugged of all the Hebrides; and is compofed chiefly of valt mountains, naked, and without a poffibility of cultivation. Some of the fouth and weftern fides only are improveable, and in good feafons as much bear and oats are raifed as will maintain the inhabitants; though by the diftillation, as Mr Pennant fuppofes, of their grain, they fumetimes want. Bear produces four or five fold, and oats three fold. Sloes are the only fruits of the inland. An acid for punch is here made from the berries of the mountain-afh; and a kind of fpirit is alfo difilled from them. Neceffity hath in, ftructed the inhabitants in the ufe of native dyes. Thus the juice of the tops of heath boiled fupplies them with a yellow; the roots of the white water-lily with a dark-brown; thofe of the yellow water iris with a black; and the galium verum, $r u$ of the iflanders, with a very fine red, not inferior to madder. On the hills is fome pature for cattle; and the prodice, whea Mr Pennant vifited the ifland, amounted to about 300 or 400 head of black cattle, fold annually at 31. each to graziers who conse for them; about too horfes alfo fold annually; a few fheep with fleeces of a moft excellent quality, and great numbers of goats. The o ther animals of Jura are about 100 ftags; though thefe muft formerly have been much more numerons, as the original name of the ifland was Deir-ay, or the ile of deer, fo called by the Norwegians on account of the abundance of deer found in it. Here alfo Mr Pennant had fome obfcure account of a worm that, in a lefs perniciwus degree, refembles the Forla infernalis of Linnæus. The fillan, a little worm of Jura, fmall as a thread, and not an inch in length, infinuates itfelf under the Nk in, caufes a rednefs and great pain, flies fiwiftly from place to place; but is cured by a poultice of cheefe and honey. Of the mountains of Jura, thofe

## J U R

from their fhape called the paps, are the mot remarkable. There are only three very large ones; the biggett, called Beimn-an-oir, or the mountain of gold, lies fartheft to the north; the fecond is called Beimn-/beunta, or the ballowed mountain; and the third, Beinn-a-chaolois, or the mountain of the found, is the lealt of the three. Mr Pennant afeended the firlt with great labour and diff. culty. It is compofed of vaft thones, covered with moffes near the bafe; but all above bare and unconnected with each other. The whole, he fays, feems a cairn, the work of the fons of Saturn. The grandeur of the profpect from the top abundantly made amends for the fatigue of afcending the mountain. Jura itfelf afforded a ftupendous fcene of rock, varied with innumerable little lakes. From the weft fide of the hill ran a natrow Atripe of rock terminating in the fea, and called the flide of the old hag. To the fouth appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the eaft two other iflands, Cantyre, Arran, and the frith of Clyde bounded by Ayrhire; an amazing tract of mountains to the northealt as far as Ben-lomond; Skarba finifhed the northern view; and over the weftern ocean were featered Colonfay and Oranfay, Mull, Iona, and its neighbouring ines; and fill further, the long extents of Tirey and Col, juft apparent. The other paps are feen very diftinetly, but all of them inferior in height. Mr Banks and bis friends mounted that to the fouth, and found the beight to be 2359 feet; but this is far overtopped by Beinn-an-oir. The fones of this mountain are white, a few red, quartzy, and compored of fmall grains ; but fome are breciated or filled with cry Italline kernels of an amethyltine colour. The other flones of the ifland are, a cinereous flate, veined with red, and ufed here as a white-ftone; a micaceous fand-Itone; and between the fmall ifles and Arfin, a micaceous quartzy reck-ftone. On the weft fide of the iflan 1 there is an anchoring-place called $W$ Whiffarlan ; towards the north end is a bay called Da'lyaul; and on the fame coaft is formed another riding-place for veffels among feveral fmall iflands. Between the north end of Jura and the fmall ine of Skarba, there is a famous whirlpool, called Cory-Vrekan, from Brecan, fon to a king of Denmark, who perifhed in this gulph. His body being caft afhore on the north fide of Jura, was buried in a cave, and his grave is ftill diftinguifhed by a tombtone and altar. In this vortex, which extends about a mile in breadth, the fea begins to boil and ferment with the tide of flood, increafing gradually to a number of whirlpools, which, in the form of pyramids, fpout up the water with a great noife, as high as the mall of a fmall veffel, agitated into fuch a foam as makes the fea appear white even at the ditance of two leagues. About half flood the violence begins to decreafe, and continues to do fo till abont half an hour after high-water : then it boils as before, till within an hour of low-water, when the fmallett fihing boat may erofs it without danger.

Jura is furniftee with many rivulets and fiprings of excellent water, and the air is remarkably healthy ; its falubrity being increafed by the high fituation, perpesually fanned by breezes. It is, however, hut ill-peopled; and did not contain above 700 or 800 inhabitants at the time it was vifited by Mr Pennant. The women are prolific, and very often bear twins. The
inhabitants live to a great age, and are liable to few diftempers. Men of 90 can work; and there was then living a woman of 80 , who could run down a fheep. The inhabitants are all Proteftants, but addited to fome fuperftitions. The parifh is fuppofed to be the latgeft in Great Britain, and the duty the moll dangerous and troublefome : it confilts of Jura, Oranfay, Colonfay, Skarba, and feveral little iles divided by narrow and dangerous founds; forming a length of not lefs than 60 miles; fupplied by only one minitter and an affiftant.

The very old clans of Jura are the Mac-ilverys and the Mac-raines: but it feems to have changed matters more than once. In 15+9, Donald of Cantyre, Macguillayne of Doward, Mac-guillayne of Kinloch-buy, and Mac-duffie of Colonfay, were the proprietors: Mac-lean of Mull had alfo a thare in 1586 . At prefent it belongs to the duke of Argyle, Mr Maeneil of Colonfay, and Mr Campbell of Shawfield.

Jura is allo the name of a chain of mountains in Switzerland, beginning in the canton of Zarich, extending from thence along the Rhine into the canton and bifhopric of Bafle, ftretching into the canton of Soleura and the principality of Ntuchatel, and branching out towards the Pays de Vaud; feparating that county from Frenche Come and Burgundy, and continued beyond the Genevan territories as far as the Rhone. Many elevated valleys are formed by different parts of this chaia in the country of the Pays de Vaud; among which one of the moft remarkable is the valley of the lake of Joux, on the top of that part of the chain named Mount Joux. It contains feveral populous villages, and is beautifully diverfified with wood, arable land, and pafture. It is watered by two lakes; the largeft of which is that of Joux already mentioned. This has one fhore of a high reck covered with wood; the oppofite banks forming a gentle afcent, fertile and well cultivated; behind which is a ridge envered with pines, beech, and oak-wood. The fmaller lake, named Brenet, is bordered with fine corn-fields and villages; and the ftram which iffues from it is loft in a gulf named Entonnoir, or the Funnel, where the people have placed feveral mills which are turned by the force of the falling current. The river Orbe ifflies from the orher fide of the mountain, about two miles from this place; and probably owes its origin to the fubterraneous ftrearn jut mentioned. The larget lake is fupplied by a rivulet which iffues from the bottom of a rock, and lofes it felf in it. The valley contains about 3000 inhabitants, remarkable for their indultry. Some are wateh makers; but the greatef number employ themfelves in polifhing cryftals, granites, and mareafites. The country is much infelled with bears and wolves. In afeending to this place there is a very extenfive prorpect of great part of the Pays de Vaud, the lake of Geneva, and that of Neuchatel, which from that high point of view appear to be hearly on a level; though M. de Luc found the latter to be 159 feet above the level of the lake of Geneva.
JURATS, Jurati, magiftrates in the nature of Aldermen, for the government of feveral corporations. Thus we mett with the mayor and jurats of Maiditone, Rye, Winchelfea, \&e.-So alfo Jerfey has a bailiff and twelve jurats, or fworn affilants, to ga. vern the illand.

IVREA思。

IVREA, an ancient and frong town of Italy, in Piedmont, and capital of Canavez, with a flrong fort, a bihop's fee, the title of a narquifate, and an ancient cafle. It is fubject to the king of Sardinia, and feated on the river Doria between two hills, in E. Long. 7-48. N. Lat. 45. 12.

JURIEU (Peter), an eminent French Proteftant divine, called ironically by the papilts the Goliath of the Proteflants, was born in 1637. He was educated in England under his maternal uncle Peter du Moulin, and took orders in the Englifh church; but retuning to fucceed his father as paftor of a reformed congregation at Mer in the diocefe of Blois, he was made profeflor of divinity and Hebrew at Sedan, where he acquired great reputation. This univerfity being taken from the Proteflants, a proffforthip of divinity was founded for him at Rotterdam; and he was alfo appointed miniter of the Walloon church in the fame town. Being now in a place of liberty, he gave full fcope to an imagination naturally warm, and applied himfelf to fludy the book of Revelation, of which he fancied he had by a kind of infpiration difcovered the true meaning; a notion that led him to many entiufialical conjectures. He was moreover fo unfortunate as to quarrel with his beft friends for oppofing his vifionary opinions, which produced violent difputes bctween him and Meffrs Bayle and de Beauval He died in 1713 ; and left a great number of cifeemed works behind him.

JURIN (Dr James), a ditinguifhed perfon, who cultivated medicine and mathematics with equal fuccefs. He was fecretary of the Royal Society in London, as well as prefident of the College of Phyfficians there. He had great difputes with Micheltoti upon the moment of running-waters, with Robins upon diflinct vifion, and with the partizans of Leibutz upon moving bodies A treatife of his "upon Vifion" is printed in Smith's "Optics." He died in 1750.

JURISCON-ULTUS (ICfus,) among the Romans, was a perfon learned in the law; a matter of the Roman jurifprudence; who was confulted on the interpretation of the laws and culloms, and on the difficult points in law. fuiss. The fifteen books of the Digetts were compild wholly frum the anfwers or reports of the ancient jurifconfulti. 'Tribonianus, in dellroying the 2000 volumes from whence the code and Digett were taken, has deprived the public of a world of things which would have given them light into the ancient office of the jurifconfulti. We fhonld fearce have known any thing beyond their bare names, had not Pomponius, who lived in the fecond century, taken care to preferve fome circumillances of their office.

The Ruman jurifconfulti feem to have been the fame with our chamber-counfellors, who arrived at the honour of being confulted through age and experience, but never pleaded at the bar. Their pleading advo. eates or lawyers never became jurifconfulti. See Adrocate.

In the times of the commonwealth, the advocati had by much the more honourable employment, as being in the ready way to attain the higheat preferments. They then defpifed the jurifconfulti, calling them in derifinn formularii and legulei, as having invented certain forms and monofyllables, in order to give their
anfwers the greater appearance of gravity and my fery. Juriftia But in procefs of time they became fo much stiteemed, that they were called prudentes and fapientes, and the emperors appointed the judges to follow their advice. Augutus advanced them to be public officers of the empire; fo that they were no longer confined to the petty counfels of private perfons.-Bern. Rutilius has written the lives of the molt famous jurifconfulti who have lived within thefe 2000 years.

JURISDICIION, a power or authority, which a man has to do jutice in cafes of complaint made before him. There are two kinds of juriddiction, the one cocleffafical, the other jecular.

Secular Furisdiction, belongs to the king and his jultices or delegates. The courts and judges at Weitminfter have jurildiction all over England, and are not reftrained to any councy or place; but all other courts are confined to their paticular jurildifions, which if they exceed, whatever they do is erroneons. There are three forts of inferior jurifdictions; the firt is tenere placita, to hold pleas, and the plaintiff may fue either there or in the king's courts. Another is the conufance of pleas, where a right is invelled in the lord of the franchite to hold pleas: and he is the only perfon that can take advantage of it, by claiming his franchife. The third fort is an exempt jurifdiction, as where the king grants to fome city, that the inhabitants flall be fued within their city and not elfewhere ; though there is no jurifdiction that can withltand a cerfiorari to the fuperior courts.

Ecclffiafical Furisdiction belongs to bifhops and their deputics.

Binhops, \&c. have two kinds of jurifdiction; the one internals, which is exercifed over the confcience in things purely fpiritual; and this they are fuppofed to hold immediately of Crod.

The other is contentious, which is a privilege fome prinees have given them in terminating difputes between ecclefiattics and laymen.

JURISPRUDENCE, the fcience of what is juft or unjuft; or the knowlege of laws, rights, cuftoms, flatures, \&̌c. neceflary for the adminitration of juftice. See Law.

Juror, Jurator, in a legal fenfe, is one of thofe twenty four or twelve men who are fworn to deliver truth upon fuch evidence as thall he given them tonching any matter in queftion. The punifment of petty jurors attainted of giving a veldict contrary to evidence, willingly, is very ievere.
JURY, a certain number of men fworn to enquire into and try a matter of fact, and to declare the truth upon fuch evidence as fhall appear before them.
Juries are, in thefe kingdoms, the fupreme judgea in $3 l l$ courts and in all caufes in which either the life, property, or reputation. of any man is concerned : this is the ditinguilihing privilege of evcry Briton, and one of the molt glorious advantages of our conflitution ; for as every one is tried by his peers, the meanelt fubject is as fafe and as free as the greatelt. See the article Trial.
Furr-Mg $f$, whatever is fet up in room of a maft that bas been loft in a llorm or an engajement, and to which a lefier yard, ropes, and fails, are affixed.
JUS coronae. See Mereditary Righe, and Succession.

Fus Deliberanch, in Scots law, that right which an heir las by law of delibcrating for a certain time "lis:lher he will renefent his predectlor.

Y̌es D: roluman, in Scots law, the right of the church, of protenting a miniller to a vacant parifh in cafr- the patron thall neglect to ufe that right within the time limited by law.

Fics Milariti, in Scota law, the right the hufband acquires to laie wife's muveable eilate, in vircue of the marriage.

Fers Relide, in Scots law, the right the wife has in the goods in communion, in care of the previuln decarle of the hufoand.

Yes Preverdicnis, in Scots law, the preferable right of junfliction acquird by a court, in any caufe to which other courts are equally competent, by having exerciled the firit act of jurifdistion.

Fos Civile, amen th the Romans, ligrified nomore then the interprecation given by the learard, of the law of the tweive tilles, thongh the phrafe now cxtends to the whole fyitem of the $R$ math laws.

F'us Cititulis, lignifics freedom of the city of Rome, which imted thofe parf ns who had obanined it to mo't of the privileces of Reman eitizens-vet it differs
 tagrs which a free native of Rome was intithed tothe eifictme is much the fame as betwixt denisertion and unturchization wish us.

Fus Ilwhortrium, was a mame given to thofe Roman laws which were made up of edicts of the fupreme magifrates, y? iculatly the pratars.
juvs Inaginis, wids the right of ufing pictures and ftetues arongt the Romans, and lad fome refemblance to the right of bearing a cuat-of arms amonglt us. This honour was allowed to nome but thofe whide ancefiors or themielves had borne fome curule office, that is, hat beun Ciurule A:día, Cenfer, Preler, or Conful.

The ufe if itaturs, $\dot{\alpha} \mathrm{c}$. which the Jus Imuginis gave, wa the exhibiting :hem in funeral procufions, \&ic. See Inage.

Fus Pafirianum, was the laws of Romulus, Numa, and cther kings of Rome, coliectico into a body by Sextus Papirius, who lived in the tine of Tarquin the Prout, which accomits for the ame.

Jus Triun Libcrorum was a privilege granted to fuelt perfors in the cicy of Rome as ind ihree chitdren, by which they were exenipted from ali trublefome wfices. The fame exemption was granted to any perfons who lived in other parts of Italy, having four children: and thofe that lived in the proviacts, provided zhey had tive (or as fome fay feven) children, were intitied to the fame immunities. This was gond poticy, and tended to the population of the empire. For a further account of thefe privilegee, Sce Chilpres.

JUSSICA, in botany: A genus of the monogy nia order, belongirg to the decandria clafs of plants; and in the natural method ranking under the 17 th order, Calycanthema. The caisx is quadripartite or quinquepartite fuperior ; there are four or five petals; the capfule quadrilocularor quinquelocular, oblong, opening at the anglee; the feeds are frmmernus and fmall.

JUST, a fporive kind of combat on horieback, man againt suan, armed with lances. The word is by
lome derived from the Frencli jouffoc of the Latin juxta, becaule :Se combatants fought rear one another Sul. maliu:s istrives it from thic inodern Greck zoufra, or rather 7 .ee? which is ufed in this anenfe by Niecphorus Greguius. Olhers derive it from jugha, which in the corrupt age of the Latin tongue wan ufed for this exercife, hy reafon it was fuppoied a more jut and equal conibat than the tommamen!.

The difits ree between juits and tournaments confifts in this, that tle later is the genus, of which the former is ouly a fpecies. Tournaments included all kinds of military forits and engagenents made out of gatanny an diverfon: In:ls were thofe particular combats where the parties were near each other, and engaged with lance and fivord. Add that the tournanient was frequently perform d by a nuraber of cavaliers, who fousht in a body: 'Tlice jutc was a fingle combat of ore man againit anotler.-Though the julls Wicre ufually made in toumaments after a general rencounter of all the cavalitr, yet they were fometimes fingly, and independent of any wurnament. See Tournament. IIE who appeared for the firlt time at a jutt, forfeittd lis h.-lm or cafque unitfs he had forfeited before at a tournament.
JUsiTLL (Chrittopher), a learned counfellor, and fectetary to the Fratheh king, was born at Paris in 15 sio, and applied himfelf to the fludy of eccelfiaitieal
hillory. He maintained a correfpondence with the 15 sio, and appled himfell to the Audy of rectelialical
hillory: He maintained a correfpendence with the mult learsied men of Lis time, as archbihop UTher, Sir Hemry Spelmen, Biondel. Sce. till his death, which Sir Henry Spelmen, Biondel. Sec. till his death, which
hopucned in irity. He wrote, I. The conde of the canons of the church univerfal, and the councils of Africa, with rotes. 2. A genealogical hittory of the
houle of Aucrgne. And, 3. Colluctions of Greek Africa, with rotes. 2. A genealogical hithory of the
houle of Aucrgne. And, 3. Collections of Greek and Latin canous, from fereral manufcripts, which formed the Billiotheta juris cartonici oeteris, publifh-
ed in 2 vols fulio, by Widian? Voet and our author's ed in 2 vols folio, by Willian? Voet and our author's fun.

Justel (Henty), fon of the foregoing, was born at Paris in 1620 . He became fecretary and counfellor to the king ; and was as dittinguilled for his own learning as remarkable for encouraying it in others. He came to Lumion in $568 t$, on the perfecution of tire Proteflants ; and was rade keeper of the royal library at St James's: which office be heid till his death in 1693 , when he was fucceeced by the famous Dr Bent-
ley. He wrote fereral torks, the titles of which may 1693 , when he was fucceeced by the famous Dr Bent-
ley. He wrote feveral torks, the titles of which may be feen in the catalogue if the Bodlesan library.
JUSTrice, in a moral fenfe, is one of the four cardinal virtues, which gives every perfon his due.

Cuvilians dilinguifh jultice into two kinds; commu. nicative and diflibutive The former ellablifnes fair dealing in the niutual commerce betwern man and man ; and includes fincerity in our difcourfe, and integrity in ou: ò calings. The effect of fincerity is murual confidence, in neceffary anong the members of the fame communty ; and this mitual conderece is fullained and preferved by the integ ity of cur conemat.
$D$ ifrilutive jutlice is that by which the diferences of mankrid are decidud, according to the rules of equity. The former is the jufice of urivate individuals ; the latter of princes and magiftrates.
Fidelity and tuth are the foundation of juflice. As

 ins as remarkable for encolraysing it in others. He Proteftants; and was racte heeper of the royal hibary

\begin{abstract}

#### Abstract

$\qquad$
\end{abstract} to be perfedly jult is an attribute of the Divine Nature, to be fo to the utmof of our ability is the glory of man.

The following examples of this virtue are extracted from various authors.

1. Among the feveral virtues of Arifides, that for which he was molt renowned was juftice; becaufe this virtue is of moft general ufe, its benefits extending to a greater number of perfons, as it is the foundation, and in a manner the foul, of every public office and employment. Hence it was that Arillides, though in low circumftances, and of mean extraction, obtained the glorious furname of the $\mathcal{F}_{u f /}$; a title, fays Plutarch, truly royal, or rather truly divine: but of which princes are feldom ambitiours, beczufe generally ignorant of its beauty and excellency. They choofe rather to be called the conquerors of cities and the thunderbolts of war, preferring the vain honour of pompeus titles, which convey no other idea than violence and llaughter, to the folid glory of thofe expreffive of goodneis and virtere. How much Ariftides deferved the title given him, will appear in the following inflances; though it ought to be obferved, that he acquired it not by one or two particular actions, but by the whole tenor of his conduct.

Themiftocles having conceived the defign of fupplanting the Lacedemonians, and of taking the government of Greece out of their hands, in order to put it into thofe of the Athenians, kept his eye and his thoughts continually fixed upon that great project $;$ and as he was not very nice or fcrupulous in the choice of his meafures, whatever tended towards the accomplifing of the end he had in view he looked upon as jult and lawful.

On a certain day then he declared in a full affembly of the people, that he had a very important defign to propofe; but that he could not communicate it to the people, becaufe its fuccefs required ir fhould be carried on with the greateff fecrecy : he therefore defired they would appoint a perfon to whom he might explain himfelf upon the matter in queftion. Ariftides was unanimounly fixed upon by the whole aflembly, who referred themfelves entirely to his opinion of the affair; fo great a confidence had they both in his probity and prudence. Themiftocles, therefore, having taken him afide, told him that the defign he had conceived was to burn the flect belonging to the reft of the Grecian ftates, which then lay in a neighbouring port ; and by this means A thens would certainly become miftrefs of all Creece. Aritides hereupon returned to the affembly, and only declared to them that indeed nothing could be more advantageous to the commonwealth than Themillocles's project, but that at the fame time nothing in the world could be more unjuft. All the people unanimoufly ordained that Themiflocles fhould entirely defilt from his project.

There is not perhaps in all hiftory a fact more worthy of admiration than this. It is not a company of phulofophers (to whom it cofts nothing to eftablifh fine maxims and fublime notions of morality in the fchool) who determine on this occafion that the confideration of profit and advantage ought ncver to prevail in preference to what is honeft and jult ; but the whole people who are highly interefted in the proporal made to $\boldsymbol{N}^{\circ}{ }^{171}$.
them, that are convinced it is of the greateft importance to the welfare of the ftate, and who, however, reject it with unanimous confent, and without a moment's hefitation ; and for this only reafon, that it is contrary to juftice. How black and perfidious, on the other hand, was the defign which Themilocles propofed to them, of Burning the flect of their Grecian confederates at a time of entire peace, folely to aggrandize the power of the Athenians! Had he an hundred times the merit afcribed to him, this fingle action would be fufficient to fully all his glory; for it is the heart, that is to fay, integrity and probity, which conflitutes and difinguifhes true merit.
2. The government of Greece having paffed from Sparta to the Athenians, it was thought proper under this new government to lodge in the iffand of Delos the common treafure of Greece; to fix new regulations with regard to the public money; and to lay fuch a tax as might be regulated according to the revenue of each city and ftate, in order that the expences being equally borne by the feveral individuals who compofed the body of the allies, no one might have reafon to murmur. The difficulty, was to find a perfon of fo honeft and incorrupt a mind, as to difcharge faithfully an employment of fo delicate and dangerous a kind, the due adminiftration of which fo nearly concerned the public welfare. All the allies caft their eyes on Ariftides; accordingly they invefted him with full powers, and appointed him to levy a tax on each of them, relying entirely on his wifdom and juftice. The citizens had no caufe to repent their choice. He prefided over the treafury with the fidelity and difintereftednefs of a man who looks upon it as a capital crime to emberzle the fmalleft portion of another's poffeffions, with the care and activity of a father of a family in the management of his own eftate, and with the caution and integrity of a perfon who confiders the public moneys as facred. In fine, he fucceeded in what is equally difficult and extraordinary, viz. to acquire the love of all in an office in which he who efcapes the public odium gains a great point. Such is the glorious character which Seneca gives of a perfon charged with an employment of almolt the fame kind, and the noblett eulogium that can be given to fuch as adminifter public revenues. It is the exact picture of Ariftides. He difcovered fo much probity and wifdom in the exercife of this office, that no man complained; and thofe times were confidered ever after as the golden age; that is, the period in which Greece had attained its highefl pitch of virtue and happinefs.

While he was treafurer-general of the republic, he made it appear that his predeceffors in that office had cheated the ftate of vaft fums of money, and among the reft Themiftocles in particular ; for this great man, with all his merit, was not irreproachable on that head; for which reafon, when Aritides came to pafs his account, Themiftocles raifed a mighty faction againt him, accufed him of having embezzled the public treafure, and prevailed fo far as to have him condemned and fined. But the principal imhabitants, and the moft virtuous part of the citizens, rifing up againft fo unjuft a fentence, not only the judgment was reverfed and the fine remitted, but he was clected treafurer a-

## J U S

gain for the year enfuing. He thicn fetmed to repent of his former adminiftration ; and by flowing himfelf more tractable anc' indulgent towards others, he found out the fecret of pleafing all that plundered the commonwealth: for as he neither reproved them nor narrowly infpected their accounts, all thefe plunderers, grown fat with fpoil and rapine, now extulled Ariftides to the flies. It would lave been eafy for him, as we perceive, to have enriched himfelf in a polt of that nature, which feems, as it were, to invite a man to it by the many favourable opportunities it lays in his way ; efpecially as he had to do with officers, who for their part were intent upon nothing hut robbing the public, and would have been ready to conceal the frauds of the treafurer their maller upon condition he did them the fame favour. Thefe very officers now made intereft with the people to have him continued a third year in the fame employment: but when the time of election was come, juft as they were on the point of electing Ariftides unanimoufly, he rofe up, and warmly reproved the Athenian people: "What (fays he), when I managed your treafure with all the fidelity and diligence an honelt man is capable of, I met with the moft cruel treatment, and the nolt mortifying returns; and now that I have abandoned it to the mercy of thefe robbers of the republic, I am an admirable man and the belt of citizens! I cannot help declaring to you, that I am more afhamed of the honour you do me this day, than I was of the condemnation you paffed againft me this time twelvcmonth; and with grief I find that it is more glorious with us to be complaifant to knaves than to fave the treafures of the republic." By this declaration he filenced the public plunderers and gained the efteem of all good men.
3. In the Univerfal Hiftory we meet with the following remarkable inftance of a ferupuious regard to jultice in a Perfian king named Noufchirvan. Having been out a-hunting, and defirous of eating fome of the venifon in the field, feveral of his attendants went to a neighbouring village and took away a quantity of falt to feafon it. Tbe king fufpecting liow they had acted, ordertd that they fhould inmediately go and pay for it. Then turning to his attendants, he faid, "This is a fmall matter in itfelf, but a great one as it regards me : for a king ought ever to be juft, becaufe lee is an example to his fubjects; and if he fwerves in trifles, they will become diffolute. If I cannot make all my people juft in the fmalleft things, I can at leaft fhow them it is poffible to be fo."

Thefe examples, to which many more might be added, are highly pleafing to a fagacious and virtuous mind ; but the fenfual and brutal part of mankind, who regard only the prefent moment, who fee no objects but thofe which fall under the cognizance of the corporeal eye, and eftimate the merit of cvery action by the gain which it produces, have always conlidered jultice and utility as independent of each other. They put utility in the balance againgt honety every day; und never fail to incline the beam in favour of the former, if the fuppofed advantage is thought to be confiderable. They have no regard to juftice but as they reckon to gain by it, or at leaft not to lofe; and are always ready to defert it when it expufes them to any danger or threatens them with any lofs. From this Vol. IX. Part II.

## 409

difpofition of mind procecds that avidity of wealth Juntice. and that habitual fraud which perpetually embroil $\underbrace{\mathrm{J}}$ civil fucicty: from this fatal fource arifez that deluge of iniquity which has overfowed the world; from this preference of interelt to honelly proceed every unjult litigation and every act of violence. And yet nothing is more certain than that "Whatever is unjutt muft, upon the whole, be difadvantageous:" which might
be proved thus: be proved thus:

Nothing is advantageous or ufeful but that which has a tendency to render us happy: the higheft advantage, or abfolute utility, is complete happinefs; and to this happinefs, whatever is advantageous or ufeful is relative as to an ultimate end; and nothing that is not thus relative to happinefs can properly be fais to be advantageous or ufeful. But whatever is unjul, fo far from tending to promote, that it deitroys our happinefs; for whatever is unjult is contuary to the Divine will : but it is not poffible that we fhould become hap. py by refiting that will ; becaufe of this will our hap. pincts is the immediate object. God is not a tyrant, proud of incontroulable power, who impofes capricious laws only as tefts of our obedience, and to make us feel the weight of his yoke; all his precepts are lofions which teach us how to be happy. But it is the will of God that we fhould be juil: from whence it follows, that no true happinefs can be acquired by thofe who are unjull. An action, therefore, which is contraly to the will of God, mult be inconfitent with our true interelt ; and confequently, fo far from being ufeful or expedient, it mult inevitably produce ruin and mifery. Injultice fometimes meets with the punifhment it deferves in this world ; but if it hould efcape here, it does not follow that it will for twer efcape. It proves, on the contrary, that there is another wuild in which the fates of mankind will be impartially decided.
But to prevent the dreadful confufion which the miltaken notion of intereft had introduced anong mankind, it became neceflary to have recuurfe to the innate principles of jutice; to fufpend the balance and difplay the fword, for the determination of differences and the punifhment of guilt. This is the reafon and origin of diftributive juftice, which became the neceffary appendage of fovereignty. Accordingly in ancient times, princes adminiflered jutice in perfon and without delay; but at length being embarrallid and opprefled by the multiplicity of bufinefs which increafed with their domivions, or diverted from their attention to civil government by the command of armies, certain laws were elfablihed with great folemnity to adjuft and determine the differences which might arife among the members of the fame community, and to reprefs the infolence of thore who dared to violate the public peace, by poffeffing then with the dread either of cotporeal punilhment or infamy. The execution of thefe laws was put into the hands of fubordinate judges. Thefe delegates of the fovereigu power were called magitrates; and thefe are the perfons by whom jultice is at this time adminitered, except in particular cates, in which the fovereign himfle interfires. But by whonfoever this kind of jultiee is adminiftered, it ought to be dose focdily, impartially, and withuut expence to the parties.
4. Arintides being judge between two private per3 F fons,

Juntice. fons, one of them declared, that his adverfary had greatly injured Arifides. "Relate rather, good friend (faid he, interrupting him), what wrong he hath done thee; for it is thy caufe, not mine, that I now fit judge of." - Again: Being defired by Simonides, a poet of Chios, who had a caufe to try before him, to itretch a point in his favour, he replied, "As you would not be a good poct if your lines ran contraty to the jult meafires and rules of your art ; fo I thould neither be a good judge nor an honeft man if I decided aught in oppofition to law and jutice."
5. Artabarzanes, an officer of Artaxerxes king of Perfia, begged his majelly to confer a favour upon him; which if complied with would be an act of injuttice. The kine being informed that the promife of a confiderable funn of muney was the only motive that indinced the officer to make fo, unsalicnable a requeft, ordered his treafurer to give him thirty thoufand darinfes, being a prefent of equal value with that which he was to lave received. Giving him the order for the moncy, "Here, take (fays the king) this token of wh friendhip for you: a gift of this nature cannot make me poor; but complying with your requeft would make ne poor indeed, for it would make me unjufl."
6. Cambyfes king of Perfia was remarkable for the feverity of his governinent and his inexorable regard to jultice. This prince had a particular favourite whom he made a judge ; and this judge reckoned himfelf fo fecure in the credit lie had with bis mafter, that without any mose ado caufes were bought and fold in the courts of judicature as openly as provifions in the market. But when Cambyfes was informed of thefe proceedings, curaged to find his friendfhip fo ungratefully abufed, the honour of his government proftituted, and the liberty and property of his fubjects faerificed to the avalice of his wretehed minion, he ordered him to be feized and publiely degraded; after which he commanded his fiin to be ftripped over his ears, and the feat of judgment to be covered with it as a warning to others. At the fame time, to convince the world that this feverity proceeded only from the love of jultice, he permitted the fon to fucceed his father in the loonours and office of prime minitter.
7. When Charles duke of Burgundy, furnamed the Bohl, reigned over fpacious dominions, now fwallowed up by the power of France, he heaped many favours and honours upon Claudins Rynfaut, a German, who bad ferved him in his wars againft the infults of his neighbours. The prince himfelf was a perfon of fingular humanity and juftice ; and being prepoffeffed in favour of Rynfault, upon the deceafe of the governor of the chief town of $Z$ ealand gave him that command. He was not long feated on that government before he ealt his eyes upon Sapphira, a woman of exquifite beauty, the wife of Paul Danvelt, a wealthy merehant of the city, under his protection and government. Rynfault was a man of a warm conftitution, and violent inelination to women. He knew what it was to enjoy the fatisfactions which are reaped from the poffffion of beauty; but was an utter ftranger to the deceneies, honours, and delicacies, that attend the paffion toward them in elegant minds. He could with his tongue utter a paffion with which his heart was wholly untouched. In fhort, he was
one of thofe brutal minds which can be gratified with jufti the violation of innocence and beauty, without the leaft pity, paffion, or love for that with which they are fo much delighted.

Rynfault being refolved to accomplifh his will on the wife of Danvelt, left no atts untried to get into a familiarity at her houfe ; but the knew his character and difpofition too well not to fhum all occafions that might enfiare her into his converlation. The governor, defpairing of fuccefs by ordinary means, apprehended and imprifoned her hufuand, under pretence of an information that he was guilty of a correfpondence with the cnemies of the duke to betray the town into their poffeffion. This defign had its defired effect: and the wife of the unfortundte Danvelt, the day before that which was appointed for lis execution, prefented herfelf in the hatl of the governor's houfe, and as he paffed through the apartment threw herfelf at his fect, and holding his knees, befeeched his mercyRynfault beheld her with a diffembled fatigfaction; and afluming an air of thought and authority, he bid her rife, and told her the mult follow him to his clo. fet ; and afking her whether fhe knew the hand of the letter he puiled out of his pocket? went from her, leaving this admonition aloud: "If you would fave your hufband, you mult give me an account of all yous know, without prevarication; for every body is fatisfied that he is too fond of you to be able to hide from you the names of the relt of the confpirators, or any other particulars whatfoever." He went to his clofet, and foon after the lady was fent for to an audience. The fervant knew his ditance when matters of flate were to be debated; and the governor, laying alide the air with which he had appeared in public, began to be the fupplicant, and to rally an affliction which it was in her power eafily to remove. She eafly perceived his intention ; and, bathed in tears, began to. deprecate fo wicked a defign. Lutt, like ambition, takes all the faculties of the inind and body into its fervice and fubjection. Her becoming tears her honefl anguifh, the wringing of her hands, and the many changes of her pofture and figure in the vehemence of fpeaking, were but fo many attitudes in which he beheld her beauty, and farther incentives of his defire. All humanity was loft in that one appetite; and he fignified to her in fo many plain terms, that he was unhappy till be poffeffed lier, and nothing lefs fhould be the price of her hufbano's life ; and the mul, before the following noon, pronounce the death or enlargement of Danvelc. After this notification, when he faw Sapphira enough diltracted to make the fubject of their difoourfe to common eyes appear different from what it was, he calted his fervants to conduct her to the gate. Loaded with infupportable affliction, fhe immediate.\% repairs to her hußand, and laving fignified to the gaolers that the had a propofal to make to her hufband from the governor, the was left alone with him, revealed to him all that had paffed, and reprefented the endlefs conflict the was in between love to his perfon and tidelity to his bed. It is cafy to imagine the fharp affiction this honeft pair was in upon fuch an incident, in lives not ufed to any but ordinary occurrences. The man was bridled by fhame from fpeaking what his fear prompted upon fo near an approach of deatb; but let

e. fall words that fignified to her, he foould not think her polluted, though flue had not confefled to him that the governor had violated her perfou, fince he knew her will had no part in the action. She parted from him with this oblique permiffon, to fave a life he had not refolution enough to refign for the fafety of his honour.

The next morning the unhappy Sapphira attended the governor, and being led into a remote apartment, fubmitted to his defires. Rynfault commended her charins; chamed a familiarity after what had paffed between them; and with an air of gaicty, in the language of a gallant, bid her return and take her hußand out of prifon: but, continued he, my fair one muft not be offended that 1 have taken care he fhould not be an interruption to our future affignations. Thefe laft words fureboded what fhe found when fle came to the gaol, her lufband executed by the order of Rynfault.

It was remarkable, that the woman, who was full of tears and lamentations during the whole courfe of her afliction, uttered neither figh nor complaint, but flood fixed with grief at this confummation of her misfortunes. She betook herfelf to her abode; and, afier laving in folituace paid her devotions to Him who is the avenger of imocence, fhe repaired privately to court. Her ferfon, and a certain glandeur of forrow negligent of forms, gaintd her paffage into the prefence of the duke her fovercigu. As foon ais the came into the prefence, the broke forth into the following words: "Behold, O mighiy Charles, a wretch weary of life, though it has always been feent with innocence and virtue. I: is not in your power to redrefs my injuries, but it is to avenge them; and if the protection of the dillieffed, and the punifhment of oppreffors, is a tafk worthy of a prince, I bring the duke of Burgundy ample matter for doing honour to his own great name, and of wiping infamy off mine." When the had foken this, fle delivered to the duke a paper reciting her flory. He read it with all the emotion that indignation and pity could raife in a prince jealous of his honour in the behaviour of his officers and the profperity of his fubjects.

Upon an appointed day Rynfault was fent for to court, and in the prefence of a few of the council confronted by Sapphira. The pilince alking, "Do you know that lady ?" Rynfault, as foon as he could recover his furpiife, told the duke he would marry her, if his highnefs would piedfe to think that a reparation. The duke feemed contented with this anfwer, and hood by during the immediate folemnization of the ceremony. At the conclufion of it he toid Ryufault, "Thus far you have done as conftrained by my anthority: I thall not be fatisfied of your kind vage of her, without you fign a gift of jour whole eflate to lier after your deceafe.". T'o the performance of this alfo the duke was a wituefs. When thefe two atts were executed, the duke turning to the lady, told her, "It now remains for me to put you in quiet poffffion of what your hufband has fo bountifully beftowed on you;" and ordered the immediate execution of Ryufault.
8. One of the greateit of the Turkifl princes was Mamood, or Mahmud, the Gaznevide. His name is ftill venerable in the eatt ; and of the noble parts of his
claracter, a regard to jultice was not the leatt. Of this the following example is related by Mr Giblon in his Decline and Fall of the Roman Empire.-As he fat in the divan, an unlappy fubject bowed before the throne to accufe the infolence of a Turkinh foldier who had driven him from his houfe and bed. "Sufpend your clamours (faid Mahmud); inform me of his next vifit, and ourfelf in perfon will judge and punif the offender." The fultan followed his guide; invefled the houfe with his guards; and extinguifhing the torches, pronounced the death of the criminal, who had been feized in the act of rapine and adultery. After the execution of his fentence, the lights were rekindled, and Mahmud fell proftrate in prayer; then rifing from the ground, he demanded fome homely fare, which he devoured with the voracioufnefs of husger. The poor man, whofe injury he had avenged, was unable to fupprefs his aftonithment and curiofity; and the courteous monarch condefcended to explain the motives of this fingular behaviour. "I had reafon to fufpect that none except one of my fons could dare to perpetrate fuch an outrage; and I extinguifhed the lights, that my jutice might be blind and inexorable. My prayer was a thankfgiving on the difcovery of the offender; and fo painful was my anxiety, that I had paffed three days without food fince the firt moment of your complaint."
9. In Bourgoane's Travels in Spain, vol. iii. the following anecdote is given of Peter III. of Caltile. A canon of the cathedral of Seville, affected in his drefs, and particularly in his fhoes, could not find a workman to his liking. An unfortunate Shoemaker, to whom he applied after quitting many others, having brought him a pair of hoes not made to pleafe his tafte, the canon became furious, and feizing one of the tools of the fhoemaker, gave him with it fo many blows upon the head as laid him dead upon the floor. The unhappy man left a widow, four daughters, and a fon 14 years of age, the eldell of the indigent family. They made their complaints to the chapter: the canon was profecuted and condemned not to appear in the choir for a year. The young thoènaker having attained to man's eftate, was fcarcely abie to get a livelitood; and overwhelmed with wretchednefs, fat down on the day of a proceffion at the door of the cathedral of Seville in the moment the proceffion paffed by. Amonglt the other canons he perceived the murderer of his father. At the fight of this man, filial affection, rage, and defpair, got fo far the better of his reafon, that he fell furioully upon the prieft, and ftabbed him to the heart. The young man was feized, convicted of the crime, and immediately condemned to be quartered alive. Peter, whom we call the Cruel, and whom the Spaniards, with more reafon, call the lover of julfice, was then at Seville. The affair came to his knowledge; and after learning the particulars, he determined to be himfelf the judge of the young thoemaker. When he proceeded to give judgment, he firlt annulled the fentence jult pronounced by the clergy; and after afking the young man what profeflion he was, "I forbid you (faid he) to make hoes for a year to come."
10. In Gladwin's Hitory of Indoftan, a fingular faet is related of the emperor Jehangir, under whofe father Abber the Mogul empire in Hindotlan firlt ob-
tainet
funtice. tained any regular form. Jehangir fucceeded him at Agra on the 22 d of October 1605 ; and the firtt order which he iffued on lis acceffion to the throne was for the couftruction of the golden chain of juflice. It was made of pure gold, and meafired 30 yards, confilting of 60 links, weighing four maunds of Hindoftan (about 400 pounds avoirdupois). One end of the chain was fufpended from the royal baftion of the fortrefs of Agra, and the other faldened in the ground near the fide of the river. The intention of this extraordinary invention was, that if the officers of the courts of law were pattial in their decifions, or dilatory in the admiuitration of joflice, the injured partits might come themelelves to this chain; and making a noife by flnking the lin's of it, give notice that they were waiting to reprefent their grievances to his majelty."
Justice is alfo an appellation given to a perfon deputed by the king to adminiter juftice to his fubjects, whofe authority arifes from hio deputation, and not by risht of mapiltracy.

Of thefe jufices there are various kiuds in England; viz.

Chief Fustice of the King's Bencls, is the capital jur. tice of Creat Britain, and is a lord by his office. His bufinefs is chiefly to lear and determine all pleas of the crown; that is, fuch as concern offences againt the crown, dignity, and peace of the king; as treafons, fulonies, \&c. This officer was formerly not only chief juftice, but alfo chief baron for the exchequer, and maller of the court of wards. He ufiually fat in the king's palace, and there executed that office, formerly performed per conitem palatii; he determined in that place all the differences happening between the barons and other great men. He had the prerogative of being viceregent of the kingdom whenever the king went beyond fea, and was ufually chofen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed from capitulis Anglix jullitiarius, to capitalis juflitiarius acl plucita, coram regre tenendas, or capitalis juflitiarius banci regii.

Chicf Yostien of the Common Pleas, he who with his affilants hears and determines all caufes at the common law; that is to fay, all civil caufes between common perfons, as well purfonal as real ; and he is alfo a lund by his office.
Juspice of the Foreh, is a lord by his office, who has power and authority to determine offences committed in the king's forefts, \&c. which are not to be determined by any other court of juftice. Of thefe there are two ; whereof one has jurifdiction over all the foafts on this fide Trent, and the other beyond it.
By many ancient records, it appears to be a place of great honour and authority, and is never beltowed but on fone perfon of great dittinction. The court where this juftice fits is called the juffice feat of the forefl, held once every three years, for hearing and deternining all trefpaffes within the foref, and all claims of franchifes, liberties, and privileges, and all pleas and caufes whatfoever therein ariling. This court may fine and imprifon for offences within the foreft, it being a swurt of record; and therefore a writ of erior lies from hence to the court of king's bench. The laft court of juftice feat of any note was that held in the reign
of Charles I. before the earl of Holland. After the refloration another was held for form fake before the earl of Oxford; but fince the revolution in 16,88 , the foreit laws have fallen into total difufe, to the great advantage of the fubject.

This is the ouly juftice who may appoint a deputy: he is alfo called jufice in eyre of the forefl.

Jusyices of Affie, were fuch as were wont by fpecial commifion to be fent into this or that county to take affifes, for the eafe of the fubjects. Fer, whereas thefe actions pafs always by jury, fo many men might not without great damage and charge be brought up to Loudon; and therefure jullices, fur this purpole, by commiffions particularly authorifed, were fent down to them. Thefe continue to pafs the circnit by two and two twice every year through all England, except the four northern counties, where they go only once, difpatching their feveral bufineffes by feveral commifions; for they have one commulion to take affifes, another to deliver gaols, and another of oyer and terminer. In London and Miduiefex a court of general gaol-delivery is held tight times in the year.

All the juffices of peace of any county wherein the affifes are held, are bound by law to attend them, or elfe are liable to a fine; in order to return recognizances, \&c. and to affit the judges in fuch matters as lie within their knowledge and jurifdiction, and in which fome of them have been probably concerned, by way of previous examination. See Assises and Jury.
Fustices in Eyre (jufficiarii itinerantes, or trrantes), were thofe who were anciently ient with commiffion into divers counties to hear fuch caufes efpecially as were termed pleas of the crozun; and that fur the eafe of the futject, witho mult elfe have been hurried to thie courts of Wellminter, if the caufe were too high for the county-courts.
According to fome, thefe jultices were fent once in feven years; but others will have then to have been fent oftener. Camden fays, they were iaflituted in the reign of king Henry II. A. D. $118_{+}$; but they appear to be of an older date.
They were fomewhat like our jultices of affife at this day; though for authority and mamer of proceceing very different.
Fostices of Gaol-Delivery, thofe commiffioned to hear and determine caufes appertaining to fuch as for any offence are calt into priton. Juftices of gaol-delivery are impowered by the common law to proceed upon indictments of felony, trefpafs, \&c. and to order execution or reprieve ; and they have power to difclarge fuch prifoners as upon their trials ftall be acquitted; alfo all fuch againt whom, on proclamation made, no evidence appears to indict; which juftices of oyer and terminer, \&c. may not do. 2. Hawk. 24, 25. But thefe jultices have nothing to do with any perfon not in the cutody of the prifon except in fome fpecial cafes; as if fome of the accomplices to a felony may be in fuch prifon and fome of them out of it, the jultices may rcceive an appeal againft thofe who are out of the prifon as well as thofe who are in it ; which appeal, after the trial of fuch prifoners, fhall be removed into B. R. and procefo iffue from them againt the rell. But if thofe out of prifon be omitted in the appcal, they can never be pui into any other; becaufe there

## J U S

there can be but one appeal for one felony. In this way the gaols are cteanced, and al! offe nders tried, punifhed, or delivered, in every year.-Their commifion is now turned aver to the juitices of affife.
Fusticks of Nif/ Prius are now the fame with juf. tices of $a f /$ ife. It is a common adjournment of a caule in the cummon pleas to put it off to fuch a diay. Niji prius julitiarii venerint ad cas partes ad capiendas allifas: from which claufe of adjourument the; 3ic calied juflices of nifi prius, as well as jufices of affife, on account of the writ and actions they have to dital in.

Fissicks of Oyer and Terminer, were juttices deputed on fume fpecial occations to hear and determine particular caules. - The commiffion of oyer and terminer is directed to certain perfons upon any infurrection, heinous demeanour, or trefpafs committed, who mult fitt enquire, by means of the grand jury or inquelt, befure they are empowered to hear and determine by the help of the petit jury. It was formerly held, that no judge or other lawyer could act in the commiffion of ojer and terminer, or in that of gaul-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo . II. cap. 27. to allow any man to be a jullice of oyer and terminer and general gaul-delivery within any county of England.

Fustices of the Peace are perfons of interelt and credit, appointed by the king's commifion tu keep the peace of the county where they live.

Oithefe fome for fpecial refpect are made of the quorum, fo as no bufinefs of importance may be dif. patched without the prefence or affent of them or one of them. Huwever, every juftice of peace hath a feparate power, and his office is to call before him, examine, iflue warrants for apprehending, and commit to prifon, all thieves, murderers, wandering rogues; thofe that hold confpiracies, riots, and amut all delinquents which may occafion the breach of the peace and quiet of the fubject: to commit to prifon fuch as cannot find bail, and to fee them brought forth in due tine to trial ; and bind over the profecntors to the af. lifes. And if they neglect to certify examinations and informations to the next gani-delivery, or do not bind over profecutors, they fhal! be fined. A jultice may commit a perfon that doth a felony in his uwo view, without warrant; but if on the information of anotner, he must make a warrant under hand and feal for that purpofe. If complaint and oath be made before a jultice of goods flolen, and the informer, fufpecting that they are in a particular houfe, flows the caufe of bis fufpicion, the jutice may grant a warrant to the conltable, \&sc. to fearch in the place fuipected, to feize the goods and perfon in whole cultody they are found, and bring them before him or fome other juftice. The fearch on thefe warrants ought to be in the day-time, and doors may be broke open by conthables to take the goods. Jultices of peace may make and perfuade an agreement in petty quarrels and breaches of the peace, where the king is not intitled to a fine, though they may not compound offences or take money for making agreements. A juftice hath a difcretionary power of binding to the good behavisur; and may require a reco-snizance, with a great penalty of one, for his keeping of the peace, where the party bound is a dangenus perfon, and likely to break the peace, and d.a much mifchief; and for default of fureties he may be committed :o gaol. But a man giving fccu-

413 J J U S
rity for keeping the peace in the king's bench or chancely, may have a fuperfecteas to the juitices in the counIy not to take fecurity; and alfo by gising furcty of the peace to any other jullice. If one make an arault upon a juitice of peace, he may apprehend the witendor. and commit hims to gaol till he fillds furctics for the peace; and a jutice may record a forcible entry on his own purffion: in other cafes he cannot judge in his own caufe. Contemprs againat julices are punifhable by indictment and fine is the telfirus. Joítices finall not be regularty punifhed for any thing done by them in feffions as judgres: and if a juitice be tried for any thing done in his office, he may plead the general iftue, and give the fpecial natter in evidence ; and if a verdict is given for him, or the plamiff he nonfuir, he fall have double colts; and fuch action Ih lif unly be laid in the county where the offence was committed. 7 Jac. cap. 5. 2t Jac. cap. 12. But if they are guilty of any midemecnour in office, information lies againft them in the king's hench, where they fhall be punifhed by fine and imprifanment ; and all perfuas who recover a verdict againit a jutice for any wifful or malicious injury, are intitled to double cofts. By ${ }^{2}+$ Geo. II. cap. 44 , no writ thall be fued out againft any justice of peace, for any thing done by him in the execution of his office, until nutice in writing iball be delivered to him one month before the fuing out of the fame, containing the caufe of action, \&ce. within which month he may tender amends; and if the tender be found fufficient, he fhall have a verdict, \&c. Nor hall any action be brought againtt a juftice for any thing done in the execution of his office, unlefs commenced within fix months after the act committed.

A juttice is to exercife his authority only within the cousty where he is appointed by his commifion, not is any city which is a county of it felf or town curporate, having their proper juftices, \&c. but in other towne and liberties he may. The power and office of juitices terminate in fix months after the demfe of the crown, by an exprefs writ of oifcharge under the great feal, by writ of Superfedeas, by a new conmiffion, and by acceffiun of the offise of fineriff or coroner.

The original of jultiees of the peace is referred to the fourth year of Edward III. They were hrft called confervators, or wardens of the prthe, elected by the county, upon a writ directed to the fheriff; but the power of appointing thea was transferred by flatutes froin the people to the king; and under this appellation appointed by t Edw. HII. cap. 16. Afterwards the Ha:ute 3+ Edw. III. cap 1. gave them the power of trying felonies, and then they acquired the appellation of jufices. They are appointed by the king's fpecial commiffion under the great feal, the form of which was fettled by all the judges, A. D. 1590 ; and the king may appoint as many as he fhall think fit is. every county in England and Wales, though they are generally made at the difcretion of the lord chancellor, by the king's leave. At firit the number of jultices. was not above two or three ill a county. 18 Edw. 11 I. cap. 2. Then it was pruvided by $3+$ Ediv. 11 I. cap. 1. that one lord, and three or four of the moft worthy men in the county, with fome fearned in the law, fiould be made jullices in every county. The number was. afterwards reftrained firft to lix, and then to eight, in every cuanty, by 12 Ric. II. cap. 10. and 14 Ric. 11 .

## I U S [ 414 1 J U S

Jufice. cap. Ir. But their number has greatly increafed fince their lirf inftitution. As to their qualifications, the ftatutes jult cited direct them to be of the belt reputation and moft worthy men in the county; and the ftatute 13 Ric. 11. cap. 7. orders them $t o$ be of the moft fufficient knights, effuires, and gentlemen of the law ; and by 2 Hen. V. ftat. 1. cap. 4. and llat. 2. cap. 1. they mult be refident in their feveral coun. ties. And by 18 Hen. VI. cap. 14. no juttice was to be put in commifion, if he lad not lands to the value of 20 l . per annum. . It is now enacted by 5 Geo. II. cap. 11. that every jutice thall have 100 l . per annum, clear of all deductions; of which he mult make oath by 18 Geo. II. cap. 20. And if he acts without fuch qualification, he fhall forfeit 1001 . It is alfo provided by 5 Geo. Il. that no practifing attomey, folicitor, or proctor, thall be capable of acting as a juftice of the peace.

Fustices of Peace within. Librties, are jultices of the peace who have the fame authority in cities or other corporate towns as the others have in counties; and their power is the fame; only that thefe have the affize of ale and beer, wood and viciuals, Exc. Juftices of cities and corporations are not within the qualification act, 5 Geo. Il. cap. 18.

Fountain of 7 USTICE, one of the characters or attributes of the king. See Jrerogative.

By the fountain of jultice the law does not mean the aubbor or original, but only the diflributor. Jullice is not derived from the king, as from his free gift; but he is the fleward of the public, to difpenfe it to whom it is due. He is not the fpring, but the refervoir; from whence right and equity are conducted, by a thoufand channels, to every individual. The original power of judicature, by the fundamental principles of fociety, is lodged in the fociety at large: but as it would be impracticable to render complete jullice to every individual, by the people in their collective capacity, therefore every nation has committed that power to certain felect magiftrates, who with mote cafe and expedition can hear and determine complaints; and in England this authoricy has immemorially been exercifed by the king or his fubllitutes. He therefore has alone the right of erecting courts of judicature: for though the conflitution of the kingdom hath entrulted him with the whole executive power of the laws, it is impoffible, as well as improper, that he fhould perfonally carry into execution this great and extenfive truft : it is confequently neceffary that courts foould be erected, to affitt him in executing this power ; and equally neceffary, that, if erected, they fhould be erceted by his authority. And hence it is, that all jurifdictions of courts are either mediately or immediately derived from the crown, their proceedings run generally in the king's name, they pafs under his feal, and are executed by his officers.

It is probable, and almoll certain, that in very early times, before our conflitution arrived at its full perfection, our kings in perfon often heard and determined caules between party and party. But at prefent, by the long and uniform ufage of many ages, our kings have delegated their whole judicial power to the judges of their fever:l couts; which are the grand depofitory of the fundamental laws of the kingdom, and have gained a known and Itated jurifdiction, regulated by certain and eftablifhed rules, which the
crown itfelf cannot now alter but by act of parliament. And in order to maintain both the dignity and independence of the judges in the fuperior courts, it is enacted by the natnte $1_{3}$ W. III. c. 2. that their commifions thall be made (not, as formerly, durante boneplacito, but) quamdiue bene fe gefferint, and their falaries afcertained and eftablifhed: but that it may be lawful to remove them on the addrefs of both loufes of parliament. And now, by the noble improvements of that law in the flatute of I Geo. 111. c. 23. enacted at the earnefl recommendation of the king himfelf from the throne, the judges are continned in their offices during their good behaviour, notwitloltanding any demife of the crown (which was formerly held immediately to vacate their feats), and their full falaries are abfolutely fecured to them during the continuance of their commiffions; his majefty having been pleafed to declare, that "he looked upon the independence and upriglitnefs of the judges, as effential to the impartial adminiftation of juftice; as one of the beft fecunties of the rights and liberties of his fubjects; and as must conducive to the honour of the cuown."

In criminal proceedings or profecutions for offences, it would till be a higher abfurdity, if the king perfonally fat in judgment : becaufe in regard to thefe he appears in another capacity, that of projecutor. All offences are cither againft the kinir's peace or his crown and dignity; and are fo laid in every indictment. For though in their confequences they generally feem (except in the cafe of treafon and a very few others) to be racher offences againtt the kingdom than the king ; yet, as the public, which is an invifible body, has delegated all its power and rights, with regard to the execution of the laws, to one vifible magiftrate, all affronts to that power, and breaches of thofe rights, are immediately offences againt him, to whom they are fo delegated by the public. He is therefore the proper perfon to profecute for all public offences and breaches of the peace, being the perfon injured in the eye of the law. And this notion was carricd fo far in the old Gothic conftitntion (wherein the king was bound by his coronation oath to conferve the peace), that in cafe of any forcible injury offered to the perfon of a fellow fubject, the offender was aceufed of a kind of perjury, in laving violated the king's coronation oath; dicebutur fregiffe juramentum reris juratum. And hence alfo arifes another branch of the prerogative, that of pardoning offences: for it is realonable, that he only who is injured thould have the power of forgiving. See Pardon.

In this difinet and feparate exiltence of the judicial power, in a peculiar body of men, nominated indeed, but not removeable at pleafure, by the crown, conlifts one main prefervative of the public liberty; which camnot fubfift long in any fate, unlefs the adminiftration of common jutice be in fome degree feparated both from the leginative and allo from the execurive power. Were it joined with the legillative, the life, liberty, and property, of the fubject would be in the hands of arbitrary judges, whole decifions would be then regulated only by their own opinions, and not by any fundamental principles of law; which, thongh legiflators may depart from, yet judges are bound to obferve. Were it joined with the executive, this union might foon be an over-balance for the legiflative. For which reafon, by the tatute of 16 Car. I. c. 10. which
abolifhed the court of ftar-chamber, efficetual care is taken to remove all judicial power out of the hands of the king's privy-ccurcil ; who, as then was evident from recent inttances, might foon be inclined to pronounce that for law which was moft agreeable to the. prince or his officers. Nothing thesffore is more to be avoiued in a free confitution, than uniting the provinces of a judge and a minifter of finte. And indeed, that the abfolute power, clained and exercifed in a neighbouring nation, is more tolerable than that of the eaftern empires, is in a great meafure nwing to their having velled the judicial power in their parliaments; a body fepatate and diftinet from both the legillative and executive: ard if ever that nation recovers its former liberty, it will owe it to the efforts of thofe affemblies. In Turkey, where every thing is centered in the fultan or his minifters, defpotic power is in its me. ridian, and wears a more dreadful afpect.

A confequence of this prerogative is the legal ubiquity of the king. His majetty, in the eye of the law, is always prefent in all his conrts, though he cannot perfonally diltribute juftice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal perfon, that is always prefent in court, always ready to undertake profecutions or pronounce judgment, for the benelit and protection of the fubject. And from this ubiquity it follows, that the king can never be nonfuit ; for a nonfuit is the defertion of the fuit or action by the nonappearance of the plaintive in colirt. For the fame reaton allo, in the forms of legal proceedings, the ling is not faid to appear by his attorney, as other men do; for he always appears, in contemplation of law, in his own proper perfon.

From the fame original, of the king's being the fountain of juftice, we may alfo deduce the prerogative of ifluing proelamations, which is vefted in the king alone. See Proclamation.

Fustice-Seat. See Forest Courts.
JUSTICIA, malabar-nut: A genus of the monogynia order belonging to the diaudria clafs of plants; and in the natural method ranking under the 40 th order, Porgonate. The corolla is ringent; the capfule bilocular, parcing with an elaftic fpring at the heel; the ftanina have only one anthera. There are 19 fpecies, all of them natives of the Eaft Indies, growing many feet ligh; fome adorned with fine large leaves, others with fmall narrow ones, and all of them with monopetalous ringent flowers. Only two Species are cultivated in our gaidens, viz. the adhatoda or common Malabar-nut, and the hyflopifolia or fnap-tree. The firft grows ten or twelve feet high, with a flrong woody ll em , branching out widely all around; having large, lanceolate, oval leaves, placed oppofite; and from the ends of the branches floort Spikes of white flowers, with dark fpots, having the helmet of the corolla concave. The fecond hath a flirubby llem branching from the bottom pyramidally three or four feet high; fpear-fhaped, narrow, entire leaves, growing oppofite; and white flowers, commonly by threes, from the fides of the branches; fucceeded by capfules, which burf open with elaftic force for the difcharge of the feeds; whence the name of frap-tree. Both fpecies flower here in fummer, but never produce any fruit. They are propagated by
layers and cuttings, and require the fame ireatment with other tender exotics.

JUSTICIAR, in the old Engifh laws, an officer inltituted by William the Conqueror, as the chief officer of fate, who principally determined in all cales civil and cuiminal. He was called in Latin Capitalis Guficiarius tatius Anglic. I'or Justiciar in Scotland, Sec Law, $n^{0}$ clvi. 10 - 12.

Justiciary, or Ceurt of Fustictart, in Scutland. Sce Law, $n^{\circ}$ clvi. 10-12.

JUSIIFICATICN, in law, lignifies a maintaining or flowing a fufficient reafon in court why the defendant did what he is called to anfwer. Pleas in jullification mult liet forth fome fpecial matter: thus, on being fued for a trefpafs, a perfon may jurtify it by proving, that the land is his own freehold; that he entered a houfe in order to appreliend a felon; or by virtue of a warrant, to levy a forfciture, or in order to take a diftrefs; and in an affanlt, that he did it out of neceffity.

Justification, in theology, that act of grace which renders a man juft in the fight of God, and worthy of eternal happinefs. See Theology.

The Romanitts and Reformed are extremely divided about the doctrine of jultification ; the latter contending for juftification by faith alone, and the former by good v:orks.

JUSTIN, a celebrated hiftorian, lived, according to the molt probable opinion, in the fecond century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgment of the hiflory of Trogus Pompeius; comprehending the actions of almoft all nations, from Ninus the founder of the Alfyrian empire to the emperor Auguftus. The original work, to the regret of the learned, is loft : this abridgment. being written in a police and elegant ttyle, was probably the reafon why that age neglected the original. The bett editions of Jullin are, ad ufum De!phini, in sto; and cum notis variorum et Gronovii in 8 vo .

Justiv (St), commonly called Fufin Míartyr, one of the earlitit and moft learned writers of the eaftern church, was born at Neapolis, the ancient Sechern of Paleftine. His father Prifcus, a Gentile Greek, brought him up in his own religion, and had hin educated in *ll the Grecian learning. To complete his tudies he travelled to Egypt : and followed the fect of Plato, with whofe intellectual notions he was much pleafed. But one day walking by the fea-fide, wrapt in contemplation, he was mot by a grave ancient perfon of a venerable afpect ; who, falling into difcourfe with him, turned the converfation by degrees from the excellence of Platonifm to the fuperiur perfection of Chriflianity : and reafoned fo well, as to raife in him an ardent curiofity to inquire into the merits of that religion; in confequence of which inquiry, he was converted about the year 132. On his embracing that religion, he quitted neither the profeffion nor the habit of a philofopher: but a perfecution breaking out under Antoninus, he compofed An Ajology for the Cbrifians ; and afterwards preferted another to the emperor Marcus Aurelius, in which he vindicated the innocence and holinels of the Chriftian religion againft Crefcens a Cynic philofopher, and other calumniators. He did honour to Chriftianity by his learning

Juftinian, and the purity of his manners; and fuffered martyrJuftiniari. dom in 167 . Befides his two Apologies, there are fill extant his J)inghgue with Trylpo, a Jew; two treatifes acidreffed to the Gentiles, and another on the unity of God. Other works are alfo alcribed to him. The belt editions of St Jultin are thofe of Robert Stephens, in 1551 and 1571, in Greek and Latin: that of Morel, in Greek and Latin, in $1 \mathrm{~K}_{5} 6$; and that of Don Prudentus Marandus, a learned Benedictine, in 1742 in folin. His fly 1 l is plain, and void of all ornament.

JUSTINIAN I. Con of Juftin the elder, was made Crafar and Auguftus in 527 , and foon after emperor. He conquered the Perfians by Belifarius his general, and exterminated the Vandals; regained Africa; fubdued the Goths in Italy; defeated the Moors; and reftored the Roman empire to its primitive glory. Sce (Hittory of) Constantinople, $n^{\circ} 93$-97. and Italy, $\mathrm{n}^{\circ}$ I2, \&c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Juttinian made the belt ufe of it, by collecting the immenfe variety and number of the Roman laws into one body. To this end, he felected ten of the mofl able lawyers in the empire; who, revifing the Gregorian, 'Theodolian, and Hermogenian codes, compiled one body; called Codex. Yiflinionus. This may be called the fatute lawe, as confiting of the refcripts of the emperors. But the reduction of the other part was a much more difficult talk: it was made up of the decilions of the judges and other magiltrates, together with the authoritative opinions of the moft eminent lawyers; all which lay fcattered, without any order, in no lefs than 2000 volumes and upwards. Thefe were reduced to the number of 50 ; but ten years were fpent in the reduction. However, the defign was completed in the year 553 , and the name of Digells or Pandeas given to it. Befides thefe, for the ufe chicfly of young fludents in the law to facilitate that fudy, Jutinian ordered four books of inflitutes to be drawn up, containing an abitract or abridgement of the text of all the laws: and, latly, the laws of modern date, poltcior to that of the former, were thrown into one volunse in the jear 541, called the Novella, or New Code.

This emperor died in the year 565 , aged 83 , in the 39 th of his reign, after having built a great number of churches; particularly the famous Saneta Sophia at Conllantinople, which is efteemed a matterpiece of architecture.

JUSTINIANI (St Laurence), the firt patriarch of Venice, was born there of a noble fanily in 138 s . He was a very pious prelate, and died in 1485 ; he Jeft feveral pieces of piety, which were printed together ar Lyons in 1568, in one volume folio, with his life prefixed by his nephew. Clement VII, beatified hum in 15'4, and he was canonized by Alexander VIII. in 1690 .

Justiniani (Bernard), was born at Venice in 1408. He obtained the fenator's robe at the age of 19, ferved the republic in feveral embaffies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote the Hiflory of Venice, with fome other works of confiderable merit; and died in 1498 .
$\mathrm{N}^{0} 17 \mathrm{t}$.
$416] \quad \mathrm{J} U \mathrm{~V}$
Justiniani (Auguftin), bifhop of Nebo, one of Juntiai the mofl learned men of his time, was defcended from a branch of the fame noble family with the two foregoing; and was born at Genoa in 1480 . He affited at the fifth council of Lateran, where he oppofed fome articles of the concordat between France and the court of Rome. Francis I. of France made him lis alnoner; and he was for five years regius profeffor of Hebrew at Paris. He returned to Genoa in 1522, where he difcharged all the duties of a good prelate; and learning and piety flourifhed in his diocefe. He perifhed at fea in his paffage from Genoa to Nebbio, in 1536. He compofed feveral pieces; the mott confiderable of which is, Pfalterium Helveum, Gracum, Arabicum, et Cbaldaum, cum tribus Latinis interpreta. fionibus ef gloflis. This was the firft pfalter of the kind printed; and there is alfo aferibed to the fame prelate a tranflation of Maimonides's Moore Nerrochinis.

JUS I'NESS, the exactnefs or regularity of any thing.

Iutinefs is chiefly ufed in fpeaking of thonght, lan. guage, and fentiments. The jutnefs of a thought confifts in a certain precifion or accuracy, by which every part of it is perfectly true, and pertinent to the fubject. Juftnefs of language confifts in ufing proper and well chofen terms; in not faying either too much or too little. M. de Miere, who has written on juftnefs of mind, dittinguifhes two kinds of jutnefs; the one arifing from tafte and genius, the other from good fenfe or right reafon. There are no certain rules to be laid down for the former, viz. to thow the beauty and exactnefs in the turn or choice of a thought; the latter confilts in the juft relation which things have to ore another.

JU'TES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninfula, which makes the principal part of the kingdom of Denmark. It is bounded on the fouth-eaft by the duchy of Folltein, and is furrounded on the other fides by the Gernan ocean and the Battic fea. It is about 180 miles in length from north to fouth, and 50 in breadth from ealt to welt. The air is very cold but wholefome; and the foil is fertile in corn and paltures, which feed a great number of beeves, that are fent to Germany, Holland, and elfewhere. This was anciently called the Cimbrian Cherfonefus, and is fuppofed to the the country from whence the Saxons came into England. It is divided into two parts, called North and South Futland: the latter is the duchy of Slefwick, and lies betwcen North Jutland and the duchy of Holltein; and the duke of that name is in poffeffion of part of if, whofe capial town is Gottorp, for which reafon the fovereign is called the duke of Holfin Gottorp.

JUVENAL (Decius Junius), the celebrated Roman fatyrift, was born about the beginning of the emperor Claudian's reign, at Aquinum in Campania. His father was probably a frced-man, who, being rich, gave him a liberal education, and, agreeably to the talte of the times, bred him up to eloquence; in which he made a great progrefs, firlt under Frontu the grammarian, and aftel wards, as is gen-rally conjectured, under Quintilian ; after which he attended the bar, and made a diftinguifhed figure there for many years by his eloquence. In the practice of this profeffion

## J U X

he had improved his fortune and intereft at Rome before he turned his thoughts to poetry, the very ilyle of which, in his fatires, fpeaks a long habit of declamation: fubafum redulent declamatoren, fay the critics. It is faid he was above 40 ygars of age when he recited his firlt effay to a fmall audience of his friends; but being encouraged by their applaufe, he ventured a greater publication: which reaching the ears of Paris, Domitian's favourite at that time, though but a pantomime player, whom our fatyrift had feverely infulted, that minion made his complaint to the cm peror; who frnt him thereupon into banifhment, under preterice of giving hina the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our fatyrift returned to Rome, fufficiently cautioned not only againft attacking the characters of thofe in power, under arbitrary princes, but againtt all perfonal reflections upon the great men then living; and therefore he thus wifely concludes the debate he is fuppofed to have maintained for a while with a friend on this head, in the firft fatire, which feems to be the firlt that he wrote after his banifhment:

> Experiar quid concesidutur in illos
> Quorım Flaniniaizegitur cinis atgue Lutiana.
"I will try what liberties I may be allowed with thofe whofe afhes lie under the Flaminian and Latin ways," along each fide of which the Romans of the firtt quality ufed to be buried. - It is believed that he lived till the reign of Adrian in 128. There are ftill extant 16 of his fatires, in which he difcovers great wit, frength, and keennefs, in his language: but his Ayle is not perfectly natural; and the obfernities with which thefe fatires were filled render the reading of them dangerous to youth.

JUVENCUS (Caius Vecticus Aquilinus), nne of the firt of the Chrittian poets, was born of an illultrious famidy in Spain. About the year 320 he put the life of Jefus Chrift into Latin verfe, of whichi he compofed four books. It this work he followed almoft word for word the text of the four cvangelifts: but his verfes are written in a bad tafte, and his Latin is not pure.

JUVENTAS, in mythology, the goddefs who prefided over youth among the Romans. This goddefo was long honoured in the Capitol, where Servius 'Tullius erected her flatue. Near the chapel of Minerva there was the altar of Juventas, ard upon this altar a pieture of Proferpine. The Gtceks called the goddefs of youth Hebe; hut it has been generally fuppofed that this was not the fame with the Roinan $Y^{\prime} w$ rantas.

JUXON (Dr William), born at Chichefter in 1682 , was bred at Merchant-Taylor's fchool, and from thence clacted into St John's college Oxford, of which he became prefident. Ring Charles I. made him bifhop of London; and in 1635 promoted him to the polt of lord high treafurer of England. The whole nation, and efpccially the nobility, were greatly offended at this high office being given to a clergyman; but he bebaved fo well in the adminiftration, as foon put a fop to all the clamour raifed againf him. This place he licld no longer than the 17 th of May $16+1$, when

Voz. IX. Part II.

## 417

he prudently refigned the Ataff, to avoid the ftorm Juxtarofiwhich then threatened the court and the clergy. In the following February, an act paffed depriving the biflops of their votes in parliament, and incapacitating them from any temporal jurifdiction. In thefe leading Aeps, as well as the total abolition of the epifcopal order which followed, he was involved with his brethren; but neither as bilhop nor as treafurer was a fingle accufation brought againft him in the long parliament. During the civil wars, he refided at his palace at Fulliam, where his meek, inoffenfive, and genteel behaviour, notwithfanding his remainiug feady in his loyalty to the king, procured him the vifits of the principal perfons of the oppolite party, and refpect from all. In 1648 , he attended on his majefty at the treaty in the ifle of Wight; and by his particular defire, waitcd upon him at Cotton-houfe, Wreftminiler, the day after the commencement of his trial ; during which he frequently vifited him in the oifice of a fiiritual father; and his majelly declared he was the greateit comfort to him in that aflictive fituation. He likewife attended his majelty on the fcaffold, where the king taking off his cloak and Gcorge, gave him the latter: after the execution, our pious bilhop took care of the body, which he accompanied to the royal chapel at Windfor, and food ready with the commonprayer book in his hands to perform the latt ceremony for the king ; but was prevented by Colonel Whichcot, governor of the cattle.-He continued in the quict poffeffion of Fulham-palace till the enfuing year 1649, when he was deprived, having been fpared longer than any of his brethren. He then retired to his own eflate in Glouceflerfire, where he lived in privacy till the relluration, when he was prefented to the fee of Canterbury ; and in the little time he enjoyed it, expended in buildings and reparations at Lambeth-palace and Croyden-houfe near $15,0 c o l$. He died in 1663 ; having bequeathed 70001. to St John's college, and to other charitable ufes near 50001 . He publimed a Sermon on Luke xviii. 31. and Some Confiderations upon the Act of Uniformity.

JUXTAPOSI'ION, is ufed by philofophers to denote that fpecics of growth which is performed by the appofition of new matter to the furface or outfide of old. In which fenfe it Itands oppofed to intuffuffeption; where the growth of a body is performed by the receptiots of a juice within it diffufed through its canals.

IV Y, in botany. See Hedera.
IXIA, in botany: A genus of the monogynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the oth order, $E_{n}$ fate. The corolla is hexapetalous, patent, and equal; there are three Iligmata a little upright and petalous. There are feveral fpecies, confifting of herbaceous, tubcrous, and bulbous-rooted flowery perennials, from one to two feet high, terminated by hexapetalous flowers of different colours. They are propagated by off fets, which fhould be taken off in fummer at the decay of the leaves: but as all the plants of this genus are natives of warm climates, few of them can bear the open air of this country in winter.

IXION, in fabulous hiftory, king of the Lapithx, married Dia the daughter of Deionius, to whom he 3 G refufed

## J Y N

frora, Jynx. with ferpente, which turns without ceafin5. berry tetrafpermous.
refulcd to give the cultomary nuptial prefents. Deionius in revenge took from him his harfes: when Ixion, diffembling his refentment, invited his father-in-law to a feaft, and made him fall through a trap door into a burning funace, in which he was immediately confumed. Ixion being afterwards flung with remorfe for his cruelty, ran mad; on which Jupiter, in compafion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt juno. jupiter, to be the better affured of his guilt, formed a cloud in the refemblance of the goddefs, upon which Ixion begat the centaurs: but boalting of his happinefs, Jove hurled him down to T'artarus, where he lies fixed on a wheel encompalled

IXORA, in botany: A genus of the monogynia order, belonging to the tetrandria clafs of plants; atid in the natural method ranking under the $+7^{\text {th }}$ order, Stellate. The coro!la is monopetalous, funnel-haped, and long, fuperior; the flamina above the throat ; the

JYNX, in ornithology, a genuz of birds belonging to the order of picie ; the characters of which are, that the bill is flender, round, and pointed ; the noftrils are concave and naked; the tongue is very lony, very flender, cylindric, and terminated by a hard point; and the feet are formed for climbing. There is only one fecies, viz. the torquilla. The colours of this bird are clegantly pencilled, though its plumage is marked with the plainett kinds: a lift of black and ferruginoas ttrokes dividss the top of the head and back; the fides of the head and neck are aft. coloured, beantifully traverfed with fine lines of black and red-difh-brown; the quill-feathers are dutky, but each web
is marked with ruft-coloured fpots; the chin and breat are of a light yellowifh-brown, adoned with flarp-pointed bars of black; the tail confifts of ten feathers, broad at their ends and weak, of a pale afhcolour, powdered withoblack and red, and marked with four equidiftant bars of black : the irides are of a yellowih colour. - The wry-neck, Mr Pennant apprehends, is a bird of paffage, appearing with us in the ipring before the cuckoo. Its note is like that of the keftril, a quick-repeated fqqueak; its eggs are white, with a very thin fhell; it bulds in the hollows of trees, making its neft of dry grafs. It has a very whimfical way of turning and twifting its neck about, and bringing its head over its fhoulders, whence it had its Latin. na me trquuilla, and its Englifi one of sury neck: it has alio the faculty of erecting the feathers of the head like thofe of the jay. It feeds on ants, which it very dexteroufly transtixes with the bony and fharp end of its tongue, and then draws them into its mouth; and while the female is fitting, the male has been obferved to carry thefe infects to her.-We find this bird mentioned as an inhabitant throughout Europe, and of many parts of the old Continent. It is in Ruffia, Sweden, Lapland, Greece, Italy, Babylon, and Beagal; authorities for which Buffon mentions, and fays, that at the end of fummer this bird grows very fat, when it becomes excellent eating; for which reafon forne have named it the Ortolun. The young ones, while in the neft, will hifs like to many fnakes ; info. much that many have been prevented plundering the old ones of their offspring, on fuppofition that they were advancing their hands on the brood of this loathfome reptile.

K,the tenth letter $r$ and feventh confonant, of our alphabet; being formed by the voice, by a guttnral exprefion of the breath through the mouth, together with a depreffion of the lower jaw and opering of the teeth.

Its found is much the fame with that of the hard $c$, or $q^{u}$ : and it is ufed, for the mott part, only before $e$, $i$, and $n$, in the beginning of words; as ken, kill, know, sic. It ufed formerly to be always joined with $c$ at the end of words, but is at prefent very properly omitted, at leaft in words derived from the Latin: thus, for pubblick, miyfick, sce. we fay, public, muffic, \&c. However, in monofyllables, it is itill retained, as jack, block, mock, \&c.
$K$ is borrowed from the Greek kappa; and was but little ufed among the Latins: Prifcian looked on it as a fuperfluous letter; and fays, it was never to be ufed except in words borrowed from the Greek. Daurquius, after Sallun, obferves, that it was unknown to the ancient Romans.-Indeed we feldom find it in any latin auchors, excepting in the word kaleuta, where it fometimes ftands in lieu of a $c$. -Carthage, however, is frequently fpelt on medals with a $K$ : salvis aug. etcaes. fel. kart. and fometimes the letter $K$ alone ftood for Carthage.-M. Berger hasobferved, slat a capital $K$, on the reverfe of the medals of the
emperors of Conftantinople, fignified Koonfantinus ; and on the Greek medals he will have it to fignify kona ztila, "Coelefyria."

Quintilian tells us, that in his time fome people had a multaken notion, that wherever the letter $c$ and $a$ occurred at the beginting of a word, $k$ ought to be ufed inftead of the $c$. See C.

Liplius obferves, that $K$ was a Atirma anciently marked on the forcheads of criminals wich a redhot iron.

The letter $K$ has various fignifications in old charters and diplomas; for inllance, KR. Atood for choo rus, K R. C. For cara civitas, K R M. for carmen, K R. AM. N. carus amicus nofer, K S. chaos, KT. capite tonfus, \&c.

The French never ufe the letter $k$ excepting in a few terms of art and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in $k$ complaining, that he has been often in a fair way to be banimed out of the French alplabet, and confined to the countries of the north.
$K$ is alfo a numeral letter, fignifying 2.50, according to the verfe;

K quoque ducentos \& quinquaginta tinebit.
When it had a froke at top, $\overline{\mathrm{K}}$, it flood for 250,000 .
$K$ on the Fiench coinage denotes money coined at Bourdeaux.

KABA. See Mecca.
Kadesh, Kadest-barnea, or En-mishpat (anc. geog.), a city celebrated for feveral events. At Eadefh, Mirian the ither of Mofes died (Numb. xx. r.). Here it was that Mofes and Aaron, flowing a diftruft in God's power when they fmote the rock at the waters of Atrife, were condenned to die, without the confolation of entering the promifed land (Numb. xxvii. t4.). The king of Kadefh was one of the princes killed by Johtua (xii. 22.). This city was given to the tribe of Judah, and was fituated about eight leagues from Hebron to the fouth.

Mr Wells is of opinion, that this Kadefl, which was fituated in the wildernef3 of Zin , was a different place from Kadofl-barnea in the wildernefs of Pa ran.

KADMONEI, or Cadmonei (anc. geog.), a people of Paleftine, faid to $d x+l l$ at the foot of mouns Hermon ; which lies eaft, and is the reation of the appellation, with refpect to Libanus, Phoenicia, and the north parts of Palefline. Called alfo Hevai (Mofes).
K.EMPERIA, zEDOARy, in botany: A genus of the monogynia order, belunging to the monandria clafs of plants; and in the natural method rarking under the 8 th order, Scitamines. The curolla is fexpartite, with three of the fegments larger than the relt, patulous ; and ore only bipartite.

Species. I. The galanga, common galangal, or long redoary, has tuberous, thick, oblong, flelhy roots; crowned wish oval, clofe-fitting leaves, by pairs, four or five inches long, without fuotlalks; and between them clofe. litting white flowers, with purple bottome, growing fingly. 2. The rotunda, or round zedoary, has thick, flehly, fwelling, roundifh, clulering roots, fending up fpear-flaped leaves, fix or eight inches long, near half as broad, on upriglt footftalks; and between them, inmediately from the roots, rife whitifh flowers, tinged with green, red, yellow, and purple, centres. Both thefe are perennial in root; but the leaves rife annually in fpring, and decay in winter. They flower in fummer: each flower is of one petal, tubulous below, but plain above, and divided into fix parts ; they continue three or four weeks in beauty, but are never fucceeded by feeds in this eountry.

Culture. Both thefe plants muft be potted in light rich mould. and always kept in the hot-houfe, giving in plenty of water in fummer, but more fparingly in winter. They are propagated by"parting the roots in the fpring, juft before they begin to pufh forth new leaves.

Ufes. This plant is cultivated with great care by the inhabitants of Siam for the fake of its root; the ufe of which, fays hempfer, is to remove obllruktions of the hypoelhondria, to warm the flomach, difeufs fiatulcucies, and to ftrengthen the bowels and the whole servous fyttem. The root was formerly ufed in this country in bitter infufions; but is now laid afide, on account of its flavour being difagreeable.

KALENDAR, a diftribution of time, accommodated to the uies of life; or a table or almanac, containing the order of days, weeks, months, fealts, \&e. happening throughout the year. See Time, Month, Year, sec.

It is called kalendar, from the word laleatä, ancient. Kralemlar, ly wrote in large characters at the lead of each month. See Kalends.

The days in kalendars were originally diviled into ociocales, or cights ; but afterwards, in initation of the Jews, intu beblomades, or fevens; which cultom, Scahger obferves, was not introduced among the Romans till after the time of Theodofius.

There are divers kalendars, according to the different forms of the year and diltributions of time cflahlifhed in different countries. Fence the Roman, the Jewih, the Perfian, the Julian, the Gıegorian, \&ic. kzlendars.

The ancient Roman kalendar is given by Rieciolns, Struvius, Danet, and others; by which we fee the order and number of the Roman holidays and work-days.
'The three Chritian kalendars are given by Woiius in his Elements of Cluronology.

The Jewifh kalendar was fixed by rabbi Hillel abont the year 360 , from which time the days of their year may be reduced to thofe of the Julian kalendar.

The Roman Kalfinar owed its origin to Rominlus; but it has undergone various reformations fince his time. That leginator ditributed time into feveral periods, for the ufe of the people under his command: but as he was much better verfed in matters of war than of aftronomy, he only divided the year into ten months, making it begin in the fpring, on the firl of March; imagining the fun made his courfe through all the feafons in 304 days.

Romulus's kalendar was reformed by Numa, who added two months more, January and February; placing them before Mareh : io that his year confifted of 355 days, and began on the firt of January. He chofe, however, in imitation of the Crecks, to make an intercalation of 45 days, which he divided into two parts; intercalating a month of 22 days at the erid of each two years; and at the end of each two years more another of 23 days; which month, thus interpo. fed, he called Marcednnius, or the intercalary liebruary.

But thefe intercalations being ill obferved by the pontiff, to whom Numa committed the care of them, oecafioned greac diforders in the conititution of the year; which Cæfar, as fovereign pontiff, endeavoured to remedy. To this end, he made choice of Sofigencs, a celebrated aftronomer of thofe times; wha found, that the difpenfation of time in the haleudai could never be fettled on any fure footing without ha. ving regard to the annual courfe of the fun. Accordingly, as the fun's yearly courfe is performed in 365 days fix hours, he reduced the year to the fame num. ber of days: the year of this correction of the kalendar was a year of confufion; they being obliged, in order to fwallow up the 65 days that had been inprudently added, and which occafiwaed the confufion, to add two months befides the Marcedonins, which chanced to fall out that year: fo that this year tonfifted of 15 months, or $4+5$ days. This reformation was made in the year of Rome 708,42 or 43 years before Chria.

The Roman kalendar, ealled alfo 'yulian Ralendar, from itsreformer Julins, is cifpofed into quadrit nuial periods; whereof the fintt three years, which he catled communcs, confitt of 365 days; and the fourth, bifixitile, of 366 ; 3 G 2

## K A L

Kulendar. by reafon of the fix hours, which in four years make a day or fomewhat lefs, for in 134 years an intcrea. lary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciaconius, appointed, that the hundredth ycar of each century fould have no biffextile, excepting in each fourth century : that is, a fubtraction is made of three biffextile days in the face of four centuries; by reafon of the 11 minutes wanting in the. fix hours whereof the biffextile confifts.

The reformation of the kalendar, or the new $f 2 y / e$, as we call it, commenced on the 4 th of Oetober 1582, when ten days were thrown out at once, Co many having been introduced into the computation fince the time of the council of Nice in 325 , by the defect of II minutes.

Gulian Cbriflian Kalendef, is that wherein the days of the week are determined by the letters $A, B$, C, D, E, F, G, by means of the folar cycle ; and the new and full moons, efpecially the parchal full moen, with the fealt of Eafter, and the other moveable fealls depending thereon, by means of golden numbers, rightly difpofed through the Julian year. See Cycle, and Golden Number.

In this kalendar, the vernal equinos is fuppofed to be fixed to the 2 If day of March; and the cycle of 19 years, or the golden numbers, conftantly to indicate the places of the new and full moons; yet both are erroneous: And hence arofe a very great irregularity in the time of Ealler. 'Co fhow this error the more apparently, let us apply it to the year 1715 . In this year, then, the vernal equinox falls on the roth of March ; and therefore comes too early by is days. The pafchal full moon falls on the 7 th of April; and therefore too late, with regard to the cycle, by three days. Eafter, therefore, which fhould have been on the 1oth of April, was that year on the 1 gth. The error here lies only in the metemptofis, or poftpofition of the moon, through the defect of the lunar cycle. If the full moon had fallen on the 1 ith of March, Eafter would have fallen on the 13 th of March ; and therefore the error arifing from the anticipation of the equinox would have exceedingly augmented that arifing from the poft pofition. Thefe errors, in courfe of time, were fo multiplied, that the kalendar no longer exhibited any sregular Eafter. Pope Gregory XIII. therefore, by the advice of Aloyfius Lilius, in 1582 , threw 10 days out of the month of October, to reftore the equinox to its place, viz. the 21 ft of March; and thus introduced the form of the Gregorian year, with fuch a provifion, as that the equinox fhould be conftantly kept to the 2 If of March. The new moons and full moons, by advice of the fame Lilius, were not to be indicated by golden numbers, but by epacts. The kalendar, however, was ftill retained in Britain without this correction: whence there was a difference of 11 days between our sime and that of our neighbours. But by $2_{4} \mathrm{Geo}$. II. c. 23. the Gregorian computation is eftablifhed here, and accordingly tock place in 1752 .

Gregorian KALENDAR, is that which, by means of spacts, rightly difpofed through the feveral months, determines the new and full moons, and the time of EaAter, with the moveable feafts depending thereon, in the Cregorian year.

The Gregorian kalendar, therefore, differs from the Juliap, both in the form of the year, and in that epacts
are fubftituted in lieu of golden numbers: for the ufe $\mathrm{K}_{\mathrm{s}}$ and difpofition whereof, fee Epact.

Though the Gregorian kalendar be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Caffini imagine, it is impoffible ever to bring the thing to a perfect juitnefs). For, firt, the Gregorian intercalation does not hinder, but that the equinox fometimes fucceeds the 21 ft of March as far as the 23 d ; and fometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20 th of March, is fometimes the pafchal; yet not fo accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22 d of March the pafchal ; which yet, falling before the equinox, is not pa\{chal. In the firtt cafe, therefore, Eaffer is celebrated in an irregular month; in the latter, there are two Eafters in the fame ecclefiafical year. In like manner, the cyclical computation being founded on mean fullmoons, which yer may precede or follow the true ones by fome hous, the pafchal full-moon may fall on Saturday, which is yet referred by the cycle to Sunday: whence, in the firt cafe, Eafter is celebrated eight days later than it thould be; in the other, it is celebrated on the very day of the full-moon, with the Jews and Quartodeciman heretics ; contrary to the decree of the council of Nice. Scaliger and Calvifius fhow other faults in the Gregorian kalendar, arifing from the negligence and inadvertency of the authors; yet is this kalendar adhered to by the Romanifts throughout Europe, \&c. and ufed wherever the Roman breviary is ufed.

Reformed, or Correiled KALENDAR, is that which, fetring afide all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the pafchal full-moon, and the moveable feafts depending thereon, by aftronomical computation, according to the Rudolphine Tables.

This kalendar was introduced among the Proteftant ftates of Germany in the year 1700, when II days were at once thrown out of the month of February ; fothat in 1700 February had but 18 days: by this mcans, the corrected ftyle agrees with the Gregorian. This alteration in the form of the year they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by obfervation, the Romanifts would agree withs them on fome more convenient intercalation.

Confluction of a Kalendar, or Almanac. 1. Compute the fun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and by means thereof diltribute the kalendar into weeks. 3. Compute the time of Eafter, and thence fix the other moveable feafts. 4. Add the immoveable feafs, with the names of the martyrs. 5. To every day add the fun's and moon's place, with the rifing and fetting of each luminary ; the length of day and night ; the crepufcula, and the afpects of the planets. 6. Add in the proper places the chief phafes of the moon, and the fun's entrance into the cardinalpoints; i. e. the foltices and equinoxes; tugether with the rifing and the fetting, efp:cially heliacal, of the planets and chief fixed flars. See Astronomy.

The duration of the crepufcula, or the end of the evening and beginning of the morning twilight, together with the fun s rifigg and fetting, and the length of days, may be transferred from the kalendars of one year into thofe of another; the differences in the fe-

## K A L

ar. reral years being too fmall to be of any confideration in civil life.

Hence it appears, that the confruction of a kalendar has nothing in it of myitery or difficulty, if tables of the heavenly motions be at liand.

Some divide kalendars or alnaanacs into public and private, perfect and imperfect ; others into Heathen and Chriftian.

Public almanacs are thofe of a larger fize, wfually hung up for common or family ufe; private are thofe of a fmaller kind, to be earried about cither in the hand, infcribed on a ftaff, or in the pocket; perfect, thore which have the dominical letters as well as primes and fealls inferibed on them; imperfect, thofe which have only the primes and immoveable featts. Till about the fourth century, they all carry the marks of heathenifm ; from that age to the feventh, they are generally divided between heathenifm and Chriftianity.

Almanaes are of fonewhat different compofition, fone containing more points, others fewer. The effential part is the kalendar of months and days, with the rifing and fetting of the fun, age of the moon, \&cc. To thefe are added varions parerga, aftronomical, aftrological, meteorological, chronological, and even political, rural, medical, isc. as caleulations, and accounts of eclipfes, folar ingreffes, afpeets, and configurations of the beavenly bodics, lunations, heliocentrical and geocentrical motions of the planets, prognoftics of the weather, and predietions of other events, tables of the planetary motions, the tides, terms, intereft, twilight, equation, kings, \&c.

Gelalean, or Fellalsan Kalendar, is a correction of the Periian kalendar, made by order of fultan Gelaleddan, in the $467^{\text {th }}$ year of the Hegira; of Chritt 1089.

Kalendar, is alfo applied to divers other compofitions refpecting the 12 months of the year.

In this fenfe, Spencer has given the fhepherd's kalendar; Evelyn and Miller the gardener's kalendar, \&c.

Kalendar, is ufed for the catalogue or fafti anciently kept in cach church of the faints both univerfal and thofe particularly bonoured in each church; with their bihops, martyrs, \&c. Kalendars are not to be confounded with martyrologies; for each church had its peculiar kalendar, whereas the martyrologies regarded the whole church in general, containing the martyrs and confeflors of all the cluurches. From all the feveral kalendars were formed one martyrology : fo that martyrologies are pofterior to kalendars.
Kalendar, is alfo extended to an orderly table or enumeration of perfons or things.
Lord Bacon wifhes for a kalendar of doubts. A late writer has given a kalendar of the perfons who may inherit eftates in fee-fimple.
Kalendar, Kalendarium, originally denoted, among the Romans, a book containing an account of moneys at intereft, which become due on the kalends of Janu ary, the ufual time when the Roman ufurers let out their money.

Kalendar Months, the folar months, as they fland in the kalendar, viz. January 31 days, $\varepsilon$ c.

Afronomical KALENDSik, an inatrument engraved upon copper-plates, printed on paper, and pafted on board, with a brafs gider which carries a hair, and flows by infpection the fun's meridian altitude, right afcenfron,
declination, rifing, ferting, amplitude, \&e. to a greater exarnefs than our eommon globes will thow.

Kalendar of Prifoners. See Calendar.
Kalendar Brotbers, a fort of devout fraternities, compofed of ecclefiallics as well as laymen; whofe chief bufinets was to procure mafles to be faid, and alms diftributce, for the fouls of fuch members as were deceafed. They were alfo denominated kalend.brothers, becaufe they iffually met on the kalends of each montb, though in fome places only once a quarter.

KALENDARIUM festum. The Chritians retained much of the ceremony and wantonnefs of the kalends of January, which for many ages was held a feaft, and celebrated by the clergy with great indecencies, under the names follun kalendarum, or bypodiaconorum, or fultorum, that is, "the fealt of fools:" fometimes alfo libertas dicembrica. The people met maked in the church; and in a ludicrous way. proceeded to the election of a mock pope, or bilhop, who exercifed a jurifdiction over them fuitable to the feftivity of the occafion. Fathers, councils, and popes, long laboured to reftrain this licence to little purpofe. We find the feat of the kalends in ufe as low as the clofe of the 15 th century.

## KAlenders. Sce Calenders.

KALENDS, or Calends, in the Roman chronology, the firft day of every month. -The word is formed from $\times 2 \lambda \ldots \omega$ I call or proclaim; becaufe, before the publication of the Roman faft, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof tor, the rex facrificulus; upon which a facrifice being offered, the pontiff fummoned the people together in the Capitol, and there with a loud voice proclained the number of kalends, or the day whereon the nones would be; which he did by repeating this formula as often as there were days of kalends, Calo Juno Novella. Whence the name calende was given thereto, from calo, calare. This is the account given by Varro. Others dcrive the appellation hence, That the pcople being convened on this day, the pontifex called or proclaimed the feveral fealts or holidays in the month ; a cuftom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the fatti or kalendar to be fet up in public places, that every body might know the difference of times, and the return of the feftivals.

The kajends were reckoned backwards, or in a retrograde order. Thus, v. g. the firlt of May being the kalends of May; the laft or the 30 oh of April was the pridic kalendarum, or fecond of the kalends of May; the 29 th of April, the third of the kalends, or before the kalends: and fo back to the 13 th, where the idcs commence; which are likewife, numbered invertedly to the fifth, where the nones begin; which are numbered after the fame manner to the firft day of the month, which is the kalends of April. See loes, and Nunes.

The rules of computation by kalends are included in the foilowing verfes:
Prima dies menfis cujufque eft diara kalendx:-
Sex Mains nonas, October, 耳ulius, \& Mars;
Quatuor at reliqui : babet idus quilibet ocio.
Inde dies reliquos omnes dic effe kalendas;
Quas retro numerans dices a menfe foruent?

In find the day of the kalenda an?uering to any day of the month we are in ; fee how many days there are yet remaining of the month, and to that number add two: fur example, fuppofe it the 22 d day of April; it is then the toth of the kalends of May. For April contains 30 days : and 22 taken from 30 , there remains 8 ; to which two being added, the fum is 10 . The reafon of adding two is, becaufe the latt day of the month is called fecnuto kalendas, the laft but one tevtio kalencias, \&c.

The Roman writers themfelves are at a lofs for the reafon of this abfurd and whimtical manner of computing the days of the month : yet it is ftill kept up in the Roman chancery ; and by fome authors, out of a vain affectation of learning, preferred to the common, more natural, and eafy manner.

Kalends, are alfo ufed in church-hiftory to denote conferences ancientls held by the clergy of each deanry, on the firt day of every month, concerning their duty and conduct, efpecially in what related to the impofition of penance.

Kalenos of January, in Roman antiquity, was a folemn feflival confecrated to Juno and Janus; wherein the Romans offered rows and facrifices to thofe deities, and exchanged prefents among themfelves as a token of friend hip.

It was only a melancholy day to debtora, who were then obliged in pay their intere:ls, Sce. Hence Ho. race calls it trifes kalenda; Lib. i. Serm. Sat. 3.

KALl, in botany. Sce Salsol.a.
KALISH, a province of Lower Poland, with the title of a palatinate. It is brounded on the welt by the palatinate of Bofnia, on the ealt by that of Syrad, on the north by Regral Prufia, and on the fouth by Silefia. "Kalifh is the eapital town.

Kalish, a town of Lower Poland, and capital of a palatinate of the fame name, where the Jefuits have a magnificent college. It is leated on the river Profna, in a morafs, which renders it difficult of accels. E. Long. 18. O. N. Lat. 52. 20.

KALMIA, in botany: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 18 th order, Bicornes. The calyx is quinquepartite; the corolla falverfhaped, formed with five nectariferous horns on the under or outer fide; the capfule ouinquelscular. Of this genus there are two fpecies, viz.

1. The latifolia, a mont beautiful firub, which rifes ufually to the height of five or fix feet, and fometimes twice that height in its native places. The thems of fome are as big as the fmall of a man's leg, though generally they are fmaller, and covered with a brown rough bark. The wood is very clofe grained, heavy, and hard like hax. The limbs in general are crooked and grow irregular; but are thick-clothed with ftifi imouth leaves of a fhining buicht gieen. 'The flowers grow in buncbes on the tops of the branches to foot-ltalks of three inches long: they are white, tained with purplifn red, confilting of one laf in form of a cup divided at the verge intu five fections: in the middle is a fylus and 12 lta mina: which, when the tower firlt opens, appear lying clofe to the lides of the cup at equal ditances, their apices being lodged in ten little hulluw cells, which being prominent on the outide, appeai as io many little tubercles. The flowers are fucceeded by fmall routd capfules; which when ripe open in live
paits, and Uifcharge their fmall duft like feeds. This plant is a native of Carolina, Virginia, and other parta of the northern continest of America; yet are not common, but are found only in particular places : they grow on rocks hanging over rivulets and ranning fireame, and on the dides of barten hills. They blof. Som in May, and continue in flower the greatelt part of the fummer. The noxious qualities of this elegans plant leffen that eftecm which its beauty claim3: for although deer feed on its green leaves with impunity, yet when cattle and heep, by fevere winters deprived of better food, feed on the leaves of thefe plants, a great many of them die annually.
2. The angultifolia, rifes to the lueight of about i 6 feet, producing ever-green leaves in lhape like the lauro cerafus, bnt imall, and of a thining dark green. The flowers grow in cluaters, the buds of which appear in autumn wrapped up in a conic fcaly perianthium, on which is lodged a vifcons matter, which protects them from the fevere cold in winter. Thefe buds dilating in the following fpring, break forth into tuenty or more monopetâlous fluwers divided into five fegments, and fet fingly on pedicles half an inch long. Thefe flowers, when blown, appear white; but on a near view are of a faint bluifh-colour, which as the flower decays grow paler. One of the five petals is longer and morc concave than the reft, and is blended with purple, green, and yellow fpecks, being a vifcous matter on the extremities of very tine hairs. The conves fide of the fame petal is alfo feeckled with $y$ ellowith green. The poincal rifes from the centre of the flower, and has its head adorned with fcarlet, and furrounded by 10 Itamina, whereof three are long and feven Rhort, whofe farina iffues out at a fmall round hole at its top. This elegant trce adorns the we:tern and remote parts of Pennlylvania, always growing in the molt Iterile foil, or on the rocky declivities of hills and river banks, in thady moit piaces.

KALMUCS, a tibe of Tartars, called alfo Eluths, inhabiting the larger half of what the Europeans call Wellern Tarlary. Their territory extends from the Cafpian fea, and the river 2aik or Ural, in 72 degrees of longitude from Ferro, to mount Altay, in 110 degrees, and from the foth to the 52 d degree of north latitude; whence it may be computed about 1930 miles in length from weit to ealt, and in breadth from north to fouth about 650 miles where broadent. It is bounded on the north by Ruflia and Siberia, from which it is feparated by a chain of mountains; on the ealt by mount ditay ; on the fuuth by the countries of Karazm and the two Bukharias, from which it is alfo feparated partly by a chain of mountains and partly by fome rivers. Sce Tartary.

Ut the Kalmuc Tartars the following curious account is given by profeffor Pallas. They are in general, fays he, of a middle fize, and it is even rare :o fee among them a perfon that is tall; the women efpecial1y are of low ttature, and bave very agreeable features. 'I'heir limbs are neatly turned, and very few have any defects cuntracted in infancy. Their education being left fulety to nature, procures for them a well formed body and found conltitution. The unly defect which is common among them is their having the thighs and Icgs fomewhat beat. A fat perfon is hardly ever to be me: with; the richeft and molt diftinguifhed, tbough they lead a life iuficiently indulent, and enjoy abun-

## K A I

dance of every thing they defire, are never exceffively corpulent. Their fkin is pretty fair, efpecially when young; but it is the cuftom of the lower fort to allow their male children to go quite naked both in the heat of the fun and in the finoky atmofphere of their felt huts; the men tou fleep naked, covered only with their drawers; and from thefe circumftances they acquire that rellowill brown colour which characteiles them. The women, on the contrary, have a very delicate complexion ; among thofe of a certain rank are found fome with the moft beautiful faces, the whitenefs of which is fet off by the fine black of their hair; and in this as well as in their features they perfecily refemble the ligares in Chinefe paintings.

The phyfiognomy which dillinguifnes the Kalmues is pretty generally known. Strangers are made to believe that it is frightfully deformed; and though indeed there are very ugly men to be fornd, yet in general their conntenance lias an opennefs in it that befpeaks a mild, a frank, and focial difpofition. In many it is of a roundilh thape, and exceedingly agreeable; among the women fume would be thought beanties even in thofe European cities where the talte is molt ferupulous. The characterittic features of a Kalmuc or Mongul countenance are the following: The interior augle of the eye is placed obliquely downwards towards the nole, and is acute and fefly'; the eye-brow's are black, narrow, and much arched; the nofe is of a Atructure quite fingular, being generally flat and broken towards the forelsead; the cheek bone is high, the head and face very round ; the eye is dark, the lips thick and flefhy, the chin fhort, and the teeth exceeding white, continuing fo toold age; the ears are of an enornous fize, ttanding out from the head. Thefe characters are more or lefs vilible in eich individual ; but the perfon that poffeffes them alt in the highiett degree is confidered as the mott beautifully formed.

Among all the Mongul nations, the men have much lefs beard than in our Europeau countries, and among the Tartars it appears much later. The Kalmucs have moft of it; and yet even with them the beard is very fcanty and thin, and few have much hair on any other part of the body.

People that lead a paforal life enjoy the hodily fenfes in the greatelt perfection. The Kalmucs find the fubtilty of their fenfe of fmell very ufeful in their military expeditions, for hy it they perceive at a diftance the fmoke of a fire or the fmell of a camp. There aremany of them who can tell by applying the nofe to the hole of a fox or any other quadruped if the animal be within or not. They hear at a great difance the tranpling of horfes, the noife of an enemy, of a flock of fheep, or even of Atrayed cattle; they have only to ftretch them. frlves on the ground, and to apply their ear clofe to the turf. But nothing is more afonifhing than the acutenefs of fight in moft of the Kalmucs, and the extraordinary diftance at which they often perceive very minute ohjecs, fuch as the dutt raifed by cattle or horfes, and this from places very little elevated; in iimmenfe level defarts, though the particular inequalities of the furface and the vapours which in fine weather are feen to undalate over the foil in great heats, condiderably increafe the difficulty. They are alfo accuftomed to trace the print of a foot in thefe defarts by the fight alone.

Thefe people poffefe many good qualities, which
$K$ A L .
give them a great fuperiority cver the wandering Tar- Kinnuce. tars. A certain natural fagacity, a focial drfpolition, hofnitality, cagernefs to oblige, fidelity to their chiefs, much envinfity, and a certain vivacity accompanied with good humour, which hardly ever forlake's even the molt wretched annoug them, form the fair fide of their character. On the oster hand, they are carelefs, fuperficial, and want true comage; befiles, they are remarkabic for credulity, difiruft, and a natural inclination authorifed by cutom for drunkeanefo and debauchery, but efpecially for a great degree of cun. ning, which they ton often practife. The difpoftion to indolence is common and natural, efpecially among the men, to all Aliatic nations, who lead a kind of life exempt from fubjection and devoid of activity ; but this is lefs to be perceived among the Kalancs, ou account of their satural vivacity, and does not prevent their endeavours to oblize. Thofe among thens who exercife any little trace, or who are reduced by poverty to hire themfelves to the Ruflians cither for labour or for fifhing, are very affiduous and indefatigable. They fleep but little, going to ret late and rifing with the fun. 'To fleep throngh the day, unlefs a peifon is drunk, is confidered by them as difhon urable. But cheir eatieme dirtinefs can neither be difguifed nor ju!tified, and proceeds much more from their education, from the flovenlinefs attached to the profeflion of a hercifnate, and from levity, than from lazines: for the Kainane women are indefatigable in whatever concerns dunce ic maters: and it is for this reafon, as well as on the core of feufuality, that the Kirgifiens are eager to feize and carry them off whenever an opportunity prefents it.ed?.
With regard to the inteliectual falser of the Kalmucs, notwithtanding their want of inftruction and information, they polf if good natural parts, an excellent memory, and a ltrong defire to learn. They acquire the Ruffian language with great facility, and pronounce it well; in which laft article they very nuch furpafs the Chinefe. It wuuld he very eafy to civilize them, if their petulance and manner of life did not render it impráticable.

Although the Kalmucs are generally of a fanguine and choleric temperament, they live more amicahly together than one could expect in a people that lead fo independent a life. They feldom come to blows even over their cups, and their quartels are lardly ever bloody. A murder very rarely happens, though their anger has fomething in it exceedingly fierce. It would feem that the morality of their religion, thongh extremely idolatrous, has been able to moderate their natural difpoftion in this refpect; for in coufequence of their dogmas, with regard to the tranfmigration of fouls, every wanton murder either of men or beafts is thoughe a deadly fin.

The Kalmucs ane exceedingly affable; and of fo focial a difpofition, that it is rare for a traveller to perceive another even at the dillance of feveral miles without going to falute him, and to inquire into the object of his journey. When a troop of Kalmues perceive any perion at a diftance, it is cuftomaty for them to detach one of their number to the next eminence, from vibence he makes a fignal with his cap for. the perfon to draw near. If this fignal is not obeyed, the perfon is confidered as an wiemy or a robber, and is often purfued at fuch. They cater willingly ite of fiend-
nips:

## $\left.\begin{array}{lllll}\mathrm{K} & \mathrm{A} & \mathrm{L} & 424\end{array}\right] \quad$ K A I

Kininuce. hips: but thefe connections are not quite difinterefted; for to give and to receive prefents are with them effential articles. A mere trifle, however, is fufficient to induce them to do you all manner of fervice; and they are never ungrateful as far as they are able. Adverfity cannot deprive them of courage nor alter their good humour. A Kalnuc will never beg if he were in the extremeft mifery, but rather endeavour to acquire a fubfiftence by cheating; and when no other way remains, he will lire himfelf to fome rich individual of his nation, or to fome Ruffian, either as a herdfinan, a fifherman, or for any other fort of labour. Very few of the rich value themfelves much upon their wealth : but thofe who du, fhow no contempt for the poor of their own nation; though the meaner fort pay their court very obfequioufly to the rich, who are always furrounded with a fwarns of idle dependants.

Nothing can be more prudent than that exercife of hofpitality practifed by wardering nations: it -is of the greatelt advantage to thofe among them who travel acrofs their defarts; and each individual who practifes it, may rely on reaping the benefit of it wherever lie goes. A Kalmue provided with a horfa, with arms and equipage, may ramble from one place to another for three months together, without taking with him either money or provitions. Wherever he comes he finds either diflant relations or friends, to whom he is attached by the ties of hofpitality, from whom he meets with the kindeft reception, and is entertained in the beft manner their circumftances afford. Perhaps he lodges in the firt unknown coftage he finds upon his road; andifcarcely has he entered it, but his wants are fupplied with the molt affectionate cordiality. Every ftranger, of whatfoever nation, never fails to be well received by a Kalmuc; and he may depend upon having his effects in the greatelt fecurity the moment he has put himfelf under the protection of his hot : for to rob a gueft is confidered by the Kalmues as the mot abominable of all crimes.

When the matter of the houfe fits down to meat in company with others of inferior rank, he begins indeed by ferving himielf and his family, but whatever renains is dill ributed among the affiftants. When they imoke tobacco, the pipe circulates inceffantly from one to another. When any one receives a prefent either of meat or drink, he divides it faithfully with his companions, even, though of inferior rank. But they are much more niggardly of their other effects, and efpecially of their cattle, and do not willingly give thefe away except when they hope to receive a fuitable return : or if any relation has accidentally fuffered the lofs of his flocks, he is fure to be molt willingly affilted. Perhaps too it may be related as an article of their hofpitality, that they abandon their wives to their friends with the greatell facility, and in general they are very little inclined to jealoufy.

Their robberies are never committed upon their equals, and even the greater patt of the rapine excrcifed on other tribes is founded on hatred or national quarrels ; neither do they willingly attempt this by open foree, but prefer the machinations of cunning, which are fo natural to them. It mult alfo be confeffed, that it is only thofe that live with princes, and in canps where thefe hold their courts, or their priefts, No 172.
that are noof addicted to thefe practices; while the Kals common people, fatisfied with the pleafures of the paftoral life, fpend their days in innocent fimplieity, and never attack the property of another till foreed by neceflity, or led by their fuperiors who fhow them the example.

The Kalmucs are very faithful to their lawful prinee: they endure every fort of oppreffion, and yet are with difficulty induced to revolt; but if they belong to a prince who has not become fo by right of fueceffion, they very eafily rebel. They honour old age. When young men travel with fuch as are older than themfelves, they take upon them the whole care of the cattle as well as of the fealt. They are exceedingly prudent in matters that relate to their fovereign or their nation, or which are recommended to their direction by the priefts, to whom they yield an unreferved obedience.

The moveable habitations of the Kalnucs are thofe felt huts with a conical roof in ufe among all the roaming Afiatics. The truly ingenious invention of thefe tents was undoubtedly conceived in the eafteru parts of Afia, and mull probably by the Mongul nations. As they ean be entirely taken to pieces and folded in a fmall compafs, they are very ufeful, and perfectly agree with the migratory life of thefe people, who are ftill ignorant of the ufe of carriages. The frame of thefe huts, and the felt they are covered with, though made ass light as poffible, yet are a fufficient load for a camel or two oxen. But the capaeity of thefe huts, their warmth in winter, their ftrength in refifting tempelts and excluding rain, abundantly compenfate for this inconvenience. The wood eodures many years; and though the felt begins to brcats into holes in the fecond year, the common people, who do not confider it as difgraceful to have them mended and patched, nake them ferve a good deal longer. The huts are in general ufe from the prince down to the meanett Kalmuc, difiering only in fize and in the embellifhments within. In winter, they are warm even when heated with the dried excrements of their cattle, to which they are often oblized to have recourfe for want of other combuftibles in many places of the defarts which are defitute of wood. In iummer they temuve the felt to enjoy the freh air.
The mafter of the tent has his bed placed oppofite to the door behind the fire-place. The bedlleads are low and made of wood. The rieh adorn their beds with curtains, and fpread carpets of felt upon the ground. When a Kalmuc poffefles an idol, he places it near the head of his bed, and fets before it feveral fmall confecrated cups full of water, milk, or other food. Before this fort of altar he fixes in the ground the trunk of a tree, on which he plaees a large iron bafin deftined to receive the libations of all the driuk he makes ufe of in a day. On feltivals the idol is deeorated, the lamps are lighted, and perfumes burnt befure it.
The riches of the Kalmucs, and their whole means of fubfitence, depend on their flocks, which many of them reckon by hundreds and even by thoufands. A man is thought eapable of living on his poffeffions when he is mafter of ten cows with a bull, eight mares with a ftallion. The animals they lave in greatef abundance are bor!es, horned cattle, and fheep. Camels, which
re-
require time and pains to fear, cannot multiply much with them: they are hefides too delicate; and it is only the rich or tbe priefts who pofiefs any of them. Their horfes are but fmall, too weak for the draught, and too wild; but they do not yield to any in fuiftnefs, and fupport witb eafe the weight of a man. They may be made to gallop for feveral hours fucceffively without injury; and when neceffity requires it, they can pafs twice 24 hours without drinking. They have a little hoof, tut very lard; and they may be wfed at all times without being mod. In this country the horfes live and perpetuare themfelves without any affifance from man. The Kalmucs caftrate the greater part of their male foals, and at the fame time fitit their noftrils, that they may breathe more freely whien they run. The fallions are never feparated from the mares, that there may always be plenty of milk. The tiallions are leaders of the herd, ano cften wander at a diflance into the defarts at the head of their females, defending them from the wolves with the greateft intrepidity. The Kalmucs have the art of breaking a young horfe without ufing a bridle. They feize him bufore he is two years old by means pf a noofe fixed to the end of a long pole; an juflrument they ufe in taking their siding horfes which feed in the midft of the herd. They put no faddle at firt on the colt they mean to break, but tie a ftrait girth round his body; by the help of which the horfeman can keep himfelf firm. When he is mounted, the horfe is abandoned to his fury ; they allow him to run and agitate himfelf as much as he pleafes on the open plain till he is fatigued. The horfeman is folicitous only to keep himfelf falt; and when the horfe begins to abate of his impetuofity, he urges him again with the whip till his Arength is almott gone: he is then faddled and bridled, and made to go for fome time at a moderate pace; after which he is entirely tamed.

The horned cattle of the Kalmucs are of a beautiful flape. They keep more bulls than are neceflaty for the covs, and cmploy a great number of them as beafts of burden for carrying their houfes and their other furniture from place to place. They think a bull equal to 50 cows. Thefe and the mares give milk only while they fuckle their calves or their foals, which are accordingly kept clofe to the tents during the day, and only fuffered to fuck freely during the night ; a practice which the Kalmucs pretend makes their cattle ftronger and more durable. They generally milk their mares three or four times a day, and fometimes every two hours when the herbage is abundant. The cows are milked but twice a day.

The Kalmuc fheep are of the fame fpecies with thofe found in all Gieat lartary, laving large tails like a bag, excredingly fat, and which furnih a fuet as foft as butter. They have alfo large pendant ears, and their head is much arched. Their wool is coarfe, and the ewes feldom lave horns. One ram is fufficient for an hundred ewes. Little ufe is made of the milk. Ihe wool is fit for notling but to make felt for the tents. A great many fheep die during winter, and a greater number flill of the early lambs; the fins of which are wrought into thofe fitie furs fo much clleemed in Ruffia and foreign parts.

Camels belong only to the rich; for they are very dear, multiply very flowly, and are fubject to maty
difeafez. The đefarts of the Wolga, and almof all Kalmucs. thofe of the fouthern parts of Great l'artary, furnifh excellent pafture for thefe animals; but they require not only nuch attention in winter, but they mull be continually under the eye of the herdfinen; for notwithHanding the advantage of their ftuture, they are of all aninials leaf able to defend themflues againtt the wolf. They are guarded with much care againt the violence of the cold and the winds of winter; neverthelefs many of them die of a confumption accompanied with a diarrlica, occafioned moft probably by the moif. ture of their pafture and of the feafon. This difeafe, for which no remedy has been found, makes them languifh for fix montbs or more. They are in general fo delicate, that a flight wound or blow often prove fatal to them. Befides, no animal is fo much tormented with infects; and they often die in fummer of thofe they fwallow in eating the leaves of the oak and of the birch. The mela profcarabizus, which covers all the plants ia many of thofe places where they feed, is generally fatal to them. In fpring, when they calt their thair, and which fells at once from every part of their body, they are expofed to the bite of the fpider-fcorpion, an animal rery common in fouthern countries. The wound inflicted by this infect on the flin thus naked is fo venomous, that the camel dies of it in lefs than eight days, fometimes in three. In winter, and efpecially after rutting time, which happens at the end of March, the camels become lean and weak; the bunch upon their back grows flabby, and hangs down upon the fide, nor does it recover its plumpnefs till fummer.

Camels milk is thick, unctuous, and of a faltifh tafte, efpecially when the animals frequent paftures abounding with faline plants; and this laft property makes the Kalmucs fond of it to tea. They make ufe of the hair for fluffing cufhions, and for making ropes, packthread, and felt. It may be wrought into the molt beautiful camlets, or into the fineft and fofteft claths. The camels with two bunches are a very uneafy feat to the perfon who mounts them; their trot is fo heavy, and even their walk fo rude, that he receives the moft violent fhocks at every flep.

When a Kalmuc Horde intends to remove in fearch of frefl pafture, which in fummer neceffarily happens every four, fix, or eight days, people are in the firlt place difpatched to reconnoitre the befl place for the khan or prince, for the lama, and for the huts containing the idols. Thefe begin the march, and are followed by the whole troop, each chooting for himfelf the place he thinks moft convenient. The camel that is luaded with the moft precious furniture is decorated with little bells, the rett march in a flring one behind another, and the bulls with burdens are driven on before. On thefe days the women and girls crefs themfetves in their beft clothes, and lay on abundance of painc. They have the charge, together with the boys, of leading the flocks and the beatts of burden; and on the road they beguile the tedioufnefs of the journey with their fongs.

The Kalmucs are fupplied by their flocks with milk, cheefe, butter, and flefh, which are the principal articles of their fond. With regard to the laft, they are fo little fqueamifh, that they not only eat the flelh of their own difeafed cattle, but that of almoft every fort

Kialnuzs, of wild beat, and the poor will even feed upon carion. They eat, however, the roots and italks of many plants; fuch as the bulbsus-rooted chervil and dandelion, \&c. which they ule both boiled and raw.

Their ordinary drink is the milk of mares or cows; but the former is for feveral reafons preferred. This, when frefh, has indeed a very difagreeable taine of garlic: but befides that it is much thinner than cow-milk, it takes as it grows four a very agreeable vinous flavour; it yiclds neither cream nor curd, but furnifhes a very wholefome refrefling beverage, which fenfibly inebriates when taken to excefs. They never make nfe of new milk, and Aill lefs of milk or of water that lave not been boiled. Their milk is boiled as foon as it is taken from the animal; when it is cold it is poured into a large leathern bag, in which there remains as much of the old milk as is fufficient to turn the new quantity four, for they never think of cleanfing thofe bags; and as the infide is lined with a cruft depotited by the cafeous part of the milk and other impurities, it is eafy to imagine that a naufeous fmell mult exhale from them. But this is precifely the circumflance in swich the fecret confifts of communicating to the milk a vinous fermentation.

In fummer, and as often as the Kalmucs procure much milk from their flocks, they never fail to intoxicate themfelves continually with the firituous liquor which they know how to diftil from it. Mares milk is the mof Spirituous; and the quantity meant to be difilled remains twenty-four hours in fammer, and three or four days in winter, in thofe corrupted bags we mentioned, to prepare it for the operation. The cream is left, but the butter which forms at top is taken off and referved for other purpofes. Cows-milk yields one-thirtieth part, and mares milk one-fifteenth part, of fpirit. This liquor is limpid and very watery, and coniequently does not take fire, but is capable of being long keyt in glafobottles. The rich Kalmucs increafe its Arength by a fecond diftillation.

Thefe people are exceedingly fond of tea and tobacco. The former is fo dear, as it comes to them from Clina by the way of Ruffia, that the poor people fupply its place with various wild plants; fuch as a fpecies of liquorice, the feed of the flarp-leaved dock, the roots of wild angelica, and the feed of the Tartarian maple.

The Kalmucs are exceltent horfemen. Their arms are lances, bows, and arrows, poignards, and crooked fabres, though the rich have fire-arms. They wear, when at war, coats of mail, which coft 50 horfes, and their helmets are guilded at top. They are fond of falconry, and hunting of all forts is their principal amufe. ment. Their paffion for play, efpecially with thofe who play cards, is carried to as great excefs among then as in any other nation.

The greater part of their time is fpent in diverfions; and however wifierable their manner of life may feem to us, tbey are perfeally happy with it. They cannot endure fur any time the air of a clofe room; and think our cuftom of living in houfes infupportable. The greatelt part of them, notwithlanding of the apparent unhealthinefs of their way of life, arrive at a vigorous old age; their difeafes are neither frequent nor dangerous. Men of 80 or 100 years old are not uncommon; and at that age they can fill very well endure the exer-
cife of riding. Simple food, the free air- which they $\mathrm{K}_{3}$ confantly breathe, a hardy vigorous conflitution, continual exercife without fevere labour, and a mind free from care, are the natural caufes of their health and Iongevits.

It is very remarkable, that a migratory people, whofe manner of life feems fo congruuns to the natural liberty of mankind, fhould have been fubjected from cime immemorial to the unlimited authority of an abfolute fovereign. The Monguls of Alia afford the only inflance of it ; for neither written records nor ancient tradition have preferved the fmalleft trace of their ever having enjoyed a flate of independence. On the contrary, they acknowledge that they have at a! times been fubject to khans and princes, whofe authority bas been tranfmitted to them by fucceflion, and is confidered as a right perfectly eftablifhed, facred, and divine.

KAMAKURA, a famous ifland of Japan, about three miles in circumference, lying on the fouth coalt of Niphon. It is here they confine their great men when they have committed any fault. The coaft of this ifland is fo fteep, that they are forced to be lifted up by cranes.

KAMEEL, Kamel, or Camel, a machine for lifting hips. See Camel.

KAMINIECK, a very ftrong town of Poland, and eapital of Podolia, with two cafles and a bifhop's fee. It was taken by the Turks in 1672, who gave it back in 1690 , after the treaty of Carlowitz. It is feated on a craggy rock, in E. Long. 27. 30. N. Lat. 48. 58.

KAMSIN, the narae of a hot foutherly wind common in Egypt, of which we find the following defeription in Mr Volney's Travels.-Thefe winds, fays he, are knowu in Egypt by the general name of quinds of 50 days; not that they laft 50 days without intermiffion, but becaufe they prevail more frequently in the 50 days preceding and following the equinox. Travellers have mentioned them under the denomination of poifonous winds, or, more correctly, bot zuinds of the defart. Such in fact is their quality; and their hent is fometimes fo exceffive, that it is difficult to form any idea of its violence without having experienced it; but it may be compared to the heat of a large oven at the moment of draving out the bread. When thefe winds begin to blow, the atmofphere aflumes an alarming afpect. The fky, at other times fo clear in this climate, becomes dark and heavy; the fun lofes his fplendor, and appears of a violet colour; the air is not cloudy, but grey and thick, and is in fact filled with an extremely fubtile duft, which penetrates every where. This wind, always light and rapio, is not at firl remarkably hot, but it increafes in heat in proportion as it continues. All animated bodies foon difcover it by the change it produces in them. The lungs, which a too rarefied air no longer expands, are contracted, and become painful. Refpiration is hort and difficult; the fkin parched and dry, and the body confumed by an internal heat. In vain is recourfe had to large draughts of water; nothing can reftore perfpiration. In vain is coelnefs fougbt for; all bodies in which it is ufual to find it deceive the hand that touches them. Marble, iron, water, notwithftanding the fun no longer appears, are hot. The flreets are deferted, and the dead filence of night reigns every where.

## $\left.\begin{array}{llll}\mathrm{K} & \mathrm{M} & {[427]} & K\end{array}\right]$ M

Tue inhabitants of towns and villagea flut themfeives up in their houfes, and thofe of the defart in their , tents or in wells dug in the earth, where they wait the termination of this deftructive heat. It ufualiy lafts three days, but if it exceeds that time it becomes infupportable. Wo to the traveller whom this wind furprifes remote from thelter; he nu:t fuffer all its lorrible effeets, which fometimes are mortal The danger is molt imminent when it blows in fqualis; for then the rapidity of the wind incteafes the heat to fuch a degree as to caufe fudden death. This death is a real fuffocation; the lungs being empty are convulfed, the circulation is difordered, and the whole mals of blood driven by the heart towar's the head and breaft; whence the hxnorrhage at the nofe and mouth which lrappens after death. This wind is efpecially defructive to perfors of a plethoric habit, and thofe in whom fatigue has deffroyed the tone of the mufcles and the veffels. The corpfe remains a long time warm, fiwells, turns blue, and foon becomes purrid. Thefe accidents are to be avoided by flopping the nofe and mouth with handkerchiefs; an efficacious method likewife is that prattifed by the camels. On this occafion thefe animals bury their nofes in the fand, a:l keep them there till the fquall is over. Another quality of this wind is its extreme aridity; which is fuch, that water fprinkled on the floor evaporates in a few minutes. By this extreme drynefs it withers and Arips all the plants; and by exhaling too fuddenly the emanations from animal liodics, crifps the fkin, clofes the pores, and canfes that feverifh heat which is the contant effect of fupprefled perfpiration.

KAMTCHATKA, Kamschatha, or Ǩamehat. $k a$; a large peninfula on the north-eaftern part of Afia, lying between $51^{\circ}$ and $62^{\circ}$ of north latitude, and between $173^{\circ}$ and $182^{\circ}$ of eant longitude from the ille of Ferro. It is bounded on the ealt and fouth by the fea of Namtchatka, on the weft by the feas of Ochotfk and Penflinfls, and on the north by the country of the Koriace.
This peninfula was not difcovered by the Ruffians before the end of the laft century. It is probable, however, that fome of that nation had vilited Kamtchatka before the time above mentioned. For when Volodomir Atlaffoff entered upon the conquelt of this peninfula in 1697 , he found that the iulabitants had already fome knowledge of the Ruffians. A common tradition as yet prevails among them, that, long before the expedition of Atlafloff, one Feodotoff and his companions had refided among them, and had intermarried with the natives; and they till fhow the place where the Ruflian babitations flood. None of the Ruffians remained when Atlaffoff firlt vifited Kamtchatka. Tbey are faid to have been held in great veneration, and almof deified by the natives; who at firlt imagined that no human power could hurt them, until they quarrelled anong themfelves, and the blood was feen to flow from the wounds which they gave each other; and foon after, uppon a feparation taking place, they were all killed by the natives. -Thefe Rufians were thought to be the remains of Ahip's crew who had failed quite round the northeaftern promontory of Afia calied Tfchukutfoci-Nofs. The account we have of this voyage is as allows.In 1648 , feven kotches cr veffels fated from the mouth
of the river Kovyma or K (lyina, lying in the frozen o. Kuamethat: cean in about $72^{\circ}$ nothllatitude, and $173^{\circ}$ or $174^{\circ}$ eat longitude from Ferro, in order to penetrate into the caltern ocean. Four of thefe were never more heard of; the remaining three vere commanded by Simon Deflneff. Geralim Ankudinoff, two chiefs of the Cof. facs, and lyeodotoff Alexecff, head of the Promy fhenics or wandering Ruffians, who oecafionally vifited Siberia. Each vefiel was probably manned with about 30 perfons. They $m=t$ with no offructions from the ice; but Aukudinoff's vifitl was wrecked $0: 1$ the promontory abcre menioned, and the cres were dilltibuted on board the two remainiog veItels. Thefe two foon after loft fight of each other, and never afterwards rejoined. Delineff was driven about by tempeftuous winds till October, when he was fhipwrecked on the wortbern part of Kam:chatha. IIere he was infurmed by a woman of Yakuth, that Feodotuff and Geralim had died of the feurvy; that part of the crew had been flain; and that a few has efcaped in fnall veffels, who hizd never afterwards been heard of; and thefe were probably the people who, as we have already mentioned, fettled among the Kamtchatkans.

As the inhabitants of this country were neither na- Subdues bre merous nor warlike, it required no great force to fuls thens. due them; and in 1711 the whole peninfula was finally reduced under the dominion of the Ruffinns. For fome years this acquifition was of very litile confequence to the crown, excepting the fmall tribute of furs exacted from the inhabitants. The Ruffans indeed occafionally hunted, in this peninfula, foxes, wuives, ermines, fables, and other anitnals, whofe flains form an extcalive article of commerce among the eaftern nations. But the fur-trade carried on from thence was very incoufiderable, until the feries of illands mentioned in the next article 'were difcosered; fince which time the quantities of furs brought from thefe infands have greatly increafed the trade of Kamtchatka, and rendered it an important past of the Ruffian commerce.

The face of the country throughout the peninfula counery is chiefly mountainons. It produces in fome parts birch, poplars, elders, willows, underwood, and berries of different fort3. Greens and other vegetablcs are raifed with great facility; fuch as white cabbage, turnips, radifhes, beet-root, carrots, and fome cucumbers. Agriculture is in a very low ftate, owing chiefly to the nature of the foil and the fevere hoarfrolts; for though fome trials have been made with refpect to the cultivation of grain, and oats, barley, and rye, have been fown, yet no crop has ever been procured fufficient in quantity or quality to anfwer the trouble of raifing it. Hemp, however, has of late years been cultivated with great fuccefs,- Every year a veffel belonging to the crown fails from Ochotf to Kamtchatka laden with falt, provifions, corn, and Ruffian manufactures; and returns in June or July of the following year with flivs and furs.
Many traces of volcanoes have been obferved in this peninfula; and there are fonse mountains which are in a burning tlate at prefent. The mott confiderable of thefe is lituated near the middle of the peninfula. In 1762 , a great noife vas heard iffuing from the infrde of that mountain, and flames of fire were feen to

## $\mathrm{K} \quad \mathrm{A} \quad \mathrm{M}$

Kamtchat- burft from different parts. Thefe flames were immeka. diately fucceeded by a large ftream of meked fnowwater, which fowed into the neighbouring valley, and drowned two natives who were there on a hunting party. 'The afhes and burning matters throven from the mountain were fipread over a furface of 300 verits. In 1767 was antether difcharge, but lefs confiderable. Every niglit flames of fire were obferved Areaming from the mountain; and confiderable damage was done by the eruption which attended them. Since that year no flames have been feen; but the mountain emits a 5. conliant fmoke.

Population, Kamtchatka is divided by the Ruflians into four di\&s. ftricts; and the government of the whole is dependent upon, and fuhject to, the infpection of the chancery of Ochotfls. The whole Ruffian forfe llationed in this peninfula amounts to no more than 300 men . The prefent population of Kamtchatka is very frazll, amounting to fcarce 4000 fouls. Formerly the inhabitants were more numerous; but in $17{ }_{7} G^{6}$, the finallpox carried off 5368 perfons. There are now only about 700 males in the whole peninfula who are tributary, and few more than 100 in the neighbouring iflands, called the Kizril Ifles, who are fubject to Ruffia: The fixed annual tribute confilts in 279 fables, 454 red foxes, 50 fea-otters with a dam, and 38 cub otters. All furs exported from Kamtchatka pay a duty of 10 per cent. to the crown; the tenth part of the cargoes bought from the neighbouring iflands is alfo

The natives of Kamtchatka are as wild as the couniry itfelf. Some of them have no fixed habitations, but wander from place to place with their herds of rein-deer; others have fettled habitations, and refide upon the banks of the rivers and the flore of the Peufchinfla fea, living upon fifh and fea-auimals, and fuch herbs as grow upon the thore: the former dwell in huts covered with decr-fkins; the latter in places dug out of the earth; both in a very barbarous manner. Their difpofitions and tempers are rough; and they are entirely ignorant of letters or religion. The natives are divided into three different people, namely, the Kamtchatkans, Koreki, and Kuriles. The Kamtchatkans live upon the fouth fide of the promentory of Kamtchatka: the Koreki inhabit the northern parts on the coaft of the Penchinfia fea, and round the eaftern ocean almof to the river Anadir, whofe mouth lies in that ocean almof in $68^{\circ} \mathrm{N}$. Lat.: the Kuriles inhabit the iflands in that fea, reaching as far as thofe of Japan. The Kamtchatkans have this particular cuftom, that they endeavour to give every thing a name in their language which may exprefs the property of it; but if they do not underftand the thing quite well themfelves, then they take a name from fome foreign language, which perhaps has no relation to the thing itfelf; as, for example, they call a prieft bogbog, becaufe probably they hear him ufe the word bogbog, "God;" bread they call brugbtatin aug $/ 3$, that is, Ruflian root; and thus of feveral other words to which their language is a ftranger.
It appears probable, that the Kamtchatkans lived formerly in Mungalia beyond the river Amur, and made one people with the Mungals; which is farther confirmed by the following obfervations, fuch as the Kamtchatkan having feveral words common to the Mun-
gal Chinefe language, as their terminations in ong, Kamt ing, uang, chin, cha, ching, kfii, kfung ; it would be fill a greater-proof, if we could fhow feveral words and fenteaces the fame in both languages. The Kantchatkans and Mungals alfo are both of a middling flature, ase fivarthy, have black hair, a broad face, a harp nofe, with the eyes falling in, eye-brows fnall and thiu, a hanging belly, flender legs and arms; they. are both remarkable for cowardice, boaling, and favifhnefs, to people who ufe them hard, and for their oblinacy and contempt of thofe who treat them with geutlencts.

Although in ontward appearance they refemble the other inhabitants of Siberia, yet the Kamichatkans differ in this, that their faces are not folong as the other Siberians; their cheeks ftand more out, their teeth are thick, their mouth large, their flatore midding, and their thoulders broad, particularly thofe pecple who intabit the fea-coaft.

Before the Ruflan conquef, they lived in perfect freedom, having no chief, being fubject to no law, nos paying any taxes; the old men, or thofe who were remarkable for their bravery, bearing the principal authority in their vil"ages, though none had any right to. command or inflict punifhmeut.
Their manner of hiving is novenly to the laft degree: they never wath their hands nor face, nor cut their nails; they eat out of the fame difh with the dogs, whicla they never walh; they never comb their heads, but both men and women plait their hair in two locks, binding the ends with fmall ropes. When any hai: flarts out, they few it with threads to make it lie clofe; by this means they have fuch a quantity of lice, that they can fcrape them off by handfuls, and they are nally enough even to eat then. Thofe that have not natural hair fufficient, wear falie locks, fo:netimes as much as weigh to pounds, which makes their heads look like a hay cock.

They place their chie $\int$ happinefs in idlenefs, and fatisfying their natural lut and appetites; which incline them to finging, dancing, and relating of love-ltories; and they think it more eligible to die than to lead a difagreeable life; which opiuion often leads them to felf murder. This was fo common after the con- $\mathrm{K}_{3}$ queft, that the Ruffians had great difficulty to put a kar Itop to it. Thiey have no notion of riches, fame, or nee horour ; therefore covctoufnefs, ambition, and pride, alv are unknown among them. On the other hand, they are carelefs, luffful, and cruel: thefe vices occafion frequent quarrels and wars among them, fometimes with their neighbours, not from a defire of increafing their power, hut from fome other caufes; fuch as the carrying off their provifions, or rather their girls, which is frequently practifed as the moft fummary method of procuring a wife. Their trade is alinot entirely confinied to procuring the immediate neceffaries and conveniences of life. They fell the Korekifables, fox and white dog.fkins, dried muthrooms, and the libe, in exchange for cloaths made of deer-Ains and other hides. Their domeftic trade confifts in dogs, boats, difhes, troughs, nets, hemp, yarn, and provifions: and this kind of barter is carried on under a great fhow of friendilhip; for when one wants any thing that another has, he goes freely to vifit him, and without any ceremony makes known his wants, al-

## K A M

though perhaps he never had any acquaintance with him before : the hof is obliged to hehave according to the cuthom of the country, and give his guet what he has occation for; but he may afterwards return the vifit, and mull be received in the fame manner. They fill alnoit every place in heaven and eatth with difle. rent fuirits, and offer them facrifices upon every occafon. Some carsy licte idols about them, or have them placed in their dwellings; but with regard to God, they nut only neglet to worfhip him, but in cafe of troubles and misfortuass they curfe and blafpheme him.

It is very diverting to fee theri attempt to recknn ahove ten:- for having reckoned the fingers of both hands, they clafp thent together, which fignifiss ten ; then they beyin with their toes, and count to twenty; after which they are quite confounded, and cry, Metcia? that i-, Where hall I take mare? They reckon ten months in the year, fome of which are longer and fome fiorter; for they do not divide them by the changes of the moon, but by the order of particular occurrences that happen in thofe regions. They commonly divide our yeal iuto two, fo that winter is one year and fummer another: the fummer year begins in May, and the winter in November. They do not dillinguif the days by any particular appellation, nor form them into weeks or months, nor ytt know how many days are in the month or year. They mark their epocins by fome remarkable thing or other; fuch as the arrival of the Ruffians, or the firlt expedition to Kamtchatka.

If any one kills another, he is to be killed by the selations of the perfon flaia. They burn the hands of people who have been frequently caught in thefc; but for the firt offerice the thicf mult reftore what he hath folen, and live alone in fclisude, without expecting the affitance of others. They never have any difpates about their land or their hus, every one having land and water more than fufficient for his wants. Tbey think themfelves the happiell people in the world, and loo': upon the Ruffians who are fettled among them with contempt. However, this notion begins to change : for the old people who are contirmed in their cultoms drop off; and the young ones being converted to the Chriftian religion, adopt the cuttoms of the Ruflians, and defpife the barbarity and fupertition of their anceltors.

In every ofrog or large village, by order of her inperial majefty, is appointed a chief, who is fole judge in all caufes except thofe of life and death ; and not only thofe chiefs, but even the common people, have their chapels for worthip. Schools are alfo erected in almoft every village, to which the Kamrchatkans fend their children with great pleafure: by this means it is to be hoped that barharity will be in a fhort time rooted out from amonglt them.

Under the name of ofror, is undertood every habitation confifting of one or more huts, all furrounded by an earthen wall or palifado.- The huis are built in the following manner: they dig a hole in the earth about five feet deep, the breadth and length proportioned to the number of people defigned to live in it. In the middle of this hole they plant four thick wooden pillars; over thefe they lay balks, upon which
they form the roof or ceiling, leaving in the middle a Kamech tfquare opening which ferves them for a window and ka. chimney ; this they cover with grafs and earth, fo that the outward appearance is like a romad hillock; but within they are an oblong fquare, with the fire in one of the long fides of the fquare : between the pillars round the walls of their huts they make benches, upou which each family lies feparately; but on that fide oppofite to the lire there are no benches, it being defigned for their kitchen furniture, in which they drefs their victuals for themitives and dogs. In thofe huts where there are no benches, there are balks laid upon the floor, and covered with mats. They adorn the walls of their huts with mats made of grafs. They cnter their huts by ladiders, commonly placed near the five-hearth; fo that, when they are lieating their huts, the lleps of the ladder become fo hot, and the fmoke fo thick, that it is almoit impoflible for a ftranger to go up or down without being burnt, and cyea ftifled to death; but the natives find no difficulty in it ; and though they can only fix their toes on the Ateps of the ladder, they mount like fquirrels; nor do the women helitate to go through this fnoke with their children upon their fhoulders, though there is another opening through which the women are allowed to pafs; but if any man pretend to do the fame, he would be laughed at. The Kamtchatkans live in thefe huts all the wincer, after which they go into others called bulagazs: thefe ferve them not only to live in during the fuminer, but alfo for magazines. They are made in the following manner: nine pillars, about two fachoins long, or more, are fixed in the ground, and bound together with balks laid over them, which they cover with rods, and over all lay grafs, fafteniog fpars, and a round tharp roof at top, which they cover with bramble, and thatch with grafs. They faften the lower ends of the fpars to the balks with ropes and thongs, and have a door on each fide, one directly oppofize to the other. They make ufe of the fame kind of huts to keep their fifh, \&e. till winter comes on, when they can more eafily remove it ; and this without any guard, only taking away the ladders. If thefe buildings were not fo high, the will bealts would undoubtedly plunder them; for notwithitanding all their precaution, the bears fornetimes climb up and force their way into their magazines, efpecially in the harveft, when the fifh and berries begin to grow fcarce.

The fouthern Kamtchatkans commonly build their villages in thick woods and other places which are naturally ftrong, not lefs than 20 vertts from the fea; and their fummer habitstions are near the mouths of the rivers; but thofe who live upon the Penfchinika fea and the eaftern ocean build their villages very near the thure. They look upon that river near which their village is fituated as the inheritance of their tribe.

In order to kindle fire, they ufe a board of dry Method of wood with round holes in the fides of it, and a fmall kindiag lound llick; this they rub in a hole till it takes fire ; fire. and inltead of tinder they ufe dry grafs beat foft. Thefe intruments are held in fuch efteem by the Kamtchatkans, that they are never without them, and they value them more than our fleels and nints; but they

ズantclấo are exccinivly fond of iron influments, fuch as hatchka. ets, knives, or needles; nay, at the firlt arrival of the Ruflians, a piece of broken iron was looked upon as a great prefent; and even now they receive it with thankfulnefs, finding ufe for the lealt fragment, either to point their arrows or make darts, which they do by hammering it out cold between two flones. As fome of them delight in war, the Ruffian merchants are forbid to fell them any warfike inttrments : but they are ingenious enough to make fpears and arrows out of the iron pots and hettles which they buy ; and they are fo dexterot:s, when the eye of a needle breaks, as to make a new eye, which they will repeat until nothing remains b:It the point.
The Kamtchatkans make their boats of poplarwood; but the Fiuriles not having any wood of their own, make ufe of what is thrown on fhore by the fea, and is fuppofed to cone from the coafts of Japan, China, or America. 'lke northern inhabitants of Kamtchatka, the fettled Koreki and Tichukotkoi, for want of proper timber and plank, nake their boats of the finis of fearamimals. Thev few the pieces together with whales beards, and cauk them with mols or nettles beat finall. Thefe boats hold two perfons; one of which fits in the prow, and the other in the flern. They pufl them againt the Atran with poles, which is attended with great trouble: when the current is Atrong, they can farcely advance two feet in ton minutes; notwithtanding which, they will carry thefe boats, fully loaded fometimes 20 verts, and when the ftream is not very ftrong, even 30 or 40 verfts. The larger boats cary 30 or 40 pood; when the goods are rot very heavy, they lay them upon a flout or bridgc relting upon two boats joined together. They ufe this method in tranfporting their provifions down the ftream, and alfo to and from the iflands.

Their cloaths for the molt part are made of the fins of deer, dogs, feveral fea and land animals, and even of the fkins of birds, thofe of different animals being frequently joined in the fame garment. They make the upper garment after two fafhions; fometimes cutting the nkirts all of an equal length, and fometimes leaving them long behind in form of a train, with wide neeves of a length to come down below the knee, and a hood or caul behind, which in bad weather they put over their heads below their caps; the opening above is only large enough to let their heads pafs : they fcw the fivins of dogs feet round this opening, with which they cover their faces in cold flormy weather ; and round their fkirts and neeves they put a border of white dog-fzin; upon their backs they few the fmall hreds of fkins of different coloums. They commonly wear two coats; the under coat "with the hair-fide inwards, the other fide being dyed with aldcr; and the upper with the hair outwards. For the upper garment they choofe black, white, or fpeckled kins, the hair of which is mott efteemed for the beau$t y$ of its colour.

Men and women without diftinction ufe the abovementioned garments, their drcfs only differing in their under-cloathing and in the covering of their feet and legs. The women have an under-garment, which they commonly wear at home in the houfe, confifting of a treeches and waiftcoat fewed together. The breeches
are wide like thofe of the Dutch fkippers, and tie be-Kame low the knee ; the waiftcoat is wide above, and drawn round with a ftring. The fummer habits are made of dreffed fkins without hair: their winter-garment is made of deer or ftone-ram fkins with the hair on. The undrefs or houfehold habit of the men is a girdle of leather with a bag before, and likewife a leathern apron to cover them behind; thefe girdles are fewed with hair of different colours. The Kamtchatkans ufed formerly to go a hunting and fihing during the fummer in this drefs; but now this fafhion is changed, and they wear linen fhirts, which they buy from the Ruffians.

The covering of their feet and legs is made of fkins of different forts: in the fummer-time, during the rains they wear the fkins of feal with the hair outwards; but their mott common covering is the nkin of the legs of the rein-deer, and fometimes of the legs of other beafts, the fhaggieft they can find, to preferve
 the Coffacs and Kamtchatkans ufe in their fineft drefs, are made in the following manner: the fole is of white feal Ikin, the upper part of white fine leather, the hind quarters of white dog nkin; what comes round the legs is of dreffed leather or dyed feal-fkin; the upper parts are embroidered. Thefe bufkins are fo extraordina:y, that if a bachelor is obferved to wear them, he is immediately concluded to be upon a fcheme of courthip.

They wear the fame fort of caps as the people of Yakutfi. In fummer they have a fort of hats of birch bark tied about their head. The Kuriles ufe in the fummer-time caps madc of plaited grafs. The womens head drefs is the perukes that we formerly mentioned; and thefe were fo dear to them, that when they came to be Chriltians they were with difficulty prevailed upon to quit this drefs for one more decent : however, at prefent, round be Rufs fettlements, all is entirely changed, the women wearing hirts, ruffes, wailtcoats, caps, and nibhands; which change nobody now complains of except the very old peopli. The women do all their work in mittins; they formerly never wathed their faces, but now they ufe both white and red paint: for white paint they make ule of a rotten wood; and for red a fea plant, which they boil in feal's fat, and rutbing their cheeks with it, nake them very red. They drefs moft in the winter time, efpecially when they either receive or pay vilits.

The common cloaths for a Kamtchatkan and his family will not coft him lefs than 100 rulbbles; for the coarfeft worfted fiockings, which colt in Ruffia 20 kopeeks, cannot be bought here for lefs than a ruble and all other things are fold in the fame proportion. The Kuriles are more able to buy good cloaths than the Kamtchatkans; for they can purchafe for one feabeaver as much as the Kamtchatkans can for twenty foxes; and one beaver cofts the Kuriles no more trouble than five foxes do the Kamtchatkans; for he muft be a good hunter who catches more than ten foxes in the winter; and a Kurile thinks himfelf unlucky if he doth not catch three beavers in the feafon; befides which, great numbers are thrown upon the fhore by ftorms.

The Kamtchatkans divide their fifh into fix parts: Theis the fides and tail are hung up to dry; the back and

## K A M [ $431 \quad] \quad \mathrm{K}$ A M

Eat*: thinner part of the belly are prepared apart, and generally dried over the fire; the head is laid to four in pits, and then they eat it like falt fifh, and efterm it much, though the ftink is fuch that a ftrange: cannot bear it; the ribs and the fleh whieh remain upon them they hang up and dry, and afterwaros pound for ufe; the larger bones they likewife dry for food for their dogs: in this manner all thefe different people prepare Ile yokola, which is the principal food, or, one may fay, houfehold bread; ano they eat it for the moit past dry.

Their fecond favourite food is caviar, or the roes of tifh, which they prepare three different ways. They
 which invelopes it, and fpreading it upon a bed of \$lafs, dry it before the fire ; or, lattly, make rolls of it with the leaves of grafs, which they allo diy. They never take a journey or go to hunting without dry caviar ; and if a Kamtchatkan has a pound of this, he can fubGf without any other provifion a great while : for every bireh and alder tree furnifhcs him with bark, which with his dried caviar makes him an agrecebie meal; but they cannot eat either feparately, for the caviar lticks like glue to the teeth; and it is almoft impofible to fwaliow the bark, chewed ever fo long by itfelf. There is Aill a fourth method, which both Kamtchatkans and Koreki ufe in prepaxing their caviar: the firt having corcred the bottom of a pit with grafs, they throw the frcha caviar into it, and leave it there to grow four: the Korcki tie theis in bags, and leave it to four ; this is elleemed their moft dulicate difh.
There is a third fort of diet, called by the Kiamtclatkans chupriki, which is prepared in this manner: in theirghus, over the fire-place, they make a bridge of Aakes, upou which they lay a heap of finh, which remains there until the hut beeomes as warm as a bagrio. If there is no great thicknefs of finh, onc fire ferves to drefs it ; but fometimes they are obliged to make two, three, or more fires. Fifh dreffed in this manner is half roatted, half finoaked, but has a very agreeable tafte, and may be reckoned the beft of all the Kuintchatkan cookery : for the whole juice and fat is prepared with a gradual heat, and kept in by the תkin, from which they may when done enough be eafily feparated; and as foor as it is thus dreffed, they take out the guts, and fpread the body upon a mat to dry : this they afterwards break fmall, and putting it into bags, carry it along with them for provifien, eating it like the yokola.
The Kamtchatkans have a difh which they effeem very much, called buigul: it is fifh laid to grow four in pits; and though the fmell of it is intolerable, yet the Kamtchatkans ecteem it a peffume. This fin fometimes rots fo much in the pits, that thes cannot take it out without ladles ; in which cafe indeed they ufe it for feeding their dogs.
As for the flefh of land and the larger fea animals, they boil it in their troughs with feveral different herbs and roots; the broth they drink out of ladles and bowls, and the neat they take out upon boards, and eat in their hands. The whale and fea-horie fat ehey alfo boil with roots.
There is a principal difl at all their fealts and en.
tertainments, called feluga, which they make by pound. Kanatclesing all forts of different roots and berries, with the arl- $\qquad$ dition of caviar, and whale and feal's fat.

Before the conquelt, they feldom ufed any thing for driuk but plain water, unlefs when they made merry; then they drank water which had ftood fome time upon muflrooms. At prefent they drink fpisits as faft as the Kuffians. A fter dinner they drink wa. tcr: : and when they go to bed at night, fet a veffel of water by them, with the addition of fnow or ice to keep it cold, and always drink it up before norning. In the winter-time, they amufe themfelves frequently by throwing handfuls of fnow into their months: and the bridegrooms, who work with the fathers of their future brides, find it their hardeft tafk to provide fnow for the family in fummer-tiose; for they mult bring it from the higheft hills be the weather what it will, otherwife they would never be forgiven.
The Kamtchatkans commonly travel in fledges Methot of drawn by dogs, The animals ufed for this purpofe travelling differ very little from the common houfe dogs; they with dym are of a midding fize, of various colours, though there fecm to be more white, black, and rrey, than of any other. In travelling, they nake ufe of thofe that are caltrattd, and generally yoke four to a fledge. They drive and dircet their dogs with a crooked tick about four feet long, which they fometimes adorn with different coloured thongs ; this is looked upon as a great piece of finery. They drive their fledge fitting upon their right fide, with their feet hanging down; for it would he looked upon as a difgrace for a man to fit down at the botom of the fledge, or to make ufe of any perfon to drive him, nobody doing this but the women. It is very difficult to travel in thefe nedges; for unlefs a man keeps the exacteft balance, be is liable every moment from the height and narrownefs of them to be overtuncel : in a rugged road this would be very dangerous, as the dogs never ftop till they come to fome houfe, or are entangled by fomething upon the road; efpecially in going down iteep hills, when they run with all their force, and are fcarcely to be kept in; for which reafon, in defeending any great declivity, they unyoke all the dogs except one, and lead them foftly down. They likewife waik up hills; for it is as much as the dogs can do to drag up the Iledge empty. After a deep fnow, before it las been hardened by a froft, there is no travelling with dogs till a road be made, which is effected by a man going before upon fnow foes, whom they call b-odoykika. The fnow-hoes are made of two thin boards, feparated in the middle, bound together at the ends, and with the fore part bent $\&$. little 1.pwards. The brodowhika, having one of thefe thoes upon each foot, leaves the dogs and fledge, and going on clears the road for fome way; then return. ing, leads forward the dogs and Nledge fo far as the road is made; a method which he muit continue till lee comes to fome dwelling-loufe. This is very-laborious; and it happens co often, that no driver ever fets out without his fnow-fhoes. When a ftorm of driven fnow furpifes them, they are obliged with all hafte to feek the fhelter of fome wood, and ftay there as long as the tempeft lafts, which fometimes is a whole week. If they are a large company, they dig a place for themfelces

## K A M

which is known to the Ruffinns. It is wafhed up by tiic Kanuc fea, and covers the fhores in fuch abundance that many ka. fhips might be loaded with ic. Perhaps an India tra. der might make a profitable voyage from thence to China, where this metal is in high demand. This cop$p \in r$ is moflly in a metallic or malieable ftate, and many pieces feem as if they had formerly been in fufion. The ifland is not high; but has many hillocks, each of which has the appearance of having formerly been a volcano. With this kind of hillocks all the inlands in the fea of liantchatka abound, infomuch that not a.fingle ifland, though ever fo fmall, ras found with. out one; and many of them confifted of nothing elfe. In fhort, all the ehain of inlands above mentioned may without any ftretch of inagination be conlidered as thrown un by fome late volcanoes. The apparent noveliy of every thing feemz to juftify this conjecture : nor can any objection be derived from the vegetable productions with which thefe inands abound ; for the fummer after the lower dittrict of Zutphen in Holland was gained from the fea, it was covered over with wild muftard. - All thefe iflands are fubjeet to frequent and violent earthquakes, and abound in fulphur. We are not informed whether any lava is found upon them; but a party-coloured fone as heavy as iron, probably a lava, is mentioned as being found there. From this account it is by no means improbable that the eopper above mentioned has been meleed in fome eruption.

Beering's ifland is fituated due ealt from Kamtchat- Beerrit ka , in the 185 th degree of longitude; and Copper-inand about one degree more to the eattward, and in the la titude of $54^{\circ}$ north. The former is from 70 to 80 verfts long, and ftretches from north weft to fouth-ealt in the fame direction as Copper-illand. The latter is about 50 vert's in length. About 300 verlts eaft-byfouth of Copper-ifland lie the Aleutian ines; of which Attak is the nearelt : it is rather larger than Beering's ifland, and ftretches from welt to fouth-ealt. From thence about 20 verifs eaftwards is fituated Semithi, extending from weft to eaft; and near its extremity is another fmall ifland. To the fouth of the ftrait which feparates the two latter iflands, and at the dillance of 40 verifs from both of them, lies Shimiya in a fimilar pofition, and not above 25 verfts in length. All thefe iflands lie between 54 and 55 degrees of north latitude.

The Fox iflands are fituated ealt-north-saft from the Fori Aleutians: the neareft of thefe, Atchak, is about 800 verlts diflant; it lies in $56^{\circ}$ north latitude, and extends from well-fouth welt, towards eall-north-eaft. It greatly refembles Copper-ifland, and is provided with a commodious harbnur on the north. From thence all the other iflands of this chain ftretch in a direction towards north-ealt by eafl. The next to Atchak is Amlak, and about i5 verts diftant : is is nearly of the fame fize, and has an harhour on its fouth fide. Next follows Saugagamak, at about the fame diftance, but fomewhat fmaller; from thence is 50 verfs to Amuchta, a fmall rocky ifland; and the latter to Yunakfan, another fmall iland. About 20 verits from Yunakfan there is a clutter of five fmall illands, or rather mountains, Kigalgif, Kagamila, Thigulac, Ulagá, and Tana Unok; and which are therefore called by the Rur-
themilves under the fnow, and cover the entry with wood or brambles. Sometimes they hide themfelves in caves or holes of the earth, wrapping themfelves up in their furs; and when thus covered, they move or turn themfelves with the greatelt eaution left they Ahould throw off the fnow, for under that they lie as warm as in their common huts: they only require a breathing-place; but their eloaths mutt not be tight or hard firt about them, for then the cold is infulfer. able. Another danger aitending travellers is, that in the fevereft frof feveral rivers are not quite frozen over: and as the roads for the molt part lie clofe upon the rivers, the banks being very feep, fcarce a year paffes without many being drowned. A difagreeable circumftance allo to thofe who travel in thefe parts, is their fometimes being obliged to pafs through cop$f \in s$, where they run the rifk of having their eyes feratched out or their limbs broken; for the doge always run mof violently in the worlt roads, and, to fiee themfelves, very often overturn their driver. The beft travelling is in the month of March or April, when the fnow is turned hard or frozen a little at top; however, there is ftill this inconvenience attending it, that fometimes travellers are obliged to ludge twe or three nights in defert places; and it is diffeult to prevail upon the Fiamtchatkans to mal:e a fire either.for warming themfelves or drefing victuals, as they and lheir dogs eat dried fift, and find themfelves fo warin wrapped in their furs, that they want no other heat; nay, all the people of this climate bear cold fo well, that they fleep in the open air as found as others in a warm bed, and awake next morning perfectly refrefhed and alert. This feems to be fo natural to all -here, that fome of them have been feen to lie down with their backs uncovered againit a fire, and notwithfanding the fire has been burnt out long before morning, they continued to fleep on very comfortably, and without any inconvenience.

Iflands in the Sea of Kamtchates. So many of - thele have been difcovered by the Ruffians, that the exittence of almott a continued chain of illands between the continents of Afia and America is now rendered extremely probable. Many further difcoveries of great importance to feience, however, remain yet to be made. The principal inlands already known are the Kuril inles, which Atretch fouthwelt towards the coalts of China or Japan, and are almoft uninhabited; thofe called Beering's, and Copper iflands, the Aleutian ifles, and Foxiffands, or $L_{j i} / \sqrt{i e}$ Oftroria, lie almoft directly eaft, Atretching neariy to $230^{\circ}$ of longitude ealt from Ferro. The firtt project of making difcoveries in that tempeluous fea which lies between Kamtehatka and America was fet on foot by Peter the Great of Ruffia. Captains Beering and 'T'fchirikoff were employed in the undertaking; the former of whom was hipwrecked and died on the infand which is ftill called by his name. As this lies at no great diftance from Kamtchatka, the inhabitants of the latter foon ventured over to it, as the feaotters and other animals of that kind were accuftomed to refort thither in great numbers.

Mednoi Oftroff, or Copper-illand, which lies in full light of Beering's ifland, was next vifited. This ifland has its name from the great quantity of copper with which the north-eaft coalt of it abounds, the only fide
$\mathrm{N}^{\circ} 17 \mathrm{I}$.

## K A M <br> K A M

fians $P_{u t}$ Sopki, or the Five Mountains. Of thefe Tana-Unok lies mof to the north eaft, towards which the weftern point of Umnak advances within the diftance of 20 verts.

Umnak flretclies from fouth-wct to north-eaR ; it is 150 verts in length, and has a very confiderable bay on the welt end of the northern coatt, in which there is a fmall ifland, or rock, called Adugak; and on the fouth fide Shemalga, another rock. The weftern point of Aghunalafhka, or Unalafhka, is Separated from the eaft end of Umnak by a ftrait near 20 verlts in breadth. The pofition of thefe two illands is fimilar; but Aghunalafhka is much the largeft, and is above 200 verts long. It is divided towards the northeaft into three promontories, one of which suns out in a wefterly direction, forming one fide of a large bay on the north coall of the ifland : the fecond flretches out north-eaft, ends in three points, and is connected with the ifland by a fmall neck of land. The third, or molt foutherly one, is feparated from the laft-mentioned promontory by a deep bay. Near Unalafhka towards the eaf lies another fmall ifland called Shirkin. About 20 verlls from the north-eaft promontory of AghunaJahka lie four iflands: the firf, Akutan, is about half as big as Umnak; a verlit further is the fmall ifland Akun ; a little beyond is Akunok; and laftly, Kigalga, which is the fmalleft of thefe four; and Aretches with Akun and Akunok almof from north to fouth. Kigalga is fituated about the GIft degree of latitude. About 100 verfts from thence lies an ifland called Unimak, upon which a Ruffian navigator (Captain Krenitzin) wintered; and beyond it the inhabitants faid there was a large tract of country called Alaf/ba, of which they did not know the boundaries.

The Fox inlands are in general very rocky, without containing any remarkably high mountains: they are deflitute of wood; but abound in rivulets and lakes, whick are mofly without fiff. The winter is much nilder than in Siberia; the fnow feldom falls before the beginning of January, and continues on the ground till the end of March. There is a volcano in Amuchta, and fulphur is produced on another ifland; in fome others are fprings hot enough to boil provifions. Sulphureous flames alfo are fometimes feen at night upon the mountains of Unalafhka and Akutan.

The Fox-iflands are tolerably populous in proportion to their fize. The inhabitants are entirely free, and pay tribute to no one ; they are of a middle fature, and live, both in fummer and winter, in holes dug in the earth. No figns of religion were found among them. Several perfons indeed pafs for forcerers, pretending to know things paft and to come; and are accordingly held in high efteem, but without receiving any emolument. Filial duty and refpect towards the aged are not held in eflimation by thefe iflanders. They are not, however, deficient in fidelity towards each other; they are of a lively and cheerful temper, though rather impetuous, and naturally prone to anger. In general, they do not obferve any rules of desency ; bur follow all the calls of nature publicly and without the lealt referve. Their principal food confilts in fifh, and other fea-animals, fmall fhell-fifh, and fea-plants; their greateft delicacies are wild lilies and Tol. IX. Part II.
other roots, together with different kinds of berrics. KameliatWhen they have laid in a ftore of provifions, they eat

## ka.

 at any time of the day without diftinction; but in cafe of neceffity, they are capable of fafting feveral days together. They feldom heat their dwellings: but when they are defirous of warming themfelves, they light a bundle of liay, and stand over it; or elfe they fet fire to train-oil, which they pour into a hollow fone. They feed their children when very young with the coarfelt flefh, and for the moft part saw. If an in fant cries, the mother immediately carries it to the fea-fide, and, be it fummer or winter, holds it naked in the water until it is quiet. This cultom, it is faid, is fo far from doing the children any harm, that it hardens them againt the cold; and accordingly they go barefooted through the winter without the leaft inconvenience. They are alfo trained to bathe frequently in the fea; and it is an opinion generally received among the iflanders, that by thefe means they are rendered bold and fortunate in fifling.The men wear fhirts made of the 0kins of cormorants, fea divers, and gulls; and in order to keep out the rain, they have upper garments of the bladders and other inteltines of feallions, fea-calves, and whales, blown up and dried. They cut their hair in a circular form quite clofe to their ears; and have alfo a round place on the top. The women, on the contrary, let the hatr defcend over the frohead as low as the eycbrows, and tie the remaining part in a knot upon the top of the head. They pierce the ears, and hang in then hits of coral, which they get from the Ruffians. Both fexes make holes in the griftles of their nofes, and in the under-lips, in which they thrult pieces of bone, and are very fond of fuch kind of ornaments. They mark alfo and colour their faces with different figures. They barter among one another fea-otters, fea bears, clothes made of birds 1 kins and of dried inteflines, fkins of fea-lions and fea-calves for the coverings of their canoes, wooden mafks, darts, thread made of finews and hair of reindeer.
-Their houfehold utenfils are fquare pitchers and large troughs, which they make out of the wood driven athore by the fea. Their weapons are bows and arrows pointed with flint, and javelins of two yards in length, which they throw from a fmall board. Inftead of hatchets, they ufe crooked knives of flint or bone. Some iron knives, hatchets, and lances, were obferved among them, which they had probably got by plundering the Ruflians.

According to the reports of the oldeftinhabitants of Umnak and Unalafhka, they have never been engaged in any war, either amongit themfelves or with their neighbours, excert with the people of Alafhka, the occation of which was as follows. The fon of the toigon or chief of Unmak had a maimed hand; and fome inhabitants of Alafhka, who came to vilit upon that inland, faftened to his arm a drum, out of mockkery, and invited him to dance. The parents and relations of the boy were offended at this iufult : hence a quarrel enfued; and from that time the people have lived in continual enmity, attacking and plundering each other by turrs. According to the reports of the illanders, there are mountains upon Alathka, and woods of great extent at fome dillance from the coaft. The sa-
tives

## K A M

Kamtchat-lives wear clothes made of the fkins of reindeer, wolves, ka. and foxes; and are not tributary to any of their neighbours. The inhabitants of the Fox-iflands feem to have no knowledge of any country beyond Alafhka, which is one of the moft eaferly inancis yet difcovered in thefe feas, and is probably not far diftant from the continent of America.

Fealts are very common among thefe iflanders; and more particularly when the inhabitants of one ifland are vilited by thofe of the others. The men of the village meet their guefts, beating drums, and preceded by the women who fing and dance. At the conclufion of the dance, the hults invite them to partake of the feats; after which ceremony, the former return firft to their dwellings, place mats in order, and ferve up their beft provionn. The guefts next enter, take their places, and, after they are fatisfied, the divertions begin. Firft, the children dance and caper, at the fame time making a noife with their fmali drums, while the owners of the huts of both fexes fing. Next, the men dance almolt naked, tripping after one another, and beating drums of a larger fize: when thefe are weary, they are relieved by the women, who dance in their clothes, the men continuing in the mean time to fing and beat their drums. At laft the fire is put out which had been kindled for the ceremony. The manner of obtaining fire is by rubbing two pieces of dry wood againtt each other, or moft commonly by Ariking two flints together, and letting the fparks fall upon fome fea-otter's hair mixed with fulphur. If any forcerer is prefent, it is then his turn to play his trieks in the dark; if not, the guefts immediately retire to their luts, which are inade, on that occafon, of their canoes and mats. The natives who have feveral wives do not with-hold them from their guefts; but where the owner of the hut has himfelf but one wife, he then makes the offer of a female fersant.

Their hunting feafon is principally from the end of October to the beginning of December; during which time they kill great numbers of young fea-bears for their clothing. They pafs all December in feaftings and diverfions fimilar to thofe above mentioned: with this difference, however, that the men dance in woodenmafks, reprefenting various fea-animals, and painted red, green, or black, with coarfe-coloured earths found upon thefe iflands.

During thefe feltivals, they vifit each other from village to village, and from inlarid to illand. The fealts concluded, mafks and drums are broken to pieces, or depofited in caverns among the rocks, and never afterwards made ufe of. In fpring, they go cut to kill old fea-bears, fea-lions, and whales. During fummer, and even in winter when it is calm, they row out to fea, and eatch cod and other fith. Their hooks are of bone; and for lines they make ufe of a ftring made of a long tenacious fea-weed, which is fometimes found in thofe feas, near 160 yards in length.

Whenever they are wounded in any encounter, or bruifed by any accident, they apply a fort of yellow root to the wound, and faft for fome time. When their head aches, they open a vein in that part with a ftonelancet. When they want to glue the points of their arrows to the fhafts, they frike their nofe till it bleeds, and $u$ fe the blood as glue.

Murder is not pusihed among them; for they have
no judge. The following ceremonies are ufed in the burial of the dead. The bodies of pour people are wrapped up in their own clothes, or in mats; then laid in a grave, and covered over with earth. The bodies of the rich are put, together with their clothes and arms, in a fmall boat made of the wood driven afhore by the fea: this boat is hung upon poles placed crofswife; and the body is thus left to rot in the open air.

The cuftoms and manners of the inhabitants of the Alcutian ifles are nearly fimilar to thofe of the inhabitants of the Fox-iflands. 'The former indeed are rendered tributary and entirely fubject to Ruliz; and mult of them have a light acquaintance with the Ruflian lan. guage, which tbey have learaed from the crews of the different veffels who have landed there.

KAN, or Khan, the name of an officer in Perfia, anfwering to that of governor in Europe. - There are kans of provinces, countries, and cities, who have different additions to ditlinguifh them.

## KANGUROO. See Didelphis.

KANISCA, a very flrong town of Lower Hungary, capital of the county of Selawar. It was taken by the Imperialifs in 1690 . It is feated on the river Drave, in E. Long. 17.37. N. Lat. 46..23.

KAN-ICHEOU-FOU, a fourifhing town of China, in the province of Kiang-fi. Its rivers, port, riches, and population, all contribute to attract ftrangers. A day's journey from this city is a very rapid current, al motl 20 leagues in length, which flows with great im: petnofity over a number of fcattered rocks that are level with the water. Travellers here are in great danger of being loft, unlefs they take care to be conducted by one of the pilots of the country; after tbis paffage, the river becomes twice as large as the Seine at Rouen; it is continually covered with loaded barks and other veffels under fail. - Near the walls of the city is a very long bridge, compofed of 130 boats joined together by Atrong iron chains. The cuftom-houfe is upon this bridge, where a receiver conftantly refides to vifit all barks, and examine if they have paid the duties impofed on the commodities with which they are loaded. Two or three moveable boats are fo placed, that by their means the bridge can be opened or fhut, to give or refufe a paltage ; and no barks are ever permitted to pals until they have been examined. In the territory belonging to this city, a great number of thofe valuable trees grow, from which varnifh diftils. Its diftrict is extenfive, and contains 12 cities of the third clafs.

KAOLIN, the name of an earth which is ufed as one of the two ingredients in oriental porcelain. Some of this earth was brought from China, and examined by Mr Reaumur. He found that it was perfectly infufible by fire, and believed that it is a talky earth; but Mr Macquer obferves, that it is more probably of an argillaceous nature, from its forming a tenacious pafte with the otber ingredient called petuntfe, which has no tenacity. Mr Bomare fays, that by analyfing fome Clinefe kaolin, he found it was a compound earth confilting of clay, to which it owed its tenacity; of calcareous earth, which gave it a meally appearance; of fparkling cryfals of mica; and of fmall gravel, or particles of quartz-cryftals. He fays, that he has found a fimilar earth upon a ftratum of granite, and conjectures that it may be a decompofed granite. This con-
jecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See Porcelain.

## KAOUTCHOUK. See Caoutchouc.

KaRaites. See Caraites.

## karat. Sce Caract.

KARECK, an ifland in the Perfian Gulf, lately fubject to the Dutch. It was vifited by Mr Ives in 1758. He found the fouth part of the ifland well cultivated, with agreeable fields of corn, and producing plenty of efculent vegetables. In the middle are very high hills abounding with a variety of flells. Some fragments torn from their fides afforded an opportumity of obferving an immenfe quantity of oyfters, fcallop, cockle, and other thells. The common tree here is the banian, but without thofe luxuriant fhoots, which in fome other places go downward and take root in the ground. The lavender-cotton is alfo found here; and the ifland abounds with fowl of various kinds. Pcarl oyiters are alfo found here, but lie at confiderable depths. Mr ives mentions one pearl of confiderable fize, which had upon it a natural reprefentation of the face of a human fetus in the early months of preg. Hancy.

This fettlement was founded by Baron Kniphaufen, brother to one of that name fome time age ambaffador at the court of London. Having left the Pruflian fervice on fome difgut, he entered into that of France. He afterwards went to the Eaft Indies, and was appointed refident to the Dutch factory at Baffora. Here he became an object to the avarice and rapacity of the Turkifh governors; who having got him accufed of capital crimes, he was at latt glad to compound with them for 50,000 rupees, the whole fum he was worth, befides giving directions how they might fqueeze other 50,000 from his fucceffur in of fice (who in truth wifhed him turned out) and the banian who did the butinefs of the Dutch factory, and who had likewife been concerned in underhand practices agrantt him.

The new refident was overjoyed at his acceffion, but boft all patience when he found himfelf obliged to pay 30,000 rupees to the governor as a compliment on his entering into a poil of fush confequence. Nor had the banian much better reafon to be fatisfied, being obliged to pay down 20,000 rupees to make up the fun which was to fatisfy the rapacity of the governor.

Baron Kniphaufen failed from Baffora the very day after he was fer at liberty; but having landed on this ifland, he, in conjunction with an Arabian flacick, formed the plan of the fettlement. He then carried a lecter from the heick to the governor and council of Batavia, in which the former propofed to give up the fovercignty of the ifland. Before fetting out for this place, however, the baron took care to difpatch a meffenger acrofs the defart to Conitantinople, ocquainting the Dutch ambaffidor with the treatment he had received, and requetting liberty of the grand vizier for the Dutch to fettle at Kareck. The meffenger returned with a favourable anfiwer before the baron came back from Batavia. The governor of Baffora, then, having attempted is vain to perfuade him to return to that place, wrote a letter of complaint to Datavia, accufing the baron in terms of the
utmoft exaggeration, but without any mention of the 100,000 rupees. The baron, however, having got intelligence of this proceeding, ufed fuch diligence that he got back to Batavia in the very flip which carried the letter. Being thus prefent on the fpot to anfwer the charges brought againft him, he acquitted himfelf fo well that his fcheme was inllantly approved of, and he was fent back with two fhips and 50 men to take poffefion of Kareck, whofe inliabitants at that time amounted to no more than 100 poor fifhermen.
Confiderable difficulties now occurred in the eftablifhment of the new colony; for he had but very few materials with him, and the government of Batavia was very flow in fending him the fuccours they liad promifed. He was therefore obliged to fend for worknen from Perfia and Arabia, with whofe affiltance he built a fmall compact fort, ftrong enough to defend itfelf againt any of the country powers and any hlipa ufually failing to India, excepting thofe of our Eaft India company. Nor was he content with putting himfelf in a poiture of defence, but even commenced hoftilities againit the Turks; and by detaining two veffels very richly laden, which happened to touch at the ifland, he at laft obliged the governor of Baflora to pay back the 100,000 rupees he had extorted, 30,000 of wbich he reftored to his fucceffor in office at Baffera, and 20,000 to the banian. Witen Mr Ives vifitert him, he informs us, that furprifing progrefs lad been made during the little time the baron had held the fovereignty of the ifland, and that he intended to make it a trong and wealthy place; at the fane time that he difeovered his tafle for literature by advaneing a fum of money for books and ino Aruments of various kinds, which were afterwards punctually-fent. After that time, bowever, the baron quitted the fervice of the Dutcl; and the ifland is again in poffeflion of the fheick of Bundarie, to whom it formerly belonged. It is about five miles long and two in breadth; lying nearly in the middle of the Perfian $G$ ulf, about feven leagucs from each fide, and about 30 leagues from the mouth of Baffora river, where all ihips bound to that port maft call for pilots.

KARLE, a Saxon word ufed in our law, fometimes fimply for a man; and fometimes, with an addition, for a fervant or cluyn. Thus the Saxons call a feaman bufcurli, and a domellic fervant hufarle. From hence comes the modern word churl.
KARMATIANS, a fect of MohammeJans, who occalioned great diforders in the empire of the Arabs. See Bagdad, ${ }^{\circ}$ 49.

## KAStrile, or Kestril. See Falco.

KATTEGAT FE, a noted fea lying between part of Jutland aldd the coalt of Sweden, and towards the latter covered with a great number of ifes. It is almoft clofed at the extremity by the low Danifh iflands of Sealand and Funen, which had in old times been (with Siseden) the fart of the Suiones. Betwcen the firlt and the coart of Sweden is the famous fround, the paffare tributaty to the Danes by thourands of ihips. Thefe illands were of old called Codonania, and gave to the Katiegatte the name of Sinus Codmus. Its greateft depth is 35 fathom3. It decreafes as it approaches the found; which begins with 16 fathoms, and near Copenhagen fhallows to even four. The Roman flet, under the command of Germanicus, failed,
accor。
according to Pliny, round Germany, and even doubled the Cimbricum Promontorium, and arrived at the iflands which fill the bottom of the Kattegatte : either by obfervation or information, the Romans were acquainted with 23. One they called Glefforia, from its amber, a foffil abundant to this day on part of the fouth fide of the Baltic. A Ronan knight was employed liy Nero's mafter of the gladiators to collect in thefe parts that precious production, by which he came perfectly acquainted with this country.

KAUFFBEUREN, a free and imperial town of Germany, fituated in the river Wardach, in E. Long. 10. 53. N. Lat. 47.57.

KAy, Quay, or Kcy. See Key.
KAZY, in the Eaft Indies, a Mahometan judge or magiftrate; appointed originally by the court of Delhi to adminitter jultice according to their written law; but particularly in matters relative to marriages, the fales of houfes, and tranfgreffions of the Koran. He attelts or authenticates writings, which under his feal are admitted as the originals in proof.

KEBLA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is fituaced, towards which they are obliged to turn themfelves when they pray.

KECKERMAN (Bartholomew), a native of Dantzick, and profeffor of philofophy there about the beginning of the 17 th century. compofed fyltems of almoft all the fciences, in which he thows more method than genius. He died in 1609, fairly worn out at the age of 38 with mere fcholallic drudgery:

KEDAR (anc. geog.), a diftriet in the defart of the Saracens (fo called from Celar, the fon of IThmael, according to Jereme, who in another place fays that Kedar was uninhabitable), on the north of Arabia Felix Kedareni, the people; who dwelt in tents like the other Scenites (Paalm exx.), were rich in eattle (Ifaiah Ix.), of a fwarthy complexion (Canticles i.), and excellent at the bow (ifaiah xxi.)

KEDES (anc. geog.), a city of refuge and Levitieal in the tribe of Naphthali, on the coritines of Tyre and Galilee; (Jofephus). Jerome calls it a facerdotal city, lituated on a mountain 20 miles from Tyre, near Pancas, and called Cidifius, taken by the king of Affyria. - Another Kedes in the tribe of Iffachar (I Chron. vii. 72 ) whieh feems to be called $K i f i o n$ ( Johnua xix.)

KEDGE, a fmall anchor, ufed to keep a hip fteady whiltt the rides in a harbour or river, partieularly at the turn of the tide, when fhe might otherwife drive over fier principal anchor, and entangle the fock or flukes with her flack eable, fo as to loofen it from the ground. This is accordingly prevented by a kedgerope that hinders her from approaching it. The Kedges are particularly ufeful in tranfporting a fhip; i. e. removing her from one part of the harbour to anether, by means of ropes which are faftened to thefe anchors. They are generally furnifhed with an iron ftock, which is eafily difplaced for the convenience of Rowirg them.

KEDRON, or Cedron (anc. geog.), a town which, from the defeat and purfuit of the Syrians ( $1 \mathrm{Mac} . \times \mathrm{xvi}$.), appears to have flood on the road which led from the Higher India to Azotus: in this war it was burnt by the Jews.

Kedron, or Gedion (anc. geog.), St John ealls it
a brook, but Jofephus a deep valley between Jerufalem and mount Olivet to the eaft; called alfo Kedron from ${ }_{\text {Keell }}^{\mathrm{K}_{4}}$ its blacknefs. A brook only in winter, or in rainy weather, accerding to Maundrei.

KEEL, the principal piece of timber in a fhip, which is ufually firft laid on the blocks in building. If we compare the earcafe of a thip to the flkeleton of the human body, the keel may be conlidered as the baekbone, and the timbers as the ribs. It therefore fupports and unites the whole fabric, fince the ftem and ttern-poft, which are elevated on its ends, are in fome meafure a continuation of the keel, and ferve to connect and inclofe the extremities of the fides by tran. foms; as the keel forms and unites the buttom by timbers.

The keel is generally compofed of feveral thick pieces placed lengthways, which, after being fearfed together, are bolted, and clenched upon the upper fide. When thefe pieces cannot be procured large enough to afford a fufficient depth to the keel, there is a ftrong thick piece of timber bolted to the bottom thereof, called the falfe ksel, which is alfo very ufeful in preferving the lower fide of the main keel. In our largelt hips of war, the falfe keel is generally compofed of two pieces, which are called the upper and the lozver fulfe keels. See MTidshit-Frame.

The loweft plank in a flaip's bottom, called the garboard-freak, has its inner-edge let into a groove or channel cut longitudinally on the lide of the keel : the depth of this channel is therefore regulated by the chicknefs of the garboard-ftreak.

Keer is alfo a name given to a low flat. bottomed veffel, ufed in the river TYne to bring the coals down from Neweafle and the adjacent parts, in order to load the colliers for tranfportation.

Kerl. Houling, a punifhment inflicted for varions offences in the Dutch navy. It is performed by: plunging the delinquent repeatedly under the flip's bottom on one fide, and hoifting him up on the other, after having paffed under the keel. The blocks or pullies by which he is fufpended are fallened to the oppofite extremities of the main- yard, and a weight of lead or iton is hung upon his legs, to fink him to a competent depth. By this apparatus he is drawn clofe up to the yard-arm, and thence let fall fuddenly into the fea, where, paffing under the hip's bottom, he is hoifted up on the oppofite fide of the veffel. As this extraordinary fentence is executed with a ferenity of temper peculiar to the Dutch, the eulprit is allowed fufficient intervals to recover the fenfe of pain, of which indeed he is frequently deprived during the operation. In truth, a temporary infenfibilicy to his fufferings ought by no means to be conftrued into a difrefpeet of his judges, when we confider that this punifhment is fuppofed to have peculiar propriety in the depth of winter, whilt the flakes of ice are floating on the ftream; and that it is continued till the culprit is almoft fuffocated for want of air, benumbed with the cold of the water, or funned with the blows his head receives by ltriking the fhip's bottom.

KEELSON, a piece of timber which may be properly defined the interior or counter-part of the keel; as it is laid upon the middle of the floor-timbers, immediattly over the keel, and like it compofed of fe-

## K E E

it:r, veral pieces fcarfed together. In order to fit with more fecurity upon the floor-timbers and crotches, it is notched about an inch and a half deep, oppofite to each of thofe pieces, and thereby firmly foored down upon them to that depth, where it is fecured by fpike-nails. The picces of which it is formed are onlv half the breadth and thicknefs of thofe of the keel.

The keelfon ferves to bind and unite the floor-timbers to the keel. It is confined to the keel by long bolts, which, heing driven from without through feveral of the timbers, are fore-locked or clenched upon rings on the upper-fide of the keelfon.

Keeper of the great seal, is a lord by his office, and Alyled lord keeper of the great feal of Grent Brifuin; he is always one of the privy-council. All grants, charters, and commifions of the king under the great feal, pafs through the hands of the lord keeper; for without that feal many of thofe grants, \&c. would be of no force; the king being, in the interpretation of the law, a corporation, and therefore paffes nothing but by the great feal, which is alfo faid to be the public faith of the kingdom, being in the higheft efteem and r eputation.

Whenever there is a lord-keeper, he is invefted with the fame place, authority, pre-eminence, jurifdiction, or execution of laws, as the lord-chancellor of Great Britain is vefted with.

The lord-keeper is conitituted by the delivery of the great feal, \&c.

Kegper of the Privy-feal, is alfo a lord by his office, through whofe hands all grants, pardons, \&c. pafs before they come to the great feal; and even fome things pafs his hands which do not pafs the great feal at all. This officer is alfo one of the privy council, yet was anciently called clerk of the privy.feal. His duty is to put the feal to no grant, \&c. without a proper warrant; nor with warrant where it is againft law, or inconvenient, but fhall firlt acquaint the king therewith.

KEEPING, in painting, denotes the reprefentation of objects in the fame manner that they appear to the eye at different diftances from it; for which the painter thould have recourfe to the rules of perfpective. There are two inflances in which the famous Raphael Urbin has tranfgreffed thefe rules: in one of his cartons, reprefenting the miraculous draught of filhes, the men in each of the two boats appear of full fize, the features of their faces being flrongly marked; and the boats are reprefented fo fmall, and the men fo big, that any one of them appears fufficient to fink either of the boats by his own hare weight: and the fowls on the fhore are alfo drawn fo big, as to feem very near the eye of the obferver, who could not poffibly, in that cafe, diltinguith the features of the men in the diftant boats. Or, fuppofing the obferver to be in either of the boats, he could not fee the eyes or beaks of the fowls on the fhore. The other inftance occurs in his hiltorical picture of our Saviour's transriguration on the mount; where he is reprefented with thofe who were then with him, almoft as large as the relt of his difciples at the fout of the mount, with the facher and mother of the boy whom they brought to be cured; and the mother, though on her knees, is more than hati is rall as the mouat is ligh. So that the mount appears only of the fize of a little hay-rick, with a few
people on its top, and a greater number at its bottom on the ground ; in which cafe, a fpectator at a little diftance could as well diftinguilh the features of thofe at the top as of thofe on the ground. But upon any large eminence, deferving the name of a mount, that would be quite impofible.

KEIL, a very important fortrefs of Germany, feated on the banks of the Rhine, built by the French after a defign of marfhal Vauban, for the defence of Strafburg. It was ceded to the empire in 1697, by the trcaty of Ryfwick. The French retook it in i70.3, and it was reftored to the empire hy the treaty of Reftadt. E. Long. 7.45 . N. Lat. 48.40.

KEILL (Dr Joha), a celebrated aftronomer and mathematician, was born at Edinburgh 1671, and Audied in the univerfity of that city. In $169+$ he wert to Oxford; wlere, being admitted of Baliol college, he began to read lectures according to the Newtonian fyltem in his private chamber in that college. He is faid to lave been the firft who taught Sir Iiaac Rewton's principles by the experiments on which they are founded: and this, it feems, he did by an apparatus of intruments of his own providing, by which means he acquired a great repuiation in the univerfity. l'he firft fpecimen he gave the public of his kill in mathematical and philofophical knowled re, was his Examination of Dr Burnct's theory of the earth, with Re. murks on Mr Whilon's theory: and thefe theories being defended by their refpectuve inventors, draw from Mr K cill An examination of the reflections on the theory of the earth, together with $A$ defence of the remaiks on MIr Whifon's neww theory. In 1701, he publifhed his celebrated treatife, intitled, Introduaio ad veram pbyficam, which only contains 14 lectures; but in the following editions he added two more. This work has been tranfated into Englifh, under the title of An introduation to natural philofophy. Afterwards, being made fellow of the Royal Society, he publifhed, in the Philofophical Tranfactions, a paper, of the lawsof attraction; and being offerided at a pafage in the AEta eruditorum of Leiplic, warmly vindicated againft Mr Leibnitz Sir Ifaac Newton's right to the honour of the firt invention of his method of fluxions. In ${ }^{1709}$ he went to New- England as triafurer of the Palatines. About the year 1711, feveral objections being urged againf Sir lfaic Newton's philolophy, in fupport of Des Cartes's notions of a plenum, Mr Keill publiked a paper in the Plitofophical Trantactions on the rarity of matter, and the tenuity of its compofition. But while he was engaged in chis difpute, queen Anne was pleafed to appoint him her decypherer; and he continued in that place under kiag George 1. till the year 17i6. He lad alfo the degree of doetor of phyfic conferred on him by the univerfity of Oxford in 1713. He died in 1721. He publifhed, befides the works already mentioned, $I n-$ trolusio ald veram gfronomian, which was tranflated into Englth by Dr Keill himfelf; and an edition of Commandinus's Euclid, with additions of his nwn.

Keill (James), M. D. an emincut phylician, and brother of the former, was born in Scotland about the year 1673; and having travelled abroad, read lectures of anatomy with sreat applaufe in the univerfities of Oxford and Cambridge, by the latter of which he had the degree of doctur co phyfic con?erted upon him.

Keil,
Ex:nt.

Keifcriberg In $; 700$ he fettled at Northampton, where he lad
Keith. confiderable practice as a phyfician; and died there of a caneer in the mouth in 1719 . He publifed, 1 . An Englifh tranflation of Lemery's chemiftry. 2. An account of animal fecretion, the quantity of blood in the human body, and mufcular motion. 3. A treatife on anatomy. 4. Several pieces in the Philofophical Tranfactions.

KEISERSBERG, a town of Alface in France, and in the bailiwic of Haguenou, which has belonged to the French ever fince the year $15+8$. It is feated in a pleafant country, in E. Long. 7. 25. N. Lat. 48. 10 .

KEISERSLAUERN, a town of Germany, in the Lower Palatinate, belonging to the elector Palatine; feated on the river Louter, in E. Long. 7.5 t . N. Lat. 49. 22.

KEISERTOUL, a town of Switzerland, in the county of Baden, with a bridge over the Rhine, and a cafle. It belongs to the bimop of Conftance, and is fituated in E. Long. 8. 40. N. Lat. 47. 10.

KEISERIWERT, a town of Germany in the circle of Weltphalia, the diocefe of Cologne, and the duchy of Derg; fubject to the elector Palatine. The fortifications are demolifhed. It is feated on the Rhine, in E. Long. 6. 49. N. Lat. 51. 16.

KEITH (James), field-maifhal in the Pruffian fervice, was the younger fon of William Keith, earl-marfhal of Scotland; and was born in t6g6. He was defigned by his friends for the law ; but his inclination led to alms, and the firft occafion of drawing his fword was rather an unhappy one. When he was 18 years old the rebellion broke out in Scotland; and through the inftigation of his mother, he joined James's party: he was wounded at the battle of Sheriff-muir, and made his efcape to l'rance. Here he applied limfelf to military fludies; and going to Madrid, he by the interelt of the duke of Liria obtained a commiffion in the Iriih brigades, then commanded by the dulse of Or mond. He afterwards attended the duke of Liria, when he went ambaffator to Mufcovy; and being by him recommended to the czarina, was promoted to the rank of lientenant-general, and invefted with the order of the black eagle. He dittinguifhed himfelf. by his valour and conduct in the Rufian fervice, and had no inconfiderable flare in rhe revolution that raifed Elizabeth the daughter of Peter the Great to the throne: he alfo ferved in feveral embaffies; but finding the honours of that country but a fplendid kind of flavery, he left that court and entered the Prufiian fervice. The king of Pruffia made him field-marihal of the Pruflian atmies, and governor of Berlin; and dittinguifhed him fo far by his confidence, as to travel in difguife with him over a great part of Germany, Poland, and Hungary. In bufinefs, he made him his chief counfellor; in his diverfins, his chief companion. The king was much pleafed with an amufement which the marhal invented in imitation of the game of chefs. The marfhal ordered feveral thoufand fmall tatues of men in armour to he call by a founder; thefe he would fet oppotite to each other, and range them in battalia, in the fame manner as if he had bcen drawing up an army ; he wonld bring out a patty from the wings or centre, and fhow the advantage or difadvantage refulting from the different draughts which
he made. In this manner the king and the marflaal Kellin often amufed themfelves, and at the fame time impro- K: ved their military knowledge. This brave and expcrienced general, after many important fervices in the late wars of that illuftrious monareh, was killed in the unfortunate affair of Hohkerchen in the year 1758 .

The family of Keith was among the moft ancient in Europe. In 1010 the Scots gained a complete victory over the Danes at Camus town in Angus; King Malcolm I1. as a reward for the fignal bravery of a certain young nobleman who purfued and killed Camus the Danifh general, bettowed on him feveral lands, particularly the barony of Keith in Eaft Lothian, from which his pofterity affumed their firname. The king alfo appointed him hereditary great ma. refchal of Scotland, which high office continued in his family till the year 1715 , when the latt earl engaged in the rebellion and forfeited his eftate and honours; and thus ended the family of Marefehal, after ferving their country in a dittinguifhed capacity above 700 years.

KELLINGTON, or Kilkhampton, a town of Cornwall in England, which fends two inembers to partiament. W. Long. 4. 38. N. Lat. 50. 36.

KELLS, a fair and poit-town of Ireland, in the county of Meath and province of Leintter, 31 miles from Dublin. It is a borough likewife, and returns two members to parliament; patron earl of Bective. This place gives title of vifcount to the family of Cholmondelcy. Near it is Headforr, the magniticent feat of Lord Bectivc. This town is pleafantly fituated on the river Blackwater, and has four fairs. It was anciently called Kenanus, and afterwards Kenlis. In former ages it was one of the moft famous cities in the kingdom; and on the arrival of the Englifh was walled and fortified with towers. In 1178 a eafle was erected where the market-place now is ; and oppolite to the callle was a crofs of an entire flone, ornamented with bas-relief figures and many curious infcriptions in the ancient lrifh elaracter. Within a fmall diltance was the church of St Senan; and on the fouth of the churchyard is a round tower which meafures 99 feet from the ground, the roof ending in a point ; and near the top were four windows oppofite to the cardinal points. There was a celebrated monaltery founded here in $55^{\circ}$ for regular canons, and dedicated to the Virgin Mary. It owed its origin to St Columb, to wham the fite of the abbey was granted by Dermod Mac Carval, or Dermod the fon of Kervail king of Iteland. An epifcopal fee was afterwards crected here, which in the 13 the century was united to that of Meath. A priory or hofpital was alfo erected by Walter de Lacie, lord of Meath, in the reign of Richard I. for erofs-bearers or crouched friars following the order of St Augultin. There was likewife a perpetual chantry of three priefts or chaplains in the parihh-church of St Columb in Kells to celehrate inafs daily; one in the Rood chapel, another in St Mary's chapel, and a thurd in the chapel of St Catherine the virgin

Kells is alfo the name of a village, bcing a poft and fair town in the cominty of Kilkenny, 64 miles from Dublin. It is an ancient place, fituated on Kings river; and was noted for a priory of Augutines, built and richly endowed by Geuffroy Fitz-Roberts, who
y. came into this kingdom with Strongbow. The prior applaufe ; and from this time he continued to write for of this place had the title of lurd Jpiritual, and as fuch fat in the houfe of peers before the Reformation; the ruins only of this abbey now remain: a fynod was held in it anno 1152, when John Paparo, legate from Rome, made one of the number of bifhops that were convened there at that time to fettle the affairs of the churcl. The prefent church is built in the Gothic manner. Fairs held ! 3th July.

There is a third place of the above name, fituated in the county of Antrim and province of Uliter, 89 miles from I)ublin, near which are the ruins of a church: this place is but a fmall village, feated on a river of the fame name, over which it has a bridge.
KELLY (Hugh), an anthor of conliderable repute, was born on the banks of Killarney lake in Irelond in 1739. His father, a genteman of good family, having reduced his fortune by a feries of unforefeen misfortunes, was obliged to repair to Dublin that he might endeavour to fupport bimielf by his perfonal induftry. A tolerable fchool education was all he could afford to his fon; who was bound an apprentice to a ftaymaker, and ferved the whole of his time with diligence and fidelity. At the expiration of his indentures, he fet out for London to procure a livelilood by his bufinefs; where he encountered all the difficulties a perfon poor and without friends could be fubject to on his firt arrival in town. Happening, lowever, to become acquainted with an attorney, he was employed by bim in copying and tranferibing; an occupation which he profecuted with fo much affiduity, that he is faid to have earned about three guineas a-week, an income which, compared to his former gains, might be decmed affluent. Tired, however, of this drudgery, he foon after, about 1762 , commerced author, and was intrufted with the management of the Lady's Mufeum, the Court Magazine, the Public Ledger, the Royal Chronicle, Owen's Weekly Puft, and fome other periodical publications, in which he wrote many original effays and pieces of poetry, which extended his reputation, and procured the means of fubliftence for himfelf, his wife to whom he was then lately married, and a growing family. For feveral years after this period, he continued writing upon a variety of fubjects, as the accidents of the times chanced to call for the affiltance of his pen; and as during this period politics were the chief objects of public attention, he employed himfelf in compoing many pamplilets on the impurtant queftions then agitated, the greater part of which are now buried in oblivion. A mong thefe, however, was a Vindication of Mr Pitt's Adminiffration, which Lurd Cheflerfeld makes honourable mention of in the fe. cond volume of his letters. In 1767, the Babler appeared in two pocket volumes, whicls laeds at firft been inferted in Oweri's Weckly Chronicle in Engle papers; as did the Memoirs of a Magdalene, under the title of Louifa Mildmay. About 1767 he was tempted by the fuccefs of Churchill's Rufciad to write fome flrictures on the performers of either theate, in two pamphlets, intitled Thefpis, both which gave great offence to fome of the principal perfons at each houfe. The talents for fatire, which he difplayed in this work, recommended him to the notice of Mr Ganick, who in the next year caufed his firl play of Falfe Delicacy to be acted at Drury-Lane. It was received with great
the ftage with profit and fuccefs, until the laft period of his life. A6 his reputation increafed, he began to turn his thoughts to forne mode of fupporting lis family lefs precarious than by writing, and for that purpofc entered himfelf a member of the Middle Tcmple. After the regular fteps had been taken, he was called to the bar in 1774, and his proficiency in the flady of the law afforded promifing hopes that he might make a ditinguifhed fisure in that profeffion. His fecien. tary courfe of life had, however, by this time injured his health, and fubjected him to much affliction. Early in 1777 an abfceifs formed in his fide, which after a few days illnels put a period to lis life. He was the author of fix plays he fides that albove-mentioned.

KELP, in the glafs-trade, a term ufed for a fort of potalhes made ufe of in many of the glafs-works, particularly for the green glafs. It is the calcined afthes of a plant called by the fame name; and in fome places, of fea-thongs or laces, a fort of thick-leaved fucus or fea-wlack *. This plant is thrown on the "See Fucuas rocks and fhores in great abundance, and in the fummer months is raked together and dried as hay in the fun and wind, and afterwards burnt to the athes called kelp. The procefs of making it is thus: The rocks, which are dry at low water, are the beds of great quantities of fea-weed; which is cut, carried to the beach, and dried: a hollow is dug in the ground threc or four feet wide ; round its margin are laid a row of ftones, on which the fea-weed is placed, aud fet on fire within, and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted netal drops into the hollow beneath : when it is full, as it commonly is ere the clofe of day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an unifurm confiltence in a flate of fufion. Whien cool, it confolidates into a heavy dark-coloured alkaline fubtance, which undergocs in the glafs-houfes a fecond vitrification, and aflumes a perfect tramfarency; the progrefs by which thus a parcel of fea-weed, formerly the fimy bed of feals or dreary fielter of thell-fifh, is converted into a cryital luffre for an affembly-room, or a iet of glaffes for his majelly's table, is a metamorphofis that might be a fubject for an entertaining tale.
KELSO, a town of Roxburghnire in Scotland, pleafantly fituated on the river Tiweed, in W. Long. 1. 20. N. Lat. 55. 38. Of this town Mr Pennant gives the following defcription. It is built much after the manner of a Fl-mifh town, with a fquare and town-houfe. It contains abuut 2700 fouls, lias a very confiderahle market, and great quantities of com are fold here weekly by fample. The abbey of Tyronenfians was a valt pile, and, to judge by the remains, of venerable magnificence. The walls are ornamented with falfe round arches, interfecting each other. Suchinterfections form a true Gothic arch; and may as probably have given rife to that mode as the arched fhades of avenues. The lleeple of the church is a vaft tower. This houfe was founded by David I. when tarl of Cumberland. He firll placed it at Selkirk, then removed it to Roxburgh, and finally, when he came to the crown, fixed it here in 1128 . Its revenues were in money above 20001 . Scots a-year. The

Kelp,
Kello.

Kempis abbot was allowed to wear a mitre and pontifical II Kemapten. robes; to be exempt from epifcopal juridiction, and permitted to be prefent at all general councils. The
erivirons of Kelfo are very fine: the lands confift of gentle rifings, inclofed with hedges, and extremely fertile. They have much reafon to boatt of their profpects. From the Chalkheugh is a fine view of the forks of the rivers. Roxburgh-hill, Sir John Douglas's neat feat, and at a diftance Fleurus; and from Pinnicle-hill is feen a valt extent of country, highly cultivated, watered with long reaches of the Tweed, well wooded on each margin. Thefe borders ventured on cultivation much earlier than thofe on the weft and eaft, and have made great progrefs in every fpecies of rural economy. Turnips and cabbages for the ufe of cattle cover many large tracts; and potatoes appear in vaft fields. Much wheat is raifed in the neiglibourhood, part of which is fent up the frith of Eorth, and part into England. The fleeces here are very fine. The wool is fent into Yorkihire, to Linlithgow, or into Aberdecnhire, for the flocking masuffacture; and fume is woven here into a cloth called ghinus, and fold into England to he dreffed. Here is alfo a confiderable manufacture of white leather, chiefly to fupply the capital of Scotland. At Kelfo there is a tine tone bridge of fix arches over the Tweed near its confluence with the Teviot.

KEMPIS (Thomas à), a pious and learned regular canom, was born at the village of Kemp, in the dioccle of Cologn, in 1380 ; and took his name from that village. He perfosmed his ftudies at Deventer, in the community of poor fcholars eflablifhed by Gerard Groot ; and therc made a great progrefs in the fciences. In 1399, he enterad the monattery of the regular canons of Mount St Agnes, near Zwol, of which his brother was prior. 'I'homas à Kempis there diftinguifhed himfelf by his eminent pitty, his refpect for his fuperiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 70. The beft editions of his works, which confirt of fcrmons, fpiritual treatifes, and lives of holy men, are thofe of Paris in $16+9$, and of Antweep in 1607. The famous and well-known book De Initatione Chrifit, which has been tranflated into almolt all the languages of the word, though it has alinoft always been numbered among the works of Thomiss à Kempis, is alfo found printed under the name of Garfon; and on the credit of fome MSS. tias been fince afcribed to the abbot Gerfon of the order of St lenedict. This has occafioned a violent difpute beiween the canons of St Augutine and the Benedictines: but while devout Chriftians find fpiritual comfort in the work, the name of the writer is of fmall importanct.

KEMIPTEN, a free and imperial town of Germany, in Lower Suabia, and in Algow, and alfo in the territory of the abbot of Kempten, who is a prince of the empire, and has a voice in the diet. The inhabitants are Proteflants; and it has been feveral times taken, but has always recovered its liberty. It is feated on the river lller. E. Long. 10. 33. N. Lat. 47.47.

Kempten, a territory in the circle of Suabia, in Germany, between the bifhopric of Anglourg and the N 21.27.
barony of Walburg. It is about 17 miles long and broad; and has no confiderable place but the towns of Kemnten and Kauffbeuren, which are imperial.

KEN (Thomas), an eminent Englifh bifhop in the 17 th eentury, was bred at Wincheiter fehool, whence he went to Oxford; and in 1669 was made a prebend of Winclefter. In 1675, the year of the Jubilee, he travelled to Rome; and ufed to fay, He had reafon to give God thanks for his travels, having returned more conlirmed of the purity of the reformed religion than he was before. He was appointed by king Charles II. to attend the lord Dartmonth at the demolifhing of Tangier; and at his return was made chaplain to his majeity, as he was fome time after to the princefs of Orange, then refiding in Holland. In 1685 he was confecrated bifhop of Bath and Wells. The month following he attended king Charles 11. at his death; and gave clofe attendance at the royal bed for three whole days and nights, watching proper intervals to fuggeft pious and proper thoughts on fo ferions an occafion. In the following reigni he zealoully oppofed the progrefs of Popety; and in June 1688, he, with five other bifhops and the atchbifhop of Canterbury, was rommitted prifoner to the Tower of London for fubfcribing a petition to his majefty againit the declaration of indilfence. Upon the Revolution, however, be refufed to take the oaths to king William and Queen Mary, on which account he was deprived of his biAlopric. Her Majefty queen Anne befowed on him a yearly pention of 2001 . to his death in 1710 . He publifhed feveral pions books. His charity was fo great, that when he was bihop of 3 ath and Wells, having received a fiue of 4000 l . he gave a great part of it to the French Proteftams.

KENDAL, a town of Wettmoreland, feated in a valley, sung hills, on the weit fide of the river Can or Kien, over which there are two ftone bridges, and one of wood which leads to the calle now in ruins. It is a large handfome place; and has two long ftreets, which crofs each other. The inhabitants have driven a trade with the cotton and woollen manufactory throughout England ever fince the reign of Edw. Ill. and particular laws were enacted for regulating Kendal cloaths as early as Richard II and Henry IV. It $i_{0}$ of note alfo for the manufactory of cottons, druggets, ferges, hats, worfted and yarn ftockings, Sic. Queen Elizabeth incorporated it with aldermen and burgefies; and king James I. with a mayor, recorder, town-clerk, 12 aldermen, 24 burgettes or common councilinen, and 2 attornics. There are 7 companies here, who have each their hall, viz. mercers, fheermen, cordwainers, glovers, tanners, taylors, and pewterers. Here is an elegant town-hall lately repaired; and they enjoy a court of confcience granted by George [11. for debts under 40s. It has a large beautiful church, which ftands on the other fide of the brook called Blindbeck, out of the liberty of the town: a large neat and handfome building 180 feet long and 99 broad, with 5 ailes each parted by a row of 8 pillars, and a ftrong fquare fteeple. Near is Ablot's-hall, the relidence of the abbot when this church belonged to an abbey difolved by Henry VIII. In 1755 , a new chapel was erected in the middle of the town, beliulds which there are 12 chapels of eafe
belonging

## K E N $\quad\left[\begin{array}{ll}441\end{array}\right] \quad \mathrm{K} \quad \mathrm{E} \quad \mathrm{N}$

belonging to it. The diffenters and quakers have mecting-houfes. Here is a fiee grammar-fchool well endowed; and alfo a charity fchool for 10 boys and 16 girls, who are all cloathed as well as taught. Eaftward of the town, on the oppofite fide of the river on a hill, from whence is a fine profpect, thand the ruins of a calle, wherein was born Catherine Parr (the fixth wife of Henry VIII.) By the late inlaud navigation, it has communication with the rivers Mercy, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancafter, Chefter, Stafford, Warwick, Leicefter, Oxford, Worcefter, \&c. Here are kept the feffions of the peace for this part of the crunty called the barony of Kendal; and there is a sery grcat market on Saturday, with all kinds of prorifions and woollen-yarn, which the gills bring liither in large bundles. It has fairs on May 6, and November 8 ; and bet ween them a great beall-market every fort night. The river here, which runs balf through the town in a fony channel, abounds with trout and falmon; and on the banks of it live the dyers and tanners.

KENNEL, a term ufed indifferently for a puddle, a water-courfe in the ftreets, a houfe for a pack of hounds, and the pack or cry of hounds themfelves.

Mr Beckford, in his Effay on Hunting, is very particular in deferibing a kennel for hounds; and a kennel he thinks indifpenfably neceffary for keeping thofe animals in propor health and order. "It is true (fays he) hounds may be kept in barns and flables ; but thofe who keep them in fuch places can belt inform you whether their hounds are capable of anfwering the purpofes for which they are defigned. The fenfe of fmelling is fo exquifite in a hound, that I cannot but fuppofe that every tlench is hurtful to it. Cleanlinefs is not only abfolutely necefiary to the nofe of the hound, but alfo to the prefervation of his health. Dogs are naturally cleanly; and feldom, if they can help it, dung where they lie. Air and frefh flaw are neceflary to keep them healthy. They are fubject to the mange ; a diforder to which poverty and malinefs will very much contribute. The kennel mould be fituated on an eminence ; its front ought to be to the eaf, and the courts round it ought to be wide and airy to admit the funbeams at any time of the day. It is proper that it fhould be neat without and clean within; and it is proper to be near the matter's honfe, for ubvious reafons. It ought to be madt large enough at firft, as any addition to it afterwards may fpoil it in appearance at leaft." Two kennels, however, in our author's opinion, are abfolutely neceffary to the weli-being of hounds: "When there is but one (fays he), it is fildom fweet; and when cleaned out, the hounds, particularly in winter, fuffer both while it is cleaning and afterwards as long as it remains wet."

When the fecder firt comes to the kennel in a morning, he floould let out the hounds into the outer court ; and in bad weather, mould open the door of the hunting kennel (that in which the hounds defigned to hunt next day are kept ), leaft want of telt mould incline them to go into it. The lodging room fould then be cleaned out, the doors and windows of it opened, the litter fhaksn up, and the kennel made dweet aud clean before the lounds seturn to it again.Vol. IX. Part II.

The floor of each lodging.room thould be bricked, and floped on both fides to ran to the centre, with a gutter left to carry off the water, that when they are wafled they may foon be dry. If water hould remain through any fault in the floor, it muft be carefully mopped up; for damps are always very prejudicial.

The kennel ought to have three doars; two in the front and one in the back; the laft to lave a latticewindow in it with a wooden fhutter, which is confantly to be kept clofed when the hounds are in, except in fummer, when it fhould be left open all the day.

At the back of Mr Beckford's kennel is a houfe thatched and furzed up on the fides, big enough to contain at leat a load of ftraw. Here fhould be a pit ready to reccive the dung, and a gallows for the fefto The gallows should thave a thatched roof, and a circular board at the pols to prevent vermin from climbing up. He advifes to inclofe a piece of ground adjoining to the kennel for fueh dog-horfes as may be brought alive; it being fometimes dangerous to turn them out where other horfes go, on account of the diforders with which they may be infected. In fome kennels a fove is made ufe of; but where the feeder is a good one, Mr Beckford thinks that a mop properly ufed will render the flove unneceffary. "I have a little hay rick (fays he) in the grafs-yard, which I think is of ufe to kecp the heunds clean and fine in their coats. You will frequently find them rubbing themfelves againlt it. The fhade of it is alfo ufeful to them in fummer. If ticks at any time be tronbleforme in your kennel, let the walls of it be well wahhed; if that fhould not defroy them, the walls muft then be white-wafhed."

Befides the directions already given concerning the fituation of the kennel, our author recommends it to have a flream of water in its neighbourhood, or even running through it if poffible. There flould alfo be moveable flages on wheels for the hounds to lie on. The foil onght at all events to be dry.

To KENNEL, a term applied by foo-hunters to a fox when he lies in his hole.

KENNET (Dr White), a learned Englifh writer and bilhop of Peterboo ought, in the I 8th century, bred at St Edmund-hall, Oxford; where he foon diftinguifhed himfelf by his vigorous application to his fudiee, and by his tranflations of feveral books into Englifh, and other pieces which he publifled. In 1695 our author publifhed bis Parochial Antiquities. A fermon preached by him on the 30th of January 1703 at Aldgate expofed him to great clamour. It was printed under the title of $A$ compaflionate inguiry into the couffs of the civil war. In 1706, he publifhed his Cafe of Im propriations, and two other tracts on the fame fubject. In 170G, he publifled the third volume of The Complete Hittory of England (the two former volumes compiled by Mr Hughes). In 1700, he publiftcd A Vindication of the Church and Clergy of England from fome late reproaches rudely and unjuftly call upon them; and A true Anfwer to Dr Sacheverel's Sermon. When the great point in Dr Sacheverel's trial, the change of the miniftry, was.gaincd, and very ftrange addrefles were made upon $i t$, theic was to be an artful addrefs from the bihop and clergy of London, and they who would not fubfribe it were to be reprefented as enemies to the queen and the minifry. Dr Kennet fell under thisimputation. He was expofed

## K E N <br> 442 K E N

Kenret, to great odium as a low church man, on account of Kern cott. his conduct and writings. When he was dean of Pe- terborough, a very uncommon method was taken to expofe him by Dr Walton, rector of the church of White chapel: for in the altar-piece of that church, which was intended for a reprefentation of Chrilt and his 12 apotles cating the paffover and laft fupper, Judas the traitor was drawn fitting in an elbow-chair, dreffed in a black garment, with a great deal of the air of Dr Kennet's face. It was generally faid that the original fietch was for a bifhop under Dr Walton's difpleafure: but the painter being apprehenfive of an action of Scandalum Mragnatum, leave was given to drop the biftop, and make the dean. This giving general offence, upon the complaint of others (for Dr Kennet never faw it, or feemed to regard it), the bithop of London ordered the picture to be taken down. In 1713, he prefented the fociety for propagating the gofpel with a great number of books, fuitable to their defggn; publifhed his Bibliotbece Amuricane Primorilid, and founded an antiquarian and hitotical library at Peterborough. In 1715 , he pulb!ithed a fermon, intitled The Witcheraft of the prefent Retellion, and afterward feveral other pieces. In 1717, he was engagrel in a difpute with Dr William Nicholfon, bifhop of Carl!ीe, relating to fome alterations in the bifhop of Bangor's fanous fermon; and dinliked the proceedings of the cunvacation againt that bilhop. Upon the death of Dr Cumberland bihop of Peterborough, he was promoted to that fee, to which he was confecrated in ifry. He fat in it more than ten years, and died in 1728. He was an excellent philologift, a grood preacher, whether in Englifh or Latin, and well verfed in the hiftories and antiquities of our nation.

Kennet (Bafi), a learned Englifh writer, and brother to the preceding, was educated in Corpus Chrifti college, in the univerfity of Oxford, where he became fellow. In 1706, he went over chaplain to the Englifh factory at Leghorn ; where he met with. great oppolition from the Papilts, and was in danger from the inquifition. He died in the year 1714 . He publifhed Lives of the Greek Pocts; the Roman Antiquities ; a volume of Sermons preached at Leghorn ; A tranflation into Englifh of Puffendorf's' Treatife of the Law of Nature and Nations. He was a man of molt ex. emplary integrity, generofity, piety, and modefty.

KENNICOTT (Dr Benjamin), well knowu in the learned world for his elaborate edition of the Hebiew Bible and other valuable publications, was born at Totnefs in Devonfhire in the year 1718. With the rank and character of his parenta we are entirely unacquainted ; but it is certain they were unable to fatisfy that thirft for knowledge which they could not but difcover in their fon. Some opportunities of early improvement muft, however, have been afforded him, or (which we fometimes fee) the natural vigour of his mind mult have fuperfeded the neceffity of them. For in the year 1743 , he wrote A Poem on the Recovery of the Hon. Mrs Eliz. Courtenay from her late dangerous llinefs; and this probably recommended hina to the notice of thofe gentlemen who afterwards fent him to Oxford and fupported him there. In judging of this performance, they may be fuppofed to have confidered not fo much its intrinfic merit, as the circumftances under which it was produced. For though it inight claim jut praife as the fruit of youthful in-
duftry ftruggling with oblcurity and indigence, as a Ker poem it never rifeg above mediocrity, and generally finks below it. But in whatever light thefe verfes were confidered, the publication of them was foon followed by fuch contributions as procured for the author the advantages of an academical education. In the year 1744 the entered at Wadham college ; nor was it long before he diftinguifhed himfelf in that particular branch of ftudy in which he afterwards became fo eminent. His two differtations, On the Tree of Loife, and The Oblations of Cain and Abel, came to a fecond edition fo early as the year 1747 , and procured him the fingular honour of a bachelor's degree conferred on him gratis by the Univerlity a year before the ftatutable time. The differtations were gratefully dedicated to thofe benefastors whore liberality had opened his way to the Univerfity, or whofe kindnefs had made it a feene not only of manly labour, but of honourable friendlhip. With fuch merit, and fuch fupport, he was a fuccefsful candidate for a fellowhip of Exeter college, and foon after his admifion into that fociety, he diftinguifhed himfelf by the publication of feveral occarional fermons. In the year 1753 he laid the fonndation of that ftupendous monument of learned iudultry, at which the wife and the good will gaze with admiration, when prejudice, and envy, and ingratitude, nall be dumb. 'This he did by publifhing his firt differtation, On the State of the Printed Hebrew Text, in which he propufed to overthrow the then prevailing notion of its abfolute integrity. The firit blow, indeed; had been fruck loner before, by Cappellus, in his Critica Sucra, publinhed after his death by his fon, in 1650-a blow which Buxtorf, with all his abilities and dialectical fkill, was unable to ward off. But Capellus having no opportunity of confulting MSS. though his arguments were fupported by the authority of the Samaritan Pentatench, of parallel paffages, and of the ancient verfions, could never abfolutely prove his point. Indeed the general opinion was, that the Hebrew MSS. contained none, or at leaft very few and trifing variations from the printed text : and with refpect to the Samaritan Pentateuch very different opinions were entertained. Thole who held the Hebrevi verity, of courfe conlemned the Samaritan as corrupt in every place where it deviated from the Hebrew: and thole who believed the Hebrew tu be incorrect, did not think the Samaritan of fufficient authority to correct it. Befides, the Samaritan itfelf appered to a very great advantare ; for no Samaritan MSS. were then known, and the Pentateuch it felf was condemned for thofe cirors which nught rather to lave been afcribed to the incorrectnefs of the editions. In this differtation, therefore, Dr Kennicute, proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally fup. pofed to agree with each other, and with the Hebrew text, yut contained many and important various readings: and that from thofe various readings confiderable authority was derived in fupport of the ancient verfions. He amonunced the exiltence of fix Samaritan MSS. in Uxford only, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many paffeges in the Hebrew might undoubtedly be currected. This work, as it was reafonable to expect, was examined with great fe-

## K E N

- verity both át home and abroad. In fome foreign univerfities the belief of the Hcbrew verity, on its being attacked hy Capellus, had been infilled on as an atticle of faith-Ifa Capelli fententia adeo non approbata fuilt fidei fociis, ut potius Helvetii tbeologi, et fpeciation Genevenfes, auno 1678 , peculiari cunone caverint, ue quis in ditione fua minifer ecclefiex recipiatur, nifi fateatur publice, textum Hebraum, ut bodie ef in exemplaribus Maforeticis, guoad confonantes et vocales, divinum et authenticuns effe, (Wolfii Biblioth. Heb. tom. ii. 27). And at home this doctrine of the corrupt flate of the Hebrew text was oppofed by Comings and Bate, two Hutchinfonians, with as much violence as if the whole truth of the revelation were at ftake.

The next three or four years of Dr Kennicott's life were principally fpent in fearching out and examining Hebrew MSS. though he found leifure not only to preach, but to publifh feveral occafional fermons. A. bout this time Dr Kennicott became one of the king's preachers at Whitehall; and in the year 1759 we find him vicar of Culham in Oxfordhire. In January ${ }^{1760}$ be publifhed his fecond differtation on the flate of the Hebrew Text ; in which, after vindicating the authority and antiquity of the:Samaritan Pentateuch, he difarmed the adivocates for the Hebrew verity of one of their mott fpecious arguments. They lad obferved that the Chaldee Paraphrafe having been made from Hebrew MSS. near the time of Chrilt, it general coincidence with the prefent Hebrew Text mult evince the agreement of this laft with the MSS. from which the paraphrafe was taken. Dr Kennicott demoniltrated the fallacy of this reafoning, by flowing that the Chaldee Paraphrafe had been frequently corrupted, in order to reconcile it with che printed text; and thus the weapons of his antagoniffs were fuccefffully turned upon themelves. He appealed alfo to the writings of the Jews themfelves on the subject of the Hebrew Text, and gave a compendious hiflory of it from the clofe of the Hebrew canon down to the invention of printing, together with a defeription of ro3 Hebrew MSS which he had difcovered in England, and an account of many others preferved in varisus parts of Eu rope. A collation of the Hebrew MSS. was now londly called for by the mof learne,! and cnlightened of the friends of biblical criticifm; and in this fame year (1960) Dr Kennicott emitted his propofals for collaring all the Hebrew MSS. prior to the invention of printing, that could be found in Great Britain and Ireland, and for procuring at the fame time as many collations of foreign MSS of note, as the time and money he fhould receive would permit. His firft fubfcribers were the learned and pious Archbihop Secker, and the delegates of the Oxford prefs, who with that liberality which has generally marked their character, gave him an annual fubfcription of 401 . In the firft year the money received was about 500 guineas, in the the next it arofe to 900 , at which fum it continued Hationary till the tenth year, when it amounted to 1000. During the progrefs of the work the induffry of our author was rewarded by a cazonry of Chrift Church. He was alfo prefented, though we know not exactly when, to the valuable living of Mynhenyote, in Cornwall, on the nomination of the Chapter of Exeter. In 1776 the firt volume was publifhed, and in 1780 the whole was completed. If now we confider that

## 443 ] K E N

above 600 MSS. were collated, and that the whole work occupied 20 jears of Dr Kennicott's life, it muft be owned that facred criticifm is more indebted to him than to any fcholar of any age. Within two years of his death, he refigned his living in Cornwall, from confcientious motives, on account of his not having a profpect of cyer again being able to vifit his parith. Although many good and confcientious men may jufly think, in this cafe, that his profeffonal labours carried on ellewhere might properly have intitled him to retain this preferment, and may apply this reafoning in other cales ; yet a conduet fo fignally difinterefted deferves certainly to be admired and celebrated. Dr Kennicott died at Oxford, after a lingering illnefs, Sept. 18, 1783 ; and left a widow, who was fifter to the late Edward Chamberlayne, Efq; of the treafury. At the time of his dearh he was employed in printing Remarks on Selet Paffuges in the oll Tftament; which were afterwards publithed, the volume having been completed from his papers.

KENO. See Kino.
KENRICK (William), an anthor of confiderable abilities, was the fon of a citizen of London, and brought up, it is faid, to a mechanical employment. This, however, he feems early to have abanduned; and to have devoted his talents to the cultivation of letters, by which he fupported himfelf daring the relt of a life which might be faid to have paffed in a tlate of warfare, as he was feldom withnot an enemy to attack or to defend himfelf from. He was for fome time Atudent at Leyden, where he acquired the title of J. U. D. Not long after his return to England, he figured away as a poet in Epitlles Philofophical and Moral, 1759, addreffed to Lorenzo; an avowed defence of infidelity, written whilf under confinement for debt, and with a declaration that he was " much lefs ambitions of the character of a poet than of a philofopher." From this period he became a writer by profeflion; and the Proteus fhapes under which he appeared, it would be a fruitefs attempt to trace. He was for a confiderable time a writer in The Monthly Review ; but quarrelling with his principal, began a New Review of his own. When our great Lexicographer's edition of Shakefpeare fint appeared in 1765 , it was followed in a fortnight by a pamphlet, intitled, "A Review of Dr Johnfon's new Edition of Shakefpeare, in which the ignorance or inattention of that editor is expofed, and the poct deferded from the perfecution of his commentators, 1765.0 This pamphlet was followed by an Examination of it, and that by a Defence in 1766 ; in which year he produced his pleafant comedy of Fallaff's Wedding, at firf intend. ed to have heen given to the public as an original play of Shakefpeare retrieved from obfcurity, and is, it muft be acknowledged, a happy imitation of our great dramatic bard. With the celebrated Englifh Rofcius Dr Kenrick was at one time on terms of the flricteft intimacy: but, took occalion to quarrel with him in print, in a mode too unmanly to be mentioned. In politics alfo lie made himfelf not a little confpicuous; particularly in the difpute between his friends Wilkes and Hone. He was the original editor of The Morning Chronicle; whence being oufted for negleat, he fet up a new one in oppofition. He tranflated in a very able manner the Emilius and the Eloifa of

## K E N [ 444 ] K E N

3enfing- Rouffeau; the Elements of the Hitory of England Kon, by Milot (to injure, if poffible, a tranflation of the Kent. fame work by Mrs Brooke) ; and produced feveral
dramatic performances, together with an infinite variety of publications both original and tranflated. To him alfo the public are indebted for the collection (imperfect as it is) of The Poetical Works of Robert Lloyd, M. A. 1774,2 vols 8 vo. Dr Kenrick died June 9. 1777.

KENSINGTON, a village of Middlefex, on the weftern rodd from Lonlon, near 2 miles from Hide-Park-Corner. It is extremely populous; and befides the palace, now neglected, contains many genteel houfes, and feveral boarding-fchools. The palace, which was the feat of the Lord Chancellor Finch afterwards Earl of Nottingham, was purclafed by King William ; who greatly improved it, and caufed a royal road to be made to it, through St James's and Hide Parks, with lamp-pofts erected at equal diftances on each fide. Queen Mary enlarged the gardens. Her filter Queen Ann improved what Mary had begun ; and was fo pleafed with the place, that the freqoently fupped during the fummer in the green-houfe, which is a very beautiful one: but Queen Caroline completed the defign by extending the gardens from the great road in Kenfington to Acton ; by bringing what is called the Serpentine. River into them; and by taking in fome acres out of Hide-Park, on which the caufed a mount to be erected, with a chair on it that could be eafily turned round for fhelter from the wind, fince decayed. This mount is planted about with evergreens, and commands a fine view over the noble gardens, and the country fouth and weft. They were originally defigned by Kent, and have lately been very nuch imploved by Brown; and though they contain no flriking beauties, which their flat fituation will not admit, yet they have many pleafing parts, and afford much delight to the inhabitants of Londor, particularly to thofe whofe profeffions will tot allow of frequent excurfions to more diflant places. Thefe gardene, which are chree miles and a half in compafs, are kept in great order. The palace indeed has none of that grandeur which ought to appear in the refidence of a Britifl monarch; but the royal apartments are noble, and fome of the pictures good. It was at this place King William, Prince George of Denmark, Queen $A \mathrm{nn}$, and King George II. died. The old church was pulled down in 1696 , and a much better one built in its room. Part of this village, from the palace-gate to the Bell, is in the parih of St Margaset's, Weftminfter.

KENT, one of the counties of England, fituated at the fouth-eaft corner of the inland, and from theuce enjoying many advantages. The capacious xftuary of the Thames wafhes its northern parts, as the fea does the fouth-eaft ; whence fome with no great impropriety have flyled it a peninfula. In point of extent, this is the fifth fhire in South Britain, little lefs in its dimenfions than the province of Holland; larger in fize than the duchy of Juliers in Germany ; and almolt exactly equal to that of Modena in Italy. Kent is, with great appearance of truth, fuppofed to be fo Ayled from the ancient Britifh word kant, fignifying a eorser, or, when applied to a country, an bead land. It is certain, that the Romans beftowed the name of

Cantium on the province, and on its mof confpicuous promontory the north Foreland; and from the diatric they inhabited, the people were called Cantii; which has prevailed even to our times, when Kent, and the the men of Kent, are the common appellatives. It is however probable, that thefe Cantii were not the original inhabitants, but a latter colony from the oppofite continent, eftablifhed here, like the Belga, not long before the Roman invafion. At the time of $\mathrm{C}-$ far's coming, this fpacious and fertile region was divided into four principalities, or, as they are, according to the manners of thofe days, commonly called, kingdoms. It was his obfervation of thefe people, that $G_{\mathrm{Imm}}$ they were particularly dillinguithed by their civility Politit and politenefs; a character which their defcendants Surve have preferved. When that wife people became maAters of the fouthern parts of the ifland, this province received the molt confpicuous marks of their attention, as appears from the llations which they fo prudently ellablifhed, while their government flourifhed in its full vigour. The care they took of the ports on the fea coalt as foon as it came to be in danger, and the feveral fortreffes which they erected for the defence of their fubjects againit the fudden attempts of barba. rous invaders, are evidences of the fame kind. Thefe forts, fo prudently difpofed, and fo well fecured, were under the direction of a particular great officer, called Littoris Saxonici Comes, i. e. the count of the Saxon fhore; which office feems to have been preferved by the Britifh monarchs who governed here, after the Ro. mans quitted the ile. The Saxon kinge of Kent difcharged this truft in their legal capacity, from the middle of the fifth to the beginning of the ninth cen. tury. Uuder the northern princes, this poft was agaiu revived, though with a change of title, in the Lord Warden of the cinque Ports. Indeed, under all govern. ments, the people of Kent lave been efpecially confidered; as appears from their claim to the poft of honour in our land-armies, and the privileges granted to their havens, in confideration of their undertaking the defence of our channel.

As to the climate of this county, it varies according to the fituation of places. In the low flat lands, and efpecially in the marfhes, the air is heavy, moilt, and unhealthy ; and yet not to fuch a degree as it has been fometimes reprefented; for, with a little care and caution, ftrangers, as well as natives, quickly reconcile their conflitutions to the temperature even of thefe parts, and live in them without much inconveniency or apparent danger. But, in reference to the reft ot the country, the air is as thin, pure, and wholefome, as in any part of Britain. There is no region morehappily or more beautifully diverfified in regard to fuil, fo that every kind thereof is, fomewhere or other, to be met with in its bounds; and in no thire are any of thefe foils more fertile than they are in this. The Weald yields varicty of fine timber, particularly of chefnut; the middle part has very rich arable land, annually bearing every fpecies of grain in immenfe plenty, and thefe excellent in their feveral forts. There are alfo many beautiful orchards, which produce a variety of fine fruits, and more efpecially apples and cherries, which were introduced here from Flanders by one Richard Harris, who was the king's fruiterer, if the seign of Henry VHIL. The flat country is re: nowned

## K E N

 hardly irs equal. We may from this concife defcription very eafily collect, that the natural products of Fent are numerous, and of great value. In the bowtls of the earth chey find, in feveral places, a rough hard ferviceable ftone for paving, which turns to fome advantage; but not fo much as their exquifite fullersearth, rich marl, and fine chalk, which are there in abundance. If we except iron-ore, indeed, they have no. mines; but there are prodigious heaps of copperasfones thrown on the coalt. The ifle of Shepey, and all the adjacent thore as far as Reculver, is juftly famous for its wheat. Thanet is in no lefs credit for its Garley, or rather was fo ; for now it produces, through the painful induftry and fkilful hurbandry of its inhabitants, copious crops of good wheat as well as barley. Horfes, black cattle, and fheep, they have in great numbers, and remarkable in point of fize ; and hopgrounds in all parts of the county, which turn to very confiderable aecourt. To which we may add, weld, or as fome call it dyers-zveed, which is a very profitable commodity, and of which there grows much in the neighbourbood of Canterbury ; alfo madder, which is, or has been, oceafionally cultivated. The rivers and fea-coafts abound with fifh of different kinds. The excellency of its oyfters on the eaftern fhore is eflebrated by the Roman poets. Thofe of Feveriham and Milton are not only in great efteem at the London market, but are likewife fent in great quantities to Holland.The many rich commodities produced in this coun$s y$, is the reafon why moft of our writers have reprefented it as in a manner void of manufactures; which, however, as appears upon a trict and impartial examination, is very far from being the cafe. Of iron-works there were anciently many ; and there are flill fome, where kettles, bombs, bullets, cannon, and fuch like, are made. At Deptford Sir Nicholas Crifpe Lad in his life-time a very famous copperas work; as, indeed, there that ingenious gentleman, one of the greatel improvers and one of the moft public- spirited perfons this nation ever bred, introdueed feveral other inventions. Copperas was alfo formerly made, together with brimftone, in the ife of Shepey *. But the original and for many ages the prineipal manufacture of this county was broad eloath of different colours, eftablifhed chiefly at Cranbrook by King Edward II I. who brought over Flemings to improve and perfect (the trade being introduced long before) his fubjects in that important art. At this and other places it fourifhed fo much, that even at the clofe of Queen Elifabeth's reign, and according to fome aecounts much later, the beft for home confumption, and the largeft quantities for exportation, were wrought here; many fulling mills being erected upon almolt every river, and the greatelt plenty of excellent fullers-earth affording them fingular affiftance; infomuch that it is ftill a tradition, that the yeomanry of this county, for which it has been evel famous, were moftly the defcendants of rich elothiers, who laid out the money acquired by their induftry in the purehafe of lands, which they tranfmitted, with their free and independent fpirit, to their pofterity. The duke of Alva's perfecution of the Proteftants in the Low Countries drove 3 Inultitude of t alloons over hither, who brought with
them that ingenuity and application for which they had been always diltinguifhed. Thefe diligent and active peopie fettled a manufactory of flannel or baize at Sandwich. By them the lilk-looms were fet up at Canterbury, where they atill fubfit ; and they alfo introduced the making of thread at Maidfone, where it yet remains, and merits more notice and encouragement than litherto it has met with.

Upon the river Dart, at the ennfluence of which with the Thames flands the town of Dartford, was fet up, in the reign of Queen Elifabeth, the firll mill for making white paper by Mr Jonn Spilman, a German, upon whom, long after, King James conferred the honour of knighthood; but King Charles more fenfibly beitowed upon this Sir John Spilman a patent and a penfion of 200 l . a-year, as a reward of his invention, and for the fupport of the manufacture. A. bout the year 1590, Godfrey Box, a German, erêes. ed upon the fame river the fird litting-mill which was ever ufed for making iron-wire ; and alfo the firl bat-tery-mill for making copper-plates. Other new inventions, requiring the alfiltanee of water, have been fet up on other Areams; and a great variety of machines of this fort ftill fubfilt in different parts of this county. But thefe things are now fo common, that: it would be both tedious and ufelefs to iofift upon them. Amonglt thefe, we may reckon the making gunpowder in feveral places. That manufacture, however, which is now the glory of this count $\xi$, and indeed of Britain, is thip-building; more efpecially at the royal yards; as at Woolwich, which was lettled by Henry VIII, and fome confiderable fhips built there. At prefent, there is not only a moti complete eftablifhment for the building and equipping men of war, a rope walk, foundery, and magazines; but alfo many private docks, in which prodigions bulinefs is earried on, and multitudes of people are employed.

KENTISH-Town, a village of Middlefex, three miles north of London, near Hampitead, much im. proved of late by feveral handfome houfes belonging to the citizens of London, \&e. A new chapel has lately been erected here.

KENTUCKY, a province of Nurth America, be longing at prefent to the fate of Virginia, but propofed foon to be admitied into the union as an independent Itate. It is fituated between $36^{\circ} 30^{\prime}$ and $39^{\circ}$ $30^{\prime}$ North Latitude, and $8^{\circ}$ and $15^{\circ}$ Wett Longitude; being 250 miles in length, and 200 in bieadth. It is bounded north-weft by the river Ohio; well, by Cumberland river; fouth, by Nurth Carolina; eaft, by Sandy-river, and'a line drawn due foath from ita fouree till it Arikes the northern boundary of North Carolina. Kentucky was originally divided into two counties, Lincoln and Jefferfon. It has linee been fubdivided iato feven, viz. Jefferfon, Fayctte, Bourbon, Mereer, Nelfon, Maddifon, Lineuln; and Lexington is the chief town.

The river Ohio wafhes the north-wettern fide of K -n. tucky, in its whole extent. Its principal branches, which water this fertile tract of country, are Sandy, Lieking, Kentucky, Salt, Green, and Cumberla rivers. Thefe again branch into various directions, into rivulets of different magnitudes, fertilizing the country in all its parts. - There are five noted falt
fpricgs

## K E N $\left[\begin{array}{lll}446\end{array}\right] \quad$ K E N

ISentecky. fprings or licks in this country, viz. the higher and lower Blue Spriugs on Licking river, from fome of which, it is faid, iflue Atreams of brinihh water ; the Big Bone lick, Drennon's licks, and Bullet's lick at Salifarg. 'I'he laft of thefe licks, though in low order, has fupplied this country and Cumberland with falt at 20 thillings the buhel, Virginia currency; and fome is exported to the Illuois country. The method of procuring water from thefe licks is by finking wells from 30 to 40 feet deep. The water drawn from thefe wells is more flrongly impreguated with falt than the water from the fea.

This whole country, as far as has yet beeo difcovered, lies upon a bed of lime-ttone, which in general is about fix fect below the furface, except in the valleys where the foil is much thinner. A ract of about 20 miles wide along the banks of the Ohio is hilly broken land, interfperfed with many fertile fpots. The relt of the country is agreeably uneven, gently afcending and defcending at no great diftances. This country in general is well timbered; and fuch is the variety and beauty of the flowering flarubs and plants which grow fontaneoufly in it, that in the proper feafon the wildernefs appears in bloffom. The accounts of the fertility of the foil in this country have in fome inftances exceeded belief, and probably have been exaggerated. That fome parts of Kentucky, particuiarly the high grounds, are remarkably good, all accounts agree. The lands of the firil rate are too rach for wheat, and will produce 50 and 60 , and in fome inftanees it is affirmed ivo buthels of good corn an acre. In common the land will produce 30 bufhels of wheat or rye an acre. Barley, oats, cotton, flax, hemp, and vegetables of all kinds common in this climate, yield abundantly. The old Virginia planters fay, that if the climate does not prove too moift, few foils known will yield more and better tobacco.-The climate is heaitlyy and delightfui, fome few places in the neighbourhood of ponds and low grounds excepted. The inhabitants do not experience the extremes of heat and cold. Snow feldom falls deep or lies long. The winter, which begins about Chriftmas, is never longer than three months, and is commonly but two, and is fo mild as that cattle can fublift without fodder.

It is impoffible to afcertain with any degree of accuracy the prefent number of inhabitants, owing to the numero:ts acceffions which are made almoft every month. In 783 , in the county of Lincola only, there were on the militia rolls 3570 men, chiefly emigrants from the lower parts of Virginia. In $178+$ the number of inhabitants were reckoned at up wards of $30,00 c$. From the accounts of their aftorifhing increafe fince, we may now fafely eftimate them at $1,000,000$. It is afferted that at leaft 20,000 migrated here in the year 1787. Thefe people, collected from different flates, of different manness, cultoms, religions, and political fentiments, have not been long enough together to form a uniform and ditinguithing character. Among the fettlera there are many gentlemen of abilities, and many gentcel famlies from feveral of the ftates, who give dignity and refpectability to the fettlement. They are in general- more orderly perhaps than any people who have fettled a new country.

As to religion, the Baptitts are the moft numerous feet in Kentucky. In 1789 they had 16 churches
eflablifhed, befides feveral congregations where churches Kentuch were not conflituted. Thefe were fupplied with upwards of 30 minifters or teachers. There are feveral large congregations of Preflyterians, and fome few of other denominations.
'The legiflature of Virginia have made provifion for a college in Kentucky, and have endowed it with very contiderable landed funds. Schools are eftablifhed in the feveral towns, and in general regularly and handfomely fupported. They have a printing office, and publifh a weekly gazette. They have erected a pa-per-mill, an oil mill, fulling mills, faw mills, and a great number of valuable grill mills. Their falt works are more than fufficient to fupply all the inhabitantsat a low price. They make confiderable quantities of fugar from the fugar trees. Labourers, particularly tradefmen, are exceedingly wanted here.

The firt white man who difcovered this province was one James M4Bride, in the year 1754. From this period it remained unexplored till about the year 1767, when one Johu Finley and fome others, trading with the Indians, fortunately travelled over the fertile region now called Kentucky, then but known to the Indians by the name of the Dark and Bloody Grounds, and fometines the Middle Ground. This conntry greatly engaged Mr Finley's attention, and he communicated his difcovery to Colonel Daniel Buon, and a few more, who conceiving it to be an interelting object, agreed in the year 1760 to undertake a journey in order to explore it. After a long fatiguing march over a mountainous wildernefs, in a weftward direction, they at length arrived upon its borders; and from the top of an eminence, with joy and wonder deferied the beautiful landfcape of Kentucky: Here they encamped, and fome went to hunt provifions, which were readily procured, there being plenty of game, while Colonel Boon and John Finley made a tour through the country, which they found far exceeding their expectations; and returning to camp, informed their companions of their difcoveries. But in fpite of this promifing beginning, this company meeting with nothing but hardhips and adverfity, grew exceedingly difheartened, and was plundered, difperfed, and killed by the Indians, except Colonel Boon, who continued an inhabitant of the wildernefo until the year 177, when he returned home.

Colonel Henderfon of North Carolina being informed of this country by Colonel Boon, he and fome other gentlemen held a treaty with the Cherokee Indians at Wataga in March 1775, and then purchafed from them the lands lying on the fouth fide of Kentucky river for goods at valuable rates, to the amount of 6000 l. fpecie.

Soon after this purchafe, the ftate of Virginia trok the alarm, agreed to pay the money Colonel Donaldfon had contracted for, and then difputed Colonel Henderfon's right of purchafe, as a private gentleman of another ttate in behalf of himfelf. However, for his eminent fervices to this country, and for having been inftumental in making fo valuable an acquifition to Virginia, that flate was pleafed to reward him with a traet of land at the mouth of Green river, to the amount of 200,000 acres; and the ftate of North Ca. rolina gave him the like quantity in I'owcl's Valley. This region was formerly claimed by various tribes of Indians;

## TK E P.

per. Indians; whofe title, if they had any, originated in fuch a manner as to render it doubtful whica ought to poficfsit. Hence this fertile fpo: became an object of c ntention, a theatre of wall, from which it was properly den mivated the Bloody Crumeds. Thair contentions not being likely to decide the right to any particular tribe, as foon as Mr Henderfon and his friends propuled to parchafe, the ludians agreed to fell; and notwitiflanding the valuable corfideration they received, have continued ever fuce troublefume neighbours to the new fetters.
The progrefs in improvements and cultivation which lias heen made in this country, almolt excteds belief. Eleven years ago Kentucky lay in foreft, almoft unin habited but by wild bea!ls. Now, notwithltanding the united oppofition of all the weflern Indians, flic exhibits an extenfive fetilement, divided iuto feven large and populous counties, in which are a number of flouribhing liule rowns, containing more inhabitants than are in Georyia, Delaware, or Rhode-1fand flates; and nearly or quite as many as in New Hampfaire.

KEPLER (John), one of the greateft aftronomers of his age, was born at Wiel, in the country of Wirtemberg. in 157\%. In the year 1595 , he wrote an exceilent book, which was printed at Tubingen the year following, under the title of Prodromus differtationium de proportione orlium cateftium, deque caifis calorum numeri, magntudinis, mofuumque periodicorum genuinis et propriiis, Ejc. Tycho Brahe having fetted in Bohenia, and obtained from the emperor all for:s of conveniencies for the perficting of aftronomy, was fo paffionately defirous of having Kepler with him, and wrote fo many letiers to him on that fubject, that he prevailed upon him to leave the nimerfity of Gratz, and remove into Bohemia with his fanily and library in the year 1600. Kepler in his jurney was feized fo violently with the quartan ague, that he could not do Tycho Brahe all the fervices of which he was before capable. He was even a little diffatisfied with the refervednefs which Tycho Brahe fhowed towards him ; for the latter did not commanicate to him all he knew: and as he died in IGOM, he did not give time to Krpler to be very ufeful to him, or to receive any confiderable advantage under him. Fron that time Kepler enjoyed the title of Mathernatician to the emperor all his life; and gained more and more reputation by his works. The emperor Rodolphus ordered him to finith the tables of Ty ho Brathe, which were to be called the Rodolpbine Tables. Kepler applied himfelf to it vigurounly: bue unhappy are thofe learned men who depend upon the good humour of the intendants of the finances. The treafurers were fo ill- affected toward our author, that he could not publifh thefe tables till 1627. He died at Ratibon, where he was foliciting the payment of the arrears of his per: fion in 1630 .

The principal works of this great aftronomer are, $t$. Prodrcomus differtationum above mentored, to whicts he has alfo given the title of Mylerium: Cofmographicun; which he ellecmed more than any ocher ot li.s worns, and was for forme time fo charmed with it, that he faid lie would not give up the honour of having invented what was contained in that book. for the electorate of Saxony. 2. Harmonia mundi, with a defence of that

Somnium Lanarifue iflionomia; in which be began to draw up that fyttem of compatative all ronomy which was afterwardg purfued by Kircher, Huygens, and Gregory. His death happened while the wook was printing; upon which James Bartfchius his fon-in-law undertook the care of the imprefion, but was alfo interrupted by death: and Lewis Kitplicr his fon, who was then a phyfician at Konighberg in Pruflia, was fo much flartled at thefe difafters, that it was with the utmoll difficulty he coold be prevailed upon to attempt to finilh. it, lefl it thould prove fatal to him: he completed the tafk, however, without recciving any perfonal injury.

KERATOPHYTUM, in natural hilory, a fpecies of Gongonia. - The keratophyta are called the foutiees coralloides, or fea thubs; and generally known amurg naturalifts by the different appellations of fitophyta, hithoxyla, and keratophyta; epithets tending to comvey an idea of their compufition, which at finll yiew feems to confitit parily of a woody or horny, partly of a ftuny or calcarcous fubnance, varioußy difpofed with refoce to each othir. Their general form approaches io that of Chruts, buving a root-like buse, by which they athere to fume folid fupport in the ocean; and a tten or erunk, and branches differently difpufed; fome tifing up is one or more different twigs, fubdivided into fmaller and ferarace ramitications; while others have their fmaller branches connected in fuch a manner, as to form a curious ner-like flruequre: from this diverfity of higure they borrow the names of fea fans, fea feathers, \&c. The feeming fibres of the bale are, in realiny, fmall tubes, of which the whole flhrub confilts: : thefe tubes run up longitudinally into the trunk, and are alfo circutarly difpoled about the centre of the trunk: the wondy part, as naturalifs have called it, thus formed, affords when burni a ftrong fmell like burning horn; whence fome have called it the horny part. Upon this part is fuperinduced a kind of flony or calcareons coat, which covers both trunk and branches, to their extremities. In this coat mas be difcosered regular orders or pores of eells; and viewed by the microfcope, it always appears to be an organical body cunfiling of a regular congeries, like the cells in which animals have been formed or exifed. Some of this kind of bodies have loll their calcareous covering by the violence of the waves aud other accidents. In fome fpecimens of an advanced growth, the calcareous tubes jur mentioued fend out little cells of animals of the fulype kind, with proper openings to them all: thefe ceils are diffufed along the branches in fome regular order, much in the fame ranner as they are in the corallines. From the cells the animals have been difoovered extending themfelves, as well to procure food, as inaterials for the increafe of this furprifing flructure; and therefore therc is no reafon to doubr that they are animal produtions.
A fnall fprig of the keratophyton fabelliforme, or warted fea-fan, is reprefented in Plate CC1. The out ide is covered with a crult full of little lumpe

## $\mathrm{K} E \mathrm{R}$

$K E R$
Kercluring lumps like warts; which, when diffolved in vinegar, difcover the contracted bodies of polypes, like claws. C and $\mathrm{C}_{1}$ are two views of one of the warts magThe fame of kermes was occafioned by friar Simon, apothecary to the Chartreux friars. He received nified; $C_{2}$, is the appearance of the polype when the cretaceous matter is diffolved; $\mathrm{C}_{3}$, reprefents the particles that compofe the incruftation, magnified.D, reprefents a fea-willow, or keratophyton dichotomum. On buth edges of the flat branches are regular rows of little rifing cells in the calcareous part, with fmall holes for an entrance to each. See Corallines.

KERCKRING (Theodore), a fanous phyfician of the ${ }^{1} 7$ th century, was born at Anfterdam, and ac. quired a great reputation by his difcoveries and his works. He found out the fecret of foftening amber without depriving it of its tranfparency; and made ufe of it in covering the bodies of curious infects in order to preferve them. He was a member of the Royal Society of London, and died in 1693 a: Hamburg, where he had fpent the greateft part of his life, with the title of refident of the grand duke of Tufcany. His principal works are, I. Spicilegiun anatomicum. 2. Anthropogenice iclmographia. There is alfo attributed to him an anatomical work, printed in 1671 in folio.

IEERI Cetie, are various readings in the Hebrew Bible: keri, fignifies that which is read; and cetib, that which is written. For where any fuch various readings occur, the wrong reading is written in the text, and that is called the cetib; and the true reading is written in the margin, with $p$ under it, and called the keri. It is generally faid by the Jcwifh writers, that thefe corrections were introduced by Ezra; but it is moff probable, that they bad their original from the miftakes of the tranfcribers after the time of Ezra, and the obfervations and corrections of the Maforites. Thofe Keri cetibs, which are in the facred books written by Ezra himfelf, or which were taken into the canon after his time, could not have been noticed by Ezra himfelf; and this affords a prefumption, that the others are of late date. Thefe words amount to about 1000 ; and Dr Kennicott, in his Diffrtatio Generalis, remarks, that all of them, excepting 14, have been found in the text of manufcripts.

KERMAN, the capital city of a province of that name in Perfia, feated in E. Long. 56. 30. N. Lat. 30. o. The province hies in the fouth part of Perfia, on the Perfian gulph. The theep of this country, towards the latter end of the fpring, fhed their wool, and become as naked as fuckling pigs. The principal rcvenue of the province confifts in thefe fectes.

KERMES, in zoology, the name of an infect produced in the cxcrefecnces of a fpecies of the oak. See Coccus.

Kermes Mineral, fo called from its colour, which refembles that of vegetable kermes, is one of the molt important antimonial preparations, both with regard to its chemical phenomena and to its medicinal ufes.

The ufe of kermcs-mineral was not ellablifhed in medicine before the beginning of this century. Some chemitts, indeed, amongft others Glauber and Lemeri, had before that time mentioned in their works feveral preparations of antimony which approach more or lefs to kermes; but thefe preparations being little known, were confounded with many others which are entirely LNO 172.
neglected, although much praifed by their authors. - Ketn this prcparation from a furgeon called La Ligerie, who had procured it from a German apothecary who had been a [cholar of the famous Glauber. Friar Simon, from the commendations given to this new remedy by La Ligerie, adminiflered it to a Chartreux friar, who was dangeroufly ill of a violent peripneumony, by which the friar was fuddenly, and as it had been miraculoufly, cured. From that time the friar-apothecary publifhed the virtue of his remedy. Several other remarkable cures were performed by means of kermes. The public believed in its medicinal qualities, and called it powder of Clartreux; becaufe it was prepared only in the apothccary's fhop belonging to thefe monks. Tbe reputation of kermes extended itfelf more and more; till at length the duke of Orleans, then regent of France, procured the publication of the procefs by La Ligerie.

This procefs confitts in boiling, during two hours, pulverifed crude antimony in the fourth part of its weight of the liquor of nitre fixed by coals, and twice its weight of pure water: at the end of this time the liquor is to be decanted and filtrated, white boiling, through brown paper. It continues clear while it is boiling hot; but when it cools, it becomes turbid, acquires a red brick colour, and again becomes clear by the depofition of a red fediment, which is the kermes. The boiling may be thrice repeated, and each time the fame quantity of water is to be added to the antimony, and a fourth part lefs of the liquor of fixed nitre. The feveral fediments from thefe three boilings are to be added together, wafhed with clean water till the water acquires no tafte; and the kermes js then to be dried. La Ligerie directs, that aquavitie fhall be once or cwice poured upon it and burnt, and the kermes dried again.

We now proceed to explain the nature of kermes, and the pheromena of its preparation. -Crude antimony is compofed of regulus of antimony and common fulphur, united naturally with each other, as in almolt all metallic minerals. The fixed alkali with which the crude antimony is boiled, although it is diluted with much water, acts upon the fulphur of the antimony, and forms with it liver of fulphur ; and as this compound is a folvent of all metallic matters, it diffolves a certain quantity of the regulus of antimony. In this operation then a combination is formed of fixed alkali, of fulphur, and of regulus of antimony. Of thefe three fubftances the fixed alkali only is foluble in water, and is the intermodiate fubftance by which the fulphur and regulus arefufpended in the water. But we are to obferve, that the alkali becomes impregnated by this operation, and by boiling, with a larger quautity of regulus, and efpecially of fulphur, than can be fufpended in cold water; hence the decoction of kermes, which is clear, limpid, and colourlefs while boiling hot, becomes turbid and depofits a fediment while it cools. This compound, therefore, like certain falts, may be kept diffolved in larger quantity by hot than by cold water, and much of it is therefore depofited by cooling.

Futher, while the kermes is precipitating, the whole

## K E R [ 449 ] K E R

whole antimoniated liver of fulphur, which is diffolved by the boiling liquor, may be divided into two parts ; one of which, that is the kermes, being overeharged with the regulus, and particularly with the fulphur, contains but a little alkali, which it draws along with it duing its depolition. The other part, as it contains much more alkali, remains diffolved even in the cold licuor, by means of this larger quantity of al. kali. All thefe propoftions are to be explained and demonfrated by the following obfervations.

Firl, when the decoction of kemmes is cold, and has formed all its fediment, if, without adding any thing to it, it be heated till it hoil, it again entirely rediffulves the kermes; the fediment difappears; the liquer becomes elear, and by eeld is again rendered tuitid and depofites fediment as before. Thus the kermes may le made to precipitate and to redifolve as ofeen as we pleafe.

Secondly, by digefling kermes in aqua regia, which diffolves its alkali and regulus, the fulphur is feparated pure. The acids of aqua regia form a nitre and a febrifugal falt of Srlvius with the alkali of the kermes; and if a certain quantity of kermes be melted with hlack flux after having deftroged its fulphur by roafting, a true regulus of antimony may be obtained from it.

Thefe experiments, which were made by Mr Geoffroy, and the detail of which is found in memoins given to the Academy in the years 1734 and 1735, upon the analyfis of kermes, fhow evidently the prefence of fulphur, of fixed alkali, and of regulus of antimony, in this compound. From Mr Geoffroy's experiments we find, that 72 grains of kermes contain about 16 or 17 grains of 1 egulus, 13 or 14 grains ef alkaline falt, and 40 or 41 grains of common fulphur.

Thirdly, by repeating the boiling of the liquor upon the antimony, nore and more kermes will be formed each time by cooling, as at forf ; and this experiment may be repeated a great many times. Mr Geoffroy fays, that he repeated it 78 times withont any other addition than that of pure water to fupply that which was loft by evaporation; and that each time a confiderable quantity of kermes was formed by couling. This experiment proves, that the alkali tranfforms the antimony into kermes by overcharging itfelf with regulus and fulphur, and at each precipitätion the kermes does not retain and take with it but a very fmall quantity of alkali.

Fourthly, if any acid be poured upon the liquor in which the kermes has been formed, and from which it has been entirely feparated by cooling, Mr Beaumè las ohferved, that this liquor is again rendered turbid, and that a feeond fediment is formed of a yellow reddim colour, which is nothing elfe than golden fulphur of antimony; that is, regulus of antimnny and fulphur mixed together, but in very different proportions, and with very different Arengths of union, from thofe in which they are found in the erude antimony.

After this precipitation, in the liquor a neutral falt is left, which is formed by the contained alkali and the precipitating acid. Frons this experiment we find, that in the liquor from which the kermes has been depofited, a confiderable quanticy of antimoniated liver of fulphur remains, which differs from kermes by
containing a much larger proportion of alkali ; fo that it ean keep diffolved the regulus and fulphur with whieh it is united, even when the hquor is cold.

In the procefs for feveral antimonial preparations, a kermes, or compounds like it, are formed. 'This always happens when erude antimony is treated by fufion with a quantity of alkaline falt, fo that an antimoniated liver of fulphur refults fiom it, overeharged with regulus and fulphur ; that is, containing more of thefe two fuhtances than it can keep diffolved in cold water. If any of thefe combinations be boiled in water, a matter analogous to kermes is always depotited by cooling. This happens, for inltance, to the fcoria of the regulus of antimony, and in an operation defcribed by Mr Geoffroy to abridge the procefs for making kermes by fufion.

To make kermes by fufion, Mr Geoffroy fufes two parts of antimony with one part of alkaline falt; he powders this matter while yet hot, and keeps it during two hours in boiling water; he then filtrates it, and receives the liquos into more boiling water, from which, when it eools, about fix gros of kermes is depofited, when an ounce of antimony has been ufed. This method of making kermes is much more expeditious, but lefs perfect; for, as the author colsfeffes, the kermes produced is not fo tine and foft as that made in the ordinary method.

Mr Lemeri the elder mentions alfo, in his Treatife concerning Antimony, an operation from which his fon pretends that kermes may be obtained. This operation confits in digefting, and afterwards boiling, powdered crude antimony in a very pure liquor of fixed nitre. This liquor, if it be in fuffieient quantity, is eapable of diffolving quiekly and entirely powdered crude antimony; and we cannot doubt but that, by cooling, a eonfiderable quantity of a fubllanee very analogous to kermes will be produced. Neverthelefs, none of thefe thort methods of making kermes is directed by difpenfatories, or by the beft books for deferibing the preparations of chemical remedies.

Kermes is ufed in medicine only; and from it fingularly excellent effects may be produced, when adminiftered by able phyficians. In kermes are united the exciting and evacuant virtues of the emetic preparations of antimony, with the tonie, dividing, aperitive, and refolving properties of the liver of fulphur; that is to fay, that it is eapable of anfwering two prineipal indieations in the treatment of many acute and chronic difeafes. Properly managed, it may become an emetie, purgative, a diuretic, a fudorifie, or an expectorant, as is required, and it is always attennating and rfolving. When feven or eight grains are taken at once, it chiefly acts upon the primæ viz, generally as an emetic and as a purgative. A dofe of three or four grains is feldom emetic, and more frequently purgative When taken in thefe quantities as an evacuant, a little of it paffes allo into the viæ fecundæ \& tertix. When it is adminitered in fmaller dofes, it paftes almolt entirely into the lacteal, blood, and lymphatic veffels. In thefe it occafions fuch fpafms and ofcillations as it does in the primex vix; fo that it increafes all fecretions and excretions, but particularly thofe of urine, fueat, and expectoration, aceerding to the dofe, to the nature of the difeafe, and to the difpolition of the pritient. It produces very good effects in thofe 3 L

## K E R [ 450 ]

Kern, difeafes of the breaft which proceed from fullnefs and Kerry. obftruction.

Kermes may be adminitered in linctufes, in oily or in cordial potions, in any vehicle; or incorporated in a bolus, with other fuirable remedies. One precaution, hitherto little obferved, is very neceffary; that is, not to join it with acid matters, if it is intended to act as kermes. Anti-acid and abforbent fubitances ought to be joined with it, if the patient has an acid in the primx vix, or an acefcent difpofition; for as thefe acids faturate the alkali by which the kermes is rendered an antimoniated liver of fulphur, and by which alone it differs from golden fulphur of antimony, they accordingly render the kermes entirely limilar to the golden fulphur of antimony, the properties of which are very different from thofe of kermes.

KERN, or Kerne, a term in the ancient Irifh militia, fignifying a foot-foldier.-Camden tells us, the armies of Ireland confifted of cavalry, called gallogloffes; and infantry, lightly armed, called kernes. - The kernes bore fwords and darts; to the lalt were fitted cords, by which they could recover them after they had been launched out.

Kernes, in our laws, fignify idle perfons or vagabonds.

KERRY, a county of Ireland, in the province of Munter, anciently called Corrigia, or "the rocky country," from Cerrig or Carric, "a rock." It is boundcd by the Shannon which divides it from Clare on the north, by Limerick and Cork on the ealt, by another part of Cork on the fouth, and by the Atlantic Ocean on the weft. The belt town in it is Dingle, fituated in a bay of the fame name. It comprehends a great part of the territory formerly called $D_{i} \cdot$ mond, and confifts of very different kinds of Coil. The fouth parts are plain and fertile, but the worth full of high mountains, which, though remarkably wild, produce a great nurber of natural curiofities. It contains 636,905 lrith plantation acres, 84 parihes, 8 baronies, 3 boroughs, returns $\delta$ members to parliament, and gives title of earl to the family of Fitzmaurice. It is about 57 miles long, 45 broad, and lies within N. Lat. 51. 30. and 52. $24 . ;$ the Longitude at the mouth of Kenmare river being $10^{\circ} 35^{\prime}$ wett, or $42^{\prime} 20^{\prime \prime}$ uiffrence of time with London. It is the fourth county as to extent in Ireland, and the fecond in this prorince; but in refpect to inhabitants and culture doth not equal many fmaller counties. In it tbere are two epifcopal fecs, which have been annexed to the kifhopric of Limerich fince the jear 1660 , viz. Ardfert and Aghadoe. The fee of Ardfert was anciently called the diocele of Kerry, and its bihops were named bifhops of Kerry. Few mountains in Ircland can vie with thofe in this county for leeight; during the greater part of the year their fides are obfcured by fogs, and it mult be a very ferene day when their tops ap. pear. Iron ore is to be had in great plenty in moft of the fouthern baronies. The principal rivers are the Blackwater, Feal, Gaie and Brick, Camin, Mang, Lea, Flen, Laune, Carrin, Fartin, Inry, and Roughty, and the principal lake is Killarney. There are fome good medicinal waters difcovered in this county ; particularly Killarney water, Iveragh, Spa, Fellofivell, Dingle, Caflemain, and Cralee-Spas, as alfo a faline foring at Materybeg. Some rare and ufeful plants
grow in Kerry, of which Dr Smith gives a particular account in his hiftory of that county.

KERSEY, a kind of coarfe woollen cloth, made chiefly in Kent and Devonfhire.

IEESITAH. This word is to be met with in Genefis and in Job, and is tranflated in the Septuagint and Vulgat " Meep or lambs:" But the Rabbins and modern interpreters are generally of opinion, that kefitah fignifies rather a piece of money. Bochart and Eugubinus are of opinion the Scptuagint meant mint, and not lambs; in Giect becatonmion, sxatov, cusv, inftead of tratovapvar. Now a mina was worth 60 Hebrew thekels, and confequently 61.16 s . $10 \frac{1}{2} \mathrm{~d}$. Stciling. M. de Pelletier of Rouen is of opinion, that kefitah was a Perfian coin, flamped on one ficle with an archer (Kefitab or Kefelb in Hebrew fignifying "a bow") and on the other with a lamb; that this was a gold coin linown in the eaft by the name of a duric, and was in value about 12 livres and 10 d . French money. Several learsed men, without mestioning the value of the kefitah, fay it was a filver coin, the impreffion whereof was a theep, for which reafon the Septuagint and Vulgate tranfate it by this name. Calmet is of opinion, that kefitah was a purfe of gold or filver. In the eaft they reckon at prefent by purfes. The word kifa in Chaldee fignifies " a meafure, a veffel." And Euftathius fays, that killa is a Perfian meafure. Jonathan and the '「argum of Jerufalem tranflate kefital) "a pearl." (Gen. xxxiii. 19. ; Job, xlii. I1). Or 91. Englifh, fuppofing, as Dr Priceanx does, chat a fhekel is worth 3 s . A daric is a piece of gold, worth, as Dr Prideaux fays, 25 s. Englifh.

KESSEL, a town of Upper Guclderland, in the Netherlands, with a handfome calle. It is the chief town in the territory of the fame name, and feated on the river Meufe, between Ruremond and Venlo, it being about five miles from each. It was ceded to the king of Pruffia by the treaty of Utrcclit. E. Long. 6. 13. N. Lat. 41.22.

Kessel (Jolın Van), an eminent painter, was born at Antwerp in 1626, and became exceedingly famous for painting thofe particular objects which he delighted to reprefent; and ont only excelled in fruits and flowers, but was likewife eminent for painting portraits. In this manner he refernbled Velvet Brueghel, and very near equalled him in his birds, plants, and howers. The prodigious high prices for which he fold his works, occafioned the rich alone to be the purchafers; and the king of Spain admired the performances. of Van Keffel to fuch a degree, that he purchafed as many of them as he coult polfibly procure, till at lat he prevailed on that artit to vifit his court, where he was appointed painter to the queen, and was retained in her fervice as long as the lived. He painted portraits admirably, with a light free touch, and a tone of colour that very much refembled Vandyck; nor are his works in that ftyle confidered in Spain as inferior to that great malter. He died in 170 h, aged 82.

KESSELDORF, a village of Germany, in the circle of Upper Saxony, three miles below Drefden, remarkable for the battle gained by the king of Pruffia over the Saxons, on the 15 th of December 1745

KESTREL, the Englith name of a hawk, called alfo the fannel and the zuinellover, and by authors the tinnunculdes and chencris. It builds with us in hollow
ck hollow oaks, and feeds on partrioges and other birds. Se: Falco.

KESWICK, a town of Cumberland, fituated on the fide of a lake in a fruitful plain, almof encompafted with mountains, calld the Terwent Fells. It was formerly a town of good note, but now is mucle decayed. However, it is fill noted for its inines and miners, who have a convenient fonelting houfe on the lide of the river Derwent, the theam of which is fo managed as to make it worlt the bellows, hammers, and forge, as alfo to faw boards. There is a work-houfe here for employing the poor of this parifh and that of Crofsthwait. W. Long. 3. O. N. Lat. 54. 30.

KETCH, a veflel equipped with two malts, viz. the main-matt and mizen-matt, and ufually from 100 to 250 tons burden. - Ketches are principally ufed as yachts or as bomb-veffels; the former of which are employed to convey princes of the blood, ambaffadors, or other great perfonages, from one part to another ; and the latter are ufed to bombard citadels, towns, or other fortreffes. The bomb-ketehes are therefore furnified with all the apparatus neceflary for a vigorous bombardment ; they are built remarkably frong, as being fitted with a greater number of riders than any other veffcl of war: and indeed this reinforcement is abfolutely neceflary to fuftain the violent hock produced by the difcharge of their mortars, which would otherwife in a very ftort time fhatter them to pieces.

KETTLE, in the art of war, a term the Dutch give to a battery of mortars, becaufe it is funk under ground.
Kettle-Drums, are formed of two large bafins of copper or brafs, rounded at the bottom, and covered
 circle of iron, and by feveral holes faftened to the body of the drum, and a like number of ferews to fcrew up and down, and a key for the purpore. The two bafins are kept falt together by two llraps of leather which go through two rings, and are faftened the one before and the other belind the pommel of the Lettle-drums faddle. They have each a banner of filk or damafk, richly embroidered with the fovereign's arms or with thofe of the colonel, and are fringed with filver or gold; and, to preferve them in bad weather, they have each a cover of leather. The drumfticks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum-head and caufe the found. The kettle drum with trumpets is the molt martial found of any. Each regiment of horfe has a pair.
Ketfle-Drummer, a man on horfeback app inted to beat the kettle.drums, from which he takes his name. He marchcs always at the head of the fquadron, and his puft is on the right when the fquadron is drawn up.
KET'lLEWELL (Tohn), a learned divine, born in 1653 , was defeended from an ancient family in the North-riding of Yurkflire, bred in Edmund-Hall Oxford, and clected feilow of Lincoln college. In 1675 , he went into orders; but after the revolution was deprived of his living, on account of his refufal to take the oaths in King William and Queen Mary. He died of a confumption in 1695 . He publifhed feveral works, which were collected and reprinted together in 1718 , in

2 rols folio. He was a man of great candour, meeknefs, piety, and charity.

KEVELS, in fhip-building, a frame compofed of two pieces of timber, whofe lower ends reft in a fort of ftep or foot, nailed to the flip's fide, from whence the upper ends branch outward into arms or horns, ferving to belay the great ropes by which the bottoms of the main-fail and fore fail are extended.

KEW, a village of Surry in England, oppofite to Old Brentford, 10 miles well from London. Here is a chapel of eafe crected at the expence of feveral of the nobility and gentry in the ucighburthood, on a piece of ground that was given for that purpofe by the late Qineen Anne. Here the late Mr Molineux fecretary to the late king, when prince of Wales, had a fine feat on the Green, which became the refidence of the late prince and princefs of Wales, who greatly iiaproved both the houfe and gardens; now occupied by his prefent majelty, who has greatly enlarged the gardens, and formed a junction with them and Richmond gardeus. The gardens of Kew are not very large, nor is their fituation by any means advantageous, as it is low and commands no profpects. Originally the ground was one continued dead flat; the fioil was in general barren, and without either wood or water. With fo many difadvantares it was not eafy to produce any thing even tolerable in gardening; but princely munificence, guided by a director equally fkilled in cultivating the earth and in the politer arts, overcame all difficulties. What was once a defert is now an Eden. In 1758, an act pafted for building a bridge acrofs the Thames to Kew-Green ; and a bridge was built of eleven arches; the two piers and their dependant arches on each fide next the fhore, built of brick and ftone; the intermediate arches entirely wood; the centre arch 50 feet wide, and the road over the bridge 30 . But this bridge is to be taken down as foon as a very elegant one, now erceting cloe by it (1791), is completed.

KiEXHOLM, that part of Finland which borders upon Ruffia. The lake Ladoga croffes it, and divides it into two parts. By the treaty between Rufla and Sweden in 1721 , the Swedes were obliged to abandon the beft part to the Ruffians. The country in general is full of lakes and marfles, thinly inhabited, and badly cultivated. The lake above mentioned is 120 miles in length, and full of tith.

Kexholm, or Carelgorod, a town of Ruffa, in a territory of the fame name, not very large, but well fortitied, and has a flong calle. The houfes are built with wood. It formerly belonged to the Ruffians, after which the Swedes had pofiefion of it for a whole century ; but it was retaken by the Ruffians in 1710. Near it is a confiderable fatmon lifhery. It is feated on cwo iflands on the north-welt fide of the lake Ladoga, in E. Long. 30. 25. N Lat. 61. 12. Neat it is another town called New Kexholin.

KEY, an inflrument for the opening of locks. See Lock.
L. Molinus has a treatife of keys, $D_{e}$ clavibus veterum, printed at Upfal: he derives the Latin name clavis, from the Greek xnesis clauto, "I fhut;" or from the adverb clam "privately;" and adds, that the ufe of keys is yet unknown in fome parts of Sweden.

The invention of keys is owing to one Theodore of

## K E Y

Jiey. Samos, according to Pliny and Polydore Virgil: but this mult be a miftake, the ufe of keys having been known before the fiege of Troy; mention even feems made of them in the roth clapter of Genefis.

Molinus is of opinion, that keys at firt only ferved for the untying certain knots, wherewith they anciently fecured their doors: but the Laconic keys, he maintains, wete nearly akin in ufe to our own; they confitled of three fingle teth, and made the figure of an E ; of which form there are fill fome to be feen in the cabinets of the curious.

There was another key called Baxzuxyez, made in the manner of a male-ferew; which had its correfponding female in a bolt alfixed to the door. Key is hence become a general name for feveral things ferving to fhat up or clofe others. See the artich Locis.

Key, or Key:fone, of an Arch or Vault, is the laft ftone placed a-top thereof; wbich being wider and fuller at the top than botom, wedges, as it were, and binds all the reft. The key is different in the differont orders : in the Tufcan and Doric it is a plain flone only projecting; in the Ionic it is cut and waved fome what after the manner of confoles; in the Corinthian and Compofite it is a confole enriched with fculprure, foliages, \&:c.
$\mathrm{K}_{\mathrm{ey}}$ is alfo ufed for ecclefiatical jurrifdiction ; particularly for the power of excommunicating and abfolving. The Romanits fay, the pope has the power of the keys, and can open and fhut Paradife as he pleafes; grounding their opinion on that expreflion of Jefus Chrift to Peerer, "I will give thee the keys of the kingdom of heaven." In St Gregory we read, that it was the cuttom heretofore for the popes to fend a golden key to princes, wherein they inclofed a little of the filings of S't Peter's chains kept with a world of devotion a: Rome; and that thefe keys were worn in the bofom, as being fuppofed to contain fome wonderful virtues.
$\mathrm{K}_{\mathrm{E}} \mathrm{y}$ is alfo ufed for an index or explanation of a cipher. See Cipher.

Kers of an Organ, Harffichord, E'c. thofe little pieces in the fore part of thofe inftruments, by means whereof the jacks play, fo as to flrike the Itrings. Thefe are in number 28 or 29. In large organs there are feveral fets of the keys, fome to play thie fecondary organ, fome for the main-body, fome for the trumpet, and fome for the echoing trumpet, \&c.; in fome there are but a part that play, and the relt are only for ornament. There are 20 flits in the targe keys, which make half-notes. See the article OrGLN, \&c.
$\mathrm{K}_{\mathrm{EY}}$, in mufic, a certain fundamental note or tone, to which the whole piece, be it in cantata, fonata, concerto, \&c. is accommodated, and with which it ufually begins but always ends.
$\mathrm{K}_{\mathrm{EY}}$, or Quay, a long wharf, ufually built of fone, by the fide of a harbour or river, and having feveral ftorchoules for the convenience of lading and difcharging merchant-hips. It is accordingly furnithed with pofts and rings, whereby they are fecured ; together with cranes, caplerns, and other engines, to lift the goods into or out of the veffels which lie along-fide.

The verb cajare, in old writers, according to Scaliger, fignifies to kiep in or reflrain; and hence came
being bound in with planks and poits.

Keys are alfo certaint fuaken rocks lying near the furface of the water, particularly in thee WeftIndies.

KEYNSHAM, a town of Somerfethire, $1: 6$ miles from London. It is a greas thoroughfare in the lower road between Bath and Briltul. They call it proverbially finoaky Keynfham, ani with equal reafon they might call it foggy. It has a fire large church, a ftone bridge of 15 arches over the Avon to Gloncenterthire, and another over the river Chew. Its chief trade is malting. It has a charity-ichool, a weekly market, and three fairs.

IEEYSER's Pills, a celebrated mercurial medicine, the method of preparing which was purchafed by the French goverument, and has fince been fublifhed b7 M. Richard.

The firtt, and what, aceording to Mr Keyfer, is the moil effential operation, confifts in ieparating the mercury very exactiy from all heterogeneous matter, hy reducing it to an rethiops. This is effected by means of an hydraulic machine, a plan of which Mr Kerfere intended to have givcl to government before his death: but although he did not hive to accomplif his refo. lution, his family Itill offer to do it when defired. According to the defrription given by M. Richard, this machine confifts of a number of buckets, in which mercury is triturated with water, till the water acquires a black colour. This water, upnu ftanding, depofits a fedinsent, which, being dried by a proper heat, is the æthiops required.

The fecond procefs confifts in revivifying the mercury by ditillation, in freeing it from all oily matters by means of quick-lime, in detaching this quick-lime by repeated wafloings, and afterwards in drying it by means of a fand heat.

The third operation confilts in the reduction of the mercury purified by this procefs to a red calx, by means of heat. In conducting this operation, Mr Keyler adviles, that the mercury be put into glars matraffes, a fmall quantity only in each. For the proper degree of heat, he dirccts thofe who would practife the operation to confult Lemery and other chemifts.

The fourth operation is, the diffolution of the calcined mercury, obtained by the former procefs, in diftilled vinegar, by means of triture. A pound of this mercury may be diffolved in eight pints of vinegar, by rubbing it for an hour or two in a mortar, which fhould be kept folely for that purpofe. Care mult alfo be taken that the vinegar be not dititled in a metallic but in a glafs veffel.

The fifth procefs confils in the intimate mixture of this vinegar, impregnated with mercury, with manna. Each pound of the vinegar containing about two ounces of mercury, will require two pounds of manna. They mult be rubbed together upon marble flones till they acquire a uniform confifterice, which will be liquid to fuck a degree as to pafs shrough a hair-cloth, for feparating the impurities of the manna. After being managed in this manner, it mult be fpread upon a marble flab, and left to dry there, without the amititance of fire, till it acquires fuch a conifitence as not to

## K E Y

yer, run off upon the table being turred to its fide. It muft then be placed before the fire, and at the fame time moved from one part of the fone to another, by means of a knife, firmifhed with a large pliant blade. By this means, it is perfectly prepared for forming the pills.

The fixth and laft procefs confirts in the formation of the mafs thus prepared into pills. Thefe Mr Keyfor made to weigh either three grains or a grain and a half; the firt for robutt, the laft for delicate conflitutions.

To this accoment given for the preparation of thefe pills, Mr Keyfer has added forme reflections, by way of fupplement. He obferves, that, by the purification of the mercury from dillillation, a gieat quantity of lieteroycheous inater is feparated from it. This, bowter, by nu means frees it completely from all foreign matter. And, as racrevry purified, upon being calcineed and diffolved in vegetable acid, is a much more powerful medicine than nercury calcined with. out purification, he concludes, that repeated purifications would render it fill more active.

Another remark which he gives, refpects the diffolution of the mercurius calcinatus in the diftilled vinegar. He obferves, that the mercury thus diffolved may be nade to unite with running mercury, and to form a very tingular product. He formerly mentioned, that a pound of this mercurins calcinatus was to be difolved in eight pints of vinegar. If to this be added two pounds of ruming mercury, and the agita. tion continued, a fubflance will arife to the furface in the form of cream. This being removed by the affilitance of a wooden fpoon, more will continue to rife as long as the agitation is continued. The cream being dried and incorporated with manna, in the proportion of one part of the cream to eight of manna, forms a very ufeful purgative, and is faid to be an effectual remedy again't recent venereal complaints, particularly againft chancres.
M. Richard concludes his account of Keyfer's pills with obferving, that he confiders it to be, without ex. ception, the molt effectual remedy for the venereal dif eafe hitherto difcovered. But before entering upon the detail, he remarks, that it is his opiuion the procefs may be much abridged, without diminihing the efficacy of the medicine. He judged it proper, however, to deliver to the public the method of preparing the pills in Mr Keyfer's own words; and he has not afterwards pointed out the improvements he propoies.

KEYSLER (John George), a learned German antiquarian, was born at Thourneaus in 1689. After ftudying at the univerfity of Halle, he was appointed preceptor to Charles Maximilian and Chriftian Charles, the young counts of Giech Buchau ; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along, by illuftrating fevcral monuments of antiquity, particularly fome fragments of Celtic idols lately difcovered in the cathedral of Paris. Having acquitted himfelf of this charge with great honour, he procured in 1716 the education of two grandfons of Baron Bernftorff firt miniter of fate to his Britannic majelly as elétor of Brunfwick Lunenburg. However, obtaining leave in 1718 to vi-
fit England, he was clected a fellow of the Royal Society for a learned effay De Dea Nebolennia numine ve tcrum Waluchorum topico: he gave alfo an explanation $\qquad$
$\underbrace{\text { Kiang-Nan: }}$ of the ancient monument on Salifbury plain called Stone-benge, with A Differtation on the Confecrated Miffetoe of the Druids. Which detached cffays, with others of the fame kind, he publithed on his return to Hanover, under the title of Antiquitutes Seleate Septentrionales ct Celitice, \&cc. He afterwards made the grand tour with the young barons, and to this tour we owe the publication of his travels; which were tranflater into Englifh, and publifhed in 1756, in 4 vols 4 to. Mr Keyler on his return fpent the remainder of his. life under the patronage of his noble pupils, who committed their fine library and mufeun to his care, with a handfome income. He died in 1743.

FIAM, a great tiver of China, which takes its rife near the weftern frontier, croffes the whole kingdomcaltwart, and falls into the bay or gulph of Nanking, a little below that city.

K|ANG-s1, a province of China, bounded on the north by that of Kianr.nan, on the weft by Housquang, on the fouth by Quang tong, and on the ealt by Fo-kien and Tche-kiang. The country is extremely fertile; but it is fo populous, that it can fcarcely fupply the wants of its inhabitants: on this account they are very economical ; which expofes them to the far. cafms and raillery of the Chinefe of the other provinces: however, they are people of great folidity and acutenefs, and have the talent of rifing rapidly to the dignities of the ftate. The mountains are covered with fimples; and contain in their bowels mines of gold, iliver, lead, iron, and tin : the rice it produces is very delicate, and feveral barks are loaded with it every year for the court. The porcelain made here is the finelt and moft valuable of the empire. This prowince contains 13 cities of the firf claff, and 78 of the fecond and third.

Ktava-Nan, a province of China, and one of the moft fertile, commercial, and confequently one of the richeft, in the empire. It is bounded on the weft by the provinces of Ho nan and Hou quang ; on the fonth by Tehe-kiang and Kiang-fi ; and on the ealt by the gulph of Nanking; the relt borders on the province of Chan tong. The emperors long kept their court in this province ; but reafons of fiate having obliged them to move nearer to Tartary, they made choice of Pe-king for the place of their refidence. This province is of valt extent ; it contains fourteen cities of. the firlt clafs, and ninety-three of the fecond and third. Thefe cities are very populsus, and there is fcarcely one of them which may not be called a place of trade. Large barks can go to them from all parts; becaufe the whole country is interfected by lakes, rivers, and canals, which have a communication with the greatriver Yang fee kiang, which ruas through the middle. of the proviace. Silk-huff, lacquer-wate, ink, paper, and in general every thing that comes from Nanking, as well as from the other citics of the province, are much more elteemed, and fetch a higher price tha: thofe brought from the neighbouring provinces. Inthe village of Chang-hai alone, and the villages dependent on it, there are reckoned to be more than 200,000 weavers of common cotton cloths. The manufacturins of thefo cloths gives employment to the greater part ue

## K I D [ 454 ] K I E

Kiburg the women. - In feveral places on the fea coall there are
|| Kidterminfter.
found many falt-pits, the falt of which is diftributed all over the empire. In fhort this province is fo abun dant and opulent, that it brings every year into the emperor's treafury about $32,000,000$ taels (or ounces of filver), exclufive of the duties upon every thing exported or impurted. The people of this country are civil and ingenious, and acquire the fciences with great facility : hence many of them become eminent in literature, and rife to offices of importance by their abilities alone. This proviace is divided into two parts, each of which, has a ditinct governcr. The governor of the callern part refides at Sou tcheou-fou, that of the weltern at Ngan-king-Eou. Each of thefe gover. nors las under his jurifdiction feven fou or cities of the firlt clafz.

KIBURG, a town of the canton of Zurich in Switzerland, with a caltle; feated on the river Theoff, in E. Long. 8. 50 N. Lat. 47. 20.

KID, in zoology, the name by which young goats are called. See Goat.

KIDDER (Dr Richard), a learned Englifh bifhop, was born in Suffex, and bred at Cambridge. In 1689, he was inftalled dean of Peterborough; and in 169!, was nominated to the bihopric of Bath and Wells, in the room of Dr Thomas Ken, who had been deprived for not taking the oaths to king William and queen Mary. He publinhed, 1. The young man's duty. 2. A demonftration of the Mefliah, 3 vols $8 v o .3$ 3. A commentary on the five books of Mofes, 2 vols 8 vo ; and feveral other pious and valuable tracts. He was killed with his lady in his bed by the fall of a ftack of chimneys, at his houfe in Wells, during the great ftorm in 1703. The bihop, in the ciffertation prefixcd to his commentary on the five books of Mofes, having reflected upon Mondieur Lee Clerc, fome letters paffed between them in Latin, which are publifhed by Le Clerc in his Bibliotheque Cbaifu.

KIDDERMINSTER, or Keddermins rer, atown of Worcefterfhere, feated under a hill on the river Stour, not far from the Seven, 128 miles from London. It is a large town of 1180 honfes, with about 6000 in. habitants, who carry on an extenfive trade in weaving in varions branches. In 173, a carpet manufactory tyas eftablifhed with fuccefs, fo as to employ in :772 above 250 looms; and there are upwards of 700 looms cm ployed in the filk and wortted. Above 1600 hands are employed as finners, \&o in the carpet loms only in the town and nerghbourhood; upwards of 1400 are employed in preparing yain, which is ufed in different parts of England in earpeting ; and it is fuppufed not lefs than 2000 are employed in the filk and worlled looms in the town and neighbourhood. The filk manu facture was eftablifhed in 1755 . The town is remark. ably healthy, and has alfo an extenfive manufacturt of quilting in the loom in imitation of Marfeilles quilting. Here is a Profycerian meeting houfe; and they have a handfome church, two good free-fchools, a charity fchool, and two alms-houles, \&c. The town is go. verncd by a bailiff, 12 capital burgeffes, 25 common councilmen, \&c. who have a town-hall. It formerly fent members to parliament. By the late inland navigation, it has communication by the junction of the Severn canal with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames,

Avon, \&c. which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancafter, Weftmoreland, Cheeter, Stafford, Warwick, Leicefter, Oxford, Worcef. ter, \&e. This parifh extends to Bewdley-bridge, has a weekly market, and three fairs. W. Long. 2. 15. N. Lat. 52. 28.

KIDUERS, thofe that badge or carry corn, dead victuals, or other merchandife, up and down to fell: every perfon being a common badger, kidder, lader, or carrier, \&c. fays the ftat. 5. Eliz. cap. 12. And they are called Vidldiers, 13 Eliz. eap. 25 .

KIDDLE, or Kides, (Kilellus), a dam or wear in a river with a narrow cut in it, for the laying of pots or other engines to catch fifl.

The word is ancient ; for in Magna Charta, cap. 24. we read, Ommes kidelli leponantur per Thamefiam \& Medzeyan, Es per totan, Angliam, nifi per cofleram maris. And by king John's charter, power was granted to the eity of London, de kidellis amovendis fer Thamefram $\&$ Medrueyam. A lurvey was ordered to be made of the wears, mills, flanks, and kidells, in the great rivers of England, 1 Hen. IV. Fifhermen of late corruptly call thefe dams kettles; and they are much ufed in Wales and on the fea coalts of Kent.

KIDDINGTON, a town of Oxfordhire, four miles from Wooditock, and 12 from Oxford. It is fituated on the Glym river, which divides the parifh in two parts, viz. Uver and Nether Fiddington, in the latter of which ftands the church. This parifl was given by Iting Offa in 780 to Woreefter priory. Here King Ethelred had a palace ; in the garden of the manor houle is an antique font brought from Edward the Couleflor's ehapel at Iflip, wherein he received baptifm. In Hill wood near this place is a Roman encampment in extraurdinary piefervation, but little noticed.

KIL NAPPING, the forcible abduction or ftealing away of man, woman, or child, from ther own country, and tendins them into another. This crime was capital by the Jewifh law: "He that ftealeth a man and telleth him, or if he be found in his land, fhall furely be put to death*. So likewife in the civillaw, + F.xod the offence of firiting away and flealing men and childiren, which was called plagium, and the offenders plagiarii. was punifhed with death. This is unqueftionably a very heinous erime, as it robs the king of his fubjects. banifhes a man from his country, and may in its conlequences be productive of the molt cruel and difagreahle hardfhips; and therefore the common law of England has punifhed it witla fine, imprifonment, and pillony. Aud alfo the thatute in and 12 W. ILI. c. 7. though principally intended againlt pirates, has a claufe that extends to prevent the leaving of fuch perfons abroad as are thus kidnapped or fpirited away ; by enacting, that if any captain of a merchant veffel thall (during his being abroad) force any perfon on Shore, or wilfully leave him behind, or refure to bring home all fuch men as he earried out, if able and delirous to return, he fhall fuffer three months impriformeut.

KIDNEYS, in anatomy. Sec there, no tor. Kiongr-Bear. Sce Phaseolus.
KiLiL, a ciry of Germany, in the duchy of HolAtein, in the circle of Lower Saxony, and the refi-
igelaria dence of the duke of Holttein Gottorp. It has a cafle, and a univerfity founded in 1665 ; and there is a very celebrated fair held here. It is fcared at the bottom of a bay of the Baltic Sea called Killurrwick, at the mouth of the river Schwentin, in E. Loug 10. 17. N. I.at. 5 t. 26 .

KIGGELARIA, in botany: A genus of the decandria order, belonging to the dieccia clafs of plents; and in the natural method ranking under the 3 ith orrler, Columnificru. The male caly $x$ is quinquepartite; the corolla pentapetalous; there are five trilobous glandules; the anthero are porforated at top: the female caly $x$ and corolla as in the male ; there are five ftyles ; the capfule unilocular, quinquevalved, and polyfpermous. There is but nne fpecies, viz. the Africana. It hath an upright woody flem, and purplifh branches, growing is or 18 feet high; oblong, fawed, alternate leaves: and dioccous, greenifh-white flowers, in clufters from the lides of the brancles; fucceeded by globular rough fruit, the fize of cherries, containing the feeds, which feldom ripea here. As this is a native of warm climates, it mult be conflanely leept in a fove in this country. It is propagated by feeds, layers, or cuttinge, though molt readily by fecds.

KIGHLEY, a towa in the well riding of Yorkfire, fix miles to the "futh eafl of Skipton in Craven. It flands in a valley furrounded with tills at the meeting of two brooks, which fall into the river Ate one mile below it. Every family is fupplied with water brought to or near their doors in tlone troughs from a never-failing fpring on the welt tide of it. The parifh is fix miles long and two bread, and is 60 miles from the eaft and wefl feas; yet at the weft end of it near Camel-Crofs is a rifing ground, from which the fprings on the eafl fide of it run to the ealt fea, and thofe on the weft to the weft fea. By the late inland navigation, this town has a communication with the rivers Merfey, Dee, Ribble, Oule, Trent, Darwent, Severn, Humber, Thames, Avon, Scc. which navigation, including its windings, estends above 500 miles, in the counties of Lincoln, Nottingham. Lancafter, Weflmortland, Chefter, Stafford, Watwick, Leiceller, Oxford, Worcefter, \&c.

Kilakney. See Killarney.
KILBEGGAN, a poit, fair, and borough town of Ireland, in the county of Weflmeath and province of Leinfter, $4+$ miles from Diblin. It returns two members to parliament; patrona-e in the Lambert family. It is feated on the river Brofma, aver which there is a bridge. There was here a monattery founded in $1: 00$, and dedicated to the Virgin ilary, and in. liabited by morls from the Citertian abbey of Melefont. The fairs are two.

KILDA ( S ) , one of the Hebrides or weftern ifauds of Scretand. It lies in the Atlantic occar, aLout 58. 30. N Lat.; and is abiut thret Englifh miles in length from eaft to weft, and its breadth from fouth to north not lefs than two. The ground of St Kilda, like much the greateft part of that over all the Highlands, is much better calculated for pafture than til-lage.-Refrained by idlenefs, a fault or vice much more pardonable here than in any other part of Great Britain, or difcouraged by the form of government under which they live, the people of the ifland Itudy to rear up heep, and to kill wild-fowl, much more
than to engage deeply in the more toilfome bufinefs of hufbandry:- All the ground liethertn cultivated in this ifland lies round the village. 'I he foil is thin, full of gravel, and of confequence very fharp. Thic, tho' naturally ponr, is, however, rendered extremely fertile, by the fingular induftry of very jurlicious hufbendmen: thefe prepare and manure every inch of their ground, fo as to convert it into a kind of garden. All the inflruments of agriculture they ufe, or indeed require, accorcing to thcir fyftem, are a fpade, a mall, and a rake or harrow. After turning up the ground with a fpade, they rake or harrow it very carefully, removing every fmall fone, every noxious root cr growing weed that falls in their way, and found down every ftiff clod intn duft. It is certain that a fmall number of acres well prepared in St Kilda, in this manner, will yield more profit to the I uflandman than a much greater number when roughly handed in a hurry, as is the cafe in the other weftern ines. The people of sit Kilda fow and reap nuch earlier than any of their neighbours on the weflern coat of Scotland. The hat of the fun, reflected from the hills and rocks into a low valley facing the foutlieat, muft in the fummer time be quite intenfe; and howevtr rainy the climate is, the corn mutt for thefe reafons grow very faft and ripen early.

The larveft is commonly over at this place before the beginning of September ; and fhould it fall out ouherwife, the whole crop would be almoit deftroyed by the equinoctial forms. All the iflanders on the weftern coall have great reafon to dread the fury of autumna! tempefls: thefe, together with the exceefine quantities of rain they have generally througlout feven or cight months of the year, are undoubtedly the mof difadvantageous and mhappy circumflances of their lives.

Barley aud oats are the only forts of grain known at St Kilda; nor does it feem calculated for any other. Fifty bulis of the furmer, old Highland meafure, are every year brought from thence to Haris; and all the weftern ifiands hardly produce any thing fo good of the kind. Potatoes have been introduced among that people only of late, and hithento they have raifed but fmall quantities of them. The only appearance of a garden in this whole land, fo the natives call their principal ifland in their own language, is no more than a very inconfiderable piece of ground, which is inclofed and planted with fome cabbages. On the eaft fide of the inand, at the diflance of a quarter of a mile from the bay, lies the village, where the whole budy of this little people (the number amounting in $176+$ to no more than 88) live together like the inhabitants of a town or city. It is certain that the inha. bitants wore much more aumerous formerly than at prefent ; and the inand, if under proper regulations, might ealily fupport 300 fouls. Martin, who vifited it about the end of the latt century, found 190 perfons there; but about the year 1730, one of the prople coming to the ifland of Harris, was feized with the fmall-pcx and died. Unluckily his clothes were carried away by one of his relations next year; and thus was the infection communicated, which made fuch havock, that only four grown perfons were left alive. Their houtes are built in two rows, regular, and facing one another; with a tolerable caufeway in the middle, which

## K J L

Fills. they call the firect. Thefe babitations are made and contrived in a very uncommon manner. Every one of them is flat in the roof, or nearly fn, much like the houfes of fome oriental nations. That from any one of thefe the St Kildans have borrowed their manner of building, no man of fenfe will entertain a fufpicion. They have been taught this leffon by their own reafon, improved by experience. The place in which their Int has fallen is peculiarly fubject to violent fqualls and furious hurricanes: were their houles raifed higher than at prefent, they believe the firft winter-ftorm would bring them down about their ears. For this reafon the precaution they take in giving them rnofs much flatter than ordinary feems to be not altogether anneceflary. The walls of thefe habitations are made of a rough gritey kind of Aones, huddled up together in halte, without either lime or mortar, from eight to nine feet high. In the heart of the wails are the beds, which are overlaid with flags, and large enough to contain shree perfons. In the fide of every bid is an opening, by way of door, which is much too narrow and low to anfwer that purpofe. All their divell-ing-houfes are divided into two apartments by partitinn walls. In the divifion next the door, which is much the largef, they have their cattle ftalled during the whole winter. feafon; the other ferves for kitchen, hall, and bed room.

It will be readily expected, that a race of men and women bred in St Kilda mult be a very flovenly generation, and evcry way inelegant. It is indeed im. pofible to defend them from this imputation. Their method of preparing a fort of manure, to them indeed of vaft ufe, proves that they are very indelicate. After having burnt a confiderable quantity of dried turf, they fpread the afhes with the niceft care over the floor of that apartment in which they eat and fleep. Thefe antes, fo exactly laid out, they cover with a rich friable fort of carth; over this bed of earth they fcatter a proportionable heap of that duft into which peats are apt to crumble away: this done, they water, tread, and beat the whole compoft into a hard floor, on which they immediately make new fires very large, and. never extinguifhed till they have a fufficient fock of new afles on hand. The fame operations are repeated with a never-failing punctuality, till they are jutt ready to fow their barley; by that time the walls of their houfes are funk down, or, to fpeak more properly, the floors rifcn about four or five feet.

To have room enough for accumulating heaps of this compof one above another, the ancient St Kildians had ingenuity enough to contrive their beds within the linings of their walls; and it was for the fame reafon they took care to raife thefe walls to an height far from being common in the other weflern inands. The manure produced in this way muft un doubtedly be good; though probably rather Tharp than of long duration, as it is fcattered in fmall quantities upon the furface of the ground. Be that as it will, thofe who practice this art are abundantly lavifh in its praifes. They call it a commodity ineftimably precious; and one may venture to affirm, that a genuine St Kildian would feruple to barter it away for all the diamonds in Brafil and Golconda.

It is certain that cleanlinefs muft conttibute greatly
to bealth, and of courfe longevity ; but in fpite of that infance of indelicacy now given, and many more which might have been added, the people of this ifland are not more fhort-lived than other.men. Their total want of thofe articles of luxury, which have fo matural a ten. dency to deftroy the conftitution of the human body, and their moderate exercifes, will, together with fome other circumfances, keep the balance of life equal enough between them and thofe who are abfolute Atrangers to fovenlinefs.

Befides the dwellinc-houfes already defcribed, there are a prodigious number of little cells difperfed over all the ifland; which confilt entirely of fiones, withont any the fmalleft help of timber. Thefe cells are from 12 to 18 feet in length, and a little mone than feven in height. Their breadth at the foundation is nearly equal to the height. Every fone hangs above that immediately below, not perpendicularly, hut inclines forward, fo as to be nearer the oppolite fide of the grotto, and thus by imperceptible degrees till the two highelt courfes are near enough to be covered by a lingle flag at the top. To hinder the rain from falling do ${ }^{\prime} \mathrm{n}$ between the intertices above, the upper part of the building is overlaid with turf, which looks like a fine green fward while new. The inhabitants fecure their peats, eggs, and wild-fowl, within thefe frall repofitories: tevery St Kildian las his hare of them, in proportion to the extent of land he poffeffes. or the rent he pays to the teward. From the conftruction of thefe cells, and the toil they mult have coft before they could have been finithed, it feems plain, that thofe who put them together, were, if not more ingenious than their neighbours in the adjacent iflands, at leaft more induftrous than their own fucceffors.

The St Kilda method of catching wild-fowl is very entertaining. The men are divided into fowling-parties, each of which confilts generally of four perfons diftinguifhed by their agility and fkill. Each party muft have at leaft one rope about 30 fathoms long; this rope is made out of a flrong raw cow hide. falted for that very purpofe, and cut circularly into three thongs all of equal length; thefe thongs being clufely twifted together, form a three-fold cord, able to fuflain a great weight, and durable enough to laft for about two generations: to prevent the injuries it would otherwife receive from the fharp edges of the racks, againft which they muf frequently ftrike, the cord is lined with fheep-fins, dreffed in much the fame manner.
This rope is a piece of furniture indifpenfably neceflary, and the moft valuable implement a man of fubtance can be poffefled of in St Kilda. In the teftament of a father, it makes the very firt article in favnur of his eldeft fon: fhould it happen to fall to a danghter's fhare, in default of male heirs, it is reckoned equal in value to the two beft cows in the ifland.

By the help of fuch ropes, the people of the greateft prowefs and expenience here traverfe and examine rocks prodigiounly high. Linked together in couples, each having either end of the cord faftened about his wait, they go frequently through the mof dreadful precipices: when one of the two defcends, his colleague plants himklf on a frong flelf, and takes care

## K I I. [ 457 ] K I L

to have fuch fure footing there, that if his fellow-adventurer makes a falfe fep, and tumbles over, he inay be able to fave him.
The following anecdote of a fteward of St Kilda's deputy will give the reader a fpecimen of the dangers they undergo, and at the fame time of the uncommon ftrength of the St Kildians. This man, obferving his colleague lofe his hold, and tumbling down from above, placed himfelf fo firmly upon the thelf where he ftood, that he fuftained the weight of his friend, after falling the whole length of the rope. Undoubtedly thefe are ftupendous adventures, and equal to any thing in the feats of chivalry. Mr Macaulay givee an inflance of the dexterity of the inhabitants of St Kilda in catching wild-fowl, to which he was an eye-witnefs. Two noted heroes were drawn out from among all the ableft men of the community : one of them fixed himfelf on a craggy fhelf; his companion went down 60 fathoms below him ; and afier having darted himfelf away from the face of a moft alarming precipice hanging over the ocean, lie began to play his gambols; he fung merrily, and laughed very heartily: after having performed feveral antic tricks, and given all the entertainment his art could afford, he returned in triumph, and full of his own merit, with a large ftring of fowls about his neck, and a number of eggs in his bofom. This method of fowling refembles that of the Norwegians, as defcribed by bilhop Pontoppidan.

KILDARE, a town of Ireland, and capital of a county of the fame name, is fituated 28 miles fouthweft of Dublin. It returns two members to parliament, patron the duke of Leinfter; and is governed by a fovereign, recorder, and two portrieves. The church of Kildare was very early erected into a cathedral with epifcopal jurifdiction, which dignity it retains to this day; the cathedral, however, has been for feveral years neglected, and at prefent is almoft in ruins. St Brigid founded a nunnery at Kildare, which afterwards came into the poffeffion of the regular canons of St Augultin: this faint died ift February 523, and was interred here ; but her remains were afterwards removed to the cathedral church of Down. In the year 638 , Aod Dull) or Black Hugh king of Leinfter abdicated his throne, and took on him the Augultinian hahit in this abbey; he was afterwards chofen abbot and bihhop of Kildare, and died on the soth May. In 756, Eiglitigio the abbot, who was alfo bilhop of Kildare, was killed by a prieft as he was celebrating mals at the altar of St Brigid; fince which time no priett whatfoever was allowed to celebrate mafs in that church in the prefence of a bifhop. In 1220 Henry de Loundres archbifhop of Dublin put out the fire called inextinguijable, which had been preferved from a very early time by the nuns of St Brigid. This fire was however relighted, and continued to burn till the total fuppreffion of monatteries. Here was alio a Grey abbey on the fouth lide of the town, erected for friars of the Francifcan order, or, as they were more generally called, Grey friars, in the year 1260, by Lord William de Vefey; but the building was completed by Gerald Fitzmaurice, Lord Offaley. A confiderable part of this building yet remains, which appears not to have been of very great extent. A houfe for white fiiars was likewife founded in this town by William de loz. IX. Part II.

Vefey in $\mathbf{1 2 9 0}$; the round tower here is 130 feet high, built of white granite to about 12 feet above the ground, and the reft of common blue fione. Tlie pedeftal of an old crofs is till to be feen liere; and the upper part of a crofs lies near it on the ground. - Fairs are held here on 12 th February, Eatter.'Tuelday, 12 th May, and 19th September. The fairs held here are four.

Kildare, a county of Ireland, ir the province of Leinfter, which is 37 miles in length and 20 in breadth; and is bounded on the eat by Dublin and Wicklow, on the weft by King and Queen's county, on the north by Eaft-Meath, and on the fouth by Catherlogh. It is a fine arable country, well watered by the Barrow, Liffey, and other rivers, and well inhahited and cultivated, containing 228,590 Irifh plantation acres, 100 parifhes, 10 baronies, 4 boroughs, and returns 10 members to parliament. The chief town is of the fame name, and gave title of earl to the noble family of Fitzgerald. It was anciently called Cbilledair, i. e. "the wood of oaks," from a large foreft which comprehended the middle part of this county; in the centre of this wood was a large plain, facred to heathen fuperfition, and at prefent called the Curragh of Kildare; at the extremity of this plain, about the commencement of the 6 th century, St Brigid, one of the heathen veftals, on her converfion to the Clurifian faith, founded, with the affiftance of St Conleth, a cluarch and monaftery, near which, after the manner of the Pagans, St Brigid kept the facred fire in a cell, the ruins of which are ftill vifible.

KlLDERKIN, a liquid meafure, containing two firkins.

KILIAN (Lucas), an eminent engraver, was a native of Aughurg in Germany, and flourifhed at the beginning of the ifth century. In what fcliool he learned the art is uncertain; but his ftyle of engraving bears no fmall refemblance in many particulars to that of Henry Goltzius, and of John Muller his difciple. It appears, however, that he went to Italy in order to complete his fudies, where he engraved feveral plates from the pictures of the great Italian matters. According to Mr Strutt, few artilts have manifetted a greater command of the graver than Kilian, whether we confider the facility with which the ftrokes are turned upon each other, or the firmnefs with which they are executed ; and one cannot help admiring it, though it evidently frikes us, that hy paying tos clofe attention to this part of the art, he neglected the correctnefs of his outlines, and fatigued the lights with unneceflary work; by which means he broke the maffes, and often totally deftroyed the effect of his printz. The naked parts of the human figure are feldom well expreffed; the extremities efpecially are in general very heavy, and fometimes incorrect. Upon the works of this mafter, however, it appears, that Balechou, fo farmous for his kkill in handling of the graver, formed his tafte. His works are exceedingly numerous. The time of his death is not any where meutioned.-There were feveral other engravers of the fame name and family ; but of too inferior merit to deferve particular notice.

KILIANUS (Cornelius), a native of Brabant. diAtinguifhed himfelf as an excellent corrector of the prefs at the printing boufe of Mlantin for 50 years.

Kildare
Kilianus

## K I L [ $45^{8}$ ]. <br> K I L

Kilkenny. He likewife wrote feveral hooks which are efteemed. His Apolosy for Correctors againd Authors, an epigram of 18 verfes, is a proof of his abilities in Lacin poetry.

IILKENNY, a county of Ireland, in the province of Leinfter, bounded on the fouth by the county of Waterford, on the north by the Queen's county, on the weft by the county of Tipperary, on the ealt by the counties of TVexford and Catherloyh, and on the north-welt by Upp:r Of:iy. The greateft length of this county from north to fouth is $3^{8}$ miles, the brea!th from ealt to $w \in$ ft 28 ; and it coutains 10 baronics. It is one of the molt healthful, pleafant, and populous counties of Ireland. It contains 287,650 Irifh plantation acres, 96 parifhes, $y$ baronies, and 7 borouglis, and returns 16 members to parliament. Giibert Clare, Earl of Gloucefter and Hereford, marrying I fabella, one of the daughters and co heireffes of William eal Narfhal, received as her dower the counry of Kilkenny.

Kilkenny, the capital of a county of the fame name in Iteland, lituated in the province of Leinfter, 57 miles fouth weft of Dublin. It takes its name from the cell or church of Canic, who was an eminent hermit in this country; and is one of the molt elegrant cities in the kingdom. It is the feat of the bifhop of Offory, which was tranflated from Agabo in Offory, about the end of Henry Il.d's reign, by bihop O'Dullany. The city is pleafantly fituated on the Neor, a navigable river that difcharges itfelf into the harbour of Waterford. It is faid of Kilkenny, that its air is without fog, its water without mud, its fire without fmoke, and its Areets paved with marble. The two latter are indeed matter of fact; for they have in the neighbourhool a kind of coal that burns from firt to lait without fmoke, and pretty much refembles the Welfh coal. Mof of the ftreets alfo are actually paved with a very good fort of black marble; of whicls they have large quatries ncar the town, which takes a fine polifh, and is beautifully intermixed with white granite. The air too is good and healthy, though not remarkably clearer than in many other parts of the singriom. The city is governed by a mayor, recorder, aldermen, and theriffs. It comprifes two towns, viz. Kilkenny fo called, and lrifh-town, each of which Cends two members to parliament; and both together are computed to contain about 20,000 inhabitants. This city was once of great confequence, as may be feen by the venerable ruins yet remaining of churches, monalteries, and abbeys, wbich even now in their dilapidated fate exhibit fuch fpecinens of exquifite tafte in architecture as may vie with any modern improvements ; and the remains of its grates, towers, and walls, fhow it to have been a place of great Atrength. Here too at different times parliaments were held, in which fome remarkable ftatutes were paffed. It has two charches, and feveral catholic chapels; barracks for a troop of horfe and four com. panies of foot; a inarket is lield twice in the week, and there are feven fairs in the year. - Irifh town is more properly called the borouph of $S 6$ Canice, vilgar ly Kenny; the patronage of which is in the binop of Oill ry. The cathedrai, which fands in a fequellered fo. tuatus, is a venertele Gothic pile, built above 500 years; and clofe to it is one of thofe remarkaiole round
towers which have fo muclı engaged the attention of Kilke travellers. The bifhop's palace is a handfome building, and communicates by a covered paffage with the church. The caltle was firlt built in 1195 , on the fite of one deftroyed by the Irifh in 1173 The fituation in a military view was moll eligible: the ground was originally a conoid, the elliptical fide abrupt and precipitous, with the river running rapidly at its bafe: here the natural rampart was faced with a wall of folid mafonry 40 feet high; the other parts were defended by baftions, curtains, towers, and outworks; and on the fummit the callle was erected. This place, as it now ftands, was buit by the anceltors of the dukes of Ormond: here the Ormond family refided ; and it is now in the poffefiun of Mr Butler, a defcendant of that illultrious race. Ihe college originally founded by the Ormoud family is rebuilt in a Atyle of elegance and conventence. The tholfel and inarket houfe are both good buildings; and over the latter is a fuit of rooms, in which, during the winter and at races and afiizes times. affenhlies are held. There are two very fine bridges of cut marble over the Nore ; John's Bridge particularly is light and elegant. The Ormond family built and endowed a free fchool in this city. Here are the ruins of three old monalteries, called St Gobu's, St Francis's, and the Dlack abbey: belonging to the latter are the remains of Ceveral old monuments, almolt buried in the ruins; and the courts of the others are converted inco barracks. The manufactures chiefly carried on here are, coarfe woollen clotlis, blankets of extraordinary fine quality, and confiderable quantities of Aarch. In the neighbourhood alfo are made very beantiful chimney-pieces of that fpecies of itone already mentioned, called Kilkenny marble: they are cut and polifhed by water, a mill for that purpofe (the only one of its kind perhaps in Europe) being invented by the late Mr Colles. The Kilkenny coal-pits are within nine miles of the town. This city came by marriage into the ancient family of Le Defpencer. It was incorporated by charter from King James I. in 1609 . The market-crofs of Kilkenny continued an ornament to the city until 1771, when it was taken down; the date on it was MCCC. Sir James Ware mentions Bihop Cantwell's rebuilding the great bridge of Kilkenny, thrown down by an inundation about the year 1447 . It appears allo that St John's bridge fell down by a great flood in $156+$; and on $2 d$ October 1763 , by another like circumitance, Green's bridge near the cathedral fell. - 'The borough of St Canice, or Irifh-town, always enjoyed very ancient preferiptive rights. A clofe roll of 5 Edward III. A. D. 1376, forbids the magiltrates of Kilkenny to obttruct the fale of victuals in the market of Irifh-town, or within the crofs, under the pretence of cultom for murage : and left the ample grants made to Kilkenny might be interpreted fo as to include Irifh-town, the corporation of the latter fecured their ancient rights by letterspatent 15 Edward IV. A. D. 1474. Thefe renew their former privileges, and appoint a portrieve to be chofen every 21 it September, and fworn into office on the ith Octuber. The portrieve's prifon was at Troy-gate. Whenever the mayor of Kilkenny came within Water-zate, he dropt down the point of the city-fword, to fhow he claimed no pre-eminence withir the borough.

KILLALOE

## K I L

KIILALOE, a bifhop's fee in the county of Clare and province of Muntter, in Ireland, 86 miles from Dublin, otherwife Lounia. It was anciently written Kill-da-Lua, i. e. "the church of Lua," from Lua, or Molua, who about the beginning of the 6th century founded an abbey near this place. St Molua appears to have derived his name from Loonia, the place of his relidence, as was cuftomary amongil the ancient Irifh. On the death of St Molua, St Flannan lis difciple, and fon of the ehief of the diftrict, was confeeraied bifhop of this place at Rome about the year 639, and the church endowed with confiderable eftates by his father Theodorick. Towards the clofe of the 12 th century, the ancient fee of Roferea was mimited to that of Killalor; from which period thefe united bifhoprics have been governed by the fame bifhops. At Killaloe is a bridge over the Shannon of 19 arches; and here is a confiderable falmon and eel fithery. There are many ancient buildings in and about this town. The cathedral is a Gothic edifice in form of a crofs, with the fteeple in the centre, fupported by four arehes : it was built by Donald king of Limerick in 1160 . There is a building near it, once the oratory of S: Molua; and there is another of the fare kind in an illand on the Shannon, having marks of fill higher antiquity. The fee houfe of the bifhop is at Clarisford, near to Killatue. Adjoining to the cathedral are yet fome remains of the maufoleum of Brien Boru.
KlLLARNEY, a pot-town of Ircland is the county of Kerry and province of Munfter, feated near a fine lake called Lough Lean, or Lake of Killarney. It is diftant $1+3$ miles from Dublin, and has two fairs. Within a mile and a half of this place are the ruins of the cathedral of Agbadoe, an ancient bilhoprick united to Ardfert; and within four miles the ruins of Aglifh church. At this town is the feat and gardens of lord Kemmore.

The beautiful lake of Killarney is divided properly into three parts, called the lower, middle, and upper lake. The northern or lower lake is fix miles in length and from three to four in breadth, and the town is fiquated on its northern fhore. The country on this and the eaftern boundary is rather of a tame character; but is here and there diverified with gentle fwells, many of which afford delightful profpeeis of the lake, the iflands, and furrounding feenery. The fouthern fhore is compofed of immenfe mountains, rifing abruptly from the water, and covered with woods of the finett timber. From the centre of the lake the view of this range is altonifhiugly fubline, prefenting to the eye an extent of forell fis miles in length, and from half a mile to a mile and a balf in breadth, hanging in a robe of rich luxuriance on the fides of two mountains, whofe bare tops riting above the whole form a perfect contratt to the verdure of the lower region. On the fide of one of thefe mountains is O'Sullivan's cafcade, which falls into the lake with a roar that Atrikes the timid with awe on approaching it. The view of this fheet of water is uncommonly tine, apparing as if it were defcending from an arch of wood, which over. hangs it about 70 feet in height from the point of view. Coafting along this hore affords an almott endlefs entertainment, every change of pofition prefenting 2. new feene; the rocks hollowed and worn into a va-
riety of forms by the waves, and the trees and Mrubs Killarney. burling from the pores of the faplefs fone, forced to -ras affume the moll uncouth fhapes to adapt themfelves to their fantaflic fituations. The illands are not fo numerous in this as in the upper lake; but there is one of uneommon beauty, viz. Innisfallen, nearly oppofite to O'Sullivan's cafeade: It contains 18 Irifh acres. The coalt is formed into a variety of bays and promontories, fkirsed and crowned with arbutus, holly, and other fhrubs and trees; the interior parts are diverfitied with hills, and dales, and gentle declivities, on which every tree and fhrub appears to advantage: the foil is rich even to exuberance; and trees of the largelt fize incline acrofs the vales, forming natural arches, with ivy entwining in the branches, and hanging in feftoons of foliage. The promontory of Mucrufs, which divides the upper from the lower lake, is a perfect land of enchantment; there is a road carried through the centre of the promontory, which unfolds all the interior beauties of the place. Amongt the diflant mountains, Turk appears an object of magnificence; and Mangerton's loftier, thongh lef3 interelting fummit, rears itfelf above the whole. The paflage to the upper lake is round the extremity of Mucrufs, which confines it on one fide, and the approaching mountains on the other. Here is the celebrated rock called the eagle's meft, which produces wonderful echoes. A French horn founded here, raifes a concert fuperior to 100 inftruments; and the report of a fiugle cannon is anfwered by a fucceffion of peals refembling the loudeft thunder, which feems to travel the furrounding feenery, and die away among the diltant mountains. The upper lake is four miles in length, and from two to three in breadth; and is almoll furrounded by mountains, from which defeend a number of beautiful calcades. The iflands in this lake are numerous, ald afford an amazing variety of picturefque views.- The centre lake, which communicates with the upper, is but fmall in comparifon with the other two, and cannot boaft of equal variety. The fhores, however, are in many plaefs indented with beautiful bays, furrounded with dark groves of trees, fome of which have a moll pieturefque appearance when viewed from the water. The eaftern boundary is formed by the bafe of Mangerton, down the fleep lide of which defeends a cafeade vifible for 150 yards: this fall of water is fupplied by a circular lake near the fummit of the mountain, called the Dervi's Panch Bowl; which, on account of its immenfe depth, and the continual overfiow of $\alpha, 2$ ter, is confidered as one of the greatelt curiolities in Kmarney. - Mr Smith feems to think, that one of the bell profpects this admired lake affords, is from a rifing ground near the ruined cathedral of Aghadoe.

The lake of Killarney is otherwife called Lough Lane, or Locb Lean. from its being furrounded by high mountains. Nennius fays, that thele !akes were encompaffed by four circles of mines; the firt of tin, the fecond of lead, the third of iron, and the fourth of copper In the ieveral mountains adjacent to the lakes are ftill to be feen the veltiges of the ancient mines of iron, lead, and copper; but tin has not as yet been difenvered here. Silver and gold are faid by the Irifh antiquaries to have been found in the early ages : but this is fomewhat authful, efpecially in any confiderable quantity, thangh fome filver probably was

Killas, fillicrankie.
extracted from the lead ore, and fmall quantities of gold might have been obtained from the yellow copper ore of Mucrufs. Horever, in the neighbourhood of shefe lakes were found in the eatly ages, as well as at prefent, pebbles of feveral colours, which taking a beautiful polifh, the ancient Irifh wore in their ears, girdle3, and different articles of their drefs and furniture.

EILLAS, a genus of Itones belonging to the argillaceors clafs, found chictly in Cornwall in England. Its texture is either lamellar or coarfely granular; the fpecific gravity from 2630 to 2666 . It contains 60 parts of fliceous earth, 25 of argillaceous, 9 of magnefia, and 6 of iron. The greenifh kind contaius more iron, and gives a green tincture to the nitrous acid.

KILIIICRANKIE, a noted pars of Perthhire in Scotland. It is formed by the lofty mountains impending over the water of Garrie, which rufhes through in a deep, darkfome, and horrid channel, beneath. In the laft century this was a pafs of much danger and difficulty; a path hanging over a tremendous precipice threatened deftruction to the leaft falfe flep of the traveller : at prefent a fine road formed by the foldiery leut by government, and encouraged by an additional 6 d . per day, gives an eafy accefs to the remote Highlands; and the two fides are joined by a fine arch.

Near the north end of this pafs, in its npen and unimproved llate, was fought in the year 1689 the battle of Killicranky, between the adherents of James II. under Vifcount Dundee, and of William III. under General Mackay. Dundee's army was very much inferior to that of Mackay's. When he cane in tight of the latter, he found them formed in eight battalions ready for action. They confifted of 4500 foot, and two troops of horfe. The Highlanders under Dundee amounted to little more than half that number. Thefe he ranged inllantly in order of battle. Maclean, with his tribe, formed the right wing. The Macdonalds of Sky, under their chieftain's eldell fon, formed the left. The Camerons, the Macdonald's of Glengary, the followers of Clanronald, and a few Irifl auxiliaries, were in the centre. A tronp of horfe were placed hehind under Sir Willian Wallace. The officers feut by James from Ireland were dill ributed through all the line. His whole army flood in light of the enemy for feveral hours on the lleep fide of a hill, which faced the narrow plain where Mackay bad formed his line. Dundee wifhed for the approach of night; a feafon fuited for either victory or flight.

At five of the clock in the afternoon, a kind of flight skirmifh began betweea the right wing of the Highlanders and the left of the enemy. But neither army wihhing to change their ground, the firing was difontinued for three hours. Dundee in the mean time flew from tribe to tribe, and animated them to action. At eight of the clock he gave the fignal for battle, and charged the enemy in perfon at the head of the horle. The High.landers in deep columns rufhed fuddenly down the hill. They kept their thot till they were within a pike's length of the enemy; and baving fired their muflets, fell upon them fivord in hand. Mackay's left wing could not for a moment fuftain the hook. They were driven by the Macicans with great
flaughter from the field. The Macdonalds on the left Killig of the Highlanders were not equally fucceffful. Colnnel Haftings' regiment of foot ltood their ground. They even forced the Macdonald's to retreat. Maclean, with a few of his tribe, and Sir Evaa Cameron at the head of his clan, fell fuddenly on the flank of this gallant regiment, and forced them to give way. The flaughter ended not with the battle. 'Iwo thoufand fell in the field and the flight. The tents, baggage, artillery, and provifions of the enemy, and even king William's Dutch flandard, which was carricd by Mackay's regiment, fell into the hands of the Highlanders. The victory was now complete. But the Highlanders loft their gallant leader. Percciving the unexpected refiltance of Colonel Haftings' regiment, and the confufion of the Macdonald's, Dundee rode rapidly to che left wing. As he was raifing his arın, and pointing to the Cameron's to advance, he received a ball in his fide. The wound proved mortal; and with Dundee fcll all the hopes of king James at that time.

KILLIGREW (William), eldeft fon of Sir Robert Killigrew knight, was born in 1605 . He was gentle-man-uhher of the privy-chamber to king Charles I. and on the reftoration to Charles II. When the latter married the princefs Catlarine of Portugal, he was created vice-chamberlain; in which flation he continued 22 years, and died in 1693 . He was the author of four plays, which, though now thrown afide, were much applauded by the poets of that time, particularly by Mi Waller; and in the decline of life he pub. lifhed fome pious reflections on the inilability of human happinefs, when our views are not directed to a future llate.

Killigrew (Thomas), brother of the former, was born in 1611 ; and lm procefs of time ditinguihed himfelf by his uncommon natural parts. He was page of honour to King Charles I. and gronm of the bed-chamber to Charles II. with whom he fuffered many years exile; during which he applicd hus leifure hours to the fludy of poetry, and to the compofition of feveral plays. After the refloration he continued in high favour with the king, and had frequently accefs to him when he was denied to the firlt peers in the realnı; and being a man of great wit and livelinefs of parts, and having from his long intimacy with that monarch, and being continually about his perfon during his troubles, acquired a freedom and familiarity with him, which even the pomp of majelty afterwards could not check in him, he fometimes, by way of jell, which King Charles was ever fond of, if genuine, even though himfelf was the object of the fatire, would adventure buld truths which fcarcely any one befides would have Jared even to hint at. One ftory in particular is related of him, which if true is a ftrong proof of the great lengths he would fometimes proceed in his freedoms of this kind, which is as follows:When the king's unbounded paffion for women had given his mittrefs fuch an afcendant over him, that, like the effeminate Perfian monarch, he was much fitter to have handled a diltaff than to wield a fceptre, and for the converfation of his concubines utterly neglected the molt important affairs of ilate, Mr Killigrew went. to pay his majefly a vifit in his private apartments, habited like a pilgriun who was bent on a loug journey.

## K I L [ 46r ] K I L

rew, The king, furprifed at the oddity of his appearance, eagho immesiately afked him what was the meaning of it, and whither he was going? "To hell," bluntly replied the wag. "Prithee (faid the king), what can your errand be to that place ?" "To fetch back Oliver Cromwell (rejoined he), that he may take fome care of the affairs of England, for his fucceffor takes none at all." -One more flory is related of him, which is not barren of humour. King Charles's fondnefs for pleafure, to which he almolt always made bufincls give way, ufed frequently to delay affairs of confequence, from his majeft's difappointing che council of his prefence when met for the difpatch of bufinefs, which neglect gave grcat difguft and offince to many of thofe who were treated with this feeming difrefpect. On one of thefe occalions the duke of Lauderdale, who was naturdlly impetuous and turbuleut, quitted the council-chamber in a violent paffion; and meeting Mr Killigrew prefently after, expreffed himelf on the occafiu: in wery difrefpectful terms of his majetty. Killigrew begged his grace to moderate his paffion, and offered to lay him a wager of 1001 . that he himfelf would prevail on his majelly to come to council in half an hour. The duke, furprifed at the boldnefs of the affertion, and warmed by his refentment againt the king, accepted the wager; on which Killigrew immediately went to the king, and without ceremony told him what had happened; adding thele words, "I know that your majeily hates Lauderdale, though the neceffity of your affairs compels you to carry an outward appearance of civility: now, if you choofe to get rid of a man who is thus difugreeable to rul, you need only go this once tn council; for I know his covetous difpofition fo perfectly, that I am well perfuaded, rather than pay this 100 I . he would hang himfelf out of the way, and never plague you more." The king was fo pleafed with the archnefs of this obfervation, that he inmediately replice, "Well then, Killigrew, I pofitively will go ;" and kept his word accordingly.-Killigiew died in 1682 , and was buried in Weitmintter-abbey.

Killigrew (Anue), "a Giace for beauty, and a Mufe for wit," as Mr Wond fays, was the daughter of Dr Hemy Killigrew, brother of the two foregoing, and was boin a lictle before the reftoration. She gave early indications of genius, and became eminent in the arts buth of poetry and painting. She drew the duke of York and his duchels to whom the was maid of honour, as well as feveral other portraits and hitfory-pieces; and crowned all her other accomplifh. ments with unblemifhed virtue and exemplary piety. Mr Diyden feems quite lavifh in her praife, though Wood affures us he has faid no more of her than fine was equal if not fuperior to. This amiable young woman died of the fmall-pox in 1685 ; and the year after her prems were publifhed in a thin 4 to volume.

KILLILEAGH, a town of Ireland, in the county of Down and province of Ulfter, 80 miles from Dublin; otherwile written Killyleagh. It is the priucipal town in the barony of Duffrin; and feated on an arm of the lake of Strangford, from which it is fupplied with a great variety of tifh. The family of the IIa. miltope created firit Lords Clanbois, and afterwards Ealls of Clanbraffil, Lad their feat and refidence here in a callle ltaneing at the upper end of the great Areet; at the lower end of the ftreet is a little fafe bay, where
thips lic fheltered from all winds; in the town arc fome $k . t h y$ good honfes, a decent market houle, a horfe barrack, - - and a Prcbyterian meeting-houfe. On an em nence a frall diftance from the tuwn is a handiome church built in the form of a crofs. This place fuffered mush in the calamitous year :641. It is no thrivirg, and the linen manufacure carried on in it, and fine thread made, for which it has a great dumand. It returns two members to parlianent, pationage in the Blackwood family; and holds three fairs. The celcbrated naturalith and cminent phyfician Sir Hans Sloan was bon liere 16 th April 650 , and his father Alexander Sluan was at the head of that colony of Scots which King James I. fettled in the place. This town was iucor: porated by that king a: the ratance of the firit eall of Clanbois.

KILLOUGH (othcrwife Iorr St Arne), aporttown of Ireland, fituared in the county of Duwn and province of Lllter, 76 miles from Dublin. It lies north of St John's Foint, and has a grod quay, where mips lie very fafe. The town is agretably fituated; thet fea flowing all along the banky of the houfes, where thips ride in full view of the inhabitants. There is here a good church, and a horle-barrack. They have good hilhing in the bay; but the principal trade of the place conli!!s in the exportation of barley, and the importation of fuch commoditits as are confumed in the adjacent conntry. A manufacture of falt is alio carritd on with great advantage. The fairs held licre are five. At a fmall diftance from the town is a charter working-fchool for the reception of 25 children, which was fet on foot by the late Mr Juttice Ward. There is a remankable well here called St Scordin's well, and highly efteemed for the extraordinary light nefs of its water. It guhhes out of a high rociky bank, clufe upon the thore, and is obferved never to diminift its quantity in the driett feafon. There is alfo a minetat fpring near the fchool, the waters of which the iuhabi. tants affim to be both purgative and emetic. $\lambda_{t} z^{3}$ fmall ditlance from the tumn near the fea is a rock in which these is an oblong hole, from whence at the ebbing and fowing of the tide a Brange noife is leard fomewhat refembling the found of a tuntiman's horn. In an open field about a quarter of a mile from the town towards St John's point there is a very curious cave, which has a winding paffage two fect and an half brnad, with three doors in it befides the entrance, and leading to a circular chamber three yards in diamoter, where there is a fine limpid well. The cave is abou: 27 y ards loug.

Killovish Harbour is tolerably fafe and commodi. ous; a fmall degree of caution, however, is neceflary in failiag into it ; for a rock flands in the middle of the entrance, covered at half nood, commonly called the water-ruck. Fither to the eaft or wefl of this ruck is a fecure paffage, the inlet lying fouth by eaft and nortli by weft. On the welt fide of the rock open to Coney-ifland is aftrong quay, and a bafon for fhips where they are defenjed from all winds, within which the harbour on both fides afiords good anchorage for we?fls of 150 tons. At the end of the quay the cha:1nel is 400 yards wide. The bay of Killough is formed by Rin fad at the Long-point to the eatl, and St John's point to the welt, as the inner harbour is by a yeninfula called Coner-ifie from the number of rabbice

Killybers thereon, and not Cane-ifle as Sir William Petty has it. 11 An in pertuous fea iuns on all this coaft in forms and
friug tides.
KILLYBEGS, a borough and fair town in the county of Dunegal and province of Ulter, 123 miles from Dublin. It is fituated on the north fide of Donegal bay ; but is a place of no great trade, though it has a harbour fpacious enough to contain a large fleet : it has a bold and ample opening to the fea on the fouth, and is fecured within by the flelter of high lands furrounding it; fo that veffels may enter at any tinue of the tide. there being from 5 to 8 fathom water. The herring fiffery is the mult confiderable of any carried on liere; hut the town is likely to increafe in trade and confequence. It returns two members to pariament, patronage in the Comuygham family. It las two fairs.

KILMAINHAM, a town of I reland, fituated about half a mile from Dublin. It has a feffion-haufe and landfome gaol; and here the quarter feffions are held for the commty of Dublin, and knights of the fhire elected for that comnty. This place was fometimes the feat of government before Dublin calle was converted to thiat purpofe; and though now much decayed, it gives title of baron to the family of Wenman. An ancient priory was founded here, and a houfe for knights hofvitalers of St John of Jerufalem.

KILM : LLOCK, a town of Iseland in the county of Limerick and province of Muniter, 16 miles from the city of Limerick, and 107 from Dublin.This town makes a confpicuons figure in the milatary hiffory of lreland. In the 16 th century it was a populous place; and the remains of the wall, which entirely furtounded the town, and of feveral large hou les, are itill to be feen. Edward VI. granted a charter to it with many privileges, as did Queen Elizabeth another, dated $24^{2}$ h April $15^{8} 4$. In 1598 , it was invefted by the Irifh forees, when the earl of Ormond haftened to its relief, and arrived in sime to rafe the fiege: here was alfo fome contel during the grand rebellion in 1641 and $16+2$. By an inquifition 11 Aug. 29 Eliz. it appears that there lad been an abbey in Kilmallock called Flacifpagbe; on which a fone houfe was erected. In the eathedral church are the remains of a monument erected over the Verdon family, one of whom repirfented this town in parliament in 1613 . Kilmallock returus two members to parliament ; patron Silver Oliver, Efq. This place once gave title of vifeount to one of the Sarsfield family. Sir James Ware informs us, that an abbey of Dominicans or black friars was built here in the $13^{\text {th }}$ eentury by the fovereign, brethren, and commonaliy. From the many ruins here of caftes and ancient buildinge, it has acquired the name of the Iribb Balbeck. The parith clurch was formerly an abbey for regular canons founded by St Mochoallog, who died between the years 639 and ${ }_{5} 5$; and fome writers fay, that the Dominican abbes juft mentioned was foundes in 129 r , by Gilbert the fecoud fon of John of Calleen. Fairs ane held at this cown on Whiiffun-Tuefday.

KILMARNOCK, a populous and flourifling town of Ayrhire in Scotland, noted for its manufacture of carpets, milled hoficry, and Scotch bonnets. It gave the title of earl to the noble family of Boyd, refiding in this neighbourhood. .This title was forfeited by
ate carl, who. by engaging in the rehellion of 1745 , Kiln was deprived of his honomrs, and loft his life un the feaffold. His fon, however, who ferved in the king's army, afterwards fuccecded to the earldom of Errol, a title much more ancient and honourable.

KILMORE, a bifhop's fee in the county of Cavan and province of Ullter in Ireland. It was called in former ages Clunes, or Clunis, i. e. the "fequeftered place;" and is fituated near Loch Ern. St Fedlimid founded this bifhopric in the fixth century ; it was af. terwards removed to an obfen e village called Trilurna; where it continued until the year 1454 , when Andrew Mac Brady bifhop of Triburna erected a chureh on the fite of that founded by St Fedlimid, to whure memory it was dedicated, and denominated Kilnore or "the great church." At prefent there are neither cathedral, chapter, nor canons, belonging to this fee; the fmall parifh church contiguous to the epifcopal boufe ferving for the purpofe of a cathedral.

KlLN, a tlove ufed in the manufacture of various arrickes. A fabric formed for admitting heat, in order to dry or burn materials placed in it to undergo fuch operations.

KlLWORTH, a town of Ireland, fituated in the county of Cork and province of Muniter, 108 miles from Duhlin. It is a thriving place, with a good church, at the foot of a large ridge of mountains called Kilzuorth mountains, through which a good turnpike road is carried from Dublin to Cork : betow the town runs the river Funcheon, which is well ftored with fatmon and trout, and difcharges itfelf a mile fouth of this into the Blackwater. Near Kilworth is a good glebe and vicarage houfe. At this place is Moorpark, the fupcrb feat of Lord Mounteafhel ; and adjoining to his lordfhip's improvements flands the eafle of Clough-leagh, boldly fituated on the river Funcheon, whieh has tood feveral fieges. Six tairs are held here.
KIMBOL,TON, a town of Huntingdonfhire, feated in a botton ; and noted for the cafle of Kimbolton, the feat of the duke of Mancheiter. W. Lung. 0.15 . N. Lat. 52. 18.

KIMCHI (David), a Jewih rabbi, famous as a commentator on the Old Teilament, lived at the clufe of tlie 12 th and beginning of the $13^{\text {th }}$ centuries. He was a Spaniard by birth, fon of rabbi Jofeph Kimchi, and brother of rabbi Mofes Kimchi, both mein of eminent learning among the Jews: but he exceeded them both, being the belt Hebrew grammarian the Jews ever had. He wrote a Grammar and Dictionary of that language; out of the former of which Buxtonf made his Thefurrus lingua Hebree, and his Lexicon linguc Hebrea out of the latter. His writings have been held in fuch ellimation among the Jews, that no one can arrive at any reputation in letters and theology without fludying then.

Kincardineshire. Sie Mearns.
KLNDREI, in law; perfons related to one ano ther, whereof the law reckons three degrees or lines, viz. the defcending. afcending, and collateral linc. See Consanguinity and Descent.

On there being no kindred in the defcending line, the inheritance paffes in the collateral one.
KING, a monarch or potentate who rules fingly and
ng. fovereignly over a people.-Camden derives the voro from th Saxon cyning, which fignifies the lame ; and that from cinn "power." or ken "know'e dge," where with every morarch is fuppofed to be "nvelled. The Latin rex. the Scythian reix, the Punic refb the Spa nith rey and French roy, come all, accor ing to Po flel. from the Hebrew שxT, rofoh. "chief, head"

Kings were not known amongit the Ifraclites till the reign of Saul. Before him they were governed at firt by clders as in Esypt; then by princes of God's appointment, as Mofes and Jofhwa; then by judges till the time of Samucl ; and lat of all by kings. See Judges.

Mofl of the Grecian ftates were govemed at firt hy kings, who were chofen by the penple to decide dificrences and execute a power which was limited by laws. They commanded armics, prefided over the worthip of the Cods, \&x. This royalty was generally hertititary; but if the vices of the heir to the crown were odious to the people, or if the oracle had fo commanded, he was cut off from the right of fucceffion; yet the limgs were fuppofed to hold their fovereignty by the appointment of Jupiter. The enfgn of majelty was the [ceptre, which was made of wood adomed with fluds of gold, and ornamented at the top with fome figure; commonly that of an eagle, as being the bird of Jove.

Romer alfo was governed at firl by kings, who wene elected by the people, with the approbation of thie fenate and concurrence of the augurs. Their power extended to religion, the revenurs, the army, and the admini!" ration of juntice. The monarchical form of government fubfilited 244 years in Rome, under feven kings, the laft of whom was Tarquinius Superbus. See Rome.
A mong the Greeks the king of Perfia had anciently the appellation of the great king; the king of France now has that of the rrof Chrijtian king; and the king of Spain has that of Cattolic king. The king of the Romans is a prince chofen by the emperor, as a coadjutor in the government of the empire.

The kings of England. by the Lateran council, under Pope Julius 11. had the title of Clrificianifinus conferred on them; and that of defender of the faith was added by pope Leo $X$. though it had been uled by them fome time hefore. The title of grace was fril givin to our kings aloout the time of Hinny 1V. and that of majigy filt to Henry VIII. before which time our kings were called grace, his bofefs, \&ic. - In all pub lic inftruments and leters, the kirg fyles himfelf hoos "we;" though till the time of king John he fpoke in the fingular turn ber.
Thic definition of king above given, is according to the general acceptazion of the term. It wihl nut therefure Arielly apply to the fovereign of Brisain; and 'ili:] !cfs of fate to that of France, Fermerly one of the moft abfolute, now the moft degraded, of princes, with eut power and without confquence In Britain, a happy mean prevails. The power of the king is inderd fubject to grat limitiations: but they are the linitations of wifdom, and the fources of dignity; being fo far flum dimininthing his honcur, that they add a glory to his crown: For white other kings are abfolute monarclis over innumerathe multiudes of flaves, the king of Britain ha the dillinguifled glory of governing a fiee peopile, the leatit of whom
is prosected by the law: in wers ereat prerogatives, an' a boundlefs power in doing good : and is at the fane time only cefrained from actin r inconfall mely with his"own happinefs, and that of hapople

Toundertand the royal rights and auhority in Britain, we muft confider the king under sx diatinct vicors. 1. Wit', regard to his title. 2. His royal family. 3. Fiis councils. of His duties. 5. His prerogative. 6. His revenue.

1. His title. For this, fee Harbditary Right, and Succession.
II. His royal family, See Roral Fanily.
Ill. His councils. See Councul.

1V. His dutics. By our conlitution, there are certain duties incumbent on the king: in confideratinn of which, lis digrity and prerogative are eflablified by the laws of the land: it being a maxim in the law, that protection and fubjection are reciprocal And thele seciprocal duties are whut $\mathrm{S}^{\circ} \mathrm{r}$ W'illian Black. fone apprehends were meant by the convention in 1685 , when they declared that king james had broken the original contract between king and people. But however, as the teims of that original contract were in fome meafure difputed, being alleged to exilt principally in theory, and to be only deducible by reafon and the rules of natural law, in which deduction dif. ferent underllandings might very confiderahly differ; it was, after the revolution, judred proper to declare thefe duries exprefsly, and to roduce that contract to a plain certainty. So that, whateret doubts might be formerly raifed by weak and feupulous minds about the exiftence of fuch an original contract they mufl now entirely ceafe; efpecially with regard to every prince who hath reigned fince the year 1688.

The principal duty of the king is, To govern his people accosding to law. Nec regiuus infunita cut libera poteflas. was the conftitution of our Gcrman ancefors on the continent. And this is not only confonant to the principles of nature, of liberty, of reafon, and of fociety; but has always been efteemed an exprels part of the common law of England, even when prerogative was at the highef. "The king (raith Bracton, who wrote under Henry III.) onglit nut to be fubject to man; but to God. anif to the law : for the law makerh the king. Let the ling therefore render to the law, what the Jaw has invelted in him with regard to others; dominion, and power: for he is not truly king, where will and pleafure rules, and wot the law." And again: "The kiug hath a fuperior, ramely God: and alfo the law, by which he was made a king." Tlins Bracton; and Fortefue alfo, having firt well dillinguifed between a nonalchs abfolutely and d, fpotically regal, which is introdnced ty conquelt and violence, and a political or civil monarihy, which arifes from mutual confent (of which laft foecies he afferts the government of England ta be), inmediately lays it down as a priaciple, that "tho king of England mufe rale his pecple according to the decrees of the laws thereof; infomuch that he is bound by an oarh at bis coronation to the obfervance and keeping of his own laws." Bus to obviate all doubes and difficulties concerning this matter, it is exprefsly declared by flatute 12 and 13 W. III. c. 2. "t that the laws of Eng. laved are the birthright of the people thereof; and all the kings and queens who thall afcend the thorone of

King. this realn ought to adminitter the government of the fame according to the faid laws, and all their officers and minifters ought to ferve them refpetively according to the fame : and therefore all the other laws and flatutes of this realn, for fecoring the eftablifhed religion, and the rights and liberties of the people thereof, and all other lawi aud flatutes of the fane now in force, are by his najelty, by and with the advice and confent of thic lords firitual and temporal, and commons, and by authority of the lame, ratified and confirmed accordiugly."

And as to the terms of the original contract between king and pcople, thefe, it is apprehended, are now conched in the coronation-oath, which by the ftatute 1 W. \& M. At. I.c. 6 . is to be adminiltered to every king and queen who thall fucceed to the imperial crown of thefe realms, by one of the archbifheps or bifhops of the realm, in the prefence of all the people; who on their parts do rcciprocally take the oath of allcgiance to the crown. This coronationrath is corceived in the following terms:
"The archbifhop or bifbop foall fay, Will you folemnly promife and twear to govern the penple of this kingdom of Britain, and the dominions thereto belonging, accoiding to the flatutes in parliament agreed, and the laws and cuntoms of the fame? The king or queen Jball fiy, I fuleunly promife fo to do.
"Arcblifhop or liflop. Will you to your power caufe law and jurtice, in mercy, to be executed in all your judgments?-King or queen. I will.
"Arctbibop or bilhop. Will you to the utmont of your power maintain the laws of $G$ od, the true profeffion of the gofpel, and the Proteftant reformed religion eftabliihed by the law? And will you prefcrve anto the biftops and clergy of this realra, and to the churches cummitted to their charge, all fuch rights and privileges as by law do or fhall appertain unto them, or any of them?-King or quech. All this I promife to do.
"After this the king or que:n, laying bis or ber band
pon the boly golpel, Ball fay, The things which I have upon the boly gofpel, foall fay, The things which I have kere before prumifed, I will perform and keep : fo help me God. Aud then fisall kifs the book."

This is the form of the coronation-oath, as it is now prefcribed by cur laws; the principal arricles of which appear to be at lealt as ancient as the Mirror of Juftices, and even as the time of Bracton: but the wording of it waa changed at the revolution, becaufe (as the flatute alleges) the oath itfelf had been framed in doubtful words and expreffions, with relation to ant cient laws and confitutions at this tinne unknown. However, in what form foever it be conceived, this is moft indifputably a fundamental and oniginal exprefs contract ; though, doubtefs, the duty of protection is impliedly as inuch incumbent on the fovereign before coronation as after: in the fame manner as allegiance to the king becomes the duty of the fubject inmediately on the defcent of the crown, before he has taken the oath of allegiance, or whether he ever takes it at all. This reciprocal duty of the fubject will be conlidered in its proper place. At prefent we are only to obferve, that in the king's part of this original contract are expreffed all the duties which a monarch can owe to his people, viz. to govern according to
$\mathrm{N}^{\circ} 172$.
law ; to execute judgment in mercy ; and to maintain the eftahlifhed religion. And with refpect to the latter of thefe three branches, we may farther temark, that by the act of union, 5 Ann. c. 8 . two preceding ftatutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England : which enact; the former, that every king at his acceffion flall take and fublcribe an oath, to preferve the Proteftant religion, and prebyterian churchgovernment in Scotland ; the latter, that at his coronation he fhall take and fubferibe a fimilar oath, to preferve the fettlement of the church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.
V. His prerngative. See Prerogative.

V1. His revenue. See Revenue.
Having in the preceding articles chalked out all the principal outlines of this valt title of the law, the fupreme executive magiftrate, or the king's majefty, confidered in his Ceveral capacities and points of view; it may not be improper to take a thort comparative review of the power of the executive magiftrate, or prerogative of the crown, as it Itood in former days, and as it tlands at prefent. And we cannot but obferve, that molt of the laws for afcertaining, limiting, and rettraining this prerogative, fhave been made within the compafs of litele more than a century paft; from the petition of right in 3 Car . I. to the prefent time. So that the powers of the crown are now to all appearance greatly curtailed and diminifhed fince the reign of king Janes I. particularly by the abolition of the Itarchamber and high-cominifion courts in the reign of Charles I. and by the difclaiming of mantial law, and the power of levying taxes on the fubject, by the fame prince : by the difufe of forelt laws for a century palt: and by the many excellent provifions enacted under Charles 11.; efpecially the abolition of military tenures, purveyance, and pre-emption; the babeas corpus aet ; and the act to prevent the difcontinuance of parliaments for above three years; and fince the revolution, by the flrong and emphatical words in which our liberties are afferted in the bill of rights, and aft of fettlement; by the act for triennial, fince turned inro feptenuial elections; by the exclufion of certain officers from the houfe of commons; by rendering the feats of the judges permanent, and their كalaries independent; and by reftraining the king's pardon from obftrueting parliamentary iinpeachments. Befides all this, if we conlider how the crown is impoverifhed and Aripped of all its ancient revenues, fo that it greatly depends on the liberality of parliament for its neceflary fupport and maintenance, we may perhaps be Ied to think that the balance is inclined pretty Atrongly to the popular fcale, and that the executive magiltrate has neither independence nor power enough left, to form that check upon the lords and commons which the founders of our conftitution intended.

But, on the other hand, it is to be confidered, that every prince, in the firt parliament after his acceffion, has by long ufage a truly royal addition to his hereditary revenue fettled upon him for his life; and has nevery any occafion to apply to parliameut for fupplies, but upon fome public neceffity of the whoie realm. This reftores to him that conflitutional independence, which at his firft acceffion ferms, it mult be uracd, to be
be wanting. And then with regard to power, wc may find perhaps that the hands of government are at leaft fufficiently frengthened; and that a Britifh monarch is now in no danger of being overborne by cither the nobility or the people. The inftruments of power are not perliaps fo open and avowed as they formeriy were, and therefore are the lefs liable to jcalous and invidious reflections; but chey are not the weaker upon that account. In fhort, our national debt and taxes (befides the inennveniences before mentioned), have alfo in their natural confequences thrown fuch a weight of power into the cxecutive fale of govern. ment, as we cannot think was intended by our patriot anceflors; who glorionfly ftuggled for the abolition of the then formidable parts of the prerogative. and by an unaccountable want of forefight eftablifhed this fyftem in their ftead. The entire collection and mauagement of fo valt a revenue, being placed in the liands of the crown, have given rife to fueh a number of new officers, created by and removeable at the royal pieafure, that they have extended the influence of government to every corner of the nation. Witnefs the commiffioners, and the inultitude of dependents on the cultoms, in every port of the kingdom; the commiffoners of excife, and their numerous fubalterns, in every inland diftrict ; the poit mafters and their fervants, planted in every town, and upon every public road; the commiffioners of the ftamps, and their diftributors, which are fully as fcattered and fully as numerous; the officers of the falt duty, which, though a fpecies of excife, and conducted in the fame manner, are yet made a diltinct corps from the ordinary managers of that revenue; the furveyors of houfes and windows; the receivers of the land-tax ; the managers of lotteries; and the commiffioners of lackney-coaches; all which are either mediately or immediately appointed by the crown, and removable a* pleafure without any reafon affigned: thefe, it requires but little penetration to fee, mult give that power, on which they depend for fubfiftence, an influence moft amazingly extenfive. To this may be added the frequent opportunities of conferring particular obligations, by preference in loans, fubfcriptions, tickets, remittances and other money-tranfactions, which will greatly increafe this influence; and that over thofe perfons whofe attachment, on account of their wealth, is frcquently the moft defrable. All this is the natural, though perhaps the unforefeen, confequence of erecting our funds of credit, and, to fupport them, eftabliming our perpetual taxts: the whole of which is entirely new fince the reforation in 1660 ; and by far the greatefl part fince the revelution in 168\%. And the fane may be faid with regard to the officers in our numerons army, and, the places which the army has created. All which put together give the executive power fo perfuafive an energy with refpect to the perfons themfelve: and co prevailing an intereft with their friends and families, as will amply make amends for the lofs of external prerogative.

But though this profufion of offices fhould have no effref on individuals, there is fill another newly acquired branch of power ; and that is, not the infla. ence only, but the force of a difciplined army : paid indeed ultimately by the people, but inmediately by the crown; raifed by the crown, officered by the
crown, commanded by the crown. They are kept on foot, it is trae, only from year to year, and that by the power of parliament : but during that year, they muft by the nature of our conftitution, if raifed at all, be at the abfolute difpofal of the crown. And there need but few words to demonltrate how great a trut is thereby repofed in the prince by his people: A auft that is more than equivalent to a thouland little troublefome prerogatives.

Add to all this, that befides the civil lift, the immonfe revenue of almolt feven millions tterling, which is annually paid to the creditors of the public, or carried to the finking fund. is firlt depofited in che royal exchequer, and thence iffued out to the refpective offices of payment. This revenue the penple can never refufe to raife, becaufe it is made perpecual by act of parliament; which alfo, when well confidered, will appear to be a truft of great delicacy and ligh impor-
tance. tance.

Upon the whole, therefore, it feems clear, that whatever may have become of the nominal, the real power of the crown has not been too far weakened by any tranfactions in the lalt century. Much is indecd given up; but much is alfo acquired. The ftern com nands of prerogative have yielded to the milder voice of influence: the flavinı and exploded doctrine of non refillarce has given way to a military eftailifhment hy law; and to the difufe of parliaments has fuccteded a parliamentary truit of an immenfe perpetual revenue. When, indeed, by the free operation of the finking fund, our national debts thall be leffened; when the pofture of foreign affairs, and the univerfal introduction of a well planned and national militia, will fuffer our formidable army to be thinned and regulated; and when (in confequence of all) our taxes fhall be gradually reanced; this adventitious power of the crown will nowly and imperceptibly diminith, as it nowly and imperceptibly rofe. But till that fhall happen, it will be our efpecial duty, as good fubjects and good Eng.. lifhmen, to reverence the crown, and yet guard againft corrupt and fervile influences from thofe who are intrufted with its authority; to be loyal, yet free; obedient, and yet independent ; and above every thing, to hope that we may long, very long, continue to be governed by a fovereign, who, in all thofe public acts that have perfonally proceeded from himfelf, hath manifelled the higheft veneration for the free conflitution of Britain; hath already in more than one inflance remarkably ftrenythened its outworks; and will therefore never harbour a thought, or adopt a perfuafion in any the remoteft degree detrimental to public liberty.

King at Arms, or of Arms, is an officer of great antiquity, and anciently of great authority, whofe bulinefs is to direct the heralds, profide at their clapters, and have the jurifdiction of armoury.

In England there arc three kings of arms, viz. garter, elarencicux, and norroy.

Garter, principal KINS at Arms, was inftituted by Honry V His bufmefs is to attend the knights of the garter at their affemblies, to marfhal the folemnities at the funerals of the hishelt nobility, and $t$, carry the garter to kings and princes beyond the fea; on which occafion he ufed to be junned in commifion with fome principal peer of the kingdom. See Garter.

Eing. Clarencieux King at Arms, is fo called from the duke of Clarence, to whom he firf belonged. His office is to marthal and difpofe the funerals of all the inferior mobility, as baronets, knights, efquires, and gentlemen, on the fouth fide of the Trent. See Clabencieux.

Norroy King at Arms, is to do the fame on the north fide of the river Trent.

Thefe two latt are alfo called provincial heralds, in regard they divide the kingdom hetween them into provinces. By charter, they have pouer to vifit n wlemens fanilies, to fet down their pedigrees, diftinguifh their arms. appoint perfons their atms, and with garter to dircet the other heralds.

Anciently the kings at anms were created and folemnly crowned by the kings of England themfelves; but of later days, the earl marthal has a fecial commiffion at every creation to perfonate the king.

Lyon Kisg at Arms, for Scotland, is the fecend king at arms for Great Britain; he is invetted and crowned with great folemnity. To him belongs the publifhing king's proclamations, marfalling funirals, reverfing arms, \&c. See Lron.

King (Dr John), a learned Englifh bihop in the 37th conrury, bred at Weflminfter-fehool, and afterward at Clrifit church Oxford. He was appointed chaplain to queen Elizabeth. In 1605 he was made dean of Chrill-ehureh, and was for feveral years vicechancellor of Oxfurd. In 161 he was advanced to the bifhopric of London. Befides his Ledures upon Jonah, delivered at York, he publifhed feveral fermons King James I. ufed to Hyle him the king of preachers; and lord chief juftice Coke often declared, that be was the beff fpraker in the flar-chamber in bis time. He was fo contlant io preaching after he was a bilhop, that, unlefs he was hindered by want of health, he -mitted no Sunday whrreon lie did not vifit fome pulpit in London or near it. Soon after his death, the Papifts reported, that he died a member of their church. But the falfity of this ftoty was fufficiently expuffd by his fon Mr Henry King, in a fermon at St Paul's crofs foon after; by binhop Godwin in the Appendix to his Commentarius de prafulibus Anglia, printed in 1622 ; and by Mr Joho Gee, in his bouk, intitled, Tbc foot out of the frare.

King (Dr Henry), bithop of Chichefter, eldeft fon of the former, was boin in 1591, and educated at Oxford. He became an eminent preacher, and chapLain to king James I. and Charles I. In 1638 he was made dean of Rochefter; and in 164: was advanced to the fee of Chicheffer. Upon the breaking out of the civil wars, and the diffolution of epifcopacy, he was treated with great feverity by the friends to the parliament; but recovered his bifhopric at the refloration. This worthy prclate, who had a molt amiable character, died in 1669; and was interred at his cathedral of: Chichefter, where a monument was erected to his memory. He publifhed, 1. The pfalms of David turned into metre. 2 Poems, elegies, parodoxes, and fonnets. 3. Several fermons, and other works.

Kıng (Dr William), a facetious Englifh writer in she beginning of the 18 th century, was well defcendsd , being allied to the noble families of Clarendon and Rochefter. He was elected a fudent of Chrith-church from Wefminfer-fchool in 1683 , aged 18. He af-
terward entered npon the law line, and took the dtgree of doctor of civil law. He foon acquired a confiderable reputation as a eivilian, and was in great practice. He attended the earl of Pembroke, lord lieutenant of Ireland, inte that kingdom, where he was appointed judge adrocatc, fole cominifizner of the prizes, keeper of the records, vicar-general to the lord primate of Ireland ; was counteranced by perfons of the highell rank, and might have made a furtune. But fofar was he from heaping up riches, that he returned to England with no ofher treafure than a few merry poems and humorons elficys, and retired to his Itudents place at Chritt church. He died on Canifmas day in 1712 , and was interred in the Cloikers of Weltmin. fler ahbey. His writines are pretty numerous. The principal are, 1. Animalverfions on a pretended account of Denmark. wrote by Mr Molefworth, afterwards lord Mulefworth. The writing of thefe procured Dr King the place of Secretary t, princefs Amne of D:nmark. 2. Diaingues of the dead. 3. The art of love, ia imitation of Ovid De arte anzand!. 4. A volume of poems. 5. Ufeful tranfations. 6. An hiftorical ac. count of the heathen gods and heroes. 7. Several tranflations - As to the character of Dr King, he na. turally hated bufinefo, efpecially that of an adrocate: hut made an excellent judse when appointed one of the court of delegates. His chief pleature confited in trifles; and he was never happier than when he thought he was. hid frum the world. Yet he loved company, provided they were fuch as tallied with his bumour. He would fay a great minny it natured things, but never do one. He was made up of tondernefs and pity, and tears would fall from him on the fmalleft occation. His education bad been thrict, and he was naturally of a religious difpofition.

King (Dr Willam), archbihop of Dublin in the 18 th century, was defeended from an ancient family ia the north of Scotland, but born in the county of Antrim in the north of Ireland. In 1074 he went into pricts orders. In 1679 he was promoted by his patron, Dr Parker, archbiftop of Dublin, to the chancellormip of St Patrick. In 167 Peter Manby, dean of Londonderry, having publifhed at London, in 4to, a pamphlet intitled Confiderations zubich olliged Peter Manby dean of Londonderry to embrace the Cathodic reo ligien, our author immediately wrote an anfwer. Mr Manby, encouraged by the court, and sfatited by the moft learned champions of the church of Rome publifhed a reply under this title, $A$ reforned catechifm, in truo dialogues concerning- the Engl/.j reformation, \&cc. in reply to Mr King's anfwer. \&c. Our author foon rejoined in $A$ vindication of the anjwer. Mr Manby drnpped the controverfy; but difperfed a loofe theet of paper, artfully written, with this title, $A$ lether toc friend, ßowing the vanity of this opinion, that every man's fenfe and reafon are to guide bim in matters of failh. This Dr King retuted in $A$ vindication of the Cbrifian religion and reformation, againg the attempts of a letter, \&c. In 1689 , he was twice confined in the tower by order of king James II and the fame year commenced doctor of divinity. In 1690, upan king James's retreat to France after the battle at the Boyro, he was advanced to the fee of Derry. In 1692 he publifhed at London in 4 to, The fate of the Protylants of Ireland under the late king Fames's gozernment, \&z.

## K N

${ }^{61}$ A hiftory (fays bifhop Burnct), as truly as it is finely written." He had by hin at his death attefted vouchers of every particular fact alle eed in this bo k , which are oow in the hands of his relations. However, it was foon attacked by Mr Charles Lefy. In 1693 nur author finding the great number of Prote. fant difienters, in his diucefe of Derry, increafed by a vaft addition of colonies from Scotland, in order to perfuade them to conformity to the ctlatlifhed church, publifhed $A$ difcourfe concerning the inventions of men in Whe workip of God. Mr Joleph Buyfe, a diffenting miniter, wro:e an anfiwer. The biftop anfwered Mr Boyfe. The latter replied. The bifhop rejoined. In $1{ }^{7}$ c2 he pablifhed at Dublin, in 4 to, his celebrated treatife De origine mali. Mr Edmund Law, M A. fellow of Chrifl's collcge in Cambridge, afterward publifhed a complete tranfation of this, with very valuahle notes. in 4 to. In the fecond edition he has in. ferted, by way of notes, a large collection of the anthor's papers on the fame fubj ct, which he had received from his relations after the publication of the former edition. Our author in this excellent treatife has many curious obfervations. He alferts and ptoves that there is more moral good in the earth than moral evil. A fermon by our author, preached at Dublin in 1709, was publifhed under the title of Divine prediffination and foreknowledge confgent zuith the freedom of man's will. This was attacked by Anthony Col lins. Efq; in a pamphlet intitled, " $A$ vindication of the divine attributes; in fome remarks on the arclibimop of Dublin's fermon intitled, Divine predefination. \&c." He publithed likewife, A difcourfe concerning the confecration of churches; flouring subat is meant by ededicating them, with the grounds of that offce. H H died in 1720 .

King (Dr William), late principal of St Mary's hall, Oxford, fon of the teverend Peregrine King, was born at Stepney in Middlefex, in the year 1685 . He was made ductor of laws in $1 \sim 15$, was fece etary to the duke of Ormond, and earl of Arran, as chancellors of the univerfity; and w's made principal of St Mary'shall on the death of Dr Hudfon in 1719 . When he flood candidate for member of parliament for the univerfity, he refiend is office of ficetary, but enjoyed his other preferment an it was all le did mijey to the time of his death Dr Clark, who oppor d him, carried the election; and after this difappointment, he in the year 1727 went over to lreland. where he is Said to liave written an epic prem, called The Toaff, which was a political latire, printed and given away to his friends, but never fold. On the dedication of Dr Radeliff's library ir 1749, he Spoke a Latio oration in the thearre at Oxford, which was reecived with the hisheft acclamations: but it was otherwife when printed. he being attacked in feveral pamphlets on account of it. Again, at the memurable contefted election in Oxfordhire 1755, his attachment to the old interef drew on him the refentment of the new, and he was libelled in newfpapers and paniphlets, againft which he defended hinfelf in an Apology, and warmly retaliated on his adverfaries. He wrote feveral other things, and died in 5762 . He was a polite fcholar, an excellent orator, an clegant and eafy writer, and elleemed by the fort men of his tune for his lcarning 2nd wit.

Kıne (Pcter), lord high chanccllor of Great Britain, was defcended of a good family of that name in Somerfethire, and fon to an eminent gracer and falter in the city of Exeter in Devon/hire. He was born at Exeter in 1609 . and bred up for fome years to his father's bufinefs ; but lis inclisation to learung was fo Arone, that he lad out all the money he could fpare in books, and devoted every moment of his leifure hours to tudy: fo that he became an excellent feholar before the world fufpected any fuch thing; and gave the public a proof of his fkill in church hiltory, in his Inquiry into the conflitution, difiepliae unity, and wor/hip, of the prinuitive church, that flouri/bed wuith. in the finft 300 ycars afier Chbrif, Loudon, 169', in 8vo. This was written with a view to promote the fchene of a comprehenfion of the diffenters. He afterwards pullifihed the fecond part of the Inquiry int, the confitution, sec.; and having defired, in hio preface, to be fhown, tither publicly or privately, any miAtakes he might have made, that requelt was firl complied with by Mr Edmund Elys ; between whom and our author there paffed feveral lettus upon the fubject, in 1692 , which were publiffed by Mr Elys in 1694 , 8 vo , under the title of Letters on fiveral fubjels. But the moft formal and elaborate anfwer to the Inquiry appeared afterwards, in a work intitied, Original draught of the primitize church.

His acquaintance with Mr Locke, to whom he was related, and who left him half his 1 brary at his death, was of great advantage to hum: by his advice, after he had tludied fome time in Holland, he applied him. felf to the tludy of che law; in which prufeffion his learning and diligence made him foon taken notice of. In the two lall parliaments during the reign of King William, and in live parliaments during the reign of Quecil Anne, he ferved as burgelaf fo Betr-Alfton in Devonfhire. In $17 \mathrm{~J}_{2}$, he publithed at London, in 8vo, without bis name, his Hiftory of the apofle's creed, with critical oblervations on its feveral irticles; which is highly efteened. In 1708, he was chofen recorder of thic city of London; and in \% O, was one of the members of the houfe of commous at the trial of Dr Sacheverell. In 1714, he was appointed lord chief jultice of the comuon-pleas; and the April tollowing, was made one of the privy-council. In 1715, he was created a peer. by the tute of Lord King, baron of Ockham in Surry, and appuiuted lord high chancellor of Great Bitain ; 11 which pot lit continued till 1733 , wheo he refigned; and mi 1734 died at Ockham in Surry.

King's Fijler. See Alcedo.
Books of Kinas, two canonical books of the Old Teilament, fo called, becanfe they contain the hiftory of the kings of 1 fracl and Judah from the beginning of the reign of Sulomon down to the Babylonith captivity, for the fpace of near 600 years. The firll book of kinge contains the latter part of the life of David, and his death; the flourinhing tate of the Ifraclite under Selomon, his building and decicating the temple of Jervalatem, his fhameful defection from the true relighen, and the fudden decay of the Jewifh nation after his death, when it was divided into two kingdoms: the rell of the book is taken up in relating the acts of

King, four kings of Judah and eight of Ifrael. The feKiugdome - cond book, which is a continuation of the fame hitory,
is a relation of the memorable acts of 16 kings of Judah, and 12 of Ifrael, and the end of both kingdoms, by the carrying of the 10 tribes captive into Affyria by Salmanaliar, and the other two into Babylon by Nebuchadnezzar.

It is probable that thefe books were compofed by Ezra, who extracted them out of the public records, which were kept of what paffed in that nation.

King's-County, a county of the province of LeinAler in Ireland, taking its name from king Philip of Spain, hufoand to queen Mary. It is bounded on the north by Weet Meath; on the fouth hy Tipperary and Qucen's.county, from which it is divided by the Barrow ; and part of Tipperary and Galway on the weft, from which it is Separated by the Shannon. It is a tine fruitful country, containing 257.510 Irifh plantation acres, 56 parifhes, 11 baronies, and two boroughs, and returns fix members to parliament. It is about 47 miles long and 17 broad, and the chief town is Philipflown

Kíng's Evil, or Scrophuia. See Medicine-Iudex.
KING TE-TChing, it famous village belonging to the dillrist of Jan-tchecu fou, a city of China in the province of Kiang-fi. This village, in which are col lected the beft workmen in porcelain, is as populous as the largeft cities of China. It is reckoned to contain a million of inhahitants, who confume every day more than ten thoufand loads of rice. It extene's a league and a half al r.g the banks of a beautifol river, and is not a collection of fraggling houfes intermixed with fpots of ground ; on the contrary, the perple complain that the buildings are too crowded, and that the long Neets which they form are ton narrow; thofe who pafs though them imagine themfelves tranfported into the midtt of a fair, where nothing is heard a. round but the noife of porters calling cut to make way. Provifions are dear here, becaufe every thing confumed is brought from remote places; even wond, fo neceffary for their furnaces, is actually tranfported from the dillance of an hundred leagues. This village, not withftanding the high priee of provifions, is an afylum for a great number of poor families, who could not fubfift any where elfe. Clithen and invalids find em. phoyment here, and even the blind gain a livelihood by pounding colours. The river in this place forms a lind of harbour about a league in circumference: two or thrce rows of barks placed in a line fometimes border the whole extent of this raft bafon.

KI $\backslash G D O M$, the territories or extent of country fulpicet to a king.

Kingdons, in natural hiffory. Mof naturalifts and che miitt: divide all natural bodies into three great elafts. which they call kingdoms. Thefe are the mineral, the vegctatle, and the trumal kingdoms.

This great and fult divifion is founded on this conficteration, that any plant or vegetable which is produevd, which grows, which is organized, which contains a feed, and which produces its like, feems to be a being, very diftinct and different from a fone or a metal, in which we at moft obferve only a regular arrangement of parts, but not a true organization, and which contains no feed by which it is capable of reproduction; and another foundation of this divifion is, that an
animal differs no lefs from a fimple plant, by fenfation, Kiegdi by the ufe of its fenfes, and by the power of voluntary motion which it poffeffes, white thefe qualities do not belong to any thing which is inerely vegetable.

But notwitfanding thefe fo diftinctive marks, philofophers pretend, that this divifion of natural bodies into claffes is only ideal. They affirm, that, by obferving natore attentivcly, we may perceive, that all her productions are conneeted together by an uninterrupted ehain ; and that by furveying the feveral beings, we mull be convinced, that any one being differs very little from fome other two between which it fecms tobe placed; fo that we inay defcend from the moft perfeet animal to the rudeft mineral by infenfible degrees, and without finding any interval from which a divifion might be made. The opinions of naturalifts are therefore divided upon this fubject; and each opinion feens to be founded upon obfervations, analogies, and reafonings more or lefs conclufive.

If we avoid invefligating extremes, however, the diftunctive marks mult be acknowledged fufficiently obvious to juftify the triple divifion above mentioned, and to difcriminate the individuals of each.

For a general view of the operations or conduct of nature in thofe her three kingdoms, fee the article Nature. For a particular confideration of them-(in the animal-kingdom), fee Zoology, Animal, Brute, Bird, Ornithology, Insect, Entomology, Ichthyology, Fish, Comparative Anatomy, and the different animals under their refpective names; - (in the vegetable kingdom), Botany, Plant, Agriculture, Vegetation, Defoliation, Frondescentia, Gemmatio, Fruit, Leaf, Germination, \&cc. and the different plants under their refpective names;(in the mineral kingdom), Mineralogy, Metallurgy, and the different llones and metals under their refpective names.

In what remains of this article we flall confider natural bodies only in a chemical view ; that is to fay, relatively to the feveral:prineiples which we ohtain in the analyfis of thofe bodies. In the decempofition of all beings truly living, organifed, and containing within themfelves a feed by which they may be reproduced, fuch as vegetables and animals, we always obtain an inflammable, fat, or oily fubllance; and on the contrary, we do not find the fnalleft trace of this prineiple in any fubllance purely mineral, not even in fulphur, which is the moil ingammable of all thefe fubilances. On the other fide, if we carefully examine and compare with each other the analogous principles obtained from the three kingdoms; fuch as the faline fubflances obtaised in the analy fio of animals, vegetables, an minerals; we fhall eafly perceive, that alt the faline matter which e,mes from the vegetable or aninal kingtom, is altered by oil, white all the faline matter which eomes from the mineral kingdom is entirely free from oil.

We ought to obferve here, that becaufe any matter is found in one or more individuals of any kingdom, we muft not therefore canclude, that it belongs to the kingdom of fuch individuals; for we may be convinced, from a fight obfervation of nature, that by a thoufand combinations, and particular cireumllances, fubftances of quite different elafles or kıngdoms are daily found mixed and confounded together. Thus, for example;

## K I. N. [ $469 \quad 1 \quad$ K I N

ons. within the earth, and even at great depertis, that is, in - the region appropriated to minerals, fumetimes fubflances are found evidently oily, fuch as all bitumens: but we at the fame time can prove, and all the obfervations of natural hittory prove, that thefe oily fubfances are only aceidentally within the earth, and that they proceed from the vegetable or animal bodies which lave been buried in the carth by fume of thofe great revolutions which have happeatd from tine to time upon the furface of our ghobe. Allo in decompuling feveral vegetahles and animals, falts are obtained; fuch as common falt, Glauber's fatt, and others, which contain nothing oily. and which are confequently matters evidently mineral. But, on the other file, we are cer. tain that thefe mineral falts are extraneous to the animals and vegetables in which they are found ; that they are only introduced into thefe living bodies, becanfe they happen to be mixed with the maters which lave been applied to them as aliments. and that they ought not to be numbered amongt their principles. The proof of this is, that not only the quantity of thefe mineral falts is not unform in aninals and vegetables; but alfo, that not a partisle of fuch faits is containcd in fome plants and anmais equally ftrong and healthy, and of the fame fpecies as thofe in which thefe falts have generally been obleived.

In the fecond place, we ohferve, that oils do only exit in the proximate principles of vegetables and animals; that is, in thofe of their principles which enter immediately into their compofition, when thofe principles have not been altered by further decompofitions, and confequently when they ftill prefetve their animal or vegetable character; for by a natural putrefaition continued during a long time, or by chemical operations, not only the materials of which animal and vegetable bodies are furmed may be deprived antirely of oil, but alfo this oil may itfelf be enticely deftroyed or decompofed. Thefe fublances in that flate contain nothing by which they can be difitinguifhed from minerals. The earths, for example, of vesetables and animals, when they àre deprived, by a fufficient calcination of all inflammable matter, have been thought to become entirely fimilar to the calcareous and algillacedus earths found within the globe, and which may be coufidered as mineral fubllances, although probably they have been formeily a part of animal and vegetable bedies. Stc Bowes.

Hence we conclule, that, when we confider natural bodies in a chemical view, we ought so divide them into two great claffes The firtl clafs is of fubtances inaninate, unorganifed, and the principles of which have a degree of fimplicity which is ffential to them : thefe are minerals. The other clafs eontainsoll thule bodies which nor only have been difinctly organifed, but which alfo contain an vily matter, which is no where to be found in fubflances which have not made part of animace bodits, and which, by combining with all the other prineiples of thefe animate bodres, dillinguifhes thefe prociples from thufe of minetals by a lefs degree of finplicity. This fecond clafs contains regeiabies and annials. We ought alfo to remark, that the oll contained in veretable and animal fubflances, renders them fufceptibie of fermentation, properly fo called, which cansot by any means take place in any mineral.

We fhall now proceed to examine, if, by comparing Kitgedoms the principleas obtained in the decompolition of vege. tables with theofe obtained in the decompofition of ani- King ferry. mals, we can find fome effential character by which thefe two kingdoms may be chemically diltinguifhed, in the fame manner as we have feen that both of them may be dilkiuguifhed from minerals. Fiom experiments we indeed learn, that the prineiples of vegetables difler evidently enougla from thofe of animals; that in general the fatine principles of the former are acid, and are transformable in great mealure into fixed alkali by incineration, while the principle of the latter are vold. tile alkalis, or eafily changeable into thele; that vegretables are much farthor removed from putrefaction than animals; latty, that vils truly animal have a character different from vegetable oils, and are in general more atienuated. or at leait more difpofed to be attenuated and volatilifed. But we mut at the fame time confefs, that thefe differences are not clear and decifive, like thofe betwist thefe two kingdoms and the miueral litugdom ; for we do not find any effert al principhe, cither in animals or in regetables, which is mot alfo to be found in the other. In fome plants, chiefly the cruciform, as much volatile alkali, as litte fixed al. kali, and as much difpofition to putrify, are found as in animal-matters; and thence we conclude, that if thefe two great claffes of natural bodis differ chemically from each other, this difference proceeds only from the quantities or proportions of their feveral pintciples and properties, and unt from any thing dittinct and pecoliar ; nor is it fimilar to the mauner in which boh vegetaste and animal fubfances differ from minerals, nainels, by containing an oil, and poffefing a fer. mentable quality. Befides. the degrees of the clicmical difference betwixt thefe three great claXes of natural bouics are found to be the fame, in whatever manner we contider them or compare them together. See Chemistry, pafirin.

KINGHORN, a parliament town in the county of Fife in scotland, on the Frith of Forth, directly oppofite to Leith. Here is a manufacture of thread fuckings knit by the women; the men, being chiefly mariners, are employed in coalling hlips, in the fifh. ery, or the pallage. hoats from hence to leeith, from which the town of Kinghorn derives conliderable advantage. This place gives a fecond title to the earl of Strathnore.
KINGSBRIDGE, a town of Devonfhire, 217 miles from London. It is a pretty place, with a harbour for boats, a free fchool, a market, and a fair. This is a chapel of eafe to Chefton, and has a bridge over the Salcormb to Dodbrook.
KINGSCLERE, a pleafant town of Hampfrire, fituated on the Oxford road from Bafingiloke. It is 56 miles from Lonton, and was once the feat of the Saxon kings. It has a market and two fairs.

KINGSFERRY, in Kent, the common way from the main land isto the infe of Shepey; where a cable of abuut 140 fathom in length, fatlened at each end a. erofs the water, ferves to get the boat over by hand. For the maintenance of this ferry and keeping up the highway leading to it through the marfhes for above one mile in length, and for fupporting a wall againt the fea, the land-occupiers tax themfelves yearly one penny per acre for frefh marfh-land, and one penny for 3.

## K I N

2 Singtnn. every 10 acres of falt marfh-land. Here is a houfe for the ferry keeper, who is obliged to tow all trawellers over fire, except on thefe four days, viz. Palm Monday, Whit-Monday, St James's.day, and Michaelmasday, when a borfeman pays two-pence and a foctman one penny. But on Sunday, or after eight o'clock at night, the ferry keeper demands fix pence of every horfeman, and two-pence of every footman, whether Arangers or the land-occupiers.

Kingston upen Thamfs, a town of Surry in England, fituated 13 miles from London. It takes its name from having been the refidence of many of our Saxon kings. fome of whom were crowned here on a thage in the marker-place. It has a wooden bridge of 20 arches over the Thames, which is navigable here by barges. There is another bridge here of brick, over 2 Arcam that comes from a fpring in a cellar four miles above the town, and forms fuch a brook as to drive two mille not above a bow-fhot from it and from each other. It is generally the place for the fummeraflizes of this county, there being a gallows on the top of the hill that overlooks it. It is a populous, trading, well-built tows, and in the reigns of King Edward 11 and 11 . fent members to palliamen:. It has a frec-fchool; an alms houfe buile in 1670 for fix men and lix =women, and endowed with lands to the value of ¢ol. a year; and a charity fchool for 30 boys, who are all clothed. Here is a fpacious church with eight bells. adjoining to which, on the north fide. was formerly a chapt dedicated to St Mary, in which were - Lhe pictures of three of the $S_{3 x} \times n$ dings that were crowned here, and alfo that of Kine John, who gave the inlabitants of this town their firft charter of incorporation. But thefe were all dettroyed by the fall of this chapel in 1730 . Here is a good market for corn, \& \& c. and three fairs.

Kinasson upon Hull, a tuwn in the eaft riding of York!hire, 73 miles from Lendon. Its common name is fimply Hull. It is fithated at the confux of the rivers Hull and Humber, and near the place where the latter opens intu the German Ocean. It lies fo low, that by cutting the banks of the Humber the country may he laid under water for tive miles round. Towards the land it is defended by a wall and a ditch, with the farther fortification of a calle, a citadel, and a block houfe. A dock was begun here, but after great expence left unfinifhed. - A new cut has been lately made to Hull by Wcighton. The town is large and populous, containing two churchcs, feveral meet-ing- livufes, a free fchoul, a charity fchool, and fome hofpitals. Among the latter is one called Trinity boufe, in which are maintained many diffreffed feamen, both of Hull and other places, that are members of its pult. It is governed by 12 elder brethren and fix afilltants; out of the former are chofen annually two wardens, and out of the younger brthren two flewards; they determine queflions between malters and fea. men, and other fea matters. A handfome inhirmary has lately been erefed without the town to the north. Here are alfo an exchange and a cultom-houfe, and over the Hull a ftone bridge confifing of 14 arches. A good hatbour was made here by Richard 11 . This . Loven has not only the moft confiderahle inland traffic of any port in the north of England, but a foreign *ade fuperior to any in the kingdum, excepting the
ports of London, Britol, Lirerpool, and Yarmoath. Sing By means of the many large rivers that fall into the Humber, it trades to alnooll every part of Yurkhire, as well as to Lincolnfhire, Nottinghamhire, Staffordhire, Derbyfhire, and Cheflire; the commudities of which conutics are brought hither, and exported to Holland, Hamburgh, France, Spain, the Baltic, and other parts of Europe. In return for thofe, are imported iron, copper, hemp, flax, canvas, Ruffia linew and yarn, befides wine, oil, fruit, and other articles. Such quantitice of corn are allo brought hither by the navigable rivers, that Hull exports more of this consmodity than London. The trade of Hull with London, patticularly for corn, Icad, and butter, and with Holland and France, in times of peace, for thofe commodities, as well as fur cloth, kerfeys, and other manufactures of Yorkfhire, is fo confiderable as to empluy not only fingle veffels, but fleets; the Hull fleets to London being generally from 50 to 60 fail, and in time of war frequencly 100 fail or upwards. The mayor of Hull has two fwords, one given by King Richard 11. the other by Henry VIII. but only one is borne before him at a time; alfo a cap of maintenance, and an oar of lignun vitze as a badge of his admiralty jurifdiction within the limits of the Humber. This town gave title of earl to Robert Pierpoint of Holme Pierpoint, vifcount Newark, created in the $4^{\text {th }}$ of Charles 1 . Being unfortunately flain in eroffing the Humber in $1 G_{3}$, he was fucceeded by his fon Henry, created masquis of $D$ nchelter in 1645 , only fur life; who dying in 16:0, without male ifue, was fucceeded in the earldom by Ruhert, grandfon of his younger brother Willam Pierpoint of Thorefby; who dying unmarried in 1682 , left this honour to William his brother and herr; and he alfo dymg withuut iffue in 1690 , it defcended to his bruther Evelyn, who was further advanced to the honours of inarquis of Durchelter in 1706 and duke of Kington in 17.5 : and dying in 1725 was fucceeded by his grandfon Evelya laft duke of Kingiton, who died in 2773, and the title became extinct.

Kingston, a town of Ireland, in the province of Leenter and capital of King's collnty. W. L.ng. 7 . 20. N. Lat. 53 15. It is otherwife oalled Pbilipso Torwn.
Kingston, a tnwn of Jamaica, feated on the north fide of the bay of Purt-Royal. It was founded in the year 1693, when the repeated delolations by earthquake and lire had driven the inhabitants from Purt-Ruyd. It extends a mile from north to fouch, and about as much from eaft to welt, on the harbeur. It contains about 3000 houles, befides negru-houfes and warehoufes. The number of white inhabitante is about 8000; of free people, of colour, 1500 ; and of llaves, about 14,000 . It is the county-town, where the affizes are held, in January, April, July, and O\{uber, and latt about a fortnight. It is a place of good trade; and is muck reforted to by merchants and feamen, becaufe moft of the fhips come to load and unload their cargoes here. W. Long. 76. 32. N Lat 17.40.

KINGION, or Kyneton, a pretty large town in Herefordhhire, 146 miles from London. It is lituated on the river Arroo, and is inhabited chiefly by clothiers, who drive a confiderable trade in narrow cloth. It has a charity-fchool, a market, and three

## K I N [ 471 ] K I R

$4 \pi$ firs. The markets on Wednefday before Eafter, the utmoft fafety. Within the haven on the wet fide Whitfuntide, and Chrift nas, are fo cunfiderable for corn, cattle, leather, home made linen and woollen cloth, and all forts of provilions, that they are more like fairs.

Kinnor, or Chinnor. Se€ Chinnor.
KINO. in the materia medica, a gum refin. This drity was firit recommented to the attention of medical practitioners hy $D_{1}$ Futhergill, as being a very ufe. ful vegetahle altiogen ; and in the laands of other pradtitioners it has been fof far found to anfiver the chareder he gave of $i$, that it is now in very common we. It has a contiderable refemblance to the carechu; hut is much more of a refinuus nature, and of a lels firm texture : it is alfo redder and more affringent ; its watery folution more decomp sable hy acids; and its ink lefs permanent. Its colouring and aftingent mater are more purfectly taken up by firit chan by water, though water readily enough extracts a confiderahle thare of both. It is ufed as an aftringent in diarthcea, hemorrhagies, \&cc. In proof.fpirit it furms an elegant tincture ; and it is a principal ingredient in the pulvis fiypticus, and fome other officinal compoli. tions.

- KINROSS, the county-town of Kinrosfhire in Scotlant, furted in W. Long. 3. 7. N. Lat. 56. 15. un the weft fide of lochleren, a frefh water lake about 10 miles in compafs, abounding with pike, trout, perch, and water fiol. The manufacturs are linen and fome cutlery ware The houfe of Kinrofs, an elegant an cient ifructure, Atands in the north fide of the town. Kinrofs fends a member tos parliament by turns with Clarkmannan. In the lake are two illands; on one of which appear the ruins of a prinry, heretufore pof. seffed by the Culdecs; the other is famous for the caitle in which Queen Mary was i.nprifoned by her retellinus futjects

KINSAL.E, a town of the county of Cork in Ire. land, fituated at the mouth of the river $B$ an or Bandon, 1.36 milea from Dublin. It is reckuned the third town in the kin rdom, and inferior only to Cork in point of trade. It is neat, well built, an f wealthy; is governed bv a fovereign and recorder. and returris two members to parliament, patronage in the Southwell family. It is defended by a itrons fort built by king Charles II. called Charles's Fort; and on the oppofite thore there are two well huilt villages, called Cove and Silly. In the town and libertieg are 6 pavilhes, 30 plough lands, and therein $68+6$ acres. The barracka hold 12 companies of foot, befides a regiment at Charies's fort. In the centre of the town is a goad market houfe, and near it a ftrong built prifon; and there are feattered up and down the ruins of feveral monatleries and religious houfes. It has two fairs. In time of war Kinfale is a place of much bufinefs, being then fre. quented by rich homeward bound fleets and Ships of war, for which reafon moll of the houfes are then let zt double rents. The harbour is very commodious, and perfectly fecure: fo large that the Englifh and Dutch Smyrna fleets have anchored in it at the fame time. There is a dock and yard for repairing fhips of war, and a crane and gun wharf for landing and Mipping heavy artillery. Ships may fail into or out of this harbour, keeping in the middle of the chanoel, with
lies a great fhelf, which fhoots a great waw off from the land: but leaves an ample pattaje hy the lide of it, in which, as in all the rell of the harbour, it is many fathoms deep. Lord Kinfale has the ancient privilege of kerping his hat on in the king's prefence. Kinfale gives the title of baron to the very ancient family of Courey, lineally defcended from I hin de Cuurcy ea:l of Uliter, who from him have the privilege to be covered in the prefence of the king of England.

KINIORE, a roval hornogh of Aherdeenfhire inSculand, firmated on the river Don, in IV. Long. 2. 5. N [.at. 57.38. It gives the title of earl to a branch of the notle family of Keith, but in other refpects isinconsiderable.

## KINTIRE. Sce Cantire.

KIOF, or KIow, a confiderable town of Poland and capital of the Ukrain in the palatinate of the fame name, with an archhifhop's fee and a caftle. It be: lones to Kuffia, and carries on a confiderable trade, It is divided into the Old and New Town, and leated on the river Nieper, in E. Long. 31. 51. N. Lat. 50. 12.

KIPPING (Henry), in Latin Kipsingius, a learn* ed German Lutheran burn at Bofluck ; where, after having received the degree of malter of arts, he was met by fome foldiers who preffed him into the fervice. This, however, did not prevent bis followings his Itudies. Une day while he was upon daty, holding his mufket in one hand and the poet S:atins in the other, a Swedifh counfellor, who perceived him in that attitude, came up to him, entered into difcourfe with him, and then takinis him to his houfe made him his librarian, and procured him the under-rectorth:p of the college of Bremen, where he dred in $167 \%$. He wrote mariy works in Latir ; the principal of which are, 1. A treatife on the antiquities of the Ronans. 2. Another on the works of Creation. 3 Several differtations on the Old and New Tellament, \&c.

KIRCH (Chriftian Frederic), of Berlin, a celebrated attronumer, was born at Gnben in $16 y+$, and ac. quired great reputation in the obfervatories of Danto zic and Berlin. G idfrey Kirch his father, and Mary his mother, acquired confiderable reputation by their attronomical ubfervations. This family correfponded with all the learned focieties of Earope, and their allrunomical works are in high repute.

KIRCHER (Athanafins), a famous phinfopher and mathematician, was born at Fulde in 1601 . In 1618 be entered into the fociety of the Jefuits, and taught philofuphy, mathematics, the Hebrew and Syriac languages, in the univerfity of Wirthorg, with great applaufe till the year 1631. He went to France on account of the ravages committed by the Swedes in Franconia, and lived fome time at Avignon. He was afterwards called to Rome, where he taught mathematics in the Roman cullege, collected a rich cabinet of machines and antiquities, and died in 1580 . The quantity of his works is immenfe, amounting to 22 vols in folio, 11 in quarto. and 3 , in 8vo; enough to employ a man for a great part of his life even to tranfcribe them. Molt of them are rather curious than ufeful; many of them viliunary and fanciful; and if they are not always accompanisd with the greatelt ex.

## $\mathrm{K} \quad \mathrm{I}$ R

Kirebr-Steven, or Stephen's.Church, a town of Weftmoreland, 257 miles from London, flands on the river Eden near Sedbergh and Afgarth. The church is a large building with a lofty tower; in it are feveral old monuments. Here is a good free fchool that has two exhibitions. The town is noted for the manufatory of yarn-fockings; and it las a market and a fair.

Kirabr-Thore, a town of Weftnoreland, flands alfo on the river Eden, north-wett of Appleby, 267 miles from Londen. A hort of a moofe-deer was found here a few years fince, at the depth of four feet from the furface of the earth: and fevcral other antiquitica have been dug up or taken out of a well, difcovered at the end of the town near the bridge. Below it are the valt ruins of an ancient town, where Roman coins and urns are frequently dug up. The people call it Whely cafte, 300 yards in length, and 150 in breadith, with three entrances on each tide, with bulwarks before them. At a little difance from thence Roman urns are found consaining bones and afles. The old military-way runs through it, called the Maiden suay, becaufe it began at ilaiden-cafte in Stainmore in Yorkfuire, north riding.

KIRKCUDBRIGHT, beginning at the middle of Dumfries-mire in Scotland, makes a confiderable part of Galloway, of which the eanls of Nithifdale were hereditary ftewalds. The face of the country exlibits the appearance of one continued heath, producing nothing but paiture for fheep and fimall black cartic, which are generally fold in England; yet thefe dufky moors are interfected with plealant valleys. and adorned with a great number of cafles belonging to private gentlemen, eviry houfe being furround=d with an agreeable plantation. It is watered by the river Dee; which, taking its rife front the mourtains near Carrick, runs through a tract of land about 70 miles in length, and, entering the Irifh fea, forms the harbour of Kirkcudbright, a fmall inconfiderable borongh, adnuirably fituated for the fifhery and other branches of conmerce, which are almoft totally neglected tlirough the poverty and indolence of the inbabitants. There is no other town of any conicquence in this flewartry. Kirkcudbright gives title of baron to the Maclellans, who formenly wcre a poweetid family in the county.

KIRLHAM, a town of Lancalbire, 221 miles from London, flands near the Ribble, fix miles from the I winh fea, in that part of the county called the Field-lands. It has a market and three fairs, and a free fehool well endowed. By the late inland navigation, it has a communication with the rivers Merfey, D.e, Ribble, Oufe, Trent, Darwent, Severn, Fiumber Thames, Avon, \&ce. which navigation, including its windings, extends above 500 miles, in the counties of Linccln, Nottingham. York, Weftnoreland, Chelter, Wawick, Leicetter, Oxford, Worcefter, \&cc.

KIRKOSWALD, a town of Cumberland on the Eden, 291 miles from London It had formerly a caftle, which was demolithed above 100 years ago. It has a market and two fairs. Its church is a very irregular oid building; and the helfrey is placed diftant from the church on the top of an hill, that the found of the teclls might be more eafily heard by, the circumjacetut villages.

KIRE-

## K I R

KIRKWALL, the capital of the Orkneys, fituated in the ifland of Pomona, in W. Long. 0.25. N. Lat. 58. 33. It is builk upon an inlet of the fea near the middle of the ifland, having a very fafe road and harbour for thipping. It is a royal borough, governed by a provoft, four bailiffs, and a common-council. It was formerly poffeffed by the Norwegians, who beflowed upon it the name of Crucoviara. From king Jam cs III. of Scotland they obtained a new chatter cmpowering them to clect their own magittrates year, ly, to hold borough-courts, arrell, imprifon, make laws and ordinances for the right government of the town; to have a weekly market, and three fairs annually at certain fixed terms: he moreover granted to them fome lands adjoining to the town, with the cultoms and fhore-dues, the power of a pit and gallows, and exempted them from the expence of iending commiffoners to parliament. This charter has been confirmed by fucceeding monarchs. At prefont Kirkwall is the feat of juftice, where the fleward, fheriff, and commiffary, hold their feveral courts of jurifdiction: Here is likewife a public guammar-fchool, endowed with a competent falary for the mafter. The town confites of one natrow freet about a mile in length; the houfes are chiefly covered with nate, though not at all remarkable for neatnefs and convcnience. - The principal edifices are the cathedral church and the bihop's palace. The former, called St Magnus, from Magnus king of Norway, the fuppofed founder of the town, is a large Gothic ftructure: the roof is fupported by 14 pillars on each fide, and the firie is built upon four large columns. The gates are decorated with a kind of Mofaic work, of red and white ftones elegantly carved and flowered. By the ruins of the king's catlle or citadd.jit appears to have been a flrong and fately fortrefs. At the north end of the town there is a fort of fortifica. tion built by the Englifh in the time of Oliver Cromwell. It is furrounded with a ditch and rampart, and fill mounted with fome cannon for the defence of the harbour.

KIRSTENIUS (Peter), profeffor of phyfic at Upfal, and phytician-extraordinary to the queen of Sweden, was born at Breflaw in 1577. He fludied Greek, Latin, Hebrew, Syriac, natural philofophy, anatonty, botany, and other fciences. Being told that a man could not dittinguifh himfelf in phytic unlefs he underfood Avicenna, he applitd himfelf to the Atudy of Arabic ; and not only to read Avicenna, but allo Mefue, Rhafis, Abenzoar, Abukatis, and Averroes. He vifited Spain, Italy, England, and did not return home from his travels till after feven years. He was chofen by the magitrates of Breflaw to have the direction of their college and of their fchools. A fit of ficknefs having obliged him to refign that difficult employment, with which he was alfo much difgufted, he applied limfelf chicfly to the practice of phyfic, and went with his family into Pruffia. Here lie obtained the friendfhip and efleem of the chancellor Oxentiern, whom he accompanied into Sweden; where he was made profeffor of phyfic in the univerfity of Upfal, and phyfician to the queen. He died in 1640. It is faid in his epitaph, that he underfood 26 languages. He wrote many works; among which are, 1. Liber fecundus Canoxis Avicenne, typis Arabicis,
.Vol. 1X. Part II.

## K I S

er MSS. editus, at verbum in Latinum tranfatus, in folio. 2. De vero ufu ct abufu Medicinc. 3. Grammatica Aralica, folio. 4. Vite quatuor Evangelifarum, ex autiquiffino corlice MSS. Arabico eruta, in folio. 5. Nota in Livanselium S. Mathbai, ex collationt textuum Arabicorum, Syriacorum, ERgyptiacorum, Gracorunt, है Latinorum, in folio, \&c.

He ought not to be confounded with George KerRenius, another learned phyfician and naturaliit, who was born at Stettin, and died in 1660; and alfo wrote feveral works which are efteemed.

KIRTLE, a term ufed for a fhort jacket ; alfo for a quantity of flax about a hundred weight.
KIRTON, or Kiriton, a town of Lincolufhire, 15 t miles from London. It had its name from its kirk or church, which is truly magnificent. It has a market and two fairs. This place is famous for the pippin, which, when grafied on its flock, is called the renet. It gives names to its hundreds, in which are four villages of the fame name.

KISSER, the ancient Colonid Affuras in Africa, as appears from many infcriptions till to be met with in the place. Here is a triumphal arch done in a very good tafte: there is alio a fmall temple of a fquare figure, having feveral inftruments of facrifice rarved upon it; but the execution is much inferior to the defign, which is very curious. The town is fituated in the kingdom of Tunis, on the declivity of a hill, above a large fertile plain; which is ftill called the plain of Surfo, probably from its ancient name $A f$ juras.

KISSING, by way of falutation, or as a token of refpect, has been practifed in all nations. The Roman emperors faluted their principal officers by a kifs. Kiffing the mouth or the eyes was the ufual compliment upon any promotion or happy event. Soldiers kiffed the general's hand when he quitted his joffice. Fathers, amongt the Romans, had to much delicacy, that they never embraced their wives in the prefence of their danghters. Near relations were allowed to kifs their female kindred on the mouth : but this was done in order to know whether they fmelt of wine or not ; becaufe the Roman ladies, in ipite of a prohibition to the contrary, were found fometimes to have made too free with the juice of the grape. Slaves kiffed their: malters hand, who ufed to hold it out to them for that purpofe. Kifing was a cuftomary mode of falutation amongft the Jews, as we may collect from the circumilance of Judas approaching his Matter with a kifs. Relations ufed to kifs their kindred whea dying, and when dead ; when dying, out of a Itrange opinion that they fhould imbibe the departing foul; and when dead, by way of valediEtory ceremony. They even kiffed the corpfe after it was conveyed to the pile; when it lad been feven or eight days dead.

KISTI, an Aliatic nation, which extends from the higheft ridge of Cancafus, along the Sundfha rivulets. According to Major Rennel*, they are bounded to "Mencir the well by the little Cabarda, to the eatt by the Tar- of a map of tars and Lefguis, and to the fouth by the Lefguis comprecencricd and Georgians. He imagines they may be the people betzeecen ibe whom Gaerber calls the Taulinzi, i.t. "mountaineers," Biack Sea and to whom he attributes the following ftrange cu- and the Cof flom :-"When a guct or Atanger connes to lodge ${ }^{\text {fizan. }}$ with them, one of the hoft's daughters is obliged to

## $\begin{array}{lllll}\mathrm{K} & \mathrm{S} & {[474]} & \mathrm{K} & \mathrm{I} \\ \mathrm{T}\end{array}$

Eini. receive lim, to unfaddle and feed his horfe, take care of his baggage, prepare his dinner, pafs the night with him, and continue at his difpofal during his flay. At his departure, fhe faddles his horfe and packs up his baggage. It would be very uncourtly to refufe any of thefe marks of hofpitality." The different tribes of this rellefs and turbulent nation are gencrally at variance with each other, and with all their neighbours. Their dialects have no analogy with any known language, and their hiftory and origin are at prefent utterly unknown.

Their diftricts, as enumerated in Majar Rennel's Memoir, are, I. Ingufhi, about 60 milcs to the fouthward of Mofdok, in the high mountains about the Kumbelec. 2. Endery ; and, 3. Axai, on a low ridge between the Sundha and Iaxai rivers. In thcir territories are the hotwells. 4. Ackinyurt, towards the upper part of the Sundtha and Kumbelei. 5. Ardakli, on the Rofhni that joins the Sundfa. 6. Wapi, near the Olletin village Thim, towards the fource of the Terek. 7. Anguht, on the upper part of the Kumbelei. 8. Shalkha, called by the Ruffians Maloi Angubbt. 9. Thetfhen, on the lower part of the Argun river. 10. Atakhi, a fmall dittrict on the upper part of the Argun. 11. Kulga, or Dhanti, in the high mountains. 12. Galgai, or Halha, about the fource of the Afai, a Sundfha rivulet. 13. Thabrilo, and Shabul, on the Sundfha. 14. Thimni-Kabul, on the Rofhni, a Sundfha rivulet. 15. Karaboulak, a wandering tribe, who have their little villages about the fix uppermoft rivulets of the Sunfla, particularly the Fortan. 16. Meelti, Meredhhi, Galafhka, and Duban, are fmall tribes on the Axai.
The Ingufhi, or firft of the above tribes, fubmitted to Ruffia in 1770. They are capable of arming about 5000 men; they call themfelves Ingu/hi, Kiffi, or Halba; they live in villages near each other, containing about 20 or 30 houfes; are diligent hufbandmen, and rich in cattle. Many of their villages have a flone tower, which ferves in time of war as a retreat to their women and children, and as a magazine for their effects. Thefe people are all armed, and have the cuftom of wearing finields.-Their religion is very fimple, but has fome traces of Chrittianity: They believe in one God, whom they call Daile, but have no faints or reIigious perfons; they celebrate Sunday, not by any religious ceremony, but by refting from labour ; they have a fat in fring, and another in fummer; they obferve no ceremonies either at births or dearhs; they allow of polygamy, and eat pork. One kiad of facrifice is ufual among them : at certain times a fheep is killed by a perfon who feems to be confideted as a kind of prieft, as he is obliged to live in a ftate of celibacy. His habitation is in the mountains, near an old Atone church, which is faid to be adorned with various ftatues and infcriptions. Under the church is a vault that contains certain old books, which, however, 0 one ever attempts to approach. Mr Guldenflaedt $\dagger$ was prevented by the weather from vifiting this clurch.
by them to the whole Kifti nation. The chief village of Thetflen lies on the Argut, about 85 miles from its mouth. Its other principal villages are Hadhiaul and Iangejent, both on the Sundiha.

KIT, in mufic, the name of a fmall viulin of fuch form and dimention as to be capable of being carried in a cafe or fheath in the pocket. Its length, mea. furing from the extremities, is aoout 16 inches, and that of the bow about 19. Small as this inftrument is, its powers are coextenfive with thofe of the violin.

Kit-Kat Club, an afociation of above 30 noblemen and gentlemen of diftinguifhed inerit, formed in 1703, purely to unite their zeal in favour of the Proteflant fucceffion in the houfe of Hanover. Their name was derived from Chriftopher Kat, a paftrÿ-cook, near the tavern where they met in King's-ftreet, Weftminfler, who often fupplied them with tarts. Old Jacob Tonfon was their bookfcleer; and that family is in poffeffion of a picture of the original members of this famous club, painted by Sir Godfrey Kneller. The defign of thefe gentlemen was to recommend and encourage true loyalty by the powerful influence of wit and humour ; and Sir Samucl Garth diltinguifhed himfelf by the extempore epigrams he made on their toaft, which were infcribed on their drinking glaffes.

K1TCHEN, the room in a houfe where the provifions are cooked.

Army Kitchen, is a fpace of about 16 or 18 feet diameter, with a ditch furrounding it thrce feet wide; the oppofite bank of which ferves as a feat for the men who drefs the victuals. The kitchens of the flank companies are contiguous to the outline of the camp; and the intermediate fpace is generally dillributed equilly for the remaining kitchens; and as each tent forms a mefs, each kitchen muft have as many fire-places as there arc tents in the company.

Kitchen-Garden, a piece of ground laid out for the cultivation of fruit, herbs, pulf, and other vegetables, ufed in the kitchen.

A kitchen-garden ought to be fituated on one fide of the houfe, near the fables, from whence the dung may be eafily conveyed into it ; and after having built the wall, borders thould be made under them; which, according to Miller, ought to be eight or ten feet broad; upon thofe borders expofed to the fouth, many forts of early plants may be fown; and upon thofe. expofed to the north, you may have fome late crops, taking care not to plant any fort of deep-rooting plants, efpecially beans and peafe, too near the fruittrees. You fhould next proceed to divide the ground into quarters; the bell figures for thefe is a fquare or an oblong, if the ground will admit of it ; otherwif they may be of that thape which will be mott advan tageous to the ground : the fize of thefe quarters frould be proportioned to that of the garden; if they are too fmall, your ground will be loft in walks, and the quarters being inclofed by efpaliers of fruit-trees, the plants will draw up flender, for want of a more open expofurc. The walks thould alfo be proportioned to the fize of the ground: thefe in a mall garden Phould be fix feet broad, but in a large one ten; and on each fide of the walk there fhould be allowed a horder three or four feet wide between it and the efpalier; and in theic borders may be fown fome fmall falads, or any other herbs that do not take deep root

## K L E [ 475] K N A

or continue long; but thefe quarters fhould not be fown or planted with the fame crop two years together. In one of thefe quarters, fituated neareft to the ftables, and beft defended from the cold winds, fhould be the hot-beds, for early cucumbers, melons, \&c. and to thefe there fhould be a paffage from the flables, and a gate through which a fmall cart may enter. The moft important points of general culture confit in well digging and manuring the foil; and giving a proper diflance to each plant, according to their different growths: as alfo in keeping them clear from weeds; for which purpofe, you fhould always obferve to keep your dung-hills clear from them, otherwife their feeds will be conflantly brought in and fpread with the dung.

KITE, in ornithology. See Falco, fp. 8.

KIUN-tcheou-fou. See Hat-Nan.
KLEINPOVIA, in botany: A genus of the decandria order, belonging to the gynandria clafs of plants; and in the natural method ranking under the 3 3th order, Columnifere. The calyx is pentaphyllous; the petals five; the nectarium campanulated and pedunculated, containing the ftamina; the capfule is inflated and five-feeded.

KLEIST (Edward Chriftian de), a celebrated German poct, and a foldier of diftinguifhed bravery, was born at Zeblin, in Pomerania, in 1715 . At nine years of age he was fent to purfue his fudies at Cron in Poland ; and he afterwards fudied at Dantzick and Koningtberg. Having finifhed his Itudies, he went to vifit his relations in Denmark, who invited him to fettle there; and laving in vain endeavoured to obtain preferment in the law, at 21 years of age accepted of a poft in the Danifh army. He then applied himfelf to the fludy of all the fcienees that have a relation to military affairs, with the fame affiduity as he had before fludied civil law. In 1740, at the beginning of the reign of Frederic king of Pruffia, Mr de Kleif went to Berlin, and was prefented to his najeifty, who made him lieutenant of his brother prince Henry's regiment; and he was in all the campaigns which diftinguifhed the fire firt ycars of the king of Pruffia's reign. In 1749 he obtained the polt of captain; and in that year publifhed his excellent puem on the Spring. Before the breaking out of the laf war, the king chofe him, with fome other ufficers at Potidam, companion to the young prince Fredetic. William of Pruffia, and to eat at his table. In the fill campaign, in :756, he was nominated major of Haufen's regiment ; which being in garrifon at Ieeipfic, he had time to finih feveral rew poems. After the battle of Rofbach, the king gave him, by an order in his own hand-writting, the infpection of the grcat hofpital eflablifhed at Leipfic. And on this occafion has humanity was celebrated by the fick and wounded of both parties, and his difintereftedncfs was equally admired by all the inhabitants of that city. In 1758 , Prince Henry coming to Leipfic, Mr Kleift defired to ferve in his army with the regiment of Haufen, which was readily granted. Opportunities of diftinguifhing liminfelf could not be wanting under that great officer, and he always communicated his courage to the battalion under his command. He alfo
ferved that prince at the beginning of the campaign of 1759, when he was with him in Franconia, and in ail the expeditions of that army, till he was detached with the troops under general de Fink to join the king's army. On the t 2 th of Angult was fought the bloody battle of Kunerfdorf, in which he fell. He attacked the flank of the Ruffians, and affifted in gaining three batteries. In thefe bloody attacks he received twelve contufions ; and the two firt fingers of his right hand being wounded, he was forced to hold his fword in the left. His poft of major obliged bim to remain behind the ranks; but he no fooner perceived the commander of the battalion wounded and carried away, than he inflantly put himfelf at the head of his troop. He led his battalion in the midft of the terrible fire of the enemy's artillery, againft the fourth battery. He called up the colours of the regiment; and, taking an enfign by the arm, led him on. Here he reccived a ball in his left arm; when, being no longer able to hold bis fword in his left hand, he took it again in the right, and leld it with the two laft fingers and his thumb. He till pufhed forward, and was within thirty fleps of the battery, when his right leg was thattered by the wadding of one of the great guns; and he fell from his horfe, crying to his men, "My boys, don't abandon your king." By the affitance of thofe who furrounded him, he endeavoured twice to remount his horfe; but his frength forfook him, and he fainted. He was then casried behind the line; where a furgeon, attempting to drefs his wounds, was fhot dead. The Coflacs arriving foon after, Aripped Mr Kleif naked, and threw him into a mirey place; where fome Ruffian huffars fornd hin in the night, and laid him upon fome ftraw near the fire of the grand guard, covered him with a cloak, put a hat on his head, and gave him fome bread and water. In the morning one of them offered him a piece of filver, which he refufed; on which be toffed it upon the cloak that covered him, and then departed with his companions. Soon after the Coffacs returned, and took all that the generous huffars had given him. Thus he again lay naked on the earth; and in that cruel fituation continued till noon, when he was known by a Ruffian officer, who caufed him to be conveyed in a waggon to Frankfort on the Oder; where he arrived in the evening, in a very weak flate, and was in. fantly put into the hands of the furgeons. But the fractured bones feparating, broke an artery, and he died by the lofs of blood. The city of Frankfort being then in the hands of the enemy, they buried this Pruffian hero with all military honours : the governor, a great number of the Ruffian officers, the magiftrate 3 of the city, with the profeffors and the Audents, formed the proceffion, preceded by the funeral mufic. Mr Kleift's poems, which are greatly admired, are elegantly printed in the German tongue, in 2 volumes 8 vo .

KNARESBOROUGH, a town in the Weft Riding of Yorkhire in England, 199 miles, from London, is an ancient borough by prefcription, called by foreigners the Yorkbite Spazw. It is almont encompaffed by the river Nid, which iffues from the bottom of Craven-hills; and had a priory, with a caftle, long fince demolifhed, on a eraggy rock, whence it took the name. The town is about three furlongs in length;

# K N E 

Knapdale and the parifh is famous for four medicinal fprings near each other, and yet of different qualities. 1. The
fweet \{paw, or vitriolic well, in Knarefborough foreft, three miles from the town, which was difcovered in 1620. 2. The itin\}ring, or fulphureous fpaw, which is ufed only in bathing. 3 . St Mungo's, a cold bath, four miles from the town. 4. The dropping-well, which is in the town, ${ }^{2}$ and the moth noted petrifying fpring in England, fo called by reafon of its dropping from the foongy rock hanging over it. The ground which receives it, before it joins the well, is, for 12 yards long, become a folid rock. From the well it mans into the Nid, where the fpring water has made a rock that Aretches fome yards into the river. The adjacent fields are noted for liquorice, and a foft yellow marle, which is rich manure. The town is governed by a bailiff. Its baths are not fo much frequented fince Scarborough Spaw came in vogue. It has a goud market and fix fairs. Here is a fone bridge over the river, near one end of which is a cell dug out of the rock, and cailcd St Rolert's cbapel.

KNAPDALE, one of the divifions of Argylefhire in Scotland. It is parted from Cowal on the ealt hy Lochlyn, borders with Kintyre on the Couth, with Lorn on the north, by Braidalbin on the narthealt, and on the well by the Hebrides. Its length from nortl to fouth does not exceed 20 miles, and the breadth in fome places may amount to 13 . It is joined to Kintyre by a neck of land not above a mile broad, over which the country pcople draw their boats, to avoid failing round Kintyre. This part of Knapdale abounds with lakes, fome of them containing litthe iflands, on which there are caftes belonging to different proprictors. The grounds axe more adapted for pallurage than grain; but that on the fide of Lochow is fruitful in both.

KNAPSACK, in a military fenfe, a rough leather bag which a foldier carries on his back, and which contains all his neceffaries. Square knapfacks are moft convenient; and thonld be made with a divifion to hold the fooes, black-ball and bruthes, feparate from the linen. White goat-fkins are the beft.

KNAVE, an old Saxon wurd, which had at firf a fenfe of fimplicity and innocence, for it fignified a boy: Sax. cnapa, whence a knave-cbill, i. e. a boy, dittinguifhed from a girl, in feveral old writers; afterwards it was taken for a fervant-boy, and at length for any fervant-man. Alfo it was applied to a minifter or officer that bore the mield or weapon of his fuperior ; as feld-knapa, whom the Latins call armiger, and the French efcuyer, 14 Edw. III. c. 3. And it was fometimes of old made ufe of as a titular addition; as Foannes C. filius WillielmiC. de Derly, knave, \&cc 22 Hen. V II. c. 37. The word is now perverted to the hardeft meaning, viz. a falfe deceitful felloru.

KNAVESHIP, in Scots law, one of the names of the fmall duties payable in thirlage to the miller's [ervants, called fequels.

KNAUTIA, in botany : A genus of the monogynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the $4^{\text {sth }}$ order, Aggregatic. The common calyx is oblong, fimple, quinqueflorous; the proper one fimple, fuperior; the forets irregular ; the rece ptacle naked.

KNEE, in anatomy, the articulation of the thigh and leg bones. See Anatomy, $n^{\circ} 52 \cdot$

Knee, in a hip, a crooked piece of timber; having two branches or arms, and generally ufed to connect the beams of a fhip with her fides or timbers.

The branches of the knees form an angle of greater or fmaller extent, according to the matual fituation of the pieces which they are defigned to unite. One branch is fecurely bolted to one of the deck-beam? whilt the other is in the fame manuer attacher to a correfponding timber in the fhip's lide, as reprefented by E in the plate of Midship. Frame.

Befides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the ftrength and folidity of the fhip, in the different parts of her frame to which they are bolted; and thereby enable her with greater firmnefs to refilt the effects of a turbulent fea.

In fixing of there pieces, it is occafionally neceffary to give an oblique direction to the vertical or fide branch, in order to avoid the range of an adjacent gunport, or becaufe the knee may be fo fhaped as to require this difpofition; it being fometimes difficult to procure fo great a variety of knees as may be neceffary in the conftruction of a number of hips of war.

In France, the fcarcity of thefe pieces has obliged their hip-wrights frequemly to form their knees of iron.

Knees are either faid to be lodging or banging. The former are fixed horizontally in the thip's frame, having one arm bolted to the beam, and the other acrofs two or three timbers, as reprefented in the Deck, Plate CI,VI. The latter are fixed vertically, as we-have defcribed above. See allo Ship-Building, Deck, and Midship Frame.

KNEE of the Head, a large flat piece of timber, fixed edgeways upon the fore-part of a hip's ftem, and fupporting the ornamental figure or image placed under the bowfprit. See Ship-Building.

The knee of the bead, which may propesly be defined a continuation of the flem, as being prolonged from the ftem forwards, is extremely broad at the upper-part, and accordingly compofed of feveral pieces united into one, YY (Pieces of the Hull, in Ship-Building Plates). It is let into the head, and fecured to the fhip's bows by Arong knees fixed horizontally upon both, and called the cheeks of the bead. The heel of it is fcarfed to the upper-end of the fore foot: and it is faftened to the ftem above by a knee, called a flandard, expreffed by $\&$ in the plate.

Befides fuporting the figure of the head, this piece is otherwife ufeful, as ferving to fecure the boom or bumkin, by which the fore-tack is extended to windward; and by its great breadth, preventing the thip from falling to leeward when clofe-hauled to much as fhe would otherwife do. It alfo affords a greater fecurity to the bowiprit, by increafing the angle of the bob-llay, fo as to make it act more perpendicularly on the bowfprit.

The knee of the bead is a phrale peculiar to mip-. wrights; as this piece is always called the cut-water by feamen, if we except a few, who, affecting to be wifer than their brethren, have adop:ed this expreffion probably on the prefumption that the other is a cancphrafe or vulgarifm.

Carling KNEES, in a fhip, thofe timbers which extend from the fhip to the hatch-way, and bear up the deck on both fides.

KNELLER

KNELLER (Sir Godfrey), a painter, whofe fame is well eflablifhed in thefe kingdons. He was born at Lubeck in 16d8; and receised his firit intruetions in the fohcol of Rembrant, but became afterwards a difeiple of Ferdinand Bol. When he had gained as much knowledge as that fchool afforded him, he travelked to Rome, where he fixed his parricular attention on Titian and the Caraccio. He afterwards vifited Venice, and diftinguiflatd himfelf fo (ffectually in that city by his hiftorical pictures and portraits of the noble families there, that his reputation became confiderable in Italy. By the advice of fome friends he canne at lath to England, where it was his good fortume to gain the favour of the duke of Monmouth : by his recommerdation, he drew the picture of King Charles 15. more than once ; who was fo taken with his fill in doing it, that he ufed to come and fit to him at his loufe in Covent-garden piazza. The Death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly eftabinfled. No painter could have more inceffant employment, and no painier could be miore dittinguihed by public honour. He was itate-painter to Charles II. James II. William III. Queen Anne, and George I. equally eileemed and relpected by them all : the Emperor Leopold made hin a kniglt of the Roman empire, and King George I. created him a haronet. Moft of the nobility and gentry had their likeneffes taken by him, and no painter excelled him in a fure outline, or in the graceful difpofition of his figures: his works were celcbrated by the bell potts in his time. He built himfelf an elegant houfe at Whitton near Hampton-court, where he fpent the latter part of his life; and died in 1726 .

KNiFE is a weli-known inftrument, made for cutting, and adapted in form to the ufes for which it is de figned.

IKinves are faid to have been firf made in England in 1563 , by one Mathews, on Fleet-bridge, London. The importation of all forts of knives is prohibited.

KNIGHT (eques), among the Romans, a perfon of the fecond degree of nobility, following immediately that of the fenators. See E〇UESTRIAN Order, and Ecuites.

Knight, or Cnecht (Germ), in feodal hitory, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privileges of bearing arms.

The pafion for arms among the Germanic flates, as defcribed by Dr Stuart *, was carried to extremity. It was amidt feenes of death and peril that the young were ciucated: It was by valour and feats of prowefs that the ambiticus fignalized their manhood. All the bonours they knew were alloted to the brave. The fword opened the path to glory. It was in the field that the ingenious and the noble flattered moit their pride, and acquired an afcendancy. The Itrength of their bodies, and the vigour of their comiels, furrounded them with warriors, and lifted them to command.

But, among thefe nations, when the individual felt the call of valour, and wifhed to try his theleth againt din enemy, he could not of his own authority take the lance and the javelin. The admifion of their
youth to the privilege of bearing arms, was a matter of too much importance to be left to chance or their own choice. A form was invented $t y$ which they were advanced to that honour.

The conncil of the diftrict, or of the canton to which the candidate belonged, was affembled. His age and his qualifications were inquired into; and if he was deemed worthy of buing admitied to the privileges of a foldier, a chieftain, his father or one of his kincied adorned him with a flield and the lance. In confequence of this folemnity, he prepared to dillinguifh himfelf; his mind opened to the cares of the public; and the domeflic concerns, or the offices of the family from which he had fyung, were no langer the objets of lis attention. To this ceremony, fo fimple and fo interelling, the inftitution of knighthood is indebred for its rife.

Knighthood, however, as a fyeftm, known under the denomination of Chivalry, is to be dated only from the 1ith century. All Europe being reduced to a flate of anarchy and confufion on the decline of the honfe of Chariemagne, every proprietor of a manor or lordnip became a petty fovereign; the manfionhoufe was fortified by a moat, defended by a guard, and called a cafle. The governor had a party of 700 or 800 men at his command; and with thefe he ufed frequently to make excurfions, which commonly ended in a battle with the lord of fome petty fate of the fame kind, whofe caftle was then pillaged, and the women and treafures borne off by the conqueror. Dusring this flate of univerfal hoftility, there was no friend$1 y$ communications between the provinces, nor any high roads from one part of the kingdom to another : the wealthy traders, who then travelled from place to place with their merchandife and their families, were in perpetual danger ; the lord of almoft every caftle extorted fomething from them on the road; and at lait, fome one more rapacious than the reft, feized upon the whole of the cargo, and bore off the women for his own ufe.

Thus cafles became the warehoufes of all kinds of rich merchandife, and the prifons of the diftrelfed females whofe fathers or lovers had been plundered or flain, and who being therefore feldom difpofed to take the thief or murderer into favour, were in contio unal danger of a rape.

But as fome are always diftinguifhed by virtue in the moft general defection, it happened that many lords infenfibly aflociated to reprefs thefe fallies of violence and rapine, to fecure property, and protect the ladics. Among thefe were many lords of great fiefs and the aflociation was at length ftrengthened by a folemn vow, and received the fanction of a religious ceremony. As the firlt knights were men of the highefl rank, and the largeft poffffions, fuch having mof to lofe, and the leaft temptation to fteal, the fraternity was regarded with a kind of reverence, even by thofe againt whom it was formed. Admiffion into the order was deemed the higheft honour; many extrandinary qualifications were required in a candidate, and many dew ceremonies were added at his creation, After having fated from fun-ife, confeffed himfelf, and received the facrament. he was dreffed in a white tunic, and placell by himfelf at a fide-table, where he was neither to fpeak, to froile, nor to eat ; while the
knigbts

## K N I $\quad[478] \quad$ K N I

Knight. knights and ladies, who wcre to perform the principal parts of the ceremony, were eating, drinking, and making merry at the great table. At night his armour was conveyed to the church where the ceremony was performed; and here having watched it till the morning, he advanced with his fword hanging about his neck, and received the benediction of the priff. He then kneeled down before the lady who was to put on his armour, who bcing affited by perfons of the firlt rank, buckled on lis fpurs, put an helmet on his head, and accoutred him with a coat of mail, a cuirafs, bracelets, cuiffes, and gaunt!ets.

Being thus armed cap-a-pee, the knight who dubbed him fruck him three times over the fhoulder with the flat fide of his fword, in the name of God, St Michael, and St George. He was then obliged to watch all night in all his armour, with hiy fword girded, and his lance in his hand. From this time the knight devoted himfelf to the redrefs of thofe wrongs which "patient merit of the unworthy takes;" to fteure merchants from the rapacious cruely of banditti, and women from ravifhers, to whofe power they were, by the particular confufion of the times, continually expored.

From this view of the origin of chivalry, it will he eafy to account for the caftle, the moat, and the bridge, which are found in romances; and as to the dwarf, he was a conftant appendage to the rank and fortune of thofe times, and no caftle therefore could be without him. The dwarf and the buffoon were then introduced to kill time, as the card table is at prefent. It will alfo be eafy to account for the multitude of captive ladies whom the knights, upon Cizing a cafte, fet at liberty; and for the prodigious quantities of uftefg gold and filver veffels, rich ftuffs, and other merchandife, with which many apartments in thefe caftles are faid to have been filled.

The principal lords who entered into the confraternity of knights, ufed to fend their fons to eachsother to be educated, far from their parents, in the myftery. of chivalry. Thefe youths, before they arrived at the age of 21, were called bachclors, or bas chevaliers, inferior knights, and at that age were qualified to receive the order.

So honourable was the origin of an inflitution, commonly confidered as the refult of caprice and the fource of extravagance; but which, on the contrary, rofe naturally from the fate of fociety in thofe times, and had a very ferious effect in refining the manners of the European nations. Valour, humanity, courtefy, juftice, honour, were its characteritics: and to thefe were added religion; which, by infufing a large portion of enthufiaftic zeal, carried them all to a romantic excefs, wonderfully fuited to the genius of the age, -and productive of the greateft and moft permanent effeets both upon policy and manners. War was carried on with lefs ferocity, when humanity, no lefs than courage, came to be deemed the ornament of knighthood, and knighthood a diftinction fuperior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polifed manners were introduced, when ccurtefy was recommended as the moll amiable of knightly virtues, and every knight devoted himfelf to the fervice of a lady : violence and oppreffion decreafed, when it was
accounted meritorious to check and to punih them: $\mathrm{K}_{\mathrm{n}}$ a fcrupulous adherence to truth, with the moft reli- -gious attention to fulfil every engagement, but particularly thofe between the fexcs as more eafily violated, became the diftinguifhing character of a gentleman, becaufe chivalry was regarded as the fchool of honour, and inculcated the'moft delicate fenfibility with refpet to that point; and valour, feconded by fo many motives of love, religion, and virtue, became altogether irrefifible.
That the fpirit of chivalry fomctimes rofe to an ex. travagant height, and had often a pernicious tendency, mut however be allowed. In Spain, under the infuence of a romantic gallantry, it gave birth to a ferice of wild adventures which have been defervedly ridiculed : in the train of Norman ambition, it extinguihed the liberties of England, and deluged Italy in blood; and at the call of fuperltition, and as the engine of papal power, it defolated Afia under the banner of the crofs. But thefe ought not to be confidered as argu: ments againft an inftitution laudable in itfelf, and neceflary at the time of its foundation: and thofe who pretend to defpife it, the advocates of ancient barba. rifm and ancient rulticity, ought to remember, that chivalry not only firft taught mankind to carry the civilities of peace into the operations of war, and to mingle politenefs with the ufe of the fword; but roufod the foul from its lethargy, invigorated the human character even while it foftened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleafure, to the intercourfe of life, by making woman a more effential part of fociety : and is therefore intitled to our gratitude, though the point of honour, and the refinements in gallantry, its more doubtful effects, fhould be excluded from the improvement of modern manners. For,
To illuftrate this topic more particularly, we may oblerve, that women, among the ancient Greeks and Romans, feem to have been confidered merely as objeis of fenfuality, or of domeltic conveniency: they were devoted to a flate of feclufion and obfcurity, had few attentions paid them, and were permitted to take as little thare in the converfation as in the general commerce of life. But the northern nations, who paid a kind of devotion to the fofter fex, cren in their native forefts, had no fooner fettled themfelves in the provinces of the Roman empire, than the female character began to affume new confequence. Thofe fierce barbarians, who feemed to thirt only for blood, who involved in one undiftinguifhing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the refpecfful gallantry of the north, which had power even to reltrain their favage ferocity; and they introduced into the welt of Europe a generofity of fentiment, and a complaifance toward the ladies, to which the mot polifhed nations of antiquity were frangers.- Thefe fentiments of generous gallantry were foftered by the inftitution of chivalry, which lifted woman yet higher in the fcale of life. Inttead of being nobody in fociety, the became is primum mobile. Every knight devoting himfelf to danger, declared himfelf the humble fervant of
fome

## K N I

h. fome lady, and that lady was often the object of his love. Her honour was fuppofed to be intimately connected with his, and her fmile was the reward of his valour: for her he attacked, for her he defended, and for her he fhed his blood. Courage, animated by fo powerful a motive, loft fight of every thing but enterprife: incredible zoils were cheerfully endured, incredible actions were performed, and adventures feemingIy fabuluns were more than realifed. The effect was reciptocal. Women, proud of their influence, became worthy of the heroifm which they had infpired: they were not to be approached but by the liigh-minded and the brave; and men then could only be admitted to the bofom of the chatte fair, after proving their fidelity and affection by years of perfeverance and of peril.

Again, as to the change which took place in the operations of war, it may be oblerved, that the perfect hero of autiquity was fuperior to fear, but he made ufe of every artifice to annoy his enemy: impelled by animofity and hoftile paflion, like the favage in the American woods, he was only anxious of attaining his end, without regarding whether frand or force were the means. But the true knight or modern hero of the middle ages, who feems in all his rencounters to have had his eye on the judicial combat or judgment of God, had an equal contempt for ftratagem and danger. He difdained to take advantage of lis enemy: he defired only to fee him, and to combat him upon equal terms, trufling that heaven would declare in behalf of the jult ; and as he profeffed only to vindicate the caufe of religion, of injured beauty, or oppriffed innocence, he was further confirmed in this enthufialic opinion by his own heated imagination. Strongly perfuaded that the decifion mult be in his favour, he fought as if under the influence of divine infpiration racher than of military ardour. Thus the fyften of chivalry, by a fingular
combination of manners, blended the heroic and fanc-: Kaighr. tified characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the ladies.

Chivalry flourifled moft during the time of the croifades. From thefe holy wars it followed, that new fraternities of knighthood were invented: hence the krights of the Hóly Sepulchre, the Hofpitallers, Templars, and an infinite number of religious orders. Various other orders were at length inflituted by fovereign princes: the Garter, by Edward 1II. of England; the Golden Fleece, by Philip the Good, duke of Burgundy: and St Michael, by Louis XI. of France. From this time ancient chivalry declined to an empty name; when fovereign princes eflablifhed regular companies in their armies, kuights-bannereta were no more, though it was Aill thought an honour to be dubbed by a great prince or vietorious hero: and all who profeffed arms without knighthood alfumed the title of $c$ fquire.

There is farce a prince in Europe that has not thought fit to inltitute an order of knighthood; and the fimple title of knight, which the kings of Britain confer on private fubjects, is a derivation from ancient chivalry, although very remote from its fource. See Knight-B.achelos.

Knight-Service (fervitum militare, and in law French chivalry); a fpecies of Tenure, the origia and nature of which are explaiued under the articles Chitalry, and Frodal Syfem, no 13 - 21 .

The knights produced by this tenure differed moof effentially from the knights defcribed in the preceding article; though the difference feems not to have been accurately attended to by authors (A). The one clafs of knights was of a high antiquity; the other was not heard of till the invention of a fee. The adorning with arms and the blow of the
fword
(A) "The terms knight and cbivalcr (Dr Stuart * obferves), denoted both the knight of honour and . Vieru of: knigbt of tenure; and chivalry was ufed to exprefs both knighthood and knigbt-fervice. Hence, it has proceeded, Socicty in that thefe perfons and thefe fates have been confounded. Yet the marks of their difference are fo Arong and E . $3+6$ pe, pointed, that one muft wonder that writers flould mittake them. It is not, however, mean and common ${ }^{\text {p. }} 3 \psi^{6}$. compilers only who have been deceived. Sir Edward Coke, notwithttanding his diftinguifhing head, is of this number. When eltimating the value of the knight's See at L. 20 per annum, he appeals to the flatute de militibus, an. I Ed. 1I. and, by the fenfe of his illuttration, he conceives, that the knights alluded to there were the fame with the poffeffors of knight's fees: and they, no doubt, had knight's fees; but a knight's fee might be enjoped not only by the tenants in capite of the crown, but by the tenants of a vaffal, or by the tenants of a fub-vaflal. Now, to thefe the ftatute makes no allufion. It did not mean oo annex knighthood to every land-holder in the kingdom who had a knight's fee; but to encourage arms, by requiring the tenants in capite of the crown to take to them the dignity. He thus confounds knighthood and the knight's fee. Core on Littleton, p. 6 g .
" If I am not deceived, Sir William Blackfone has fallen into the fame mittake, and has added to it. Speaking of the knights of honour, or the equites aurati from the gilt fpurs they wore, he thus expreffes himfelf: "They are alfo called, in our law, milites, becaufe they formed a part, or indeed the whole, of the royal

- army, in virtue of their feodal tenures; one condition of which was, that every one who held a knight's
- fee (which in Henry II.'s time amounted to L. 20 per annum), was obliged to be knighted, and attend the
- king in his wars, or fined for his noncompliance. The exertion of this prerogative, as an expedient to raife
- money, in the ieign of Charles I. gave great offence, though warranted by law, and the recent example of
- Quecen Elizabeth: but it was, at the reftoration, together with all other military branches of the feodal law, - abolifhed ; and this kind of knighthood has fince that time fallen ioto great difrepute.' Book I. ch. 12 .
"After what has been faid, I need hardly obferve, thar this learned and able writer has confounded the Inight of honour and the knight of tenure; and that the requifition to take knighthood was not made to everypulfetor of a knight's fee, but to the terants of kuight's fees held in capite of the crown, who had merely a
fufficiency:

## K N I

finight. Iword made the act of the creation of the ancient knight ; the new knight was conftituted by an inveftment in a piece of land. The former was the member of an order of dignity which had particular privileges and diftinctions; the latter was the receiver of a feudal grant. Knighthood was an honour ; knightfervice a tenure. The firf communicated fplendor to an army; the laft gave it Arength and numbers. The knight of honour might ferve in any ftation whatever; the knight of tenure was in the rank of a Col-dier.-It is true at the fame time, that every noble and baron were knights of tenure, as they held their lands by knight-fervice. But the number of fees they poffeffed, and their creation into rank, feparated them widely from the fimple individuals to whom they gave out grants of their lands, and who were merely the knights of tenure. It is no lefs truc, that the fovereign, without conferring nobility, might give even a fingle fee to a tenant; and fuch vaffals in capite of the crown, as well as the vaffals of fingle fees from a fub. ject, were the mere knights of tenure. But the former, in refpect of their holding from the crown, were to be called to take upon themfelves the knighthood of honour; a condition in which they might rife from the ranks, and be promoted to offices and coinmand. And as to the valfals in capite of the crown who had many fees, their wealth of itfelf fufficiently diftinguined them beyond the fate of the mere knights of tenure. In fact, they poffeffed an authority over men who were of this lat defription; for, in proportion to their lands were the fees they gave out and the knights they commanded.

By the tenure of knight-fervice, the greatef part of the lands in England were holden, and that principally of the king in capite, till the middle of the lant century; and which was created, as Sir Edward Coke exprefsly teftifies, for a military purpofe, viz. for defence of the realm by the king's own principal fubjects, which was judged to be much better than to truft to hirelings or foreigners. 'The defcription here given is that of knight-fervice proper, which was to attend the king in his wars. There were alfo fome other fpecies of knight-fervice; fo called, though improperly, becaufe the fervice or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight-fervice proper, and becaufe they were attended with fimilar fruits and confequences. Such was the tenure by grand ferjeanty, per magnum fervitium, whereby the tenant was bound, inflead of ferving the king generally in his wars, to do fome fecial honorary fervice to the king in perfon; as to carry lis banner, his fword, or the like; or be his butler, champion, or other officer, at his coronation. It was, in moll other refpects, like knight-fervice, only he was not bound to pay aid or efcuage; and when tenant by knight-fervice lpaid five pounds for a relief on every-knight's fee, tenant by grand$\mathrm{N}^{\circ}{ }^{172}$.

## So ] K N I

Serjeanity paid one year's value of his land, were it much or little. Tenure by cornage, which was to wind a horn when the Scots or other enemics entered the land, in order to warn the king's fubjects, was (like other fervices of the fame nature) a \{pecies of grandferjeanty.
Thefe fervices, both of chivalry and grand-ferjeanty, were all perfonal, and uncertain as to their quan. tity or duration. But the perfonal attendance in knight-fervice growing troublefome and inconvenient in many refpects, the tenants found means of compounding for it, by fift fending others in their ftead, and in procefs of time making a pecuniary fatisfaction to the lords in lieu of it. This pecuniary fatisfaction at laft came to be levied by affeffiments, at fo much for every knight's fee; and therefore this kind of tenure. was called fcutagium in Latin, or fervitium fcuti; fcutum being then a well-known denomination of money: and in like manner it was called, in our Norman Frencb, efcuage; being indeed a pecuniary inftead of a military fervice. The firft time this appears to have been taken, was in the 5 Hen. II. on account of his expedition to Toloufe; but it foon came to be fo univerfal, that perfonal attendance fell quite into difufe. Hence we find in our ancient hiftories, that, from this period when our kings went to war, they levied fcutages on their tenants, that is on all the landholders of the kingdom, to defray their expences and to hire troops: and thefe affeffments in the time of Henry II. feem to have been made arbitrarily, and at the king's pleafure. Which prerogative being greatly abufed by his fucceffors, it became matter of national clamour; and King John was obliged to confent, by his magna carta, that no fcutage hould be impofed without confent of parliament. But this claufe was omitted in his fon Henry IIT.'s charter; where we only find, that fcutages or efcuage fhould be taken as they were ufed to be taken in the time of Henry II. ; that is, in a reafonable and moderate manner. Yet afterwards, by flatute 25 Edw. I. c. 5. \& 6. and many fubfequent flatutes, it was enacted, that the king Thould take no aids or tafks but by the common affent of the realm. Hence it is held in our old books, that efcuage or fcutage could rot be levied hut by confent of parliament; fuch fcutages being indeed the groundwork of all fucceeding fubfidies, and the land-tax of later times.
Since, therefore, efcuage differed from knight-fervice in nothing but as a compenfation differs from actual fervice, knight-fervice is frequently confounded with it. And thus Littleton muft be underflood, when he tells us, that tenent by homage, fealty, and efcuage, was tenant by knight-fervice : that is, that this tenure (being fubfervient to the military policy of the nation) was refpected as à tenure in chivalry. But as the actual fervice was uncertain, and depended upon emergencies, fo it was necefläry that rhis pecuniary
coin-
fufficiency to maintain the dignity, and were thence difpofed not to take it. The idea that the whole force of the royal army confifted of knights of honour, or dubbed knights, is fo extraordinary a circumftance, that it might have fhown of itfelf to this eminent writer the fource of his error. Had every foldier in the feudal army received the inveftiture of arms? could he wear a feal, furpafs in filk and defs, ufe enfigns-armorial, and enjoy all the other privileges of knighthood? But, while I hazard thefe remarks, my reader will oblerve, that it is with the greatell deference I diffent from Sir William Blackfone, whofe abilitica are the object of as mof general and deferved admiration."
compenfation fhould be cqually uncertain, and depend on the affefments of the legillature fuited to thofe emergencies. For lad the efuluge been a fettled invariable furm, payable at certain times, it had been weither more nor lefs than a mere pecuniary rent; and the tenure, inftead of kuight. fervice, would have then been of another kind, called socage.
By the degenerating of knight-fervice, or perfonal military duty, into efcuage or pecuniary affeffments, all the advantages (either promifed or real) of the feodal conlitutions were defroyed, and nothing but the hardihips remained. Inftead of forming a national militia compofed of barons, knights, and gentlemen, bound by their interet, their honour, and their oaths, to defend their king and country, the whole of this fyftem of tenures now tended to nothing elfe but a wretched mealls of railing money to pay an army of occafional mercenaries. In the mean time the families of all our wis bility and gentry groaned under the intolerable burdens which (in confequence of the fittion adopted after the conquell) were introduced and laid upon them by the fubtlety and finefie of the Norman lawyers. For, befdes the fcutages to which they were liable in defect of perfonal attendance, which, however, were afiefled by themfelves in parliament, they might be called upon by the king or lord paramount for aids, whenever his eldeft fon was to be Fuighted, or his eldell daughter married; not to forget the ranfom of his own perfon. The heir, on the death of his anceftor, if of full age, was plundered of the firft emoluments arifing from his inheritauce, by way of relief and prinerer feifin; and if under age, of the whole of his ettate during infancy. And then, as Sir Thomas Smith very feelingly complains, "when he carne to his own, after he was out of ruardhbip, his woods decayed, houfes fallen doun, flock walled and gone, lands let forth and ploughed to be barren," to make amends, he was yet to pay half a year's profits as a fine for fuing out his livery; and alfo the pice or :alue of his matriage, if he refufed fuch wife as his lurd and guarcian had battered for, and impofed upon thim; or twice that value, if he martied anether woman. Add to this, the untimely and expentive ho. nour of laighturod, to make lis porerty more completely filendid. And when, by thefe deductions, his fortune was fo thattered and ruined, that perliaps lie was obliged to fell his patrimony, he had not even that poor privilege allowed him. without paying an exobitant tine for a licence of alienatiots.
A flavery fo complicated and fo extenfive as this, called aloud for a remedy in a nation that boatted of her freedon. Palliatives were from time to time applied by fuccefive acts of parliament, which affuaged fume temporary grievances. Till at length the humanity of Kiur James I. confented, for a proper equivalent, to abolith them all, thought the plan then proceeded not to effect ; in like manuer as lie had formed a fcheme, and began to put it in execution, for removing the feodal-gievance of heritatle jurifdictions in Scutland, which lias fince been purfined and effected by the flatute 20 Geo. 11. c. 43 . King James's plan for*xchanging our military tenures fiems to lave been nearly the fame as that which has been fince purfued; only with this difference, that by way of compenfation for the lofs which the crown and other lords Tos.IX. PartII.
would futtain, an annual fee-farm rent fhould be fet- Knizhrs. tled and infeparably annexed to the crown, and aflured to the inferior lords, payable out of every knight's fee within their refpective feignories. An expedient, feemingly much better than the hereditary excife which was afterwards made the principal equivalent for thefe conceffions. For at length the military temures, with all their heavy appcndages, were deftroyed at one blow by the Itatute 12 Car. II. C. 24 . which enacts, "that the court of ward or liverie $\varepsilon_{0}$ and all wardhips, liveries, primer feifins, and oufterlemains, values and forfeitures of marriages, by reafors of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, krightts-fervice, and cicuage, and alfo aids for marrying the daughter or knighting the fon, and all tenures of the king in cas 3 ite, be likewife taken away. And that: ll forts of tenures, held of the king or others, be turned into free and common foccage; fave only tenures in frankalmoign, conyholds, and the honorary fervices (without the flavifh part) of grandferjeanty." A fatute which was a greater acquifition to the civil property of this kingdom than even magna carta itfelf: fince that only pruned the luxutiances that had grown out of the military tenures, and thereby preferved them in vigour; but the tlatute of King Charles extirpated the whole, and demolifhed both root and branches.
K'viguts-Firrant. During the prevalence of chivalry, the ardour of redrefing wrungs ieized many knights fo powerfully, that, attended by efquires, they wandered about in fearch of etjects whofe miffortunes and mifery required their affifance and fuccour. And as laoies engaged mure particularly their attention, the relief of unfortunate damfels was the atchievement they mof courted. This was the rife of knights-errant, whofe adventures procuced romance. Thefe were originally told as they happened. But the love of the narvelious came to interfere; fancy was indulged in her wildeft exaggerations; and poctry gave her charms to the mof monflous lictions, and to fcenes the moft unnatural and gigantic. See Knight.

## Kineziz-Lachelor. See Bachelor.

Finght-Baromet. See Baronet.
Kinghts of the Slive, or Knights of i'arliament, are two gentlemen of worth, chofen on the king's writ in pleno comitatu, by fuch of the frecholders of every county as can experid to s. per annum, to reprefent fach county in parliament. Thefe, when every man who held a knights.fee in oupite of the crown was cu!lomarily contrained to be a knight, were of neceffity to be milites slackio cingi, for fo the writ ruts to this day; but how cuftom admits efquires to be chofen to this office. They mult have at leat 5001 . per annum; and their expences are to be defrayed by the county, though this be feldom now required.
KNIGMt-Markal, en offcer is the king's houfchold, who has jurifdiction and cognizance of any tranf. greffion within the king's houfehuld and vurge; as alfo of contracts made there, viliereof one of the houfe is party.

Kmgrts, in a hhip, two flort thick pieces of wood, commonly carved like a man's head, having four fhivers in each, thice for the halyards, and one for the 3 P
top

Wnighe top to run in: one of them flands faft bolted on the hord, beams abaft the foremaft, and is therefore called the fore-knight; and the other, Itanding abaft the main- maft, is called the main knight.

KNIGHIHOOD, a military order or honour, or a mark or degree of ancient nobility, or reward of perfonal virtue and merit.

There are four kinds of knighthood; military, regular, honorary, and focial.

Military $K_{\text {Nighthood }}$, is that of the ancient knights, who acquired it by high feats of arms. They are called milites, in ancient charters and titles, by which they were dittongaifhed from mere bachelors, \&c. Thefe knights were girt with a fword, and a pair of gilt fpus; whence they were called equites aurati.

Inighthood is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The fons of kings, and kings themfelves, with all other fovereigus, heretofore had knighthood conferred on them as a mark of honour. They were ulually knighted at their baptifm or marriage, at their coronation, before or after a battle, \&c.

Regular KNIGHTHOOD, is applied to all military orders which profefs to wear fome particular habit, to bear arms againt the infidels, to fuccour and affilt pilgrims in their paffage to the Holy Land, and to ferve in hofpitals where they hould be received; fuch were the knights templars, and fuch ftill are the knights of Malta, \&xc.

Honorary KNIGHTMOOD, is that which princes confer on other princes, and even on their own great minifters and favourites; fuch are knights of the Garter, Batb, St Patrick, Nova Scotia, Thifte, \&cc. See thefe articles; and for a reprefentation of their different infignia, ree Plate CCLVIII.
Sociad KNIGHTHOOD, is that which is not fixed nor confirned by any formal inftitution, nor regulated by any lafting ftatutes; of which kind there have many orders been erected on occalion of factions, of tilts and tournaments, mafquerades, and the like.

The abbot Bernardo Juftiniani, at the beginning of his Hiftory of linighthood, gives us a complete catalogne of the feveral orders: according to this computation, they are in number 92. Favin has given us two volumes of them under the title of Theatre d'Honneur $\mathrm{g}_{\mathrm{o}}$ de Chevalerie. Menenius has publifhed Delicie Equeffrium Ordinum, and Andr. Mendo has written De Ordinibus Militaribus. Beloi has traced their original; and Geliot, in his Armorial Index, has given us their inftitutions. To thefe may be added, Father Mene. Arier de la Chevalerie Ancienne E' Moderne, Michieli's Trefor Militaire, Caıamuel's Theologia Regolare, Miræus's Origines Equefriun five Militarium Ordinum: but above all, Juftimian's Hiflorie Cbronologiche dell'Origine de gl Ordine Militari, e di tutte le Religione Cavalerefche; the edition which is fulleft is that of Venice in Itig2, in two vols fol.

KNIGIITLOW Hill, or Cross, which gives name to a hamlet in Warwickihire, ftands in the road from Coventry to London, at the entrance of Dunlmore-Htath. About 40 towns in this hamlet, which are ipecified by Dugdale, are obliged, on the forfeiture of 30 s . and a white bull, to pay a certain reat to the lurd of the hamlet, called wroth-money, or fovarf-penny; which muft
be depofited every Martinmas-day in the morning at Knig this crofs before fun-rife ; when the party paying it mult go thrice about the crofs, and fay the wrothmoney, and then lay it in the hole of the faid crofs before good witnefs.

KNIGHTON, a well built town of Radnorfhire in South Wales, 155 miles from London. It is pleafantly fituated on an elevation riling from a fimall river, which divided this part of Wales from Shroprhise. It carries on a confiderable trade, and has a market and a fair.

KNIGHTSBRIDGE, a villagc of Middl=fex, and the firt village from London in the great wettern road. It lies in the parifnes of St Margaret's Weftminther, and St George by Hamover-Syrare ; and has a chapel, which is neverthelefs independent. At the entrance of it from London ftands that noble infirmary for lick and wounded, called St George's Ho/pital, ereeted and maintained by the contributions of our nobility and gentry, of whom there are no lefs than 300 governors. In the centre of this village, there is a fabric lately erected, where is carried on one of the molt confiderable manufactures in England for painting floor-cloths, \&c.

KNOCTOPHER, a bornugh and market town of Ireland in the county of Kilkenny and province of Leinfter, 63 miles from Dublin. It returns two members to parliament; patronage in the families of Langrifhe and Ponlonby.

KNOLL, a term ufed in many parts of the bing. dom for the top of a fmall hill, or for the hill itfelf.

KNOLLES (Richard), was bern in Nothamptonhire, about the middle of the oth century, and educated at Oxford, after which he was appointed mafter of the free-fchool at Sandwich in Kent. He compofed Grammatica Latina, Graca, et Hebraica, compendiunn, cum radicibus, London 1606 : and fent a great number of well-grounded fcholars to the univertities. He alfo Spent 12 years in compiling a hiftory of the Turks; which was firf printed in 1610, and by which he has perpetnated his name. In the later editions it is called, The general billory of the Turks, from the frif begin. ning of that nation to the rifing of the Dttomurn family, \&xc. He died in 1610 , and this hiftery has been fince continued hy feveral hands: the belt continuation is that by Paul Ricaut conful at Smyrna, folio, Loudon 1680. Knolles wrote alfo, "The lives and conquetts of the Ottoman kings and emperors to the year $1610 ;$ " which was not printed till after his death in 1621 , to which time it was continued by another hand; and laftly, "A brief difcourfe of the greatnefs of the Turkifa empire, and wherein the greatnefs of the ftrength thereof confiteth, \&c."

KNOT, a part of a tree, from which fhoots out branches, roots, or even fruit. The ufe of the knots is, to flrengthen the Item; they ferve alfo as fearces, to filtrate, purify, and refine the juices raifed up for the nourimment of the plant.

Knots of a Rope, among feamen, are diffinguifhed into three kinds, viz. whole-knot, that made fo with the lays of a rope that it cannot flip, ferving for Theets, tacks, and floppers: bow-line knot, that fo firmly made and faftened to the cringles of the fails, that they muft break or the fail fplit before it flips:
and fheep fhank knot, that made by fhortening a rope without cutting it, which may be prefently loofened, and the rope not the worfe for it.

Knots of the Log-line, at fea, are the diviitions of it. See the article Log.

Kıot, in ornithology. See Tringa.
Knot.Grafs, or Bijfort. See Polygonum.
Knor (Edward), born in Northumberland in England, entered among the Jefuits at the age of 26 , being already in prieft's orders. This happened in the year s 606 . He taught a long time at Rome in the Englith college; and was afterwards appointed fub-prorincial of the college of Eugland, and was fent provincial thither. He was twice honoured with that employment. He was prefent as provincial at tbe general affembly of the order of the Jefuits held at Rome in 1646 , and was chofen definitor. He died in 1 K 96 . He publifhed feveral pieces; amang the reft, Mercy and Truth, or Charity maintained by the Catholics ; againt Dr Potter, who had charged the church of Rume with wanting charity, becaufe the afferts that a man cannot be faved in the Proteftant communion.

KNUTTESFORD, a town of Chehire, near the Merfey, 184 miles from London, is divided into the upper and lower towns by a rivulet called Dicken. In the former is the church; and io the latter is a chapel of eafe, the market and town houfe. It has a market and three fairs.

KNOTTINGLEY, a town in the weft riding of Yorkfhire, on the Aire near Ferrybridge, is noted for its merchandize in lime. The ftones of which it is made are dug up plentifully at Elmet, and here burnt ; from whence it is conveyed at certain feafons in great quantities to Wakefield, Sandal, and Standbridge, for fale, and fo carried into the weltern parts of the county for manure.
KNOUT, the name of a punifhment inflited in Ruffia, with a kind of whip called knout, and made of a long ftrap of leather prepared for this purpofe. With this whip the executioners dexteroully carry off a flip of Rin from the neck to the bottom of the back laid bare to the wait, and repeating their blows, in a little while rend away all the ikin off the back in parallel Atrips. In tbe common knout the criminal receives the laftes fufperded on the back of one of the executioners : but in the great knout, which is generally ufed on the fame occations as racking on the whel in France, the criminal is raifed into the air by means of a pully fixed to the gallows, and a cord faltened to the two writts tied together; a piece of wood is placed between his two $\log 5$ allo tied together; and another of a crucial form under his breat. Some times his hands are tied behind over his back; and when he is pulled up in this pofition, his thoulders are diflocated. The executioners can make, this punifhment mose or lefs cruel: and it is faid, are fo dexterous, that when a criminal is condemned to die, they can make him expire at pleafure either by one or feveral lathes.
KNUWLEDGE, is d-fined by Mr Locke to be the perceptuon of the connection and agreement or dilagreement and repugnancy of our ideas. See Metaphysics and Logic.

KNOX (Jobn), the hero of the refurmation in Scotland, was born in 1505, at Gifford near Hadding. ton in Eaft Lothian ; and educated at the univerfity of

St Andrew's, where he took a degree in arts, and commenced teacher very early in life. At this time the new religion of Martin Luther was but little known in Scotland: Mr Kuox therefore at firt was a zealous Roman-catholic: but attending the fermons of a certain black friar, named Guialliam, he began to waver in his opinions; and afterwards converfing with the famous Wifhart, who in 1544 came to Scotland with the commiffioners fent by Henry VIII. he renounced the Rumiht religion, and became a zealous reformer. Being appointed tutor to the fons of the lairds of Ormithoun and Langniddery, he began to inftruct them is the principles of the Proteflant religion; and on that account was fo violently perfecuted by the bihop of St Andrew's, that with his two pupils he was obliged in the year $15+7$ to take Gelter in the caftle of that place. But the caftle was befieged and taken by $2 t$ French galleys. He continued a prifoner on board a galley two years, namely, till the latter end of the year 1549; when being fet at liberty, he landed in England, and having obtained a licence, was appointed preacher, firlt at Berwick, and afterwards at Newcaltle. Strype conjectures that in $155^{2}$ he was appointed chaplain to Edward VI. He certainly obtained an annual penfion of 40 l . and was offered the living of Allhallows in London; which he refufed, not choofing to conform to the liturgy.

Soon after the acceffion of Queen Mary, he retired to Geneva ; whence, at the conmand of John Calvin, he removed to Francfort, where he preached to the exiles : but a difference arifing on account of his refufing to read the Englith liturgy, he went back to Geneva; and from thence in 1555 returned to Scotland, where the reformation had made confiderable progrefs during his abfence. He now travelled from place to place, preaching and exhorting the people with unremitting zeal and refolution. Alout this time ( $155^{6}$ ), he wrote a letter to the queen regent, earnefly intreating her to hear the Protellant doctrine; which letter the treated with contempt. In the fame year the Englifh Calvinitts at Geneva invited Mr Knox to refide among them. He accepted their invitation. Immediately after his departure from Scotland, the bifhop fummoned him to appear, and he not appearing, condemned him to death for herefy, and burnt his effigy at the crofs of Edinburgh.

Our reformer continued abroad till the year 1559 , during which time be publifhed his "Firft blatt againtt the mouftrous regiment of women." Being now returned to Scooland, he refumed the great work of reformation with his ufual ardour, and was appointed minitter at Ediaburgh. In 1561 Queen Mary arrived from France. Stue, it is well knuwn, was bigutted to the religion in which the had been educated; and on that account was expofed to continual infults from her reformed fubjects. Mr Knox himelf frequently infulted her from the pulpit; and when admitted to her prefence, regardlefs of her $f \in x$, her beauty, and her high rank, behaved to her with a moft unjultifiable freedom. In the year 1571 our refurmer was obliged to leave Edinburgh, on account of the cunfufion and danger from the uppoition to the ca: of Lenox, then regent; but he returned the following year, and refumed his paftural functoris. He died at Edmburgh in November 1572, and was buried in the church-yard

## K N U

of St Giles's in that city.-His Hillory of the Reformation was printed with his other works at Edin. burgh in $1584,1586,1644,1732$. He publifhed many other pieces; and foveral more are prelerved in Calderwood's Hitory of the Church of Scotland. He left alfo a confiderable number of manufcripts, which in 1732 were in the poffeffon of Mr Woodrow, minifter of Ealtwood.

As to his character, it is eafily, underfood, notwith fandigg the extreme diffunilitude of the two portrates drawn by Popill and Caivinitical pencils. According to the fill, he was a dtvil; in the ideas of the latter, an angel. He was certainly neitler. The following character is drawn by Dr Robertfon. "Zeal, intre. pidity, diminteleftednefr, were vitues that he poffeffed in an eminent degree. He was acquainted too with the leaning cultivated in that age ; and excelled in that fpecies of eloquence which is caleulated to roufe and to inflame. His maxims, however, were often too fevere, and the impetunfity of his temoer exceffive. Rigid and uncomplying, he thowed no indulgence to the infirmities of others. Regardlefs of the ditincrions of rank and character, he uttered his adnonitions with an acrimony and velicmence more apt to irritate than to reclaim; and this often betrayed him inte indecent expreffions, with refpect to Queen Mary's perfon and conduct. Thofe very qualitics, however, which now render his character lefs amiable, fitted him to be the infrument of Providence for advancing the reformation among a fierce people, and enabled him to face dangers, and to furmount oppofition, from which a petfon of a more gentle firit would have been apt to thrink back. By an unwearied application to tudy and to bufinefs, as well as by the frequency and fervour of his public difcourfes, he had worn out a conllitution naturally frong. During a lingering illnefs, he difcovered the utmoft fortitude; and met the approach of death with a magnanimity infeparable from his character. He was conftantly employed in acts of devotion, and comforted himfelf with thofe profpects of immortality, which not only preferve good men from defponding, but fill them with exultation in their laf moments. The earl of Morton, who was prefent at his funeral, pronounced his eulogium in a few words, the more honourable for K nox, as they came from one whom he had often eenfured with peculiar feverity ; "Here lies he who never feared the face of man."

KNOXIA, in botany: A genus of the monogynia order, belonging to the tetrandria clals of plants: and in the natural method ranking under the 47 th order, Stellate. The corolia is monopetalons, and funnelfiraped; there are two furrowed feeds; the calyx has one leaf larger than the rell.

ISNUTZEN (Matthias), a native of Holttein, the only perfon on record who upenly profeffed and taught atheifn. It is faid he had about 1000 difciples in different parts of Germany. They were called Confienciarics, becaufe they afferted there is no other God, no other religion, no other lawful magiftracy, but confcicnce, which teaches every man the three fundamental principles of the law of nature :-To hurt nobody, to live honeftly, and to give every one his due. Several copies of a letter of his from Rome were fpread abroad, containing the fubltance of his
fyltem. It is to be found entire in the lat edition of Micrelius.

## KOEDOE. Sec Capra.

KOEI-тенеоy, a province of China, and one of the fmallett in the kingdom. On the fouth it has Quang.fi, on the ealt Hou-quang, on the north Seichuen, and Yun-nan on the welt. The whole country is almoft a defert, and covered with inaccoflible mountains: it may juftly be called the Siberia of China. The people who inhabit it are monntainerra, ac:cuflomed to iadependence, and who feem to form a feparate nation : they are no lefi fero $\therefore$ :ons than the favage animalsamong which they live. - The nundaring and governors who are fent io this province are fometimes difgraced nollemen, whom the emperor does not think jroper to difcard entirely, either on account of their alliances, or the fervices which they have rendered to the flate : numerons garrifons are entrufted to their charge, to over-awe the inhabitants of the country; but thefe troons are found infulficient, and the court defpairs of being ever able thoroughly to fubdue thefe untractable mountaineers.- Frequent attempts have been made to reduce them to obedience, and new forts have from time to tinse been erected in their country; but the people, who are not ignorant of thofe detigns, keep themfelves fhut up anong theip mountaias, and feldom iflue forth but to deftroy the Chinele works or ravage their hads. - Neither filkItuffs nor cotton cloths are manufactured in this province; but it producee a certain herb much refembling our hemp, the cloth made of which is ufed for funmer dreffes. Mines of gold, filver, quickfilver, and copper, are found here; of the laft metal, thufe fmall pieces of money are made which are in common circulation throughout the empire. - Koei-tcheou contains 10 cities of the firtt clafs, and 38 of the fecond and third.

KOEMPFER (Engelbert), was born in 1651 at Lemgow in Weftphalia. After ftudying in feveral towns, he went to Dantzick, where he gave the firft public fpecimen of his proficiency by a differtation De majef:atis divifione. He then went to Thom'; and from thence to the univerfity of Cracow, where he took his degree of doctor in philofophy; afier which he went to Koninglberg in Pruffia, and ftaid there four years. He next travelled into Sweden, where he foon began to make a figure, and was appointed fecretary of the embally to the fophi of Perfia. He fet out from Stockholm with the prefents for that emperor; and went through Aaland, Finland, and Ingermanland, to Narva, wlere he met Mr Fabricius the ambaftador, who had been ordered to take Mofcow in his way. The ambalfador having ended his negociations at the Ruffian court, fet out for Perfia. During their ltay, two years, at Ifpahan, Dr Kœmpfer, whole curious and inquifitive difpofition fuffered nothing to efcape him unobferved, nade all the advantages poffible of fo long an abode in the capital of the Perfian empire. The ambaffador, towards the clofe of 1685 , preparing to return into Europe, Dr Kœmpfer chofe rather to enter into the fervice of the Dutch Ealt India company, in quality of chicf furgeon to the fleet, then cruifing in the Perfian Gulph. He went aboard the flett, which, after touching at many Dutch fettlements, came to Batavia in September 1689. Dr Køempfer

feria here applied himfelf chicfy to natural hitory. Heace he fet out for Japan, in quality of phyfician to the embafy which the Dutcls Eall India company fends once a year to the Japanefe court. He quitted Japan to return to Europe in 1692 . In $169+$ he took his degree of ductor of phyfic at Leyden; on which occalion he communicated, in what are called Inaugural Theges, ten very fingular and curions obfervations made by hi.m io fureign countries. He intended to diget his memvirs into proper order; but was prevented, by being made phylician to the count de Jippe. He died in 1716. His principal works are, 1 Ansenit tes E:solica, in $\ddagger$ to; a work which includes many curious and ufeful particulars in relation to the civil and matural hiftory of the countries through which he paficd. 2. Hervarium Uitra-Ga:3yeticum. 3. The hitlory of Japan, in German, which is very curious and much efteemed ; and for which the public is indebted to the late Sir Hans Sloant, who purclafed for a confiderable funt of money all our author's curiofities, both natural and artificial, as likewife all his drawings ard manufcript memoirs, and prevailed with the late learned Dr Scheuchzer to tranflate the Japanefe hithory into Englifh.

K iempferla. See Kempferia.
KOENIG (Samuel), a learned philofopher and mathematician, was profeffor of philofophy at Franeker, and afterwards at the Hague, where he became librarian to the Stadtholder, and died there in 1757. He wrote feveral works which are efteemed.

KOENIGIA, in botany; a genus of the trigynia order, belonging to the triandria clafs of plants. The caly $x$ is triphyllous; there is no corolla; and but one ovate and naked feed.

KONGSBERG, a town of Norway, belonging to Denmark, and celebrated for its filver mines, whofe Yroduce lias been conliderably exaggerated by moft of the travellers that have publifhed on this fulject. The town, which firetches on both fides the river Lowe, contains about 1000 houfes, and including the miners 6000 inhabitants. The mines, which lie about two mites from the town, weref firft difcovered and worked during the reign of Chriftian IV. ; and of their prefent flate the following account is given by Mr Coxe $\dagger$. There are 36 inines now working; the deepen whereof cailed Segen-Gottes in der North, is 652 feet perpendicular. The matrix of the ore is the faxum of Linneus. The filver is extracted according to the ufual procefs, either by fimelting the ore with lead or by pounding. The pure filver is occationally found in finall grains and in fmall pieces of different fizes, fel. dom weighing more than four or five pounds. Sometimes, indeed, but extremely rare, maffes of a confiderable bulk have been cifcovered; and one in particular which weighed 4 C9 marks, and was wortb 3000 ix:dollars, or 6001 . This piece is Atill preferved in the cabinet of curofitics at Copenhagen. Formerly thefe mines produced annuatly 350,000 ix-dollars, or ;o,ccol.; and in 1769, wen $7 y, 0 c 01$; at prefent they feldom yield orily from 50,0001 . to 54,000 l. Former$l_{y}$ above 4000 men were neceffary for working the mines, fmetting and preparing the ore; but a few years ago 2400 miners were removed to the cobalt works lately eftablifhed at Foffum and to other mines, and the number is now reduced to 2500 . Dy thefe
and other reductions, the expence, which was befure Konig , eihinated at 5750 l . fer month, now amonnts to only $\underbrace{\text { Kotinfberg }}$ +400 l. or abuas 52,8001 . per uanam. Fict even with this diminution the expences generally equal, and fometimes exceed, the proits. Government, therefure, draws no other advantage from thefe mincs, than by giving erpployment to fo many perfons, who woult be otherwife incapabie of gaining their hyelihoos, and by receiving a certain quantity of fpecie, which is much wanted in the prefent exhanled 月ate of the finances in Denmark. For fuct's is the defficiency of Ppecie, that even at Konghery irfeif change for a bank note is with difficulty obtained. The mivers are paid in fmall bank notes, and the whole expences are defrayed in paper currency. The value of 13,000 rix-dollars, or 26001 . in block filver is annually fent to Copenhagen : the remainder of the ore is coined in the mint of Kongforg, and transferred to Copentargen. The largent piece of money now ftruck at KongBerg is only eight fiillings or four pence.

KONIG (George Matthias), a learned German, born at Aliorf in Frauconia in 1616 . He became profeffor of poetry and of the Greek tongue there, and librarian to the univerfity; in which lait office he fucceeded his father. He gave feveral public fpecimens of his learning ; but is principally known for a Biograghical Dictionary, intitled, Billiotheca vertus es nova, 4 to, Altorf, 1 (174: which, though it is very defective, is ufeful to biographers. He died in 1699.

Konig (Emanuel), a learned phyfician of lafal; born in that city in 1658 , whofe medicinal works were fo eftecmed in Switzetland, that he was confidered as a fecond Avicenna. He died at Bafil in $173!$.

KONINGSBERG, a town of Poland, and capital of Regal Pruflia, with a magnificent palace, in which is a hall 274 feet long aad 59 broad without pillars in fupport it, and a handfome library. It is about five miles in circumference; and including the garrio fon of 7000 men contains 60,000 inhabitants. The town-houfe, the exchange, and the cathedral church, are all very fine flructures. The tower of the calle is exceeding high; and bas $28_{4}+$ fteps to go to the topr from whence there is a very dillant profpect. There are 18 churches in all; of which if belong to the Lutherans, three to the Calvinifls, and one to the Papitls. It flands on the Pregel, a navigable niver which flows from the north-weftern provinces of Pcland, and here falls into the ealiern extremity of the Fifuhe Haf, an in'et of the Eatic. No hips drawing more than feren feet water can pafs the bar and come up to the town; fo that the large veffels anchor at Pillau, a fimall town on the Baltic, whicls is the port of Konigfoerg; and the merchandife is fent in finaller veffels to this place. les trade is very cunfiderable- Korigflerg contains an univerfity founded by Albert of Lirandenburgh. According to the original endowment there were 40 profeffors; but their number is now reduced to 16 . Each profeffor receives a falary of about 501 . per annum, which nay be increafed by private tectures. In 1775, the univerfity contained 800 fudents, of whom 200 are lodged and boarded at the expence of the crown. There are three public libraries in the town, the royal or univerfity library, the town library, and the Wallenrodt library, fo called becaufe it was given by Martien. von Wallenrodt, in 3650 . E. L. 21.35 . N. L. 54.43 .

## K O T [ 486 ] K O U

Kогая

Koran, or Alcoran. See Alcoran and Ma. HOMETANISM.
KOREKI, the country of the Koriacs. See the next article.

KORIACS, a people inhabiting the northern part of Kamtctatka, and all the coall of the Eaftern Ocean from thenee to the Anadir. - They are divided into the Rein-deer or Wandering Koriacs, and the Fixed Koriars. The former lead an erratic life, in the tract bounded by the Penfchinka fea to the fouth-eaft, the river Kowyma to the weft, and the river Anadir to the north. They wander from place to place with their rein-deer, in fearch of the mofs, the food of thofe animals, which are their only wealth. They are fqualid, cruel, and warlike ; che terror of the Fixed Koriacs as much as the Thchutasi are of them. They never frequent the fea, nor live on fifh. Their habitations are jourts, or places half funk in the earth; and they never ufe balagans or fummer-houfes elevated on pofts like the Kamtchatkans. They are in their perfons lean, and very fhort; have fmall heads and black hair, which they fhave frequently: their faces are oval; their nofe is fhort; their eyes are fmall ; their mouth is large; and their beard black and pointed, but often eradicated. - The fixed Koriacs are likewife fhort; but rather taller than the others, and ftrongly made: the Anadir is alfo their boundary to the north, the ocean to the eaft, and the Kamtchatkans to the fouth. They have few rein-deer, which they ufe in their Aldges; but neither of the tribes of Koriacs are civilized enough to apply them to the purpofes of the dairy. Each fpeak a different dialect of the fame language: but the Fixed in moll things refemble the Kamtchatkans; and, like them, live almolt entirely on fifh. They are timid to a high degree, and behave to their wandering brethen with the utmoft fubmiffiun; who call them by a name which fignitics their flaves. Thefe poor people feem to have no alternative; for, by reafon of the fcarcity of rein-deer, they depend on thefe tyrants for the effential article of cloathing Thefe two nations Mr Prnnant fuppofes, from their features, to be the offspring of Taitars, which have fpread to the eall, and degenerated in fize and Itrength by the rigour of the climate, and often by fearcity of food.

KOS, in Jewifh antiquity, a meafure of capacity, containing about four cubic inches: this was the cup of bleffing out of which they drank when they gave thanks after folemn meals, like that of the paffover.

KOTTERUS (Chriftopher), was one of the three fanatics whofe vifions were publifhed at Amfterdam in 1657, with the title of Lurx in tenebris. He lived at Sprotta in Silefia, and bis vifions began in 1616 . He fancied tie faw an angel under the form of a man, who commanded him to go and declare to the magiftrates, that, unlefs the people repented, the wrath of God would make dreadiul havock. The elector palatine, whom the Protellants had declared king of Bo. hemia. was introduced in thefe vifions. Kutterus waited on him at Breflaw in December 1620 , and informed him of his commiffion. He went to feveral other places, and at laft to the court of Brandenburg. As moft of thefe predictions promifed felicity to the elector palatine, and unhappinefs to his imerial majelly, the emperor's fifcal in Silefia and Lufatia got
him feized, fet on the pillory, and banifhed the em- Kou-cil pror's dominions. Upon this he went to Lufatia, and there lived unmoletted till his death, which hap- Kouli-kh pened in 1647.

KOU-сны, a Chinefe fhrub, which bears a great refemblance to the fig-trce both in the make of its branches and the form of its leaves. From its root feveral twigs or fhoots generally fpring up, which form Grofier's a kind of bufh ; but fometimes it confills of only one p. 480. fhoot. The wood of the branches of the kou-chu is foft and fpongy, and covered with bark like that of the fig-tree. Its leaves are decply indented, and their colour and the texture of their fibres are exactly the fame as thofe of the fig.tree; but they are larger and thicker, and much rougher to the touch.

This tree yields a kind of milky juice, which the Chinefe ufe for laying on gold-leaf in gilding. They make one or more incifions in the trunk, into which they infert the edges of a thell, or fomething elfe of the fame kind, to receive the fap. When they have extracted a fufficiency, they ufe it with a fmall brufh, and delineate whatcyer figures they intend for the de. coration of their work. They then lay on the goldleaf, which is fo ftrongly attracted by this liquor, that it never comes off.

KOUANIN, in the Chinefe language, the name of a tutelary deity of women. The Chinefe make great numbers of the ligures of this deity in white porcelain, and fend thein to all parts of the world, as well as keep them in their own houfes. The figure reprefents a woman with a chsld in her arms. The women who have no children pay a fort of adoration to thefe images, and fuppofe the deity they reprefent to have power to make them fruitful. The fatue always reprefents a handfome wonan very modeftly attired.

KOUC, or Koeck (Peter), an excellent paioter in the 16 th century, was born at Aloft, and was the difciple of Bernard Van Orley, who lived with Raphatl. He went to Rome; and by itudying the beautiful pieces which he found there, formed an excellent tafte, and became a very correct defigner. On his return to his uwn country, he undertook the office of directing the execution of fome tapefty-work after the defigns of Raphael. He was afterwards perfuaded by fome merchants of Bruffels to undertake a voyage to ConItantinuple; but when he came there, finding that the Turks were not allowed by their religion to draw any tigure, and that there was nothing for him to dusut to draw defignt for tapellry, he fpent his time in defigning the particular profpects in the neigbbourhood of Conllantinuple, and the manner of the Turks living; of which he las left many wooden cuts, that alone fuffice to give an idea of his merit. After his return fion Conftantinople he fettled at Antwerp, where he drew feveral pictures for the emperor Cha. V. He was alfo a good architect ; and, in the latter part of his life, wrote A Treatife of Sculpture, Geometry, and Purfeitive; and tranflated Vitruvius and Serliv into tae Fis.nih tongue. He died in 1550.

KOUL.l кнan (Thamas), or Schab Nadir, was not the fon of a fhepherd, as the authors of the Englifh Biograntical Dictionary affert; his father being chief of a branch of the tribe of Affchars, and governor of a fortrefs erected by that people againt the Turks. Upon his father's death, his uncle ufurped

## $\mathrm{K} O \quad \mathrm{U}$

Wi-khan, his government, under the ptetext of taking care of sumis. it during the minority of Kouli-Khan; or, more properly, young Nadir. Difgult at ihis affront made him commence adenturer. ise entered into the fervice of Beglerberg, governor of Mufchada, in the Khurafall; who, difcovering in him irong inarks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, th Uibec 「artars having made aairruption into the Karafan with 10,000 men, Beglerberg, whofe whole furce confilted only of 4000 horfe and 2000 infantry, called a council of war, in which it was declared imprudent to face the enemy with fuch an inferior fonce: but Kuali-Khan propuled to march dgaint the chimy, and coggared to condukt the expodition, and to be aniwerable for the fuccefs of it. He was accorciingly made general ; defeated the Tariars, and took their commander prifoner. Hofein Beglerberg received ham at his return with marks of diftinction: but growns jealous of his rifing fame, inilead of obtaining him the rank of lieu-tenant-general of the Khorafan, as he had promifed, obtained it for another ; which fo exafperated KouliKhan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punifled with the battinado fo feverely, that the nails of his great toes lell off. Th is effront occafioned his Hight, and his joining a banditti of robbers (not his ftealing his father's or his neighbour's theep). The reft of his adventures are too numerous to be inferted in this work. In 1729 he was made general of Perfia by Schah Thamas, and permitted to take his name Thamus, and that of Khouli, which fignilies flave: his title therefore was, The flave of Tibamas; but he was ennobled by the addition of Khan. In 1736, he fomented a revoit againt his maltor, for having made an ignominious peace with the lurks; and having the army at his comunand, he procured his depofition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as ke was ambitious, he at length met with the uiud fate of tyrants, being affanated by one of his generals, in league with his nephew and facceftor, in 1747, aged dixty.

ISOUMISS, a fort of wine made in Tartary, where it is ufed by the natives as their common beverage duting the feafon of it, and often ferves chem inthead of all other food. It is faid to be fo nourifhing and falutary, that the Bafchkir Tartars, who towards the end of winter are much emaciated, no foomer reinen in fummer to the ufe of koumifs, than they become ftrong and fat. The author of "A hiftorical defeription of all the nations which compofe the Ruflian empire," fays, fpeaking of Koumifs, Elle eft fort nouriffante, et peut tenir lieu de tout autre aliment. Les Bajcblirs s'en trouvent très bien, elle les rend bienportans et gais; elle lear donne de l'ombonpoint, at de lonnes couleurs. From the Tar-
tars it has been borrowed by the Ruffians who ufe it medicinally. It is made with fermented mares-milk, according to the following recipe communicated by Dr Glieve in the Edin. Phil. Tranf. * as he otained it from a Ruflian nubleman, who went into that part of p. $13 \mathrm{I}_{\mathrm{I}}$. Tartary where it is made, for the fake of uling it mediciually.
" L'ake of frefl mare's milk, of one day, any quantity; add to it a fixth part of water, and pour the mixture into a wooden veffel; ufe then, as a ferment, an eighth part of the fouref cow's milk that can be got; but at any future preparation, a fmall portion of old koumifs will better anfwer the purpofe of fouring; cover the veffel with a thick cluth, and fet it in a place of moderate warmth; leave it at relt 24 hours, at the end of whicis time the milk will have become four, and a thick fubitance will be gathered on the tup; then with a Itick made at the lower end in the manner of a churn-faff, beat it till the thick fubftance above mentioned be blended intimately with the fubjacent fluid. In this fituation, Itave if again at relt for 24 hours nove; after which pour it into a higher and narrower veflel, refembling a churn, where the agitation muft be repeated as before, till the liquor appear to be perfeclly homogeneous; and in this tlate it is called koumifs, of which the talte ought to be a pleafant mixture of fweet and four. Agitation mult be employed every time before it be ufed."-To this detail of the procefs the nobleman fubjoined, that in order to obtaia milk in fufficient quantity, the Tartars have a cuftom of ieparating the foal from the mare during the day, and allowing it to fuck during the night: and when the milk is to be taken from the mare, which is generally about five times a.day, they always produce the foal, on the fuppofition that the yiulds her milk more copionfly when it is prefent.

To the above method of making koumifs, our author has added tome particulars taken from orker communications with which he was favoured by Tartars themfelyes. According to the account of a Tartar who lived to the fouth-eall of Oienbourg, the proportion of mills and fouring oughe to be the fame as above; only, to prevent changing the venti, the milk may be put at orce into a pretty high and narrow veffel; and in order to accelerate the fermentation, fome warm milk may be added to it, and, if neceffary, more fouring. - From a Tartar whom the Do etor mes with at the fair of Macarieff upon the Volga, and from whom he purchafed one of the leathern bags ( 1 ) which are ufed by the Kalmucks for the preparation and carriage of their koumifs, he learned that the procefs may be much fhortenced by heating the milk befote the fouring be added to it, and as foon as the parts begin $t_{1}$ fepa. rate, and a thick fubilance to rife to the top, by agitating it every hour or oftener. In this way he made fome in the Doct .r's prefence in the fpace of 12 hours. Our author learned aifo, that it was common among fome「ar-
(A) This bag was made of a horfe's hide undrefied, and by having been fmoked had acquired a great degree of hardnefs. Its fhape was conical, hut was at the fame time fomewhat triangular, fron being compofed of three different preces, fet in a circular bafe of the fame hide. The futures, which were made with tendons, were fecured by a covering on the outide, with a doubling of the fame fkin, very clofely fecured. It had a dirty appearance, and a very difagreeable fmell. On being alied the reafon of this, he faid, "The reazaine of the old koumifs were left, in order to fupply a fermeat to the new milk."

## K O U

Ko inifr. Trartars to prepare it in one day during fummer, and that baver veres wih only two or thice agitations; but that in winter, when, from a deficiency of mares milk, they are ob liged to add a great proportion of that of cows, more agitation and more time are neceflary. And though it is commonly ufed within a few days after the preparation, yet when well fecured in clofe veffels, and liept in a cold place, that it may be preferved for three months, or even more, wishout any injury to its qualities. He was tuld farther, that the acid fermentation might be produced by four milk as above, by a four falle of rye-finur, by the renuet of a lamb's tho mach, ar, what is rore common, by a purtion of old koumifs; and that in forme places the; faved much time, by adding the new milk to a quantity of that already fermenied; on being mixed with which, it very foon underg es the vinous change.

It was accurding to the proeefs firt mentioned, honever, that all the koumifs which the Ductor employed in medicine was prepared.-It has been found fervictable in liectics and in nervous complaints ; and our anthor relates fome very ftriking cafes which the ufe of it had completely cured. All thofe who drank it, our author informs us, agreel in faying, that duing its ufe, they had little appetite for food; that they drank it in very large quantities, not only without difguft, but with pleafure; that it rendered their veins turgid, without producing languor; that, on the contrary, they foon acquired from it an uncommon degree of fprightlinefs and vivacity; that even in cafes of fonce excefs it was not followed by indigeftion, headach, or any of the fymptoms which ufually attend the abufe of other fermented liquors.

The utility. however, of this preparation as a medicine, furpofing it completely afcertained, would among us, as our author obferves, be greatly circumfcribed by the farcity of mates milk in this conntry. "Hence (fays hc) inquiries will naturally be made, whether other fpecies of milk admit of a fimilar vinous fermentation, and what proportion of fpirit they contain. As thefe have never been the object, however, of my attention, I will here give the fubfiance of what I have been able to learn from others refpecting that which is the moft common, the milk of cows.
"Dr Pallas, in the work above quoted, fays, that corss milk is alfo fufceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mares milk fails them; that the wine prepared from cows milk, they call airen; but that they always prefer koumifs when it can be got, as it is more agreeable, and contains a greater quantity of fpirit; that koumifs on diftillation yields of a weak fpirit one third, but that airen yields only two ninth parts of its whole quastity, which fpirit they call arika.
"This account is confirmed by Oferetflowflky, a Ruffian, who aceompanied Lepechin and other academicians, in their travels through Siberia and Tartary. He prblified lately a differtation on the ardent fpirit to be obtained from cows milk.
"From his experiments it appears, that cows milk may be fermented with, or even without, fouring, provided fufficient time and arriation be employed; that no fpirit could he produced from any one of its conllituent parts taken feparately, nor from any two of them, unlefs inafmuch as they were mixed with fome part of
the third ; that the milk with all its parts in their natuo ral proportion was the moft productive of it ; that the clofer it was kept, or, which is :he fame thing, the more difficultly the fixed air is allowed to efcape during the fermentation (care being taken, however, that we do not endaoger the burfting of the vef(i)), the more fpirit is obtained. He alfo informs us, that it had at fourer fmell beforc than after agitation; that the quantity of fpirit was increafed, by allowing the fermented liquor to repofe for fome time before diftillation; that from fix pints of milk, fermented in a elofe veffel, and thus fet to repofe, he obrained thrce ounces of a:dent fpirit, of which one was confumed in burning ; but that from the fame quantity of the fanie milk fermented in an open veltol, he could fcarcely obtain an ounce."

KRAKEN, in zoology, a molt amazing large fea animal, faid to be feemingly of a crab-like furm; the credit of whofe exiffence relts upon the evidenee produced by bifhop P'ontoppidan, in his Natural hiltory of Norway.

As a full grown kraken has never been feen in all its patts and dimenfions, an accurate furvey of which mutt employ fome time, and not a little motion, it is impollible to give a complete defription of one. Neverthelefs, we flall fubmit the prohablity of its exiftence on the bell information our author could collect, which feems to have lixed his own belief of it ; though at the fame time he acknowledges the account is very defective, and fuppofes a farther information concerning the creature may be referved for pofterity.

Our fifhermen, fays the author, unanimoufly and invariably affirm, that when they are feveral miles from the land, particularly in the hot fummer days, and by their diffance, and the bearings of fome points of land, expect from eighty to a luqudred fathoms deph, and do not find but from twenty to thirty ; and more efpecially if they find a more than ufual plenty of cod and ling, they judge that the kraken is at the bottons; but if they find by their lines that the water in the fame phace fitl fhallows on them, they know he is rifing to the furface, and row of with the greatelt expedition till they come into the ufual foundings of the place; when lying on their oars, in a few minutes the monfler emerges, and thows himfelf fufficiently, though lis whole body does not appear. Its back or upjer part, which feems an Englifh mile and a half in circumference ( (fome have affirmed more), looks at firt like a number of fmall inands, furrounded with fomething that floats like fea-weeds; at latf feveral bright points of horns appear, which grow thicker the higher they emerge, and fometimes lland up as high and large as the mafts of middle-fized veffels. In a flowt time it nowly finks, which is thought as dangerous as its rifing ; as it caufes fuch a fwell and whirlpool as craws every thing down with it, like that of Maleftrom. The bifhop juflly regrets the oniffion of probably the only opportunity that ever has or may be prefented, of furveying it alive, or feeing it entire when dead. This, lie informs us, once did occur, on the credit of the reverend Mr Friis, miniller at Nordland, and vicar of the college for promoting Chiflian knowledge; who informed him that in 2080 , a kraken (perhaps a young and carelefs onc, as they generally keep feveral leagues from land) came into the waters that run between the號

[^20]on. rocks and cliffs near Altahoug; where, in turning about, fome of its long horns caught hold of fome adjoining trees, which it might eafily have torn up, but that it was alfo entangled in fome clifts of the rocks, whence it could not extricate itfelf, but putrefied on the fpot. Our author has heard of no perfon deftroyed by this monfter, but relates a report of the danger of two liflermen who came upon a part of the water full of the creature's thick nimy excrements (which lie veics for fome months, as he feeds for fome other) ; they immediately flrove to row off, but were not quick enough in turning to fave the boat from one of the kraken's horns, which fo crufhed the head of it that it was with difficulty they faved their lives on the wreck, though the weather was perfectly calm; the monfter never appearing at other times. His excrement is faid to be attracive of other fifh on which he feeds; which experdient was probably neceflary, on account of his fow unwields motion to his fubfiftence; as this fow motion again may be neceflary to the fecurity of hips of the greateft force and burden, which muft be overwhelmed on encountering fuch an immenfe animal, if his velocity was equal to his weight; the Norwegians fuppofing, that if his arms, on which he moves, and with which he takes his food, were to lay hold of the largent man of war, they would puil it down to the bottom.

In confirmation of the rcality of this animal, our learned author cites Debes's defcription of Faroe, for the exiftence of certain iflands which fuddenly appear and as fuddenly vanif. Many feafaring people, he adds, give accounts of fuch, particularly in the north fea; which their fuperitition has either attributed to the delufion of the devil, or confidered as inhabited by evil fpirits. But our limelt hiftorian, who is not for wronging the devil himfelf, fuppoles fuch miftaken illands to be nothing but the kraken, called by fome the foe trolden, or Sea mijcbief; in which opinion he was greatly confirmed by the following quotation of Dr Hierne, a learned Swede, from baron Grippenhielm; and which is certainly a very remarkable paffage, viz. "Among the rocks about Stockholm, there is fometimes feen a tract of land, which at other times difappears, and is feen agaiu in another place. Buræus has placed it as an inand in his map. The peafants, who call it gunumurs ore, fay, that it is not always feen, and that it lies out in the open fea, but I could never find it. One Sunday, when I was out amongtt the rocks founding the coatt, it happened, that in one place 1 faw fomething like three points of land in the fea, which furprifed ine a little, and I thought I had inadvertently paffed tham over befort. Upon this 1 called to a peafant, to enquire for gummars ore ; but when he carne, we could fee nothing of it : upon which the peafant faid all was well, and that this prognofticated a flom or a great quantity of fifh." To which our author fubjoins, "who cannot difcover that this gummars ore, with its points and progroftications of fifh, was the kraken, miftaken by Burxus for an inaind, who may keep liimfelf about that fpot where he rifes ?" He takes the kraken, doubtlefs, from his numerous tentaculi, wlich ferve him as feet, to be of the polype kind; and the contemplation of its enormous bulk led him to adapt a pafige from Ecclcfiaflicus, xliii. 31, 32. to it. Whether by it may beintended the dragon that is in the fea, mentioned lfaiah axvii. I. we refer Vol. IX. Pat II.
to the conjecture of the reader. After paying but a Krakea, juft refpect to the moral character, the reverend func- $\underbrace{\text { Krantzus. }}$ tion, and diligent inveftigations of our author, we mult admit the poffibility of its exiftence, as it implies no contradiction; though it feems to enenunter a general prepoffeffion of the whale's being the largelt animal on or in our globe; and the eradication of any long prepoffeflion is attended with foncelhing irkfome to us. But were we to fuppofe a falmon or a furgeon the largeft fina any number of perfons had feen or heard of, and the whale had difcovered himfelf as feldom, and but in part, as the kraken, it is eafy to conceive that the exiftence of the whale hed been as indigeftible to fuch perfons then as that of the kraken may be to others now. Some may incline to think fuch an extenfive montter would eucroach on the fymmetry of nature, and be over proportionate to the fize of the globe itfelf; as a little retrofpection will inform us, that the bteadth of what is feen of him, fuppofing hing nearly round, muft be full 2600 feet (if more oval, or crab-like, full 2000), and his thicknefs, which may rather be called altitude, at leaft three hundred; our author declaring he has chofen the leaft circumference mentioned of this animal fot the greater certainty. Thefe immienfe dimenfions, neverthelefs, we apprehend will not argue conclufively againft the exifterice of the animal, though confideratly againtt a numerous increafe or propagation of it. In fact, the great fcarcity of the kraken, his confinement to the rorth fea, and perhaps to equal latitudes in the fouth; the fmall number propagated by the whale, who is viviparous; and by the largeft land animals, of whom the clephant is faid to go near two years with young; all induce us to conclude from analogy, that this creature is not numerous; which coincides with a paffage in a manufcript afcribed to Svere king of Norway, as it is cited Ey Ol. Wormius, in his Mufeum, p. 280, in Latin, which we thall exaclly tranfate. "There remains one kind, which they call bafoufe, whofe magnitude is unknown, as it is feldom feen. Thofe who affirm they have feen its body, declare, it is more like an ifland than a beaft, and tlat its careafe was never found; whence fome imarine there are but two of the kind in nature." Whether the vanifhing ifland Lemair, of which Captain Rodney went in fearch, was a kraken, we fub. mit to the fancy of our readers. In fine, if the exiftence of the creature is admitted, it will feem a fair inference, that he is the fcarceft as well as largetl in our world ; and that if there are larger in the univerfe, they probably inlabit fome fphere or planet more extended than our own. Such we have no pretence to linit; and that fiction can devife a much greater than this is evident, from the cock of Mahomet, and the whale in the Bava Bathra of the Talmud, which were intended to be credited; and to either of which our kraken is a very fhrimp in dimenfions.

KRANTZIUS (Albertus), a native of Hamburgh, and a famous hiftorian, who travelled over feveral parts of Europe, and was made rector of the univerfity of Rofloch in 1482. He went from thence to Hamburgh in 1508, where he was elected dean of the chapter in the cathedral. He did many good fervices to that church and city ; and was fo famed for his abilitics and prudence, that John king of Denmark and Frederic duke of Holfein did not fcruple to make him

## K U S [ 490 ] K Y P

Xraut umpire in a difpute they had with the Ditmarfi. He wrote feveral good hillorical works; the moft confiderable of which is an Ecclefiaftical Hizory of Saxony, inticled Metropolis, in folio; the beft edition is that of Francfort. He died in 1517.

Kraut, or Crout. See Crout.
kubesha. See Lesguis.
KUHNIUS (Joacnim), a learned German critic, was torn at Gripiwalde in Pomerania, in 1647. He was in 1669 made principal of the college at Oetingen in Suabia: in $1 \sigma_{7} 6$, he was elected Greek profeffor in the principal college at Strafurg ; and after acquitring himfelf with honour for ten years in this capacity, was made Grcek and Hebrew profefur in the fame univerfity. His uncommon fkill in the Greek language drew a great number of fcholars about him from very diftant places; and lie publithed fome claffic authors with vety learned notes both explanatory and critical He died in 1697.

KUUNCKEL (John), a celebrated Saxon chemift, horn in the duchy of Slefwick, in 1630 . He became chemitt to the elector of Saxony, the elector of Brandenburgh, and Charles II. king of Sweden, who gave him the title of counfellor in metals, and letters of nobility, with thee furname of Lonsuenffeing. He employed 50 years in chemitry; in which, ty the help of the furnace of a glafs-houfe which he had under his care, he made feveral excellent difcoveries, particularly of the phofphorus of urine. He died in Swcden in 1702; and left feveral works, fome in German, and others in Latin: among which, that initted Olfervationes Cbemice, and the "Art of making Clafs," printed at laris in 1752, are the moft elteemed.

KURIL or Kurilski Isles, extending from N. Lat. 5 r. to 4.5 . which probebly once lengthened the peninfula of Kamtchatka before they were covalfed from it, are a feries of inlands running fouth from the low promontury Lopatka, between which and Shoom Ras the moft northerly is only the diftance of one league. On the lofty Paramoufer, the fecond in the chain, is a highpeaked mountain probably volcanic; and on the fourth, callcd Arcumakutan, is another volcano. On Urufs there is another; on Storgu there are two; and on Kunatir, or Kaunachir, there is one. Thefe three make part of the group which pafs under the name of the land of Fifo. Japan abounds with volcanoes; fo that there is a ferics of firacles from Kamtchatka to Japan, the laft great link of this extenfive clain.-The Rufians foon annexed thefe iflands to their conquefts. The fa abounded with otters, and the land with bears and foxes; and fome of the illes fheltered the fable: temptationsfufficient for the Ruffians to invade thefe iflands; but the rage after the furs of the fea otters has bien fo great, that they are become extrenely fcatce both here and in Kamthatka.

KUSIEER (Ludolf), a very lenrned writer in the 2. 8 h centary, was born at Biomberg in Weftphalia. When very yonag, he was upon the recomnendation - baron Spauheirn appointed tutor to the two fons
of the count de Schwerin, prime minifter of the king of Pruffia, who, upon our author's quitting that fation, procured him a penfion of 400 livres. He was promifed a profefformip in the univerfity of Joachim; and till this fhould be vacant, being then but 25, he refolved to travel. He read lectures at Utrecht ; went to England; and from thence to France, where he collated Suidas with three MSS. in the king's library, which furnifhed him with a great many fragments that had never been publihed. He was hononred with the degree of doctor by the univerfity of Canbridge, which made him feveral advantageouts offers to continue there: but he was alled to Berlin, where he was inftalled in the profefforihip promifed him, Afterward he went to Antwerp; and being brought over to the Catholic religion, he abjured that of the Proteftants. The king of France rewarded him with a penfron, and ordered him to be admitted fupernumerary affociate of the academy of infcriptions. But he did not enjoy this new fettlement long; for he died in 1716 , aged 46. He was a great mater of the Latin tongue, and wrote well in it ; but his chief excellence was his fkill in the Greek language, to which he almoft entirely devoted himfelf. He wrote many works; the principal of which are, 1. Hifloria critica Honeri. 2. fuantlicus de vita Pythegora. 3. An excellent edition of Suidas, in Greek and Latin, threc volumes, folio. 4. An edition of Aritlophanes, in Greek and Latia, folio. 5. A new Greek edition of the New Teltament, with Dr Mills's Variations, in fulio.

IYPHONISM, Kyphonismus, or Cyphonifmus, an aucien:t punifhment which was frequently undergone by the marty1s in the primitive times; wherein the body of the perfon to fuffer was anointed with honey, and fo expofed to the fun, that the flies and wafps might be tempted to torment hing. This was performed in three manners: fometimes they only tied the patient to a flake; fometimes they hoited him up into the air, and fufpended him in a bafket; and fometimes they fretched him out on the ground with his hands tied behind him. The word is orizinally Greek, and comes from xuzav, which fignifies either the fake to which the patient was tied, the collar fitted to his neck, or an infframent wherewith they tormented him: the fcholiait on Ariitophanes fays, it was a wooden lock or cage ; and that it was called fo from xuriav, " to crook or bend," becaufe it kept the tortured in a crooked, bowing pofture; others take the xupav fo: a log of wood laid over the criminal's head, to prevent his landing upright: Hefychius defcrioes the xytav as a piece of wood whereon criminals were flretched and tormented. In effeet, it is probathec the word might fignify all thefe feveral things. It was a generical name, whereof thefe were the fpecies.

Suidas gives us the fragment of an old law, which punifhed thofe who treated the laws with contempt with kyphonifm for the fpace of twenty days ; after which they were to be precipitated from a reck, dieffed in womens habit.

## 亡 A E

L A femi-vowel, or liquid, making the eleventh letter of the alphabet.
It was derived fronis the old Hebrew Lamed, or Greck Lambda i. It is founded by intercepting the breath between the top of the tongue and forepart of the palate, with the inouth open; and makes a fweet fouad, with fomething of an afpiration; and therefore the Britons and Spariards ufually doubled it, or added an $\$$ to it, in the beginaing of words, as in lian, or llam, "a temple," founcing nearly like fl, \&c. In Englifh words of one fyllable it is doubled at the end, as tell, bet?, kne?l, Sic. but in words of more fyllables than one it is lingle at the end, as evil, general, confitutional, \& c. It is plactd after molt of the confonants in the beginning of words and fyllables, as black, glare, ad-le, ea-gle, Exc. but before nonc. Its found is clear in Alel, but obscure in alk, Exc.

As a numeral letter, $L$ denotes 50 ; and with a Cain over it, thus, $\bar{L}, 5000$. Ufed as an abbreviature, L tands for Lucius; and L. L. S. For a fefterce. See Sesterce.

LA, the fyliable by which Guido denotes the laft found of each hexachord; if it begins in $C$, it anfwers so our $A$; if in $G$, to $E$; and if in F, to D.

LABADIE (John), a famous French enthufiaft, fon of John Charles Iabadie, governor of Bourges and gentleman in ordinary of the bed-chamber to the French king, was born in $1610^{\circ}$. He entered young into the Jefuits college at Bourdeaux; which, by his own account, he afterwards quitted, but by other accounts was expelled for his peculiar notions, and for hypocrify. He became a popular preacher : but being repeatedly detected in working upon female devotees with fpiritual infructions for carnal purpofes, his lofs of character among the Catholics drove him among the Proteltants. A reformed jefuit being thought a great acquifition, he was precipitately accepted as a paltor at Montauban, where he officiated for eight years; but. attempting the chaftity of a young lady whom he could not convert to his purpole, and quar. selling with the Catholic prieft about the sight of interring a dcad bady, he was at length banifhed that place. The ftory of his affair with the lady, as related by Mr Balye, may here be given as a fpecimen of his miniftry. Having directed this damfel to the Spiritual life, which be made to confit in internal recollection and mental prayer, he gave hier out a certain point of meditation; and having Arongly recommended it to lier to apply herfelf entirely for fome hours to fuch an important object, he went up to her when he believed her to be at the height of her recollection, and put his band into ber brealt. She gave him a hafly repulfe, expreficd a great deai of furprife at the proceeding, and was even preparing to rebuke him, when he, without being in the lealt difconcerted, and with a devout air, prevented her thus: "I fee plainly, my child, that you are at a great diftance from perfection; acknowledge your weaknefs with an lumble firit; afk forgivenefs of God for your having given fo little attention to the mylteries upon which you ought to have meditated. Had jou bettowed all
neceffary attention upen thefe thinge, you would not hase becn fenfible of wisat was doing about your breaft.

Labacia.
Labadifa.

Bu: you are fo much attaciued to fenfe, fo little concentered with the Godhead, that you were not a moment in difcovering that l had tonched you. I wanted to try whether your ferwency in prayer had raifed you above the material world, and united you with the Sovercign Being, the living fource of immortality and of a fpiritual fate; and I fee, to my great grief, that you have made very fmall progrefs, and that you only cresp on the ground. May this, my child, make you alhamed, and for the future move you to perform the duties of mental prayer better than you have hitherto done." The young lady, who had as much good Cenfe as virtue, was no lefs provoked at thefe words than at the bold aitions of her ghoftly inftructor; and could never afterwards bear the name of fuch an holy father. Labadie being driven out of Montauban, went to fcets an afylum at Orange: but not finding himfelf fo fafe there as he imagined, he withdrew privately to Geneva, where he impofed on the people by his devout preaching and carriage; and from thence was invited to Middleburg, where his finituality made him and his followers confistered as fo many faints, diftinguifhed by the name of Labadils. They increafed fo much, that he excited the attention of the other churches, whofe authority he difputed, till he was formally cepofed by the fynod of Dort. Initead of oheying, he procured a tumultuous fupport from a crowd of his devotees; and at length formed a little fettlement between Uirecht and Amiterdam, where he erected a printing-prefs, which fent forth many of his works. Here he was betrayed by fome defertere, who expofed his private life, and informed the public of his familiorities with his female diferples, under pretence of uniting them more particnlarly to God; and was finally obliged to retire to Altena in Holteing where le died in I674.

LABADISTS, a fect of religionits in the myth century, followers of the opinions of John Labadie, of whom an account is given in the pieceding article. Some of their opinious were, 1. That God could, and did deceive men. 2. 'That, in reading the Scriptures, greater attention fhould be paid to the internal infpiration of the Holy Spirit than to the words of the tcst 3. That baptifm ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, provided they defcended from Ahrabam; but that the new adnitted only \{piritual men. 5. That the obfervation of Sunday was a matter of indifference. 6. That Chrift would come and reign 1000 years on earth. 7. That the eucharit was only a commemoration of the death of Chritt ; and that, though the fymbols were nothing in themfelves, yet that Chrilt was fpiritually received by thofe who partook of them in a due manner. 8. That a contemplative life was a ftate of grace, and of divine union during this life, the fummit of perfection, \&c. 9. That the man whofe heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and fees all things in him. 10. That this fate was to be $3 Q^{2}$
come

Labarum come at by an entire felf-ahnegation, by the mortifica-
tion of the feufes and their objects, and by the exereife of mental prayer.
I. ABARUM, the banner or flandard borne before the Roman emperors in the wars. The labartum confifted of a long lance, wilh a llaff a-top; croffing it at riglut angles; from which hung a rich itreamer, of a purple colour, adonned with precious itones. Till the tinc of Conftantine it had an eagle painted oo it ; but that emperor, in lieu thereof, added a crofs with a cipher expreffing the name of $y$ fefus.

This taodiard the Romans rook from the Germans, Dace, Sarmatæ, Pannonians, \&c. whom they had overcome. The name labaruni was not known before the time of Conftantine ; but the fandard itfelf, in the form we have deferibed it, abating the fymbols of Chrittianity, was ufed by all the preeeding emperors. Some derive the word from labor, as if this finifhed their labours; fome from tuגabtia, "reverence, picty;" others from $\lambda x \mu 6 \alpha v e t$, "to take ;" and others from גæ尹尸upx, " [poils."

LABAT' (John Baptit), a celcbrated traveller, of the order of St Dominic, was born at Paris, taught philofophy at Nancy, and in 1693 went to America in quality of a miffionary. At his return to France in 1705, he was fent to the ehapter of his order at Bologna to give an account of his mifion, and faid Several years in Italy. He died at Paris in 1738. His principal works are, 1. A new voyage to the American iflands, 6 vols 12 mo . 2. Travels in Spain and Italy, 8 vols 12 mo . 3. A new aceount of the weflern parts of Africa, 5 vols 12 mo : Father Labat was not in Africa, and therefore was not a witnefs of what he relates in that work. He alfo publifhed the Chevalier des Marchais's voyage to Guinea, in 4 vols $\mathbf{1 2 m o}$; and $A n$ biffrical account of the weffern parts of Ethopia, tranflated from the Italian of Father Cavaz2i, 5 vols 12 mo .
LABBE (Philip), born at Bourges in France, in 1607 ; profeffed philofophy, divinity, and the languages, with great applaufe; and died in 1667, aged 70. He was a laborious writer, and a good eritic ; and wrote, 1. Nova Bibliotheca MSS. lilroram, in two volumes fulio. 2. De Byzantine biforic Scriptoribus. 3. Galeni vitit. 4. Bibliotheca billiothecarum. 5. Concordantia chronologica, \&e. He began the laft edition of "The eouncils," and died while the gth volume was printing; they were finifhed in 17 volumes by father Coffart.

LABDANUM, or Ladanum, in the materia mediea, a refinous juice, which exfudes from a tree of the ciftus kind. It is faid to have been formerly collected from the beards of goats who broufed the leaves of the ciftus: at prefent, a kind of rake, with feveral Atraps or thongs of fkins fixed to it, is drawn lightly over the fhrub, fo as to take up the unctuous juiee, which is afterwards fcraped off with knives. It is rarely met with pure, even in the places which produce it ; the duft, blown upon the plant by the wind, mingling with the tenaceous juice: the irhabitants are alfo faid to mix with it a certain black faod. In the fhops two forts are met with. The beft (which is very rave) is in dark-coloured almoof black maffes, of the confittence of a foft plafter, whieh grows ftill foftor upon being handled; of a very agreeable fmell, and
of a light pungent bitterifh talte. The other fort is Labrlam harder, not fo dark coloured, in long rolls coiled up : this is of a much weaker fmell than the firft, and has a large admixiure of a fine fand, which in the ladanum, examined by the Freneh aeadeny, made up three fourths of the mafs.

Io medicine it is ufed extern !! $y$, to attenuate and difcufs tumors; internally, it is more rarely ufed, but is greatly extolied by fome arraint catarms and in dyfenteries. Rectified ipirit of wine al nolt entirely diffolves pure ladanum, leaving only a fmall portion of gummy matter which has no talte or fimell : and hence this refin may be thus excellently puified fin internal purpofes. It is an ufeful infredient in the tomachic platter, whieb is now indeed it yled the emphylloun ladanio

LABEL, a long, thin, brafs rule, with a fmall firght at one end, and a centre-livie at the other ; conmanly ufed with a tarigent line on the edge of a circumferentor, to take altitudes. Sce.

Label, in law, is a narrow ilfp of paper, ons parchment, affixed to a deed or writing, in order to bold the appending feal. - Any paper annexed by way of addition or explication, to any will or tellament, is alfo called a label or codicil.

Label, in heraldry, a fallet whalily piaced in the middle along the chief of the coat, without touching its extiemities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of thefe, the number muld be fpecified in blazoniog.

It is ufed on the arms of eldeft fons while the father is alive, to diftinguifh them from the younger; and is efteemed the moft honourable of all differences. See Heraldry, p. 4+5.col. I.

LABIAL Letters, thofe pronounced chicfly by means of the lips.

LABIATED flowers, monopetalous fowers confifting of a narrow tube with a wide mouth, divided into two or more fegments.

LABIAU, a fmall town of Dueal Prufia, in a circle of the fame name, feated at the mouth of the river Deime, with a ftrong calte, two fides of which are furrounded with water, and the other defended by a wall and diteh. E. Long. 19.56. N. Lat. 55. 17.

LABORATORY, or Elaboratory, the chemitts work houfe, or the place where they perform their operations, where the furnaces are built, their veffels kept, \&c. and in general the term libooratory is applice to any place where phyfical experiments in pharmaey, chemiftry, pyrotechny, \&c. are performed.

As laboratories mult be of very different kinds, according to the nature of the operations to be performed in them, it is impoffible that any directions can be given which will anfwer for every one. Where the purpofes are merely experimental, a fingle furnace cr two of the portable kind will be fufficient. It is fearce needful to add, that fhelves are neceffary for holding veffels with the products of the different operations: and that it is abfolutely neeeffary to avoid confufion and diforder, as by thefe means the products of the operations might be loft or mittaken for one another. Mortars, filters, levigating flones, \&e. muft allo be proeured: hut from a knowledge of the methods of performing the different chemieal operations will eafily be derived the knowledge of a proper place to perform
them

## L A B

them in ; for which fee the articles Chemistry, Me. tallurgy, and Furnace.
Laboratory, in military affairs, figuifies that place where all forts of fire-works are prepaied, both for ac. tual fervice and fur plafure, vis. quick matches, fuzesi, part:fires, grape-flot, cafe-flot, carcaffes, handgrenades, cartridges, fhells filled, and fuzes fixed, wads, sc. \&c.

LABOUR, in general, denotes a clofe application to work or butinefs, - Among feamen a thip is faid to be in labour when the rolls and tumbles very much, either a hull, under fatl, or at anchor. - It is alfo fpoken of a wonan in travail or chleld bith; fee Midmitery.

LABOURER, generally lignifies one that does the moit flavith and lefs artful part of a laboriouo work, as that of hurbandry, mafonry, sce.

LABOUREUR ( J han le), almoner to the king of France, and prior of Juvigne, was born at Muntmorency near Paris in 16:3. At the age of 18 , he diHinguifled himfelf by publithing "A collection of the monuments of illulthions perfons buried in the church of the Celeftines at Paris, with their elogies, gencalogies, arms, and motpoes," 4to. He afterwards publifhed an excellent edition of The Memoirs of Michael de Callelnan, with fiveral other gencalogical hitories; and died in 1675 - He had a brother, Louis be Laloureur, bailiff of Montmorency, author of feveral pieces of poetry; and an uncle, Dom. Claude lo Laloureur, provolt of the aibey of Lifle Barbe, of which abbey he wote a hiftory, and publifhed notes and corrections upon the breviary of Lyons, with fome other things.
LABRADOR, the fame with Nez Britain, or the country round Hunson's Bay. See thele articles.

LABRADORE stone, a cutions fpecies of feltfpar, which exhibits all the colvurs of a peacock's tail. See the article Felt-Spar.

LABRUM, in antiquity, a great tob which food at the entrance of the temples, containing water for the priells to wafh themfelies in previous to their facrifices. It was alfo the name of a bathing tub ufed in the baths of the ancients.

LABRUS, in ichthyology, a genus of fifhes belonging to the order of thoracici. The characters are as follow: The covers of the gills fcaly; the branchioftegous rays unequal in number; teeth cunic, long, and blunt at their ends; one tuberculated bone in the bottom of the throat; two above, oppofite to the other; one dotfal fin reaching the whole length of the back; a flender fkin extending beyond each ray, with a rounded tail. There are 41 fpecies of this genus, which vary from each other, even thofe of the fame fpecies, almof infinitely in colour; fome of them being of a dirty red mixed with a certain dukinefs; others mof beautifully friped, efpecially about the head, with the richefl colours, fuch as blue, red, and yellow. Care muft therefore be taken not to multiply the fpecies from thefe accidental teints, but to attend to the form, which never varies. Mr Pennant mentions his having feen a fpecies of labrus taken about the Giant's Canfeway in Ireland, of a molt beautiful vivid green, fpotted with fcarlet; and others at Bandooran in the county of Sligo of a pale green. To this genus belongs the fifh called by the Englifh the - ld wife.

Laburnum, in botany. Sce Cytisus,

## L A B

LABYRINTH, among the ancients, was a large I.abyrintk; intricate edifice cut out into variuus aifes and meanders $\rightarrow$ running into each other, fo as to render it difficult to get out of it.

There is mention made of fevcral of thofe edifices among the ancients; but the molt celebrated are the Egyptian and the Cretan labyrinths.

That of Egypt, according to Pliny, was the oldet of all the known labyrinths, and was fubtitting in his time after having Htend 3600 years. He fays it was built by king Petefucus, or Tithoes; but Herodotus makes it the work of feveral kings: it food on the banks of the lake Mceris, and confilted of 12 large contiguous palaces, containing 30 o chambers, 1500 of which were under ground.-Strabo, Diodorns Siculus, Pliny, and Mela, fpeak of this monument with the fame admiration as Herodotus : but not one of them tells u; that it was conltructed to bewilder thofe who attempted to go over it; though it is manifeft that, without a guide, they would be in danger of loo fing their way,

It was this danger, no doubt, which introduced a new term into the Greek language. The word labyrinth, taken in the literal fenfe, fignifies a circumferibed fpace, interfected by a number of paffages, fome of which crofs each other in every direct:on like thofe in quarries and mines, and others make larger or fmaller circuits round the place from which they depart like the fpiral lines we fee on certain fhellso In the figurative fenfe, it was applied to obfcure and captious que!!ions, to indirect and ambiguous anfwers, and to thofe difcuffions which, after long digreffions, bring us back to the point from which we fet ont.

The Cretan labyrinth is the moft famed in hiftory or fable; having been rendered particulatly remarkable by the Anry of the Minotaur, and of Thereus who found bis way through all its windings by means of Ariadne's clue. On Pliate CCLIX. is exhibited a fuppofed plan of it, copied after a draught given by Meurfirs ${ }^{*}$, taken from an ancient thone.-But what $I_{n} \mathrm{Cr}_{\text {red }}$. was the real nature of this labyrinth, merits a morelib. $\mathbf{1}$. czpas particular inquiry.

Diodorns Siculus relates as a conjecture, and Pliny as a certain fact, that Dxdalus couftructed this labyrinth on the model of that of Egypt, though on a lefs fcale. They add, that it was formed by the command of Minos, who kept the Minotaur thut up in it ; and that in their time it no longer exilted, having been either deflroyed by time, or purpofely demulifhed. Diódorns Siculus and Pliny, therefore, confidered this labyrinth as a large edifice; while other writers reprefent it fimply as a cavern hoilowed in the rock, and full of winding paffages. The two former authors, and the writers laft mentioned, have tranfmitted to us two different traditions : it remains for us to choofe that which is mof probable.

If the labyrinth of Crete liad been confructed by Drdalus under Minos, whence is it that we find no mention of it, neither in Homer, who more than once fpeaks of that prince and of Crete; nor in Herodotus, who defcribes that of Egyp!, after baving faid that the monuments of the Egyptians are much fuperior to thofe of the Greeks; nor in the more ancient geographers; nor in any of the wrieers of the ages when Greece flourihed?

The -

Libyrinth. This work was attributed to Dædalus, whofe name cities; and that, in more ancient times, they ferved $\mathrm{L}_{\mathrm{ab}}$ $\xrightarrow[\sim]{\text { - is alone fufficient to difcredit a tradition. In fact, his }}$ name, like that of Hercules, had become the refource of ignorance, whenever it turned its eyes on the early ages. All great labours, all works which required more ftrength than ingenuity, were attributed to Hercules; and all thofe which had a relation to the arts, and required a certain degree of intelligence in the execution, were aCcribed to Dedalus.

The opinion of Diodorus and Pliny fuppofes, that in their time no trices of the labyrintl exifted in Crete, and that even the date of its deflruction had been forgotten. Yet it is faid to have been vifited by the difeiples of Apollonius of lyana, who was cotemporary with thofe two authors. The Cretans, therefore, then believed that they poffeffed the labyrinth.

si. 441.

Bartalemit, from whom thefe obfervations are extracted) to attend to the following paffage in S:rabo. At Napulia, near the ancient Argos, (fays thai judicious writer), are ftill to be feen valt caverns, in which are confructed labsuinths that are helieved to be the work of the Cyclops: the meaning of which is, that the labours of neen had opened in the roek paffages which crofled and returned upon themfetves, as is done in quarries. Such, if I am not miftaken, is the idea we ought to form of the labyriath of Crete.
"Were there feveral labyrinths in that illand? Ancient authers foeak only of one, which the preater part place at Counfus; and fome, though the number is but fmall, at Gortyna.
"Belon and Tournefort have given us the defeription of a cavern fituated at the foot of mount Ida, on the fouth fide of the mountain, at a fma'l ditlance from Gortyma. This was only a quarry according to the former, and the ancient labyrinth according to the latter; whole opinion I have followed, and abridged his account. Thofe who have added critical notes to his work, befides this labyrinth, admit a fecond at Cnoffus, and adduce as the principal fupport of this opinion the coins of that eity, which reprefent the plan of it, according as the artills conceived it. For on fome of thefe it appears of a fquare form, on others round: on fome it is only fietched out; on nitirs it has, in the middle of it, the head of the Minotaur. In the Memoirs of the Academy of Belles Lettres, I have given an engraving of one which ap. pears to me to be of about the 5 he century before Chritt; and on which we fee on one fide the figure of the Minotaur, and on the other a rude plan of the lanyrinth. It is therefore certain, that at that time the Cnofians believed they were in poffeffion of that celebrated earern; and it alfo appears that the Gortynians did not pretend to contet their claim, fince they have never griven the figure of it on their money.
"The place where I fuppofe the labyrinth of Crete to have been fituated, aceording to Tournefort, is but one league diftant from Gortyna; and, according to Strabo, it was diltant from Cnoflus fix or feven leagues. Ali we can conclude from this is, that the territory of the latter city extended to very near the former.
". What was the ufe of the caverns to which the name of labyrinth was given? I imagine that they were firft excavated in part by nature; that in fome places ftones were extracted from them for building
for a habitation or afylum to the inhabitants of a difrrist expofed to frequent incurfions. In the journey of A nacharfis through Phocis, I have fpoken of two great eaverns of Parnanus, in which the neighbouring people took refuge; in the one at the time of the d.luge of Deucalion, and in the other at the invafion of Xerxes. I here add, that, according to Diodorus S:culus, the molt ancient Cretans dwelt in the cares of Mount Ida. The people, when inquiries were made on the fpot, faid that their labyrinth was originally only a prifon. It may have been put to this ufe; but it is difficult to believe that, to prevent the efcape of a few unhappy wretches, fuch inmenfe labours would have been undertaken."

Labritnth of ile Ear. See Anatomy, p. 764.
lac, mile, among phyficians. See Mile.
Lac, Gum. See Lacca.
LACAKRY (Giles), a learned Jefait of the 17 th century, was born in the diocefe of Caltres, in Languedoe, in 1 605. He taught philofophy, theology, and the holy Scriptures in his fociety; was rector of the college of Cahors; and beeane well fkilled in hiflory. He wrote many works; the prineipal of which are, I. Hif. Galliarum fub Prafectis Pratorii Gallisrum, ato. a work which is much efteened, and extends from the reign of Conllantine to that of Jultiniaa 2. Ilijhoria Romana a J̌ulio Cafure ad Conflantinum Magnum, per mumifmata $\S$ marmora antiqua, an excellent work. 3. İpitome biloric Reg. Fraitecia, ex Dionyfio Petavio excerpta, alfo much eftermed. 4. An edition of Velleius Paterculus, with learned notes.

1 ICCA, Lac, or Gum-Lac is a kind of wax, of which a fpecies of iafects form cells upon trees, like honcyeombs. See the artiele Coccus, fpee. 5. In thefe ecils remain fome of the dead infeats, which give a red colour to the whole fubtance of the lac. That called fick-lac is the wax arhering to fome of the fmall branclits of the tree, and which is unprepared. This lac, when Ceparated from the adhering Hicks, and grofsly powdered, and deprived of its colour by diveftion with menllruums, for the fake of the dyes and other purpofes, is eailed foed lac; when the ftick-lac is treed from impurities by melting it over a gentle fire, and formed into cakes, it is called lump lac ; and laftly, that called Joell-lac is the cells liquitied, Atrained, and formed into thin tranfparent laminse in the following manner. Separate the cells from the branches, break them into fmail pieces, throw them into a tub of water coun for one day, waft off the red water and dry the cells, (ium and with them fill a eylindrical tube of cotton cloth two in 1 feet long, and one or two inehes in diameter; tie both ${ }_{7}{ }_{r}$ ends. turn the hag above a charcoal fire; as the lac $\frac{71}{71 .}$ liquifies twift the bag, and when a fufficient quantity has tranfuded the pores of the cloth, lay it upon a fmooth junk of the plantain-tree (MIOsA Paradificaca, Linnai), and with a ttrip of the plantain leaf draw it into a thia lamella; take it off while flesible, for in a minute it will be hard and brittle. The value of Thell lac is according to its tranfparency.

The lac infect is one of the moft ufful of that tribe yet difcovered, particularly to the natives of the countries where it is found. They coanume a great quantity of fhell-lac in making ornamental rings, painted and gilded in various taltes, to decorate the arms of

## I. A C

cea. the ladies; and it is formed into beads, 「piral and linked ehains for necklaces, and other female ormments. - The following are recipes for various purpofes to which this fublance is applied by them.

1. For fealing wax. Take a ttick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the fhell-lac foffened above the fire; kcep alternately heating and adding more flell lac until you have got a mafs of three or four pounds of liquified thelllac upon the end of your tlick (in which manner lump lac is formed from feed lac). Knead this upon a wetted board with three ounces of levigated cinnabar; form i: into eylindrical pieces; and to give them a pulifh, rub them while hot with a cotton cloth.
2. For japanning. Take a limp of flell-lac, pree pared in the manner of fealing-was, with whatever colour jou pleare, fix it upon the end of a llick, heat the polifhed wood over a charcoal fire, and rub it over with the half mclted lac, and pulifl by rubbing it even with a piece of foldel plantain leaf held in the hand; bieating the laquer and adding more lac as occalinn requires. Their ligures are formed by lac, chargec with various colours in the fame manner.
3. For Varnih. In ornamenting their images and religious houfes, ixc. they mate ufe of very thin beat lead, which they cover with varions varnifhes, made of lae charged with colours. The preparation of them is kept a fecret. The leaf of lead is lisd upon a fraooth iron lieated by fire below while they fprcad the varuifin upon it.
4. For Grindfones. Take of river fand three parts, offeed lac wafthed one part, mix them over the fire in a pot, and form the mafs into the fhape of a grindRone, having a fquare hole in the centre, fix it on an axis with liquified lac. heat the fone moderately, and by turning the axis it may ealily be formed into an exact orbicular flhape. Polifhing grindftones are made only of fuch fand as will pafs eafly through fine muflin, in the propertion of two pats fand to one of lae. This fand is found at kagimath. It is compofed of fmall angular cryftalline particies tinged red with iron, two parts to one of hack magnetic fand. The flonecutters, intlead of fand, wfe the powder of a very hard granite called corpure. Thefe grinddones cut very fall. When they want to increafe their power, they threw fand upon them, or let them occafionally touch the edge of a vitrificd brick. The fame compofition is formed upon fticks, for cuting fones, fiell, \&c, by the hand.
5. For Painting. Take one gaiion of the red iiquid from the firt wathing for Phell-lac, flrain it thero' a cloth, and kt it boil for a frort time, the: add haif an ounce of foap earth (fufill alkali); hoil an hour more, and add thrce ounces of powdered load (baik of a tree) ; boil a fiort time, let it fland all night, and flrain next day. Evaporate three quarts of milk with. out cream to two quarts upon a flow fire, curdle it with four milk, and let it fland for a day or two ; then mix it with the red liquid above mentioned; flain them through a cloth, add to the mixture one eunce and an half of alum, and the juice of eight or ten lemons: mix the whot and throw it into a cloth bag Arainer. The blood of tive infect forms a coagulum with the cafeous patt of the milk, and remains in the bas, while a limpid acid water drains from it. The

## 495 ] L A.C

conguluan is dried in the foale, and is ufed as a red lacea. colour in painting and colouring.
6. Fur Dyeing. Take one gallon of the red liquid prepared as before without milk, to which add three cunces of ahm. B ail laree or fom ounces of tamarinds in a gatlon of water, and llrain the liquor. Mix equal parts of the red liquid and tamaind watcr over a brille fire. In this mixture dip and wring the filk alternately until it las received a proper quantity of the dye. To increafe the colour, isereafe the prepnrt :on of the red liyuid, and let the fill borit a few minutes in the mixture. 'To make the filk hold the coDour, they boil a handfut of the bark called locid in wa. ter, frain the decoedion, and add cold water to it; dip the dried filk into this liquor feveral times, and then dry it. Cotton choths are dyed in this manner; but the dye is not fo lalling as in fitk.

The lac colour is preferved by the matives upon flakes of cotion dipped repeatedly into a trong folution of the lac infect in water, and then dried.

Among us tac is alfo ufed in various arts; being entphyed in the preparation of firit-varnintes, for the making of fealing-w's, and as a colouring material for dying fcarlet; fee Varnisu, Wax, \&e. It is unfoluble in water; and difficultly fuluble in ipinit of wine, which for that purpofe mult be well dephlecrmated. According to Neumann, 16 ounces of Seed-lac, diftilled in an open fire, yielded nine ounces and fix drams of a butter or thick oil, one cence fix drams of a watery liquor meither acid nor alkaline, and a refiduem whighing two ounces and a half. The coluur given by lae is lefós beautiful, but more curable, thon that given by cochineal. To render the colouring mater of the lac diffufble in water, fo as to be applied to the fuffs to be dyed, Mr Hellot dircets the following procefs: Let fome powdered gum he be digelled during two hours in a decection of comery root, by which a fine crimfon colour is given to the water, and the gum is rendered pale or firas-coloured. To this tincture, poured off ciear, let a foltaton of ahm be added; and when the eclonring matter has fubfided, let it he feparated from the clear liquor and diced. It will weigh about $\frac{x}{5}$ th of the quantity of lac employed. This dried fecuia is to be difiulved or ciffufed in warm water, and fome folution of tin is to be added to it, by which it acquires a vivid feates colour. This liquor is to lie edded to a folution of tertar in boiling water ; and thus the dye is prepared.

The method of obtaining the fine red lac ufed by painters from :lis fubflance, is by the foliowing fimple proccfi. Buil the nick lac in water, filtre the decoction, and evaporate the clear liquor to a drysefs. over a genite fire. The occafion of this eafy feparation is, that the beautiful red colour here feparated, adhetes orly flightly to dhe outades of the Alicks broke off the trees along with the gum-lac, and readily communicates itfe!f to beiling water. Some of this alicking matter alfo adhering to the gum itfelf, it is proper to bsil the whole together; for the gum does not at all prejudice the colour, nor diffoive in boiling wa. ter: fu that after this operation the gum is as tit for making fealing-wax as before, and for all other ufes which do not require its colour.
Lac is likewife employed for medicinal purpofess.
I. Iata,

The fiick-lac is the fort ufed. It is of great efteem in Germany, and other countries, for laxity and fponginefs of the gums proceeding from cold or a fcorbutic habit: for this ufe the lac is boiled in water, with the addition of a little alum, which promotes its folution ; or a tincture is made from it with rectified firit. This tincture is recommended alfo internally in the fluor albus, and in rheumatic and fcorbutic diforders: it has a grateful fmell, and not unpleafant, bitterifh, altringent tafle.

The gum-lac has been lately ufed as an electric, inflead of glafs, for electrical machines. See Laceuer, Zake, and Varnish.

Arlificial LaccA, or Lacque, is alfo a name given to a colsured fubflance drawn from fcveral flowers: as the yellow from the flower of the juniper, the red from she poppy, and the blue from the iris or violet. The - tinctures of thefe flowers are extracted by digefling them feveral times in aqua-vite, or by boiling them over a flove fire in a lixivium of pot-alhes and alum.

An artificial lacca is alfo made of Brafil wood, boiled in a lisivium of the brancles of the vine, adding a litte cochineal, turmeric, calcined alum, and arfenic, incorporated with the bones of the cuttlc. fifh pulverized and made up into little cakes and dried. If it be to be very red, they add the juice of lemon to it ; to make it brown, they add oil of tartar. Dovecoloured or columbine lacca is made with Brafil of Fernambuc, fleeped in diftilled vinegar for the fpace of a month, and mixed with alum incorporated in cuttle-fifh bone. For other procefics, fee CoLot'kMcking.

LACE, in commerce, a work compofed of many threads of gold, Giver, or filk, interwoven the one with the other, and worked upon a pillow with fpindles according to the pattern defigned. The open wark is zormed with pins, wbich are plactd and difplaced as the fpindles are moved. The importation of gold and filver lace is prohibited.

Method of Cleaning Gold-L.scs and Embroidery when tarmi/bect.-For this purpofe alkaline liquors are by no means to be ufed; for while they clean the gold, they corrode the tilk, and change or difcharge its colour. Soap alfo alters the fhade, and even the fpecies of certain colours. But firit of wine may be ufed without any danger of its injuring either the colour or quality of the fubject; and in many cafes proves as effectual, for rettoring the luftre of the gold, as the corrofive detergents. A rich brocade, flowered with a variety of colours, after being difagreeably tarnifhed, had the lullre of the gold perfectly rehored by wafhing it with a foft bruith dipt in warm fpirit of wine; and fome of the colours of the filk, which were likewife foiled, becante at the fame time remarkably bright and lively. Spirit of wine feems to be the only material adapted to this intention, and probably the toalted fecret of certain artifts is no other than this fpirit difguifed. Among liquids, Dr Lewis fays, he does not know of any other that is of fufficient activity to difcharge the foul matter, without being hurtful to the filk : as to powders, however fine, and however cautioufly ufed, they fcratch and wear the gold, which here is only fuperficial and of extreme tenuity.

But tho' Spirit of wine is the moft innocent material shat can be enployed for this purgofe, it is not in all $\mathrm{N}^{\circ} \mathrm{Na} 3$.
cafes proper. The golden covering may be in fome parts worn off; or the bafe metal, with which it had been iniquitouny alloyed, may be corroced by the air, fo as to leave the particles of the gold difunited; while the filver underneath, tarnihed to a ycllow hue, may continue a tolerable colour to the whole: in which cales it is apparent, that the removal of the tarnifh would be prejudicial to the colour, nn: make the lace or embroidery lefs like gold than it was before. A piece of old tarninhed gold-lace, cleaned by firit of wine, was deprived, with its tarnin, of the greateft part of its golden hue, and lonked now almoll like filver-lice.

Method of feparaling the Gold and Silver from Lacs suilhout burning it. Cut the lace in pieces, and (ha. ving feparated the thread from it by which it was fewed to the garment) tie it up in a linen cloth, and boil it in foap ley, diluted with water, till you perceive it is diminifhed in bulk; which will take up but a littlc time, unlefs the quantity of lace be vers confiderable. Then take out the cloth, and walh it feveral tines in cold water, fqueezing it pretty hard with your foot, or beating it with a mallet, to clear it of the Coap-ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminifhed in weight.

This method is abundantly more convenient and lefs troublefome than the common way of burning; and as a fmall quantity of the ley will be fufficient, the expence will be trifling, efpecially as the fame ley may be ufed feveral times, if cleared of the filky calcination. It may be done in either an iron or copper veffel.

The ley may be had at the foap-boilers, or it may be made of peatl-ath and quick-lime boiled together in a fuficient quantity of water.

The reafon of this fudden change in the lace will be evident to thofe who are acquainted with chemilty: for filk, on which all our laces are wove, is an animal fubftance, and all animal fubftances are foluble in alkalies, efpecially when rendered more cauftic by the addition of quicklime; but the linen you tic it in, being a vegetable, will remain unatered.

Blond-LACE, a lace made of fine linen thread or filk, mucl in the fame manner as that of gold and filver. The pattern of the lace is fixed upon a large round pitlow, and pins being ftuck into the holes or openings in the patterns, the threads are interwoven by means of a number of bobbins made of bone or ivory, eacla of which contains a finall quantity of fine thread, in fuch a manner as to make the lace exactly refemble the pattern. There are fevcral towns in England, and particularly in Buckinghamflire, that carry on this ma. nufacture; but valt quanticies of the lineft lace have been imported froun Flanders.

LACEDÆMON (fab. hit.), a fon of Jupiter and Tayget the daughter of Atlas, who married Sparta the dauglater of Europa, by whom he had Amyclas and Eurydice the wife of Acrifius. He was the firt who introduced the worfhip of the Graces in Laconia, and who birl built then a temple. From Lacedremon and his wife, the capital of Laconia was called Lacedemon and Sparta.

Lacedemon, a noble cily of Peloponnefus, called alfo Sparta; thefe names differing in this, that the latter is the proper and ancient name of the city, the former of the country, which afterwards came

## L. A C

dre came to be applied to the city (Strabo, Stcphanus.)
on Homer alfo makes this diltinction; who calls the country boly, becaufe encompaffed with mountains. It las allo been feverally known by the name of Lelegia, from the Leleges the firtt inhabitants of the country, or from Lelex one of their kings; and Ocbalia, from Oebalas the fixth king from Eurotas. It was allo called Hecatompolis, from 100 cities which the whole province once contained. This city was the capital of Laconia, fituated on the right or welt lide of the Eurotas: it was lefs in compafs than, however equal, or even fuperior, to Atbens in power. Polybius makes it 48 fladia, a circuit much inferior to that of Atlens. Lelex is fuppofed to have been the firft king of Lacedæmon. His defcendants, 13 in number, reigned fucceffively after him, till the reign of the fons of Oreftes, when the Heraclidæ recovereo the Peloponnefus about 80 years after the Trojan war. Procles and Eurythenes, the defcendants of the Heraclidx, ufurped the crown together; and after them it was decreed that the two families frould always fit on the throne together. The monarchial power was abolifhed, and the race of the Heraclide extinguihed at Sparta about 219 years before Chrilt. Lacedæ. mon in its flourifhing ftate remained without walls, the bravery of its citizens being inftead of them ( Ne pos). At length in Caffander's time, or after, when the city was in the hands of tyrants, diftrufting the defence by arms and bravery, a wall was built round it, at firlt night, and in a tumultuary, or hafty manner; which the tyrant Nabis made very ftrong (Livy, JuAtin). Paufanias afcribes the firft walls to the times of Demetrius and Pyrrhus, under Nabis. The walls of the city were pulled down 188 years before Chrift by Philopœmen, who was then at the head of the Achæan league, and Laconia fome time after became a Roman province when reduced by Mummias. See Sparta. -The prefent city is called Mifitra, fituated in E. Long. 23. O. N. Lat. 36. 55.

LACERNA, a coarfe thick garment worn by the Romans over their gowns like a cloak, to kecp off the rain and cold. It was firit ufed in the camp, but afterwards admitted into the city. The emperors wore the lacerna of a puiple dyc. The lacerna was at firit very fhort, but was lengthened after it became fafhionable, which was not till the civil wars and the triumvirate; lefore this time it was confined to the foldiers. Senators were forbidden wearing it in the city by Valentinian and Theodofius. Martial makes mention of lacerme worth 10,000 fefterces. Some confound this garment with the penula; but it feems rather to have refembled the cblamys and birrus.

LACERTA, the lazard, in zoology, a genus of
\& amphibious animals, belonging to the order of reptilia, the characters of which are thefe: The body is naked, with four feet. and a tail. There are 49 fpecies: the moft remarkable are,

1. The crocodylus, or crocodile, has a compreffed jagged tail, five toes on the fore and four on the hind-feet This is the largett animal of the lizard kind. One that was diffected at Siam, an account of which was fent to the Royal icademy at Paris, was 18 feet and a half long, of which the tail was no lefs than five feet and a half, and the head and nock above tw. :"n $\}$ = half. He was four feet and nine inches in circumference where thickeft.

The hincer ligs. including the thigh and the paw, Vol. IX. Part II.
were two feet and two inches long; the paws, from Lacerea. the joint to the extremity of the longett claws, were above nine inches. They were divided into four tocs; of which three were armed with large claws, the longeft of which was an inch and a half, and feven lines and a half broad at the root. 'I'he fourth toe was witheu: a nail, and of a conical figure ; but was covered with a thick fkin like fhagreen leather. Thefe toes were united with membranes like thofe of ducks, but much thicker.

The fore-legs liad the fame parts and conformation as the arms of a man, both within and without; but they were [omewhat Gorter than thofe behind. The hands had five fingers, the two laft of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rifing at the top; but the reft was flat, and efpe. cially towards the extremity of the jaws. It was covered with a fkin, which adhered firmly to the fkull and to the jaws. 'The fkull was rough and unequal in feveral places; and about the middle of the forehead there were two bony crefts, about two inches high. They were not quite parallik, but feparated from each other in proportion as they mounted upwards.

The eye was very fmall in proportion to the reft of the body; and was fo placed wirhin its otbit, that the outward patt, when fhut, was only a little above an inch in length, and ruri parallel to the opening of the jaws.

The nofe was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being two inches in dianeter, of a black, foft, fpongy fubftance, not unlike the nofe of a dog. The noftrils were in the form of a Greck capital $\Sigma$; and there were two caruncles which filled and clofed them very exactly, and which opened as often as he breathed through the nole. The jaws feemed to fhut one within another by means of feveral apophyfes, which proceeded from above downwards, and from below upwards, there being cavities in the oppolite juw to receive them. They had 27 dog-teeth in the upper jaw and 15 in the lower, with feveral void fpaces between them. They were thick at the bottom, and flarp at the point ; being all of different fizes, except ten large hooked ones, fix of which were in the lower jaw, and four in the upper. The mouth was 15 inches in length, and eight and a half in breadth where broadett ; and the diftance of the two jaws, when opened as wide as they could be, was 15 inches and a half. The nkull, between the two crefts, was proof againll a mukket-ball, for it only rendered the part a little white that it fruck againft.

The colour of the body was of a dark brown on the upper part, and of a whitifh citron below, with large fpots of both colours on the fides. From the fhoulders to the extremity of the tail he was covered witlt large fcales of a fquare form, difpofed like parallel girdles, and were 52 in number; but thofe near the tail were not fothick as the ref. In the middle of each girdle there were four protuberances, which became higher as they approached the end of the tail, and compoled four rows; of which the two in the middle were lower than the remaking two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The flin was defended with a fort of armour 3 R
which

## L A C [ 498 ] L A C

Lacerta. which, however, was not proof againft a mufket-ball, contrary to what las been commonly faid. However, it mult be acknowledged, that the attitude in which it was placed might contribute not a little thereto ; for probably, if the ball had fruck obliquely againlt the fhell, it would have nown off. Thofe parts of the girdles underneath the belly were of a whitifh colour, and were made up of fcales of divers fhapes. They were about one lixth of an inch in thickuefs, and were not fo hard as thofe on the back.

This creature is, however, faid to grow to a fill larger fize than that above mentioned, fome having been known to meafure 25 feet in length.-They have no tongue; but in place of that organ there is a fors of membrane attached by its edges to the two rides of the under jaw.

The crocodile lays eggs, which the covers over with fand, and leaves to be hatched by the hear of the fun. They are to be met with in the rivers Nile, Niger, and Ganges, betides moft other large rivers in the fouthern parts of Alia, Africa, and America.

Mr Hatfelquill informs us, that the crocodile fivallows flones to affit digellion, after the mariner of feedeating birds, which commit to the flomach the work of maftication as well as concoction, being deftitute of the inftruments adapted to that purpofe. The Egyptians fay, that his excrements do not pafs by the anus: this feems to be confirmed by the llructure of the gut, which is near the pylorus; for it cannot eatily be conceived that excrements fhould pais through fuch a narrow paffage, feemingly deftined for the conveyance of the chyle only; but the ftructure of the parts, and the gut being fo near the pylorus, feem to indieate that the excrements pafs through it into the ventricle, and are vomited up. The inhabitants above Cairo fay they fee this daily; and ubferve, that the crocodile is obliged to come on flore as often as he has occafion to eafe himfelf. There is a folliculus, of the bignefs of a hazel-nut, under the fhoulders of the old crocodiles, which contains a thick matter fmelling like mufk. The Egyptians are very anxious to get this when they kill a crocodile, it being a perfume much efteemed by the grandees. When the male copulates with the female, he turns her with his fnout on her back. The Egyptians ufe the fat againft the rheumatifm and ftiffnefs of the tendons, efteeming it a powerful remedy out wardly applied. They fay the gall is good for the eyes; they make ufe of it as a certain remedy for barrennefs in women, taking about fix grains internally, and out wardly they apply a peffus made of cotton and the gall of a crocodile. The eyes of the crocodile are the beft aphrodifiacs of any known by the A rabs; who prefer them to all confections, dea-fatyrii, hyacinthi, \&c. and even to ambergris.

The crocodile is a very dangerous and terrible animal in fome countries. It does a great deal of mifshief among the common people of Upper Egypt, often killing and devouring women who come to the river to fetch water, and clildren playing on the fhore or fwimming in the river. In the ftomach of one diffected before Mr Barton the Englifh conful, they found the bones of the legs and arms of a woman, with the rings which they wear in Egypt as ornaments. Thefe aninals are feen in fome places lying for whole hours, and even days, ftretched in the fun and motionle's; fo that one not ufed to them might mitake
them for trnnks of trees covered with a rough and dry bark : but the miftake would foon be fatal; for the feemingly torpid animal, at the near approach of any living creature, inftantly darts upon it, and carries it to the bottom. In the times of an inundation they fometimes enter the cottages of the natives, where they feize the firt animal they meet with. There have been feveral examples of their taking a man out of a canne in the fight of his companions, without their being able to lend him any affiltance. The crocodile, however, except when priffed with hunger, or with a view of depofiting its eg!rs, feldom leaves the water. Its ufual method is ts float along upon the furface, and feize whatever animals come within its reach; bu: when this method fails, it then goes clofer to the bank. There it waits in patient expectation of fome land animal that comes to drink; the dog, the bull, the tiger, or man himfelf. Nothing is to be feen as the animal approaches, nor is its retreat difcovered till it is too late for fafety. It feizes the victim with a fpring, and goes at a bound much fafter than fuch an unwieldy animal could be fuppofed to do; then having fecured the creature both with teeth and claws, it drags it into the water, inflantly finks with it to the bottom, and in this manner quickly drownsit. Sometimes it happens, that the creature wounded by the crocodile makes its efcape; in which cafe, the latter purfues with great celerity, and often takes it a fecond time. In thefe depredations, however, this terrible animal often feizes on another as formidable as itfelf, and meets with a defperate refiltance. We are told of frequent combats between the crocodile and the tiger. All creatures of the tiger kind are continually oppreffed by a parching thirft, that keeps them in the vicinity of great rivers, whither they defcend to driuk very frequently. On thefe occafions they are feized by the crocodile; upon whom they inftantly turn with the greateft agility, and force their claws into his eyes, while he plunges with his fierce antagonift into the river. There they continue to Atruggle for fome time, till at laft the tiger is drowned. Notwithftanding all this, however, we are affured by Labat, that a negro, with no other weapon than a knife in his right hand, and bis left arm wrapped round with a cow-hide, ventures boldly to attack this animal in its own element. As foon as he approaches the crocodile, he prefents his left arm, which the animal fivallows molt greedily: but as it llicks in his throat, the negro has time to give it feveral ftabs below the chin, where it is eafily vulaerable: and the water alfogetting in at the mouth, which is held involuntarily open, the creature is foon bloated up as big as a tun, and expires.
The natives of Siam feem particularly fond of the capture of all the great animals with which their country abounds. The crocodiles are taken by throwing three or four flrong nets acrofs a river, at proper diflances from each other; fo that if the animal breaks through the firt, it may be caught by one of the rell. When it is firt taken, it employs the tail, which is the grand intrument of Atrength, with great foree; but after many unfucceffful ftraggles, the animal's ftrength is at laft exhaufted. Then the natives approach their prifoner in boats, and pierce him in the moft tender parts till he is wcakened by lofs of blood. When he has done ftirring, they begin by tying up his mouth,

## L A C [ 499 ] L A C

rtt. and with the fame cord tie his head to his tail, which laft they bend back like a bow. However, they are not yet perfectly fecure from his fury; but for their greater fafety they tie his fore feet, as well as thofe behind, to the top of his back. Thefe precautions are not ufelefs; for if they were to omit them, the crocndite would foon recover frength enough to do a great deal of mifchief. When thus brought into fubjecti n, or when taken young and tamed, this formidable animal is ufed to divert and entertain the great men of the eaft. It is often managed like an horfe; a curb is fut into its mouth, and the rider directs it as he thinks proper. Theugh aukwardly formed, it does not fail to proceed with fone degree of fwiftnefs; and is thought to move as fall as fome of the moll unwieldy of our nwn aninals, the hog or the cow. Some indeed affert, that no animal could efcape it but for its fownefs in turning; which, however, feems very improhable, as its back bone is full of articulations, and feemingly as flexible as that of other large animats.

All crocodiles breed near feeth waters: and though they are formetines found in the fea, yet that may be comlidered rather as a place of excurfion than abode. They produce their young by eggs, as was faid above; end for this purpofe, the female, when fhe comes to lav, chonfes a place by the fide of a river, or fome freftwater lake, to depofit lier trood in. She always pitches upon an extenfive fandy fhore, where fhe may dig a hole withnut danger of detection from the ground being foth turred up. The thore mult alfo be gentle and fhelving to the water, for the greater convenience of the aninal's going and returning; and a cunverient place mult be found near the edge of the firearn, that the young may have a finiter way to go. When all thefe requilites are adjufted, the animal is feen cautioufly llealing up on fhore to depofit her burden. The preferce of a man, a beaft, or even a bird, is fufficient in deter her at that time; and if the porceives anty creature looking on, fle infallibly returns. If, however, nothing appeare, the then goes to work, fratchjng up the fand with her fore-paws. and making a hinle pretty deep in the fhore. 'There the depofits from So to 100 egys, of the fize of a tennis-ball, and of the fame figure, covered with a tough white fkin like purchmert. Slie takes above an hour to perform this talk; and then covering up the place fo artfully that it can farcely, be perceived, fhe goes back to seturn again the next day. Upon her return with the fame precaution as before, fhe lays about the fame number nf eggs; and the day following alfo a like number. Thus lacing depofited her whole quantity, and having covered them cle fe up in the fand, they are foon vivified by the heat of the fun; aad at the end of 30 days the young ones begin to break open the fell. At this time the female is inltinctively taught that her yourg ones want relief; and the groes upon land to fcratch sway the fand and fet them free. Her brosd quickly avail therfelves of their liberty; a part run unguided to the water; another pant afeerd the back of the femake, and are carried thither in greater fafty. But the moment they arrive at the water, all natural connection is at an end; when the female has introduced her young to their ratural element, not only fhe, but the male, become amongft the number of their molt formidable enemies, and devour as many of them as they can. 'The whole brood featters into different parts
at the bottom; hy far the greateft number are defroyed, and the relt find fafety in their agility or minutenefs.

But it is not the pareut alone that is thus found to thin their numbers; the eggs of this animal are not only a delicious feaft to the favage, but are eagerly fought after by every bealt and bird of prey. The ichneumon was erected iuto a deity among the ancients for its fuccefs in deftroying the eggs of thefe monAters: at prefent that fpecies of the vulture called the gallinazo is their moft prevailing enemy. All along the banks of great rivers, for thoufands of miles, the elocodile is feen to propagate in numbers that would foon over-run the earth, but for the vulture, that feen:s appointed by Providence to abridge its fecundity. Thefe birds are ever found in great numbers where the crocodile is moft numerous; and hiding themfelves within the thick branches of the trees that flade the banks of the river, they watch the female in filence, and permit her to lay all her egys without interruption. Then when fle llas retired, they encourage each other with cries to the foil; and focking all together upon the hidden treafure, tear up the eggs, and devour them in a much frotter time than they were depofited. Nor are they lefs diligent in attending the female while the is carrying her young to the water; for if any one of them happens to drop by the way, it is fure to receive no mercy.
Such is the extraorcinary account given us by late travellers of the propagation of this animal; an acconnt adopted by Linnexts and the mofl $l_{\text {tarned }}$ naturalilts of the age. Yet if one might argue from the general analogy of naturc, the crocodile's devouring her own young when fhe gets to the water feems doubtful. This may be a ftory raifed from the general idea of this animal's rapacious cruelty; when in fact the croeodile only feems more cruct than other animals, becaufe it has more power to do mifchief. It is probable that it is not more diveficio of parental tendernefs than other creatures; and we are the more led to thirk fo, from the peculiar formation of one of the crocordile kind, callen,
2. The open bullied crooodile; which is furnihed with a falfe beily like the opoflum, where the young creep out and in as their dangers or neceffities require. The crocodile, thus furnithed at leaft, cannot be faid to be an enemy to her own yourg, fuce The thus cives thein mone than parertal protection. It is probable alfo that this open beilied crocodile is vist. parous, and fofters her young that ase prematureiy excluded in this fecond womb until they come to proper mat mity.

This crocodile is a fpecies that was not deferibed by Linneus; but has been inferted in the $S_{j}$ Aema Naturx fince his death, under the name of Lacerta gangritica. Mr Edwards tells us, that three of thefe creatures were fent from Bengal ahout the ycar 1747, to the late Dr Mead plyyfician in ordinary to the king. 'Two of them the Doctor preferved in his collecion, and prefented the third to the late curious Mrs Kennon; and fince the deceafe of thefe worthyr perfons, they became ihe property of Mr James Lemon of London, who obliged our author with one of them to produce to the royal fociety. The narrownefs of the beak is the moft extraordinary circumftance in this crocodile, which appears like $3 \mathrm{R}_{2}$

## L A C

Lacerta. the bill of the bird called soofeander. It has fmall fharp teeth. Another peculiarity is a paunch or open purfe in the middle of the under fide of the belly, which feems to be naturally formed with round hips, and hollow within, to receive its young in time of danger, as it appears in the Amcrican animal called opof. fum. Dr Parfons gave it as his opinion, that the opening in the belly was really natural, it having no appearance of being cut or torn open. In other refpects it hath all the marks common to alligators or crocodiles. The beak was finely creafed tranfverfely. The animal appeared in the fpirits all over of a yellowifh olive colour, the under fide lighter than the upper. the latter having fome dufly marks and fpots. This fpecies inhabits the banks of the Ganges; and it is very flrange that they fhould never have been defcribed before, as our India company have been fo long fettled there, and the animal is at full growth nearly, if not aleogether, as large as the common crozodile.

How long the crocodile lives we are not certainly inforined: if we may belicve Ariftotle, it lives the age of a man ; but the ancients fo nuch amufed themfelves in inventing fables concerning this aniual, that even truth from them is fufpicious. What we know for certain from the ancients is, that among the various animals that were produced to fight in the amphitheatre at Rome, the comoat of the crocodile was not wanting. Marcus Scanrus produced them living in his unrivalled exhibitions; and the Romans conlidered him as the beft citizen, becaufe he furnifhed them with the molt expenfive entertainments.
3. The alligator, or American crocodile, has a vaft mouth, furnifhed with fharp teeth; from the back to the end of the tail, ferrated; fkin tough and brown, and covered on the fides with tubercles. This dreadful fpecies, which grows to the length of 17 or 18 feet, is found in the warmer parts of North A merica; and moft numerous as we approach the fouth, and the more fierce and ravenous. Yet in Carolina it never devours the human fpecies, but on the contrary fhuns mankind; it will, however, kill dogs as they fwim the rivers, and hogs which feed in the fwamps. It is often feen floating like a $\log$ of wood on the furface of the water, and is miftaken for fuch by dogs and cther animals, which it feizes and draws under water to devour at its leifure. Like the wolf, when preffed by long hunger, it will fwallow mud, and even ftones and pieces of wood. They often get into the wears in purfuit of fifh, and do much mifchief by breaking them to pieces. They are torpid during the winter in Carolina; and retire into their dens, which they form by burrowing far under ground. It makes the entrance under water, and works upwards. In fpring it quits its retrear, and reforts to the rivers, which it iwims up and down; and chiefly feeks its prey near the mouth, where the water is brackifh. -It roars and makes a dreadful noife at its firft leaving its den, and againft bad weather. It lays a vaft number of eggs in the fand, near the banks of lakes and rivers, and leaves them to be hatched by the fun: multitudes are deftroyed as foon as hatched either by their own fpecies or by fifh of prey. In South A merica the carrion vulture is the inftrument of Providence to deftroy multitudes; by that means. preventing the country from being rendered uninhabitable.
4. The Cayman, or Antilles crocodile, which has by difficent authors been confonnded with the t:vo preceding fpecies, is evidently different from both; and has accordingly been properly ditinguifhed by the Abbe Bonaacerre in the Encyclop:dic Retbodique $\ddagger$. Foye See our figure, where the difilerences are fo apparent pectlogit as to require no detail. -The greateft ffrengyh of this "ans: animal, according to M. Merian, confifs in its teeth. vifion of which there are two rows crofing one another, by Natu: means of which it grinds with the greatelt eafe what-p.3sever it feizes upon. But it mult not be underfood from this that there is a donble row of tecth, as Seba pretends, on each fide of the under jaw : but only that there are two rows on each jaw, one on the right and the other on the left fide.- The Cayman is fo called from fome fmall iffes of that name anoong the Antilles, where thefe creatures are faid to be very numerous. They are of exceeding frength, and equally the dread both of men and animals; for they live on land as well as in the water, and devour every creature they meet with.-Another figure is added, reprefenting an egg with the young one at the time of breaking the fhell. See the Plates.
5. The caudiverbera, has a depreffed pinnatifid tail, and palmated feet. It is larger than the common green lizard, is found in Peru, and has got its name from its beating the ground with its tail.
6. The ftllio has a verticillated tail, and dentated fcales. It is a native of Africa, and the warm parts of A fia. It frequents the ruinolns walls of Natolia, Syria, and Palettine. The Arabs call it bardun. The Turks kill it; for they imagine, that, by declining the head, it mimics them while they fay their prayers.
7. The agilis, has a pretty long verticillated tail, with tharp fales, and a fcaly collar. This is the con:mon green lizard, and is a native both of Europe and India. This fpecies is extremely nimble: in hot weather it bafks on the fides of dry banks or old trees; but, on being obferved, immediatcly retreats to its hole. The food of this fpecies, as well as of all the other Britifh lizards, is infects; and they themfelves are devoured by birds of prey. They are all perfectly harmlefs; yet their form Atrikes one with difgult, and has occalioned great offcurity in their hiftoryMr Pennant mentions a lizard killed in Worcefferfire in the year 1714, which was two feet fix inches long, and four inches in girth. The fore-legs were placed eight inches from the head; the hind-legs five inches beyond thofe: the legs were two inches long; the feet divided into four toes, each furnifhed with a fharp claw. Another of the fame kind was afterwards killed in that county; tut whether thefe large lizards were natives of other countries and imported into Englant, or whether they were of Britifh growth, is uncertain.
8. The chamæleon has a crooked cylindrical tail. The head of a large chamxleon is almoft two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thickneis of the body is different at different feafons; for fometimes from the back to the belly it is two inches, and fometimes but one; for he can blow himfelf up and contract himiflf at pleafure. This fwelling and contraction is not only of the back and belly, but alio of the legs and tail.

Sliflle．

## L A C

Thefe different motions are not like thofe of other animals, which proceed from a dilatation of the brealt in breathing, and which rifes and falls fucceffively; but they aic very irregular, as in tortoifes and frogs. The chamelenn has continued as it were blown up for two hours together, and then he would grow lefs and lefs infenfibly: for the dilatation was always more quick and vifible than the contraction. In this ialt flate he appeared extremely lean, and the Spine of the back was tharp, and all his ribs might be told; likewife the tendons of the arms and legs might be feen very dilinctly.
The fkin is vely cold to the touch; and notwithftandin, be feems folean, there is no feeling the beating of the heart. The furface of the fkin is unequal, and has a grain not unlike fhagreen, but very foft. hecaufe each eminewec is as fmocth as if it was polifh. ed. Some of thefe are as large as a middling pin's head on the arme, legs, belly, and tail; hut on the fhoulders and head they are of an oval figure, and a little larger. Thofe under the throat are ranged in the form of a chaplet, from the lower lip to the breaft. Some on the liead and back are amaffed together in clufters, with fpaces between them, on which are almoit imperceptible fonts of a pale red and yellow colour, as well as the ground of the Rin itfelf, which flainly appears between thefe clufters. This ground changes colour when the animal is dearl, hecoming of a greyifh brown, and the fmall fpots are whitifh.

The colour of all thofe eminences, when the chamaleon is at reft in a fhady place, is of a bluifh grey, except on the claws, where it is white with a little yellow: and the fpaces between the cluflers is of a pale red and yellow, as was before obferved. But when he is in the fun, all parts of the body which are affected with the light become of a greyin brown, or rather of a tawney. That part of the lkin which the fun does not thine on, changes into feveral brighter colours, whish form Cpots of the fize of half one's finger. Some of thefe fefcend from the fpine half way on the back; and others appear on the fides, arms, and tail. They are all of an Ifahella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the fkin .

The head of a chameleon is not unlike that of a fifh, it being joined to the brealt by a very fhort neek, covered on each fide with cartilaginous membranes refembling the gills of fifhes. There is a creft directly on the top of the head, and two others on each fide above the eyes, and between thefe there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog : at the end there is a hole on each fide for the notkrils; but there are no ears, nor any fign of any.

The jaws are furnifhed with tecth, or 1ather with a bone in the form of teeth, which he malses little or no ufe of, becaufe he lives upon fwallowing flies and other infects without chewing them ; and hence arofe the vulgar notion of his living upon air, becaufe he was never feen to eat. The tongue, which Linnæus fays refembles an earthworm, is of confiderable length, and is enlarged and fomewhat flattened at the end. From this member there continually oozes out a very glutincus liquor, by means of which it catches fuch infects as come within its reach, and it is furprifing to fee with what quicknefs it retracts its tongue the indant it has arrelled any prey. The form, lruc.
ture, and motion of the eyes, bave fomething vary particular; for they are very large, being almof half an inch in diameter. They are of a globons figure; which may be eafily feen, becaufe they ftand out of the head. They have a fingle eye lid like a cap, with a fmall hole in the middle, throngl, which the fight of the eye appears, no bigger than a pin's head, and of a fhining brown, encircled by a little ring of a gold colour. This eye-lid has a grain like fhagreen, as well as the other parts of the fikin; and when the reft of the body clanges colour, and affumes fints of different fhapes, thofe on the lid always keep the fame form, though they are tinctured witl the fame colour as the fikin. But the mon extraordinary thing relating to the eyes is, that this animal often moves one when the other is entircly at relt ; nay, fometimes one eye will feem to lonk directly forward and the other backward, and one will look up to the Ryy when the other regards the earth.

That part of the body which is called the trunk, and comprehends the thorax and the belly in a chamxlenn, is almoft all thorax, with little or no belly. The four feet are all of a length; and the only difference between them is, that thofe before are turned backwards, and thole belind forwards. There are five toes on each paw, which have a greater relemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and theugh one of thefe parts have three toes, and the other but two, yet they feem to be all of the fame fize. Thefe tos lie tngether under the fame flin as in a mitten; however, their fhape might be feen through the fein. With thefe paws the chamrelenn can lay hold of the Imall hranches of trees in the fame manner as a parrot. When he is about to perch, he parts his toes differently from hirds, becaufe he puts two behind and two before. The claw's are little, crooked, very fharp, and of a pale yellow, proceeding but half way ont of the nkin, while the other half is hid beneath it. His walk is flower than that of a tortnife, and he feems to move along with an affectation of gravity. He feems to feek for a proper place to fet his feet upon; and when he climbs up trees, he does not trult to his feer like fquirrels, but endeavours to find out clefts in the bark, that he may get a furer holl.

His tail is like that of a viper when it is puffed up and round ; for otherwife the bones may be feen in the fome manner as on the bacis. He always wraps his tail round the branches of trees, and it ferves him as it were intead of a lifth liand.- He is a native of Africa and Ala. Mr Hafflquift is of opiaion, that. the change of colour in the chamaleon is owing to its being exceedingly fubject to the jaundice, which particularly lappens either when it is expofed to the fun or when it is made angry. The mixture of the bile with its blood is then very perceptible, and, as the Kinin is tranfparent, makes it fpotted with green and yellow. He never faw it coloured with red, blue, or purple; and does not believe that ever it affurnes thefe colours.
9. The gecko, has a cylindrical tail, concave ears, and a warty body. It is the Indian Calamander of Dontius. "This animal is very frequent in Cairo (fays Haffelquif), both in the houles and without them. The poifon of this animal is very fingular, as it exhales from the lobuli of the toes. The animals
dacerta. feeks all places and things impregnated with fea-fatt, and, paffing cuer them feveral times, leaves this very noxious poifon behind it. In July 1750, I faw two women and a girl in Cairo at the point of death, from eating cheefe new falted, bought in the market, and on which this animal had dropt its poifon. Once at Cairo, I had an opportunity of ohferving how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it ; ihere immediately rofe little puffules over all thofe parts the animal had tonched: thefe were red, inflamed, and finarted a little, greatly refembling thofe occafioned by the finging of nettles. It emits an odd found, efpecially in the night, from its throat, not unlike that of a frog."
10. The fcincus has a cylindrical tail compreffed at the point, and blunt marginated toes. This animal is found in Arabia Petrea near the Red Sea, and in Up. per Egypt near the Nile. It is much ufed by the in. habitants of the eaft as an aphrodifiac, but net at this time by the Europeans. The flefl of the anional is given in powdcr, with fome ftinulating velhicle; broth made of the recent flefh is likewife ufed by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marfeilles, and from thence to all the apothecaries Mops of Eurone.
it. The nilotica has a long tail with a triangular edge, and four lines of fcales on the back. It is met with in the moilt places of Egypt near the Nile. The Egyptians fay that this lizard proceeds from the egrs of the crocodile laid in the fand, but that the crocodilc proceeds from thofe laid in the water. Mr Haf. felquift hath detected the fallacy of this account.
12. The paluftris has a lanceolated tail, and four toes on the fure-fect, and inhabits the flagnating waters of Europe. It has a flow and crawling pace. Mr I'ennant mentions his having nore than once found, under ftones and old logs, fome very minute lizards that had much the appcarance of this kind: they were perfectly formed, and harl not the lealt veftiges of fins; which circumftance, joined to their being found in a dry place remote from water, feems to indicate, that they had never been inhabitants of that element, as it is certain many of our lizards arc in their firft thate. At that pericd they have a fin above and below their tail; that on the upper part extends along the back as far as the head; but both drop off as foon as the animal takes to the land, being then no longer of any ufe. Mr Ellis has remarked certain pennated fins at the gills of one very common in moot of our flagnating waters, and which is frequently obferved to take a bait like a fifh.
13. The falamandra, or falamander, has a fhort cylindrical tail, four toes on the fore-feet, and a naked porous body. This aniunal has been 「aid, even in the Philofophical Tranfactions, to live in the fire; but this is found to be a milike. It is found in the fouthern countries of Europe. The following account of this fpecies is extracted from the Count de la Cepede's Natural Hillory of Serpents. Whillt the hardel bodies cannot refift the violence of fire, the world have endeavoured to make us believe that a fnall lizard can not only withfand the flames, but even extinguifin them. As agreeable fables readi-
ly grain belief, every one has been eager to adopt Iaeer that of a fmall animal fo highly privileged, fo fupe- $\xrightarrow{\square}$ rior to the moft powerful agent in nature, and which could furnih fo many objects of comparifon to poetry, fo many pretiy emblems to love, and fo many billiant devices to valour. The ancients believed this property of the falamander, wifhing that its origin might be as furpriling as its power: and beiag defirous of realizing the ingeninus ficions of the poets, they have pretended that it owes its exillence to the puret of elements, which cannot confume it ; and they have callcd it the daughter of fire, riving it however a body of ice. The noderas have folluwell the ridiculous tales of the ancients; and as it is difificult to fop when one has paffed the bounds of probability, forme have gone fo far as to think that the mot violent fire could be extinguinhed by the land falamander. (2nacks fold this fmall lizard, affirning, that when thrown itto the greateft conflagration, it w uld cherk its progrefs. It was very neceffary that philofuphers and naturalits foould take the trouble to prove by facts what reafon alone might have demonflyated; and it was not till after the light of fcience was diffufed abroan, that the world gave over believing in this wonderful property of the falamander. This lizard, which is found in fo many countries of the ancient world, and even in very high latitudes, has been however very little noticed, becaufe it is feldom feen out of its hole, and becaufe for a long time it has infpired much terror. Even Ariftotle fpcaks of it as of all animat with which he was fcarcely acquaiated.

One of the largeft of this feccies, preferved in the French king's cabinet, is feven inches five lincs in length, from the end of the muzzle to the root of the tail, which is three inches eight lines. The fkin does not appear to be covered with fcales, but it is furnifled with a number of excrefences like teats, containing a great many holes, feveral of which may be very plainly diftinguifhed by the naked eye, and through which a kind of milk oozes, that generally fpreads itfelf in fuch a manner as to form a tranfparent coat of
 turally dry.

The eyes of the falamander are placed in the upper part of the head, which is a little 13atted; their orbit projects into the interior part of the palate, and is there almoll furrounded by a row of wery fmall teeth, like thofe in the jaw lones : thefe teeth eftablifly a near relation between lizard; and fifhes; many fipecies of which have alfo feveral teeth placed in the bottom of the month. The colour of this lizard is very dark: upon the belly it has a bluih calt, intermixed with pretty large irregular yellow fots, which extend over the whole body, and even to the feet and eye-lids; fome of the fe fouts are befprinkled with fmall black fpecks; and thofe which are upon the back often touch without interruption, and form two hong yellow bands. The colour mult, however, be futject to vary ; and it appears that fome filamanders are found in the marfly forelts of Germany, which are quite black above and yellow below. To this variety we mult refer the black falamander, found by Mr Laurenti in the Alps, which he confidered as a difinct fpecies.
The falamander has no ribs; neither have frogs, to which it has a great refemblance in the general form
ea. of the anterior part of its body. When touched, it fuldenly covers itfelf with that kind of coat of which we have fpoken, and it can alfo very rapidly changc its fkin from a fate of humidity to a flate of drynefs. The milk which iffues from the fmall holes in its furface is very acrid; when put upon the tongue one feels as it were a kind of fcar it the part which it touched. This milk, which is confidercd as an excellent fubitance for taking off hair, has fome refemblance to that which diftils from thofe plants called efula and euphorbiam. When the falanander is crufned, o: when it is only preffed, it exhales a bad fmell, which is peculiar to it.

Salamanders are fond of cold damp places, thick fhades, ufted woods, or high mountains, and the banks of freans that run through meadows: they fometimes retire in great numbers to hollow trees, hedges, and below old rotten flumps; and they pafo the winter in places of high latitude, in a kind of burrows, where they are found collected, feveral of them being joined and twifted together. The falamander being deflitute of claws, having only four toes on each of the fore feet, and no advantage of conformation makiug up its deficiencies, its manner of living nuft, as is indeed the cafe, be very different from that of other lizards. It walks very flowly; far from being able to climb trees with rapidity, it often appears to drag itfelf with great difficulty along the furface of the earth. It feldom gots far from the place of helter which it has fixed on; it paffes its life under the earth, oiten at the bottom of old walls during fummer ; it dreads the heat of the fun, which would dry ir ; and it is commonly only when rain is about to fall that it comes forth from its fecret afylum, as if by a kind of seceffity, to bathe itfelf, and to imbibe an element to which it is analogous. Perhaps it finds then with greateft facility thofe infects upon which it feeds. It lives upon flies, beetles, finails, and earth-worms; when it repofes, it rolls up its body in feveral folds like ferpents. It can remain fome time in the water without danger, and it catts a very thin pellicle of a greenifh grey colour. Salamanders have even been kep: more than fix months in the water of a well without giving them any food; care only was taken to clange the water often.

It has been remarked, that every time a falamander is plunged into the water, it attempts to raife its nof riis above the furface as if to feek for air, which is a new proof of the need that all oviparous quadrupeds have to breathe during the time they are not in a flate of torpor. The falamauder has apparentIy no ears, and in this it refembles ferpents. It has tven beea pretended that it does not hear, and on this sceonst it has got the name of fourd in fome provinces of France. This is very probable, as it has never been leard to utter any cry, ald filence in general is coupled with deafnefs.

Having then perhaps one fenfe lefs than other animals, and being deprived of the faculty of communicating its fenfations to thofe of the fame feccies, even by imperfect founds, it muft be reduced to a much inferior dugree of inftinet : it is therefore very ftupid; and not bold, as has been reported: it does not brave danger, as is pretended, but it does not perceive it. Whatever geftures one makes to frighten it, it always
advances without turning afide; however, as no ani- Iacerta. mal is deprived of that fentiment neceffary for its prefervation, it fuddenly compreffes its fkin, as is faid, when tormented, and fpurts forth upon thofe who attaek it that corrofive milk which is under it. If beat, it begins to raife its tail: afterwards it becomes motionlefs, as if flunned by a kind of paralytic Atroke; for we mutt not, with fome naturalils, afcribe to an animal fo devoid of inltinet, in much art and eunning as to counterfeit death. It thort, it is diffieult to kill it ; but when dipped in vinegar, or furrounded with falt reduced to powder, it expires in convulfions, as is the cafe with feveral other lizards and worms.
It feems one cannot allow a being a ehimerical quality, without refuing it at the fanc time a real properiy. The cold falamander has been confidered as an animal endued with the miraculous power of reliting, and even of extinguifing, firc ; but at the fame time, it has been debafed as much as elevated by this fingular property. It has been made the mot fatal of animals : the ancients, and even Pliny, have devored it to a kind of auathema, by affirming that its poifon is the moilt dangerous of all. They have written, that infecting with its poifon almoft all the vegetables of a large country, it might caufe the deftruction of whole nations. The moderns alfo for a long time believed the falamander to be very poifonous; they have faid, that its bite is mortal, like that of the viper; they have fought out and prefcribed remedies for it ; but they have at length had recourfe to obfervations, by which they ought to have begun. The famous Bacon wifhed naturalifts wouldendeavour io afcertain the truth refpecting the poifon of the falamander. Gefner proved by experiments that it did not bite, whatever means were ufed to irritate it ; and Wurf bainus fhowed that it might fafely be touched, and that one might without danger drink the water of thofe wells which it inhabited. M. de Maupertuis fudied alfo the nature of this lizard. In making refearches to difcover what might be its pretended poifon, he demonftrated experimentally, that fire acted upow the falamander in the fame manner as upon all other animals. He remarked, that it was fcarcely upon the fire, when it appeared to be covered with the drops of its milk, which rarified by the lieat, iffited through all the pores of the fkin, but in greater quantity from the head and dugs, and that it immediately beeame hard. It is needlefs to fay, that this milk is not fufficiently abundant to extinguifl even the fmallell fire. M. de Maupertuis, in the courfe of his experiments, in vain irritated feveral falamanders: mone of them ever opened their mouths; he was obliged to open them by force. As the teeth of this lizard are very fmall, it was very diffienlt to find an animal with a fkin fufficiently fine to be penetrated by them : he tried without fuc. cefs to force them into the flefh of a chicken lripped of its feathers; he in vain preffed them againft the fkin : they were difplaced, but they could not enter. He however made a falamander bite the thigh of a chieken, after he had taken off a finall part of the flin. He made falamanders newly caught bite alfo the tongue and lips of a dog, as well as the tongue of a turkey; but none of thefe animals rectived the lealt injury. M. de Maupertuis afterwards made a dog and a turkey fwallow \{aiamanders whole, or cut into pieces; and yc:

## I A C [ 504 ] <br> L A C

Lacerta. neither of them appeared to be fenfible of the leait un-eafinefs.-Mr Laurenti fince made experiments with the fame view : he forced grey lizards to fwallow the milk proceeding from the falamander, and they died very fuddenly. The milk, therefore, of the falamander, taken internally, may hurt, and even be fatal to certain animals, efpecially thofe which are fmall; bot it does not appear to be hurtful to large animals.

It was long believed that the falamander was of no fex; ;and that each individual had the power of engendering its like, as feveral fpecies of worms. This is not the mofl abfurd fable which has been imagined with refpect to the falamander; but if the manner in which they come into the world is not fo marvellous as has been written, it is remarkable in this, that it diffrers from that in which molt other lizards are brought forth, as it is analogous to that in which the chalcide and the feps, as well as vipers and feveral kinds of ferpents, are produced. On this account the falamander merits the attention of naturalits much more than on account of the falfe and brilliant reputation which it has fo long enjoyed. M. de Maupertuis having opened fome falamanders, found eggs in them, and at the fame time fome young perfectly formed; the eggs were divided into two long bunches like grapes, and the young were enclofed in two tranfparent bags; they were equally well formed as the old ones, and much more active. The falamander, therefore, brings forth young from an egy hatched within its belly as the viper ; and her fecundity is very great : naturalifts have long written that fhe has forty or fifty at one time ; and M. de Maupertuis found 42 young ones in the body of a female falamander, and 54 in another.

The young falamanders are generally of a black colour, almolt without fpots; and this colour they preferve fometines during their whole lives in certain countries, where they have been taken for a diltind fpecies, as we have faid. Mr Thunberg has given, in the Memoirs of the Academy of Siveden, the defcription of a lizard, which he calls the Yapanefe lizard, and which appears not to differ from our falamander but in the arrangement of its colours. This animal is almof black, with feveral whitifh and irregular fpots, both on the upper part of the body and below the paws : on the back there is a frip of dirty white, which becomes narrower to the point of the tail. This whitifl Itripe is interfperfed with very fmall fpecks which form the diftinguifhing characteriftic of our land falamander. We are of opinior, therefore, that we may confider this Japanefe lizard, defcribed by Mr Thunberg, as a variety of the fpecies of our land falamander, modified a little, perhaps, by the climate of Japan. It is in the largelt inand of that empire, named Niplon, that this variety is found. It inhabits the mountains there, and rocky placcs. The Japanefe confider it as a powerful ftimulant, and a very active remedy; and on this account, in the neiglbourhood of Jedo, a number of thefe Japanefe falamanders may be feen dried, hanging from the cieling of the fhops.
14. The bafilifkus, has a long cylindrical tail, a radiated fin on the back, and a creft on the throat. It is a native of the Irdies. It is a very harmlefs creature; and altogether deftitute of thofe wonderful qualitics $\mathrm{N}^{\circ} 173$.
which have been attributed to the fajulous animal of Lac the fame name. See the article Baslisk.
15. The fex-lineata, or lion-lizud, is about fix inclies long; the body of a grey colour, marked lengthwifeon each fide with three whitifh hnes: the legs are long; and it lias a very long tail, which it curls up, looking fierce at the fame time, whence probably it has received its Englifh name. It inhabits South Carolina and the greater Autilles. It is very inoffenfive, and remarkably agile ; but is a prey to rapacious birds.
16. The green lizard of Carolina is fo denominated from its colour. This fpecies is very flender; the tail is near double the length of the body, and the whole. length about five inches. It inhabits Carolina; where it is domeftic, familiar, and harmlefs. It Pports on tables and windows. and amufes with its agility in catching flies. Cold affects the colours: in that uncertain climate, when there is a quick tranfition in the fame day from hot to cold, it clianges inftantly from the moft brilliant green to a dull brown. They are a prey to cats and ravenous birds They appear chiefly in fummer; and at the approach of cold weather they retire to their winter receffes, and lie torpid in the hollows and crevices of rotten trees. It frequently happens that a few warm funihiny days to invigorate them, that they will come out of their boles and appear abroad; when on a fudden the weather changing to cold, fo enfeebles them, that they are unable to return to their retreats, and will die of cold.
17. The iguana, or guana, with the top of the back and tail Itrongly ferrated, and the gullet ferrated in the fame manner, is fometimes found to be five feet long. It has fmall tecth, and will bice hard. It inhatits the rocks of the Bahama iflands, and lurks in cliffs or hollow trees. It feeds entirely on vegetablez and fruits; and the fat of the abdomen affrimes the colour of that which it has lait eaten. It is flow of motion, and has a molt difgurting look; yet it is efteemed a molt delicate and wholefome food, noxious only to venereal patients, according to Linnxus. It is not amphibious, yet on neceffity will continue long under water; it fwims by means of the tail, keeping its legs clofe to the hody. Guanas are the fupport of the natives of the Bahama iflands, who go in their floops from rock to rock in fearch of them. They are taken with dogs trained for the purpofe; and as foon as canght, their mouths are fewed up, to prevent them from biting. Some are carried alive for fale to Carolina; others falted and barrelled for home-confumption.
18. The bullaris, or green lizard of Jamaica, is ahout fix inches long, of a Chining grafs.green colour. I- is common in Jamaica, frequenting hedges and trees. When approached to, thefe animals, by filling their throat with wind, fwell it into a globular form with a fcarlet colour; which, when contracted, the fcarlet difappears, and the part returns to the colour of the reft of the body. The figure reprefents the ani; mal with its throat thus inflated. This fiwelling action feems to proceed from menacing, or deterring one from coming near them, though they are very inoffenfive.
19. The muricata, or prickly lizard, has a long rounded tail; its body, which is of a brownih głey colour, is covered with fharp-pointed fcales, and the whole

$$
\text { I A C }[505] \quad \text { L A C }
$$

s whole upper part marked with tranfverte dufky bars. The fcalcs are furnifhed with a prominent line on the upper furface, and toward the back part of the head almoft run into a fort of weak fpines.
20. The laticauda, or broad-tailed lizard, has a flat. tened lanceolate tail, fomewhat Ypiny on the margin. $I_{t}$ is about four inches and a half in length. The head is difproportionably large. The upper furface of the body is of a dufky grey colour, and befet with fmall tubercles, which in fome parts fharpen to a point. The colour of the under furface of the body is pale, or almoft white. This and the preceding fpecies are inhabitants of New South Wales.

There are above 60 other fpecies of this genus; two of which, the feps and chalcides, being very different from the other fpecies, and approaching in form to the ferpent tribe, figuree of them are added in the Plates. A fimilar fpecies is the lipes, transferred to this genus, in the laft edition of the Syltema Nature, from the Anguis of former editions, where it was called the anguis bipes. See Anguis.

LACHES, (from the French lofcher, i. e. laxare, or lafche, ignavus), in the Englifh law fignifies flacknels or negligence, as it appears in Littleton, where laches of entry is a neglect of the heir to enter. And probably it may be an old Englifh word: for where we fay there is laches of entry, it is all one as if it were faid there is a lack of entry; and in this fignification it is ufed. No laches fhall be adjudged in the heir within age ; and regularly, laches fhall not bar infants or femme coverts for not entry or claim, to avoid defcents; but laches fhall be accounted in them for non-performance of a condition annexed to the flate of the land.

LACHESIS, in mythology, one of the Parcæ. Her name is derived from $\lambda \alpha x^{z i v}$, to meafure out by lot. She prefided over futurity, and was reprefented as fpinning the thread of life, or, according to others, holding the fpindle. She generally appeared covered with a garment variegated with ttars, and holding spindies in her hand.

LACHISH, (anc. geog.) a city fouthward of the tribe of Judal. Eufebius and St Jerom tell us, that in their time there was a village called Lachi $\beta$, feven miles from Eleutheropolis, fouthward. Sennacherib befieged Lachifh, but did not take it. From thence it was that he fent Rablhakeh againft Jerufalem. Here King Amaziah was flain by his rebel fubjects.

LACHNEA, in botany: A genus of the monogysia order, belonging to the octandria clafs of plants; zod in the natural method ranking under the 31 ft order, Vepreculc. There is no calyx; the corolla is quadrifid with the limb unequal ; there is one feed a little refembling a berry.

LACHRYMAL, in anatomy, an appellation given to feveral parts of the eye. See Anatomy, p. 766. col. r.

LACHRYMATORY, in antiquity, a veffel where. in were collected the tears of a deceafed perfon's friends, and preferved along with the afhes and urn. They were fmall glafs or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends of the deceafed, or the prafice, women hired for that furpofe, ufed to fill thein with their tears, and depolit them very carefully with the afhes in teftimony of their
forrow, imagining the mancs of the deccafed were lacinium thereby greatly comfortcd. Many fpecimens of them are preferved in the cabinets of the curious, particu-

Lacquers larly in the Britifh Mufeum.

LACINIUM (anc. geog.), a noble promontory of the Brutii in Italy, the fouth boundary of the Sinus T'arencinus and the Adriatic; all to the fouth of it being deemed the Ionian Sea: it was famous for a rich temple of Juno, furnamed Lacinis, with a pillar of folid gold flanding in it; which Hannibal intending to carry off, was, according to Cicero, diffuaded by a dream. Now Capo delle Colonie, from the columns of Juno's temple ftill flanding on the northeealt coalt of the Calabria ultra.

LACK of Rupees, is roo,000 rupees; which, fuppofing them flandard, or ficcas, at 2 s .6 d , amounts to 12,500 . Sterling.

LACONIA, or Laconica, a country on the fouthern parts of Peloponnefus, having Argos and Arcadia on the north, Meflenia on the weft, the Mediterranean on the fouth, and the bay of Argos at the eaft. Its extent from north to fouth was about 50 miles. It was watered by the river Eurotas. The capital was called Sparta, or Lacedæmon: (See Lacedemon and Sparta.) The brevity with which the Laconians always expreffed themfelves is now become proverbial; and by the epithet of Laconic, we underfland whatever is concife, and is not loaded with unncceffary words.

LACONICUM, (whence our term laconic), a fhort pithy fententious fpeech, fuch as the Lacedxmonians were remarkable for: Their way of delivering themfelves was very concife, and much to the purpofe. Set the preceding article.

LACQUERS, are varnifhes applied upon tin, brafs, and other metals, to preferve them from tarninhing, and to improve their colour. The bafis of lacquers is a folution of the refinous fubftance called feed lac, in fpirit of wine. The fpirit ought to be very much dephlegmated, in order to diffolve much of the lac. For this purpofe, fome anthors directly dry potafh to be thrown into the fpirit. This alkali attracts the water, with which it forms a liquid that fubfides diftinctly from the fpirit at the bottom of the veffel. From this liquid the \{pirit may be feparated by decantation. By this method the fpirit is much depblegmated; but, at the fame time, it becomes impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moifture from the air. Thefe inconvepiences may be prevented by diftilling the fpirit ; or, if the artift has not an opportunity of performing that procefs, he may cleanfe the fpirit in a great meafure from the alkali, by adding to it fome calcined aum; the acid of which uniting with the alkali remaining in the \{pirit, forms with it a vitriolated tartar, which, not being foluble in fpirit of wine, falls to the bottom together with the earth of the decompofed alum. To a pint of the dephlegmated and puritied fpirit, about three ounces of powdered shell.lac are to be addcd; and the mixture to be digefted during fame day with a moderate heat. The liquor ought then to be poured off, Atrained; and cleared by fettling. This clear liquor is now fit to receive the required colour from certain refinous colouring fublances, the

I,asacio. principal of which are gamboge and annotto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamhoge are added to one of annotto; but thefe colouring fubllances may be feparately diffolved in the tineture of lac, and the colour required may be adjulted by mixing the two folutions in different proportinns. Wbea lilver leaf or tin are to be lacquered, a larger quantity of the colouring materials are requifite than when the lacquer is intended to be laid chl brals.

LACTATIO, Lactarion, among medical writers, denotes the giving fuck. The mother's breatl, if pullible, thould be allowed the child, at leaft dming the firt month; for thus the child is more peculiarly benefited by what it fucks, and the mother is preferved from more real inconveniences than the fallely delicate imagine they would fuffer by compliance herewith: but if by reafon of an infirm conllitution, or other eaufes, the mother cannot fuckle her child, let dry murling under the mother's eye be purfued.

When women lofe their appetite by giving fuck, both the children and themfelves are thereby injured; wet nurles are to be preferred, who, during the time they give the brait, have rather an increafed appetite, and digelt more quickly; the former are apt to walte away, and fometimes die confumptive. In fhort, thofe nurfes with whom lactation may for a while agree, fhould wean the child as foon as their appetice lefiens, their Arength feems to fail, or a tendency to hyfteric fymptoms are manifelt.

When the new-born child is to be brought up by the mother's breaft, apply it thereto in ten or twelve hours after delivery; thus the milk is fooner and more eafily fupplied, and there is lefs hazard of a fever than when the child is not put to it before the milk begins to flow of itfelf.

If the mother does not fuckle her child, her breafts fhould be fo kept warm with flannels, br with a harefikin, that a conflant perfpiration may be fupported; thus there rarely will arife much inconvenience from the milk.

The child, notwithftanding all our care in dry nuring, fometimes pines if a breait is not allowed. In this cafe a wet nurfe fhould be provided, if polfible one that hath not been long delivered of a child. She fhould be young, of a healthy habit, and an active difpofition, a mild tenser, and whole breafts are well filled with milk. If the milk is good, it is fweetifh to the tafte, and totally free from faltnefs; to the eye it appears thin, and of a bluifh calt. That the woman hath her menfes, if in other refpects objections are not made, this need not be any; and as to the cuftom with many, of abtaining from venery while they continue to fuckle a child, it is fo far without reafon to fupport it, that the truth is, a rigorous chatity is as hurtful, and often more pernicious, than an immoderate ufe of venery. Amongt the vulgar errors, is that of red-haired women being improper for wet nurfes.

If the menfes do not appear during the firf months, but after fix or eight months fuckling they begin to defcend, the child hould be weaned.

Wet nurfes fhould eat at leaft one hearty meal of animal-food every day; with this a proper quantity of vegetables fhould be mixed. Thin broth or milk are
proper for their breakfatts and their fuppers; and if La the flrength fhould feem to fail a little, a draught of good ale fhould now and then be allowed: but fpiritwous liqurors mult in general be forborne; not but a fpoonful of rum may be allowed! in a quart of milk and water, (i. e. a pint of each), which is a proper common drink.

Though it is well ooferved by Dr Hunter, that the far greater aumber of thofe women who have cancers. irt the breaft or womb are old maids, and thofe who refufe to give fack to their children; yet it is the unhappinefs of come willing mothers not to be ahle: for instance, thofe with tender contitutions, and who are fubject to nervous diforders; thufe who do not eat a fufficient quantity of folid food, nor enjoy the benefit of exercife and air: if children are kept at their breafts, they either die whillt young, or are weak and fickly after chitdhond is patl, and fo on through remaining life.

LACTANTIUS, (Lucius Colius Firmianus), a celebrated author at the beginning of the sth century, was, according to Baronius, an African ; but, accord, ing to others, was born at Fermo in the marquifate of A ncona, from whence it is imagined he was called Firmiunus. He fludied rhetoric under Arrobius; and was afterwards a profeffor of that fcience in Africa and Nicomedia, where he was fo admired, that the emperor Conftantine chole him preceptor to his fon Crifpus. Crefar. Lactantius was fo far from feeking the pleafures and riches of the court, that he lived there in poverty, and, according to Lufebius, frequently wanted neceflaries. His works are written in elegant Latin. The principal of which are, 1. De ira divina. 2. Do opcribus $D_{c} i_{3}$ in which he treats of the creation of man, and of divine providencc. 3. Divine Intitutions, in feven books. This is the moft confoderable of all his works: he there uncertakes to prove the truth of the Chriftian religion, and to refute all the difficulties that had been raifed againlt it; and he folidly, and with great frength, attacks the illufions of paganifm. His Hylc is pure, clear, and natural, and his expreffions noble and elegant, on which account he has been called the Cisero of the Cbrizians. There is alfo attributed to him a treatife De morte perfecutorum; but feveral of the learned doubt its being written by Lactantius The moft copious edition of Lactantius's works is that of Paris in 1748,2 vols $4^{\text {to }}$.

LACTEALS, or Lacteal Vesset.s, a kind of long fender tubes for the conveyance of the chyle from the inteflines to the common refervatory. See Anatomy, $n^{\circ} 105$.

LACTIFEROUS, an appellation given to planta abounding with a milky juice, as the fow-thitle and the like. The name of latiferous, or ladefcent, is given to all thofe plants which abound with a thick-coloured juice, without regarding whether it is white or not. Moft lactiferous plants are poifonous, except thnfe with compound flowers, which are generally of an innocent quality.

Of the poifonous lactefcent plants the moft remarkable are fumach, agaric, maple, burning thorny plant, caffada, celandine, puccoon, prickly poppy, and the plants of the natural order contorte, as fwallow wort, apocynum, cynanchum, and cerbera.

The bell-fhaped flowers are partly noxious, as cardinal fower ; partly innocent, as campanula.

## L A C [ 507 ] L A D

1ca. Among the lattefcent plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoferia, wild lettuce, gum.fuccory, hawk-weed, baitard hawk weed, hypochcerif, goat'sbeard, and moft fpecies of lettuce: we fay moft fpecies, becaule the prickly fpecies of that genus are fais to be of a very virulent and poifnnous nature; though Mr Lightfoot denies this. and affirms that they are a fafe and gentle opiate, and that a fyrup made from the leaves and ftalks is much preferable to the common diacodinm.
I. ACTUCA, in botany: A genus of the polygamia sequalis order, belonging to the fyngenelia clafs of plants: and in the natural method ranking under the $49 t h$ order, Compofitc. The receptacle is naked: the calyx imbricated, cylindrical, with a membranaceous margin ; the pappus is fimple, ftipated, or thalked. There are feveral fpecies, moft of which are plants of no ufe, and never cultivated but in botanic gardens for variety. Thofe commonly cultivated in the kit-chen-garden for ufe, are, 1. The common or garden lettuce. 2. Cabbage lettuce. 3. Silefia lettuce. 4. Dutch brown lettuce. 5. Aleppo lettuce. 6. Imperial lettuce. 7. Green capuchin lettuce. 8. Verfailles or upright white Cos lettuce. 9. Black Cos. 10. Red Cos. 11. Red capuchin lettuce. 12. Roman lettuce. 13. Prince lettuce. 14. Royal lettuce. 15. Egyptian Cos lettuce.

Culture, se. The firt of thefe forts is very common in all gardens, and is commonly fown for custing very young, to mix with other falad herbs in fpring; and the fecond, or cabbage lettuce, is only this mended by culture. It may be fown at all times of the year, but in the hot months requires to be fown in hady borders. The cabbage-lettuce may alfo be fown at different feafons, to lave a continuation of it through the fummer. The firft crop fhould be fown in February, in an open fituation; the others at three weeks dillance; but the later ones under covert, but not under the drippings of trees. The Silefia, imperial, royal, black, white, and upriglit Cos lettuces, may be firtl fown in the latter end of Febrnary or the beginning of March, on a warm light foil, and in an open fituation; when the plants are come up, they mult be thinned to 15 inches diftance every way, they will then require no farther care than the keeping them clear of wreeds; and the black Cos, as it grows large, fhould have its leaves tied together to whiten the inner part. Succeeding crops of thefe thould he fown in April, May, and June; and toward the latter end of Augult they may be fown for a winter crop, to be preferved under glaffes, or in a bed arched over with hoops and covered with mats. The moit valuable of all the Englifh lettuces are the white Cos or the Verfailles, the Silefia, and the black Cos. The brown Dutch and the green capuchin are very hardy, and may be fown late under walls, where they will ftand the winter, and be valuable when no others are to be had. The red capuchin, Roman, and prince lettuce, are very early kinds, and ate fown for variety; as are alfo the Aleppo ones for the beauty of tbeir fpotted leaves.

Properties. The feveral forts of garden lettuces are very wholefome, emollient, cooling falad herbs, eafy of digeltion, and fomerhat loofening the belly. Moft
writers fuppofe that they have a narcotic quality ; and indeed in many cafes they contilate to procure relt; this they eflect by abating heat, and relaxing the fobres.

Laider. 'The feeds are in the number of the fur lefier cold feeds.

The virofa, or flrong-feented wild lettuce, which is indigenons in Britain, and grows in fome places in confiderable abundance, differs very eftentially in its qualities from the garden lettuce. Although it has not been introduced into any of the moderis pharma. copcias, yet it has of late heen highly extolled for fome purpofes in medicine. It fmells ftrongly of opium, and refembles it in fome of its effects; and its narcotic power, like that of the poppy heads, retides in its milky juice. An extraet from the expreffed juice is recommended in fmall dofes in droply. In dropfies of lang ftanding, proceeding from vifceral obflructions, it has been given to the extent of half an onnce a-day. It is faid to agree with the ftomach, to quench thirlt, to be gently laxative, powerfully diuretic, and fomewhat diaphoretic. Plentiful dilution is allowed during its operation. Dr Collin of Vienna afferts, that out of $2+$ dropfical patients, all but one were curcd by this medicine.

LACUNA, annong anatomilts, certain excretory canals in the genital parts of women.

LACUNAR, in architecture, an arched roof or ceiling, more efpecially the planking or flooring above porticos or piazzas.
L.ACYDES, a Greek philofopher, horn at Cyrene, was the difciple of Arcefflaus, and his fucceffor in the academy. He taught in a garden given him by Attalus king of Pergamus; but that prince fending for him to court, he replied, "That the pictures of kings fhould be viewed at a diftance." He imitated his matter in the pleafure he took in doing good without caring to have it known: he had a goofe which followed him every where by night as well as by day ; and when fhe died, he made a funeral for her, which was as magnificent as if it had been for a fon or a brother. He taught the fame doctrine as Arcefilaus; and pretended that we oughe to determine nothing, but always to fufpend our opinion. He died 212 B . C.

LADDER, a frume made with a number of fteps, by means of which people may afcend as on a ftair to places otherwife inacceffible.

Scaling LadDERS, in the military art, are ufed in fcaling when a place is to be taken by furprife. They are made feveral ways: here we make them of flat flaves, fo that they may move about their pins, and fhut like a parallel ruler, for conveniently carrying them : the French make them of feveral pieces, for as to be joined together, and to be made of any neceffary length: fumetimes they are made of fingle ropes, knotted at proper diftances, with iron hooks at each end, one to fatlen them upon the wall above, and the other in the ground; and fometimes they are made with two ropes, and flaves, between them, to keep the ropes at a proper dillance, and to tread upon. When they are ufed in the action of fcaling walls, they ought to be rather too long than too fhort, and to be given in charge only to the flouteft of the detachment. The foldiers fhould carry thefe ladders with the left arm paffed through the fecond ftep, taking care to hold them upright clofe to their lides, and

## I. A D

Esien very fort bilow, to prevent any accident in leaping into the ditch.
The firf rank of each divifion, provided with lad-
ders, fhould fet out with the relt at the fignal, marching refolutely with their firelocks flung, to jump into the ditch; when they are arrived, they fhould apply their ladders againf the parapet, obferving to place them towards the falient angles rather than the middle of the curtain, becaufe the enemy have lefs force there. Care mult be taken to place the ladders within a foot of each other, and not to give them too much nor too little flope, fo that they may not be overturned or broke with the weight of the foldiers mounting upon them.

The ladders being applied, they who have carried them, and they who come after, fhould mount up, and rufh upon the enemy fword-in hand: if he who goes firf, happens to be overturned, the next fhould take care not to be thrown down by his comerade; but, on the contrary, immediately mount himfelf, fo as not to give the enemy time to load his piece.

As the foldicrs who mount firlt may be eafily tumbled over, and their fall may canfe the attack to fail, it would perhaps he right to protect their brealls with the fore parts of cuiraffes; becaufe, if they can penetrate, the reit may eafily follow.

The fuccefs of an attack by fcaling is infallible, if they mount the four fides at once, and take care to Shower a number of grenades amonglt the enemy, efpecially when fupported by fome grenadiers and picquets, who thare the attention and fire of the enemy.
I.ADEN, in the fea-language, the flate of a thip when the is charged with a weight or quantity of any fort of merchandifes, or other materials, equal to her tonage or burden. If the cargo with which fhe is laden is extremely heavy, her burden is determined by the weight of the goods; and if it is light, the carries as much as the can llow, to be fit for the purpofes of navigation. As a ton in meafure is generally eftimated at 2000 lb . in weight, a veffel of 2 co tons ought accordingly to carry a weight equal to $400,00 \mathrm{lb}$. when the matter of which the cargo is compofed is fpecifically heavier than the water in which fhe floats; or, in other words, when the cargo is fo heavy that hee cannot float high enough with fo great a quantity of it as her hold will contain.
$L_{A D E N}$ in Bulk, the flate of being freighted with a cargo which is neither in cafks, boxes, bales, nor cafes, but lies loofe in the hold; being defended fron the moifture or wet of the hold, by a number of mats and a quantity of dunage. Such are ufually the cargoes of corn, falt, or fuch materials.
LADENBURG, a town of Germany in the Palatinate of the Rhine, feated on the river Neckar, in E. Long. 8. 42. N. Lat. 49. 27. It belougs to the billopric of Worms, and the elector Palatine.
LADISLAUS, the name of feveral kings of Poland. See Poland.
LADOGA, a town of the Ruffian empire, feated on a great lake of the fame name, which has a communication with the gulf of Finland, by the river Nisva; and it abounds in fih, particulary falmon. E. Lon. 33. 29. N. Lat. 60. o.

LADÓGNA, or lacedogna, a town of Italy, in the kingdom of Naples, and in the Capitanata,
with a bihop's fee. E. Long. 15. 12. N. Lat. 41. 16.

LADON (anc. geog.) ariver of Arcadia falling in. to the Alpheus. The metamorphofis of Daphne into a laurel, and of Syrinx into a reed liappened near its banks.

LADRONE or Marianillands, a clufter of ewelve iflands lying in the Pacific Occan, in about $145^{\circ}$ of eaft longitude, and between the rith and 21 it degree of north latitude. They were firl difcovered by Ma gellan, who failed round the world through the Straitg which bear his name. He gave them the name of Ladrone Iflands, or the Iflands of Thieves, from the thievilh difpofition of the inhabitants. At the time thefe iflands were difcovered by the Europeans, the natives were cotally unacquainted with any other country befides their own; and having no traditionary accounts of their own origin, they imagined that the author of their race was formed of a piece of the rock of Funa, one of their fmallett ifands. Many things looked upon by us as abfolutely neceffary to our exiltence, were utterly unknown to thefe people. Ther had no animals of any fort; and would not even have had any idea of them, had it not been for the birds; and even of them they had but one fpecies, fomewhat like the turtle dove, which they never killed for eating, but only camed them, and taught them to fpeak. They were much aftonifhed on feeing a horfe which a Spanifh captain left among them in 1673 . and could not for a long time be fatisfied with admiring him. But what is moft furprifing and incredible in their hiftory is, that they were utterly unacquainted with the element of fire till Magellan, provoked by their repeated thefts, burned one of their villages. When they faw their wooden houfes blazing. they tirft thought that the fire was a beaft which fed upon the wood; and fome of them who came too near. being burnt, the reft ftood at a diftance, lelt they fhould be devoured or poifoned by the breathings of this terrible animal.

The inhabitants of the Ladrones are olive-coloured, but not of fuch a deep dye as thole of the Philippine iflands; their flature is good, and their limbs well proportioned. Though their food contilts entirely of fifh, fruits, and roots, yet they are fo fat, that toftrangers they appear fwelled, but this does not render them lefs nimble and active. They ofteu live to 100 ycars or more, yet retain the health and vigour of men of 50. The men goftark naked, but the women are covered. They are not ill-looked, and take great care of their beauty, though their ideas on that fubject are very different from ours. They love black teeth and white hair. Hence one of their principal occupations is to keep their teeth black by the help of certain herbs, and to whiten their hair, fprinkling upon it a certain water for this purpofe. The women have their hair very long; but the men generally fhave it clofe, except a fingle lock on the crown of the head, after the manner of the Japanefe. Their language much refembles that of the people called Tagales in the Philippine iflands. It is agrceable to the ear, with a foft and eafy pronunciation. One of its chief graces confifts in the facality of tranfpofing words, and even all the fyllables of one word; and thus furnifhing a variety of double reanings, with which thefe people are greatly delighted. Though plunged in the deepelt
ignorance ${ }_{2}$

## 1. A D

adrone, ignorance, and deflitute of every thing valued by the reft of mankind, no nation ever fhowed more prefump. tion, or a greater conceit of themfelves, than thefe inanders, looking on their own nation as the only wife, fenfible, and polihed one in the world, and beholding every other people with the greateft contempt. Though they are ignorant of the arte and fciences, yet, like every other nation, they have thicir fables which ferve them for hiftory, and fome poems which they greatly admire. A poet is with them a character of the firt eminence, and greatly refpeted.
We neither know at what time nor from what place the Ladrone iflands were firt peopled. As Japan lies within fix or feven days fail of them, fome have been induced to believe, that the frit inhabitants of the Ladroncs came from Japan. But from their greater refemblance to the inhabitants of the Ptilippine inands than to the Japanefe, it is more probable that they came from the former than the latter. Formerly moft of the inands were inhabited; and about 90 years ago, the three principal inands, Guam, Tinian, and Rota, are faid to have contained 50,000 pecple ; but fince that time, Tinian hath been entirely depopulated, and only 200 or 300 Indians left at Rota to cultivate rice for the ifland of Guam, which alone is inhabited by Europeans, and where the Spaniards have a governor and a garrifon : here alfo thc annual Manilla thip touches for refreflhments in her paffage from A. capulco to the Philippines. The iland of Tinian afforded an afyluma to Commodore Anfon in 1742 ; and the mafterly manner in which the author of that voyage paints the natural beauties of the country, hath given a degree of eftimation not only to this in and, but to all the reft, which they had not beforc. Commodore Byron, in 5765 , continued nine weeks at Tinian, and anchored in the very fpot where the Centurion lay ; but gives a much lefs favourable account of this climate and country than the former navigator. The water, he fays, is brackifh, and full of worms; many of bis men were fiezed with fevers, occafioned by the intenfe heat ; the thermometer, which was kept on board the fhip, generally ftood at $86^{\circ}$, which is but 10 or 11 degrees lefs than the heat of the blood at the heart; and bad the inftrument been aflore, he imagines it would have flood much higher than it did. It was with the greatel difificulty that they could penetrate through the woods; and when they had fortunately killed a bull, and with prodigious labour drag. ged it through the forefts to the beach, it funk, and was full of fly-blows by the time it reached the fhore. Thle poultry was ill-tatied; and within an hour after it was killed, the fiefl became as green as grafs, and fivarned with maggots. The wild hogs were very fierce; and fo large, ihat a carcafe frequently weighed 200 pounds. Cotton and indigo were found on the ifand. Captain Wallis continued here a month in 1767 , but makes no fuch complaints.
LADY. This title is defived from two Saxon words, which fignify loaf. day, which words have in time been contracted into the prefent appellation. It properly belongs only to the daughter of earle, and all of higher rank; but cuftom has made it a word of complaifance for the wises of knights and of all emiment women.

As to the original application of this expreffion, it

## 509 L A E

may be obferved, that heretofore it was the fathion for thofe families, whom God had bleffed with affuence, to live conflantly at their manfion-houfes in the country, and that once a-wcek, or oftener, the lady of the manor diftibuted to her poor neighbours, with ber own bands, a certain quantity of bread; but the practice, which gave rife to this title is now as little known as the meaning of it; however, it may be from that hofpitable cultom, that to this day the ladies in this kingdom alone ferve the meat at their own table.

LaDr-Day, in law, the 25 th of March, being the annunciation of the Holy Virgin. See Annuncistion.

LIELIUS (Caiuz), a Roman conful and great orator, furnamed the Wife, diftinguifhed himfelf in Spaia in the war againft Viriathus the Spanifh general. He is highly praifed by Cicero, who gives an admirable defcription of the intimate friendifhip which fubfifted between Lxlius and Scipio Africanus the Younger. His eloquence, his modefty, and his abilities, acquired him a great reputation; and he is thought to have affilted Terence in his comedies. He died about 126 B. C.

LÆNA, in antiquity, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heado when they made their oblervations on the fight of birds, \&c. See Augur.

## LAER. See Bamboccio.

LeSTRYGONES, the moft ancient inhabitants. of Sicily. Some fuppofe them to be the fame as the people of Leontium, and to have been neighbours to the Cyclops. They fed on human flefh; and when Ulyffes came on their coafts, they funk his mips and devoured his companions. They were of a giganticflature, according to Homer's defcription. A colony of them, as fome fuppofe, paffed over into Italy with Lamus at their head, where they built the town of Formix, whence the epithet of Lafrygonia is often. ufed for that of Formiana.

LAET (John de), a writer in the 17 th century, born at Antwerp, was director of the Weft India company. He acquired great nkill in the languages, in hiftory, and geography; and had the managemenc of Elzevir's edition of A Defcription of moil Kingdoms. in the World, printed in Latin. He wrote in French, A Defrription of the Eaft Indies, and other works: and died in $16+9$.
L.AETLA, in botany: A genus of the monogynia order, belonging to the polyandria clafs of plauts;: and in the natural method ranking with thofe of which the order is doubtful. The corolla is pentapetalous, or none ; the calyx is pentaphyllous; the fruit uniluctrlar and trigonal ; the feeds have a pulpy arillus or coat. There are two fpecies, both natives of America. Oge of them, the apetala, or gum wood, Dr Wright informs us, is very common in the woodlands and copfes. of Jarnaica, where it rifes to a confiderable height and thicknefs. The trunks are fmooth and white; the leaves are three inches long, a little ferrated, and fomewhat hairy. The flamina are yellow, without petals : the fruit is as large as a plum; and when ripes.

## I. $A G$

Lavinus opens and flows a number of fmall feeds in a reddifh pulp. Pieces of the trunk or brancher, fufpended in the heat of the fun, difcharge a clear turpentine or balfam, which concretes into a white refin, and which feems to be the fame as grom fandarach. Pounce is there made of it; and our author is of opinion, that it might be ufeful in medicine like other gums of the fame nature.

LEVINUS (Torrentinus), commonly called Van. der Bekin, or Torrenting was a native of Ghent, and bred in the univerfity of Louvain. He afterwards made the tour of Italy, where his virtues obtained him the friendfhip of the moft illultrious perfonages of his time. On his return to the Low Countries; he was made canon of Leige, and vicar-general to Erneft de Baviere, bifhop of that fee. At length, having execlo.ed a fucceffful embaffy to Philip II. of Spain, he was rewarded with the bifhopric of Antwerp; from whence he was tranflated to the metropolitan church of Mechlin, and died there in 1595. He founded a college of Jefuits at Louvain, to which he left his library, medals, and curiofitief. He wrote feveral poems that procured him the character of being, after Horace, the prince of the lyric poets.

LEVIUS, a Latin poet. It is not well known when he lived, but probably he was more ancient than Cicero. He made a porm intitled Erotopagnia, i. e. love games. Aulus Gellins quates two lines of it. Apuleius alfo quotes fix lines from the fame peet; but he does not tell from what work he borrowed them. Levins had alfo compofed a poem intitled The Centaurs, which Feftus quotes under the title of $P_{e-}$ trarun.

## Lagan, or Lagon. See Flotsom.

LAGEMAN (lazammannus), bomo babens legem, or bomo legalis feu legitimus; fuch as we call now "good men of the jury." The word is frequently ufed in Domefday, and the laws of Edward. the Confeflor, cap. 38.

LAGEN (layena), in ancient time, was a meafure of wine, containing fix fextarii : whence probably is derived our flagon. The licuterant of the tower has the privilege to take znam hagenam vini ante malum $\mathcal{E}^{\circ}$ retro, of all wine thips that come upon the Thanes ; and Sir Peter Leicefter, in his Antiquities of Chehire, interprets lagena vini, "a bottle of wine."

LAGERSTROEMIA, in botany ; a genus of the monogynia order, belonging to the polyandria clafs of plants. Thic corolla is hexapetalons, and curled; the calyx fexfid, and campanulated; there are many ftamina, and of thefe the lix exterior ones thicker than the teft, and longer than the petals.

LAGNY, a town of the ifle of France, with a famous benedictine abbey. It is feated on the river Marne, in E. Long. 2. 45. N. Lat. 48.50.

LAGOECLA, in botany; a genus of the monogynia order, belonging to the pentandria clafs of plants. The involucrum is univerfal and partial ; the petals bifid; the fecds folitary, inferior.
LAGOON 1sland, one of the new difcovered iflands in the South Sea, lying in S. Lat. 18. 47. W. Long. ${ }^{1139.28 . ~ I t ~ i s ~ o f ~ a n ~ o v a l ~ f o r m, ~ w i t h ~ a ~ l a k e ~ i n ~}$ the middle, which occupies much the greateft part of it. The whole ifland is covered with trees of different growth. It is inhabited by a race of Indians, tall, of a copper colour, with long black hair. Their wea-
pons are poles or Ppikes, which are twice as long as Lagopus themfelves. Their habitations were feen under fome clumps of palm.trees, which formed very beautiful groves. This ifland was difcovered by Captain Cook in April 1769.
LAGOPUS, in ornithology. See Tetrao.
LAGOS, a fea-port town of Portugal, in the province of Algarva, with a caftle near the fea, where there is a good harbour, and where the Englih flects bound to the Straits ufually take in frefh water. W. Long. 8. 5. N. Lat. 36. 45 .

LAGUNA, or San Chirifoval de Lacuna, a confiderable town in the ifland of Teneriff, near a lake of the fame name, on the declivity of a hill. It has very handfome huildings, and a fine fquare. W. Long. 16. 24. N. Lat. 28. 30.

LAGUNES of Venice, are marfles or lakes in Italy on which Venice is feated. They communicate with the fea, and are the fecurity of the city. There are about 60 iflands in thefe Lagunes, which together make a bihop's fee. Eurano is the mott confiderable, next to thofe on which Venice Itands.
LAGURUS, in botany : A genus of the digynia order, belonging to the triandria clafs of plants; and in the natural methnd ranking under the 4 th order, Gramina. The calyx is bivalved, with a villous awn; the exterior petal of the corolla terminated by two awns, with a third on its back retorted.
LAHOLM, a fea-port town of Sweden, in the province of Gothland, and territory of Holland, feared near the Baltic Sea, with a caftle and a liarbour, in E. Long. 13. 13. N. Lat. 56. 35.

LAHOR, a large town of A fia, in Indoftan, and capital of a province of the fame name, and one of the moft confiderable in the Mogul's dominions. It is of a vaft circumference, and contains a great number of mofques, public baths, caravanferas, and pagodz. It was the refidence of the Great Mogni ; but fince the removal of the court, the fine palace is going to decay. Tliere is a maguificent walk of flady trees, which runs from this to Agra, that is upivards of 300 miles. Here they have manufactures of cotton cloths and fuffs of all kinds, and they make very curious carpets. E. Long. 75. 55. N. Lat. 3 r. 40.

LAINEZ (James), a Spaniard, companion of Ig natius of Loyola, fecond general of the Jefuits, and a man of a more daring and political character. Having procured from pope Paul IV. the perpetual generallhip of the new order of Jefuits, after the death of Ignatius, he got the following privileges ratifed by that pontiff, which show that he was in fact the founder of the worlt part of their inflitution: 1. The righs of making all forts of contracts (without the privity of the community) velted in the generals and their delegates. 2. That of giving authenticity to all comments and explanations of their contitutions. 3. The power of making new, and altering the old : this opened the door to their bloody political tenets, not to be attributed to Loyola. 4. That of having prifons independent of the fecular authority, in which they put to death refractory brethren. Lainez died in 1565 , aged 53.
LAIRESSE (Gerard), an eminent Flemifh painter, born at Leige in 16 to $^{\circ}$. He received the principal part of his inllruction from his, father Reniere de Laireffe,

## L A I

Lais. Laireffe, though he is alfo accounted a difciple of Bartolet. He tinit fettled at Utrecht, where he lived in diftrefed circumftances; but an accidental recommendation carrying him to Amfterdam, he foon exchanget want and obfcurity for affuence and reputation. He wds a perfect maller of biftory; lis deligns are diftinguifaed by the grablem of the compotition ; and the back.gromds, wherever the fubjects required it, atre rich in archite atere, which is an uncommon circunthance in chat conutry. He Lad the unhappinefo to dofe his fignt icveral years before his doath, which happeted in 1711 ; fo that the treatifc on defign and colouringe, which paffes under his name, was not wrote by him, tht collected from his obfervations after he was blind, and publifhed after his death. . He had three fons, two of whom were painters; and allo three brothers, Erneit, James, and John: Erbet and John painted animals, and James was a flower-painter. He engraved a good deal in aquafortis: his works conlitt of $2 \varsigma 6$ plates, atove half of which were done with his own hand. He wrote an excellent book on the art, which has been tranflated into Linglifh, and printed at London both in 4 to and 8 vo.
LAIS, a celebated courtezan, daughter of Timan. dra the miltrets of Alcibiades, born at Hyecara in Sicily. She was carried away from her native Greece, when Nicias the Athenian general invaded Sicily. She firlt began to fell ber favours at Corinth for 10,000 drans, and the immenfe number of princes, noblemen, philufophers, orators, and plebeians which courted her embraces, thow how much commendation is owed to her perfonal charms. The expenfes which attended her pleafures, gave rife to the proverb of Nou cuivis bamini contingit adire Corinthum. Even Demoflhenes himfelf vifited Corinth for the fake of Lais; but when he was informed by the courtezan, that admittance to her bed was to be bought at the enormous fuin of aDout 2 ccl. Englifh money, the orator d:parted, and obferved that he would not buy repentance at fo dear a price. The charms which liad attracted Denoolhenes to Corinth, had no influence upon Xenocrares. When Lais faw the philufopher unmoved by her beanty, the vifited his houfe herfelf; but there fhe had no reafon to boat of the licentioninefs or eafy fubmilfion of Xenocrates. Diogencs the cynic was one of ber warmet admirers, and thougb filthy in his drefs and manners, yet he gained her heart and enjoyed her moil unbounded favours. The fculptor Mycon alfo folicited the favours of Lais, but he met wich coldnefs: he, however, attributed the canfe of his ill reception to the whitenefs of his hair, and dyed it of a brown colour, but to no purpofe: "Fool that thou art (faid the courtezan) to aik what I refufed yefterday to thy father." Lais ridiculed the aulterity of plilofophers, and laughed at the weaknefs of thofe who pretend to have gained a fuperiority over their pafions, by obferving, that the fages and philofophers of the age were not above the reft of mankind, for fhe found them at her door as often as the relt of the Athenians. The fuccefs which her debancheries met at Corinth encouraged Lais to pafs into Theffaly, and more particularly to enjoy the company of a favourite youth called Hippoflratus. She was however difappointed: the women of the place, jealous of her charms, and apprehenifive of her corrupting the fidelity of their hufancls, affas-
finated her in the temple of Venus, about 340 years before the Chrillian era. Some fuppofe that there were two perfons of this name, a morher and her danghter.
L.Al'TY, the peopie as ditinguified from the clergy; (fee Clergy). The lay part of his majefty's fubjects is divided into thrue diftinct tlates; the civil, the military, and the maritime. See Civil, Milio tary, Marimiaf.

1. AKL, a collection of "aters cortaine 1 in fome cavity in an inland plice, of a large extent, furrounded with land, and having no commurication with the ncean. Lakes inay be divided into four kinds. 1 . Sucla as neither receive nor fend forth rivers. 2. Such as emit sivers, without receiving any. 3. Such as receive rivers, without emitting any. And, 4. Such as hoth receive and fend forth rivers. Of the firit kind, fome are temporary and others perennial. Moft of thofe that are temporary owe their origin to the rain, and the cavity or depreffion of the place in which they are lociged: thus in India there are feveral fuch lakes made by the induftry of the ratives, of which fome are a mille, and fome two, in circuit; thefe are furrounded with a fone wall, and being filled in the rainy months, fupply the inhabitants in dry feafons, who live at a great diflance from fprings or rivers. There are alfo feveral of this kind formed by the inundations of the Nile and the Niger; and in Mufeony, Finland, and Lapland, there are many lakes formed, partly by the rains, and partly by the metting of the ice and fnow: but moll of the perennial lakes, which neither receive nor emit rivers, probably owe their rife to \{prings at the bottom, by which they are confantly fupplied. The fecond kind of lakes, which emit without receiving rivers, is very numerous. Many rivers flow from thefe as out of cilterns; where their \{prings being fituated lou within a hollow place, finlt fill the cavity and make it a lake, which not being capacious enough to bold all the water, it uverflows and forms a river: of this kind is the Wolga, at the litad of the river Wolga ; the lake Odiun, at the head of the ' $\Gamma$ anais; the Adac, from whence one branch of the river Tigris flows ; the Ozero, or White lake, in Mufcory, is the fource of the river Shakina. The great lake Chaamay, which emits four very large rivers, which water the countries of Siam, Pegu, \&c. viz. the Menan, the Afa, the Caipoumo, and the Laquia, \&c. The third fpecies of lakes, which receive rivers but. emit none, apparently owe their origin to thofe rivers which, in their progrefs from their fource, falling into fome extenfive cavity, are collected together, and form a lake of fuch dimenfions as may lofe as much by exbalation as it continually receives from the fe fources: of this kind is that great lake improperly called the Cafpian Sea; the lake Afphaltites, alfo called the Deal Sea; the lake of Geneva, and feveral others. Of the fourth Species, which both receive and emit rivers, we reekon three kinds, as the quantity they emit is greater, equal or lefs, than they receive. If it be greater, it is plain that they mult be fupplied by lprings at the botion; if lefs, the furplus of the water is probably fpent in exhalations; and if it be equal, their fprings juft fupply what is evaporated by the fun.

Iakes are alfo civided into thofe of fref water and
:buse

## L A K

Iake, thofe of falt. Dr Halley ia of opinion, that all great perennial lakes are faline, either in a greater or lefs degree; and that this faltnefs increafes with time: and on this foundation he propofes a method for deternining the age of the world.
Large lakes anfwer the mofl valuable purpofes in the northern regions, the warm vapours that arife from them moderating the pinching cold of thofe climates; and what is ftill a greater advantage, when they are placed in warmer climates at a great diftance from the fea, the exhalations raifed from them by the fun caufe the countrics that boider upon them to be refrethed swith frequent thowers, and confequently prevent their being barren defarts.

Lake, or Laque, a preparation of different fubftances into a kind of magittery for the ufe of painters. One of the finelt and firft invented of which was that of gum-lacta or lacque; from which all the reft, as made by the fame procefs, are called by the common name lacques. See Lacca.

The method of preparing thefe, in general, may be known by the example of that of the curcuma-root of the flops, called turneric root; the procefs for the making of which is this: Take a pound of turmericront in fine powder, three pints of water, and an ounce of falt of tartar; put all into a glazed earthen veffel, and let them boil together over a clear gentle fire, till the water appears highly impregnated with the mot, and will ftain a paper to a beautiful yellow. Filtre this liquor, and gradually add to it a ftrong folution of roch alum in water, till the yellow matter is all curdled together and precipitated; after this pour the whole into a filtre of paper, and the water will run off and leave the yellow matter behind. It is to be wafhed many times with frefh water, till the water comes off infipid, and then is obtained the beautiful yel'ow called lacque of turmeric, and ufed in painting.

In this manner may a lake be made of any of the tinging fubftances that are of a fomewhat flrong texture, as madder, logwood, \&c. but it will not fucceed in the more tender fpecies, as the flowers of rofes, violets, \&cc. as it deflroya the nice arrangement of parto in thofe fubjects on which the colour depends.

A yellow lake for painting is to be made from broom-flowers in the following manner: Make a ley of pot-afles and lime reafonably frong; in this boil, at a gentle fire, frefh bloom-flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen veffels over the fire ; add as nuch alum as the liquor will diffolve; then empty this ley into a vefficl of clean water, and it will give a yellow colour at the bottom. Let all fette, and decant off the clear liquor. Wafh this powder, which is found at the hottom, with more water, till all the falts of the ley are wafhed off; then feparate the yellow matter, and dry it in the fhade. It proves a very valuable yellow.

Lake is at prefent feldom prepared from any other fubfance than fcarlet rags, cochineal, and Brafil wood. The beft of what is commonly fold is made from the colour extracted from fcarlet rags, and depofited on the cuttle-bone ; and this may be prepared in the fol- lowing manner: Diffolve a pound of the beft pearl$\mathrm{N}^{\circ}{ }^{173 .}$
afhes in two quarts of water, and filtre the liquor thro' paper add to this folution two more quarts of water and a pound of clean fcarlet flreds, and boil them in a pewter boiler till the fhreda have lof their fcarlet colour; take out the fhreds and prefs then, and put the coloured water yielded by them to the other: in the fame folution boil another pound of the fhreds, proceeding in the fame manner; and likewife a third and fourth pound. Whilf this is doing, diflolve a pound and a half of cuttle-fifh bone in a pound of itrong aquafortis in a glafs receiver; adding more of the bone if it appear to produce any ebullition in the aquafortis; and pour this ftrained folution gradually into the other 3 but if any ebullition be occafioned, more of the cuttlefifh bone mutt be diffolved as before, and added till no ebullition appears in the mixture. The crimfon fediment depofited by the liquor thus prepared is the lake: pour off the water ; and ftir the lake in two gallons of hard fpring water, and mix the fediment in two gallons of freth waier; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum fhould be added to each quantity of water before it he ufed. Having thus fufficiently freed the lake from the falts, drain off the water through a filtre, covered with a worn linen cloth. When it has been drained to a proper drynefs, let it be dropped through a proper funnel on clean boards, and the drops will become fmall cones or pyramids, in which form the lake muft be fuffered to dry, and the preparation is completed.

Lake may be prepared from cochineal, by gently boiling two ounces of cochineal in a quart of water; filtering the folution through paper, and adding two ounces of pearl-afhes diffolved in half a pint of warm water and filtered through paper. Make a folution of cuttle-bone as in the former procefs; and to a pint of it add two ounces of alum diffolved in half a pint of water. Put this mixture gradually to that of the cochineal and pearlafhes, as long as any ebullition appears to arife, and proceed as above.-A beautiful lake may be prepared from Brazil wood, by boiling three pounds of it for an hour in a felution of three pounds of common falt in three gallons of water, and filtering the hot fluid through paper; add to this a folution of five pounds of alum in three gallons of water. Diffolve three pounds of the beft pearl-afhes in a gallon and a half of watcr, and purify it hy filtertering ; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourlefs. But if any appearance of purple be feen, add a frefl quantity of the folution of alum by degrees, till a fcarlet hue be produced. Then purfue the directions given in the firft procefs with regard to the fediment. If half a pound of feed lac be added to the folution of pearl afhes, and diffolved in it before its purification by the filtre, and two pounds of the wood, and a proportional quantity of the common Lalt and water be ufed in the coloured folution, a lake will be produced that will fland well in oil or water, but is not fo tranfparent in oil as without the feed-lac. The lake with Brafil wood may be alfo made by adding half an ounce of anotto to each pound of the wood; but the anotto mult be diffolved in the folution of peart.

## 513 ] I A M

pearl-afies. There is a kind of beantiful lake brought fronl China; but as it does not mix well with either water or oil, though it difolves entirely in fpirit of winc, it is not of any ufe in our kinds of painting. This las been erroneoully called fitflower.
Orange $L$ Lase, is the tinging part of anotto precipitated together with the earth of alun. This pigment, which is of a bright orange colour and fit for varnif painting, where there is no fear of fying, and alfo for putting under cryltal to imitate the vinegar garnet, may be pripared by builing four ounces of the beit anutto and one pound of pearl afhes half an hour in a gallon of water; and fraining the folution through paper Mix gradually with this a folution of a pound and a half of alum in annther gallon of watcr; defilling when no ebullitien attends the commixture. Treat the fediment in the manner already direted for other kinds of lake, and dry it in fquare bits or round lo. zenges.
LAMA, a fynonyme of the camelus pacos. See Camerus.
Lama, the fovereign pontiff, or rather god, of the Aliatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the iuhabitants of the country, but alfo by the kiags of Taitary, who fend him rich prefents, and go in pilgrimage to pay lim adoration, calling him lama congiu, i. e. "god, the everlafting father of heaven." He is never to be feen but in a fecret place of his palace, amidit a great number of lamps, fitting erofs-legged upon a cufhion, and adorned all over with gold and precious flones; where at a diflance they proflrate themfelves before him, it not being lawful for any to kifs even his fect. He is called the great lama, or lama of lemas; that is, "prieft of prieft." The orthodox opinion is, that when the grand lama feems to die either of old age or infirmity, his foul in fact only quits a crazy habitation to look for another younger or better; and it is difcovered again in the bndy of fome child, by certain tokens known only to the lamas or priefts, in which order he always appears.
The following account of the ceremonies attending the inauguration of the infant lama in Thibet is extracied from the firt volume of the Affatic Refearches.

The emperor of China appears on this oceafion to have affumed a very confpicuous part in giving teftimony of his refpeet and zeal for the great religious father of his faith. Early in the year 1784 , he difmiffed ambafladors from the court of Pekin to Teefhoo Loomboo, to reprefent their fovereign in fupporting the dignity of the high prieft, and do honour to the occafion of the affumption of his office. Dalia Lama and the viceroy of Laffa, accompanied by all the court, one of the Chinefe generals flatinned at Laffa with a part of the troops under his command, two of the four magiftrates of the city, the heads of every monaftery throughout Thibet, and the empercr's ambaffadors, appeared at Teefhno Loomboo to celebrate this epocha in their theological inftitut ${ }^{i}$ ons. The 28 th day of the feventh moon, correfpond ${ }^{\mathrm{i}} \mathrm{ng}$ nearly, as their year commences with the vernal equinox, to the middle of October 1784 , was chofen as the molt aufpicious for the ce. remony of inauguration: a few days previous to which the lama was conducted from Terpaling. the monaAcry in which be had pafled his infancy, with every
mark of pomp and homage that could be paid by ant enthufialic people. So great a concourfe as affernbled either from euriofity or devotion was never feen before, for not a perfon of any condition in Thitet was abfent who could join the fuite. The procelfinn was hence neceflarily conitrained to move fo flow, that though Terpaling is fituated at the diftance of 20 miles only fron Teehoo Loombon, three days expired in the performance of this thort march. The firft halt was made at Tfondue; the fecond at Summaar, about fix miles off, whence the moll fplendid parade was referved for the lama's entry on the third day, the account of which is given by a perion who was prefent in the proceffion. The road, he fays, was previoully prepared by being whitened with a wahl, and having piles of flones heaped up with fmiall intervals between on either fide. The letinue paffed between a double row of priells who furmed a ltreet extending all the way from Summara to the gates of the palace. Some of the priefts held lighted rods of a perfumed compofition that burn like decayed wood, and emit an aromatic fmoke ; the reft were furnihed with the differsnt mufical inftruments they ufe at their devotions, fueb as the gong, the cymbal, hautboy, trumpets, drums, and fea-fhells, which were all founded in union with the hymn they chanted. The crowd of fpectators were kept without the freet, and none admitted on the high road but fueb as properly belonged to or had a preferibed place in the proceflion, which was arranged in the following order.

The van was led by threc military commandants or governors of diftricts at the head of 6000 or 7000 horfemen armed with quivers, bows, and matchlocks. In their rear followed the ambaffador with his fuite, carrying his diploma as is the cuftom of Clina, made up in the form of a large tube, and faftened on his back. Next the Chinefe gencral advanced with the troops under his command, mounted and accoutered after their way with fire-arms and fabres; then came a very numerous group bearing the various flandards and infig-
nia of flate; next to them moved a nia of flate; next to them moved a full band of wind and other fonorous inflruments; after which were led two horfes richly caparifoned, each carrying two large circular ftoves difpofed like panniers acrofs the horfe's back and filled with burning aromatic woods. Theie were followed by a fenior prieft, called a lama, who bore a box containing books of their form of prayer and fome favourite idols. Next nine fumptuary horfes were led loaded with the lama's apparel; after which came the priefts immediately attached to the lama's perfon for the performance of daily offices in the temple, amounting to about 700 ; following them were two men each carrying on his fhoulder a large cylindrical gold infignium emboffed with emblematical figures (a gift from the emperor of China). The Duhunniers and Soupoons, who were employed in communicating addreffes and diftributing alme, immediately preceded the lama's bier, which was covered with a gaudy canopy, and borne by eigbt of the 16 Chincfe appointed for this fervice. On one fide of the bier attended the regent, on the other the lama's father. It was followed by the beads of the different monatteries, and as the proceffion advanced, the priefts who formed the ftreet fell in the rear and brought up the fuit, which mored at an extremely flow pace, and about
1.ama,
noon was received with in the confines of the monaftery, amidft an amazing difplay of colours, the acclamations of the crowd, folemn mufic, and the chanting of their prisits.

The lana being fafely lodged in the palace, the regent and Snopoa: Choomboo went ont, as is a cultoinary compliment paid to sifitors of high rank on their near approach, to aseet and conduct Dalai Lama and the viceroy of Lafla who were on the way to Teelhoo Loomboo: Thair retinues encountered the following morning at the foot of Painom catle, and the next day mogether entered the monafters of Teefhuo Loumbw, in which both Dalai Lana and the viceroy were accommodated during their flay.

The following morning, which was the third after Teefhoo Lama's arrival, he was carried to the great temple, and about noon feaied upon the throne of his progenitors; at which time the emperor's anibaffactor delivered his diploma, and placed the prefents with which he had heen charged at the lana's fect.

The three next enfuing days, Dalai Lama met Teefhoo Lama in the temple, where they were affited by all the priefts in the invocation and public worthip of their gods. The rites then performed, completed, as we underfand, the bufinefs of inauguration. During this interval all who were at the capital were cutertain. ed at the public expence, and alms were dittributed without referve. In conformity likewife to previuus notice circulated every where for the lame fpace of time, , univerfal rejoicings prevailed throughout Thibet. Bannes were unfurled on all their fortreffes, the peafantry filled up the day with mufic and feltivity, and the night was celebrated by general illuminations. A lorg period was afterwards employed in making prefents and public entertainments to the newly inducted lama, who, at the time of his acceflion to the Mufnud, or if we may ufe the term, pontificate of Teefhoo Loomboo, was not three years of age. The ceremony was begun by Dalai Lam3, whofe offerings are faid to have anmounted to a greater value, and his public entertainments to have been more \{plendid than the relt. The fecond day was dedicated to the viceroy of Lafla. The third to the Chinefe general. Then followed the culloong or magiltrates of Laffa, and the reft of the principal perfons who had accompanied Dalai Lama, Af. ter which the regent of Teefhoo Loomboo, and all that were dependent on ihat governmeat, were feverally adnitted, aceoraing to pre-eminence of rank, to pay their tributes of obeifance and refpect. As foon as the acknowledgements of all thofe were received who were adnuifible to the privilege, Teefhoo Lama made in the fame order fuitable returns to each, and the confunmation lafted 40 days.

Many importunities were ufed with Dalai Lama to prolong his ftay at Teefhoo Loomboo; but he excufed himfelf from encumbering the capital any longer with fo numerous a concourfe of people as attended on his movements, and deeming it expedient to make his abfence as fhort as poffible from the feat of his authority, at the expiration of 40 days he withdrew with all his fuite to Laffa, and the emperor's ambalfador received his difmiffion to return to China, and thus terminated this fomous feftival.

LAMB, in zoology, the young of. the fleep kind. See Oris.

A male lamb of the fort year is called a quedder hog, Lami and the female a ecoer-hog; the fecond year it is called a coudher, and the funale a heave. If a lamb be fick, mare's milk with water may bz given it ; and by blow. ing into the mouth, many have beei recovered, after appearing dead. The belt teafort for weming them is when they are 16 or 18 weeks old; aunl abo it Michatelmas the males thould be feparatel from the females, and fucls males as are note defigned for rame, gelded. "Lamb (fays Dr Cuilen) apperrs a more fibrous kind of neat, and upon that accoumt is lefs eatily foluble than veal. In secotand, houfe lamb is never reared to advantage."

Scytbian LAARB, a kind of mofe, which grows about the roots of ferm in fome of the aorthern parts of Eue. rope and Afta, and fonetimes alfames the form of a quaditiped; fo calich frons a fuppofed refemblance in hapeto that anima!. It has fomething like four feet, and its body is covered with a kind of down. Travellers report that it will fuffer no vegetable in grow within a certain diftance of it: feat. Sir Hans Sluan read a memoir upon this plart before the Soceiety; for which thofe whothink it worth while may confult their Tranfactions, $\mathrm{N}^{3}{ }_{2.45} \cdot \mathrm{P} \cdot 461$. Mr Bell, in his "Account of a Journcy From St Peterfourgh to IPpahan," in. forms us that he fearched in vain for this plant in the neighbourhood of Altrachan, when at the fane time the more fenfible and experienced amonglt the T'artars treated the whole hiitory as fabulous. See Plate CCLIX.

LAMBECIUS (Peter), born at Hamberg in 1628 , was one of the moit learned men of his time. We went very young to lludy in foreign countries, at the expence of his mele the learned Holtenius. He was chofen profefor of hiftory at Hamburg in 1652 , and rector of the college of that city in $\mathbf{1 6 6 0}$. He lad taken his degree of doctor of law in France before. He. fuffered a thoufand vexations in his own country; becaufe his enemies charged him with atheifm, and cenfured his writings bitterly: He married a rich indy, but who was fo very covetous, that he lefther in ditguft within a fortnight. He went to Vienna, and from thence to Rome, where he publicly profeffed the Catholic religion. He returned to Vienna in 1662 , where he was kindly received hy the empcror, who appointed him his fub!!brary-keeper, and afterwards his principal librarian, with the title of counfellor and: bifloriographer; in which employment he continued till his death, and yained a great reputation by the works he publifled, viz. t. An Effay on Aulus Gellius. 2. The Antiquities of Hanburg. 3. Remarks on Codinus's An. tiquities of Conflantinople, \&.c.
LAMBERT' of Afchaffenburg, a Benedi\&ine monk, in the rith century, wrote feveral works; among which is a hiftory of Germany, from the year 1050 to 1077, which is efteemed.

Lambert (John), general of the parliament's forces in the civil wars of the lalt century, was of a good family, and for fome time ftudied the law in one of the inns of court; but upon the breaking out of the rebellion, went into the parliament-army, where he foen. rofe to the rank of colonel, and by his conduct and valour performed many eminent fervices. But when Cromwell feemed inclined to affame the title of king, Lambert oppofed it with great vigour, and even refufed to take the oath required by the affembly and

## L A M

[ 515 ]
council to be faithful to the government; on which Cromwell 'eprived him of his commifion, but granted lim a punfion of 20001 . a yyear. This was an act of prudence rather than of generofity ; as he well knew, that fuch genius as Lambert's, rendered defperate by poverty, was capable of attempting any thing.
Lambert being now divelled of all employment, retired to Wimbleton-loure; where tunning forit, he had the fineft tulips and gillifoowers tha: conld be got for love or money. Yet amid thefe amufenents he fill nourifhed his ambition : for when Richard Cromwell fucceeded his father, he acted fo effectualiy with Fleetwood, Defborough, Vane, Berry, and others, that the new proteftor was obliged to furrender his authority ; and ilhe members of the long parliament, who hind continued litting till the zoth of April 1653, when Oliver difmiffed them, weeve reflored to their feats, and Lambert was immediately appointed one of the council of itate, and colonel of a regiment of hor fe and another of foot. For this fervice the parliament prefented him 1000 l. to buy a jewet; but he diltributed it among this officers. This being foon known to the parliament, they concluded that he intended to fecure a party in the army. They therefore courteonfly invited him to come to London; but refolved, as foon as he fhould arrive, to fecure him fion doing any further harm. I.anbert, apprehenfive of this, delayed his return, and even refufed to relign his commifion when it was demanded of him and of eight of the uther leading officers; and, marcling up to London with his army, difodged the' parlianent by force in Otaber 1659 . He was then appointed, by a council of the oficers, majur-general of the arny, and one of the new council for the management of public afairs, and fent to command the forces in the north. But general Monk marching fiom Scolland into Eng. land to fupport the parliament, againit which Lam. bert had acted with fuch violence, the latter, being deferted by his army, was obliged to fubmit to the parliament, and hy their order was committed prifoner to the tower; whence efcaping he foon appeared in arms with four troops under his command, but was defeated and taken prifoner by colonel Ingoldiby.
At the Refloration he was particulaly excepted out of the act of indemnity. Being brought to his trial on the th of June 1662 , for levying war againt the king, this daring general behaved with more fubmiffion thas the meaneft, of his fellow prifonert, and was by his majelty's favour reprived at the bar, and connined during lise life in the ifland of Guerney.
Lambert (Anna Theerefáa de Marguenat de Gourcelles, marchionefs of), an elegant noural writer, was the only daughter of Stephen Marguenat lord of Courcelles. In 1666 fle martied Henry dc Lambert, who at lis deatla was licutenant.general of the army ; and flie afterwards remained a widow with a fon and a daughter, whom the educated with great care. Her houre was a kind of academy, to which perfons of ditlinguithed abilities regularly reforted. She died at Paris in 1733 , aged 86 . Her work $s$, which are writtoll with much tatte, jucigment, ane delicacy, are printed in two volumcs. The advice of a mother to hier fon and daughter are particulatly eilecmed.

LAMBIN (Dennic), an sminent claffical commentator, was born at Montueuil-fur-Mer, in Picardy,
and aequired great nkill in polite literaturc. He lived for a leng time at Rome; and at his return to Paris was nuade royal profeftor of the Greek language. He died in : $57^{2}$, aged 56 , of fure grief at the death of his friend Ramus, who was murdertd at the maffacre on St Batholomew's day. He wiote conamentaries on Plautus, Lucsetius, Cicers, and Horace, and other works. His commentary on Horace is more parricularly efteemet.

LAMECH, of the race of Cain, was the fon of Mcthufael, and father of Jabal, Jubal, 'Cubal-cain, and Namah. Gen. iv. 18, 19,20, Sc. Lamech is celebrated in fcripture for his polygamy, whereof he is thought to be the firf author in the world. He married Adah and Zillalı. Adah was the mother of Jabal and Jubal ; and Zillah of Tubal-cain, and Naamah his filter. One day Lamech faid to his wives, "Hear me, ye wives of Lamech; I have flain a man to my wounding, and a young man to my hurt. If Cain hall be avenged feven fold, truly Lamech Seventy and feven fold." Thefe words are an uninielligible riddle. The reader may confilt the commentators. There is a tradition among the Hebrews, that Lamech growing blind, ignorantly killed Cain, believing him to be fone wild beaft; and that afterwards he flew his own fon Tubal cain, who had been the caule of this murder, becaufe he had directed him to fhoot at a certain place in the thickets where lie had feen fomething Hir. See Cain.

Several other fuppofitions are produced in order to explain this paffage concerning Lamech, and all alnoft equally uncertain and ablurd.

Lamech, the fon of Methufelah, and father of Noah. He lived a hundred fourfcore and two years before the birth of Noah, (Gen. v. 25, 31.) ; and af ter that, he lived five hundred and ninets-five jears longer: thus the whole time of his life was feven hundred feventy-feven years, being born in the yar of the worid 874 , and dying in the year of the world 1651.

LAMELLIE, in natural hitory, denotes very thin plates, fuch as the fcales of fiflies are compofed $0 \hat{f}_{\text {. }}$

LAMEN'TATIONS, a canonical book of the Old Teflament, written by the prophet Jeremiah, according to archbifhop Uther and fome other lrarned men:, who follow the opinion of Jufephus and St Jerom, on occafion of Jofrah's death. But this opinion does noe feem to agree with the fibject of the book, the lamentation compofed by Jeremiah on that occalion being proliably loft. The fifty-fecond chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the lamentations: the two firt chapters are employed in deferibing the calamities of the fiege of Jerufalem: in the thitd the author deplores the perfecutions he himfelf had fuffered: the fourth treats of the defolation of the city and temple, and the misfortune of Zedekiah: the nifth chapter is a prager for the Jews in their difperfion and captivity : and at the clofe of all he fpeaks of the cruclty of the Edonites, who had infulted Jerufalem in her mifery. All the chapters of this bool, except the laft, are in metre, and digefted in the order of the alphabet ; with this difference, that in the firlt, Fecond, and fourth chapters, the firit letter of every verfe follows the order of the alphabet; but in the third the fame initial letter is continued for three verfes toge-

## I A M [ $\quad 516] \quad$ L A M

ther. This ordcr was probably adopted, that the book might be more eafily learnt and retained. The fubjeet of this book is of the moft moving kind; and the flyle throughout lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great mafter, according to the character which Grotius gives of him, Mirus in afferibus concitandis.

LAMIA (anc. geog.) a town of the Phithotis, a diftrict of 'theffaly. Famous for giving name to the Bellum Lamiacum, waged by the Greeks on the Macedonians after Alexander's death.
LAMIACUM bellum happened after the death of Alexander, when the Greeks, and particularly the Athenians, incited by their orators, refolved to free Greece from the garrifons of the Macedonians. Leofthenes was appointed commander of a numerous force, and marched againlt Antipater, who then prefided over Macedonia. Antipater entered Theffaly at the head of 13,000 foot and 600 horfe, and was beaten by the fuperior force of the Athenians and of their Greeis confederates. Antipater after this blow fled to Lamia, where he refolved, with all the courage and fagacity of a careful general, to maintain a fiege with about 8000 or 9000 men that had efeaped from the field of battle. Leoflhenes, unable to take the city by form, began to make a regular fiege. His operations were delayed by the frequent fallies of Avtipater; and Leothenes being killed by the blow of a ftone which he received, Antipater made his efcape ont of Lamia, and foon af ter, with the affiltance of the army of Craterus brought from Afia, he gave the Athenians battle near Cranon; and though only 500 of their men were flain, yet they became fo dilpirited, that they fued for peace from the conqueror. Antipater at laft with difficulty confented, provided they raifed taxes in the ufual manner, received a Macedonian garrifon, defrayed the expences of the war, and, lafly, delivered into his hands Demothenes and Hyperides, the two orators whofe prevailing eloquence had excited their countrymen againt him. Thefe difadvantageous terms were accepted by the Athenians, yet Demofthenes had time to efeape and poifon himfelf. Hyperides was carried before Antipater, who ordered his tongue to be cut off, and afterwards to be put to death.

LAMIた, a fort of demons who had their exitence in the imaginations of the heathens, and were fuppofed to devour children. Their form was human, refembling beautiful women. Horace makes mention of them in his Art of Poetry. The name, according to fome, is derived from lanio " oo tear ;" or according to others, is a corruption of a Hebrew word fignifying to devour. They are alfo called Larvie or Lenures.

LAMINE, in phyfiology, thin plates, or tables, whereof any thing confitts; particularly the human kull, which are two, the one laid over the other.

LAMINIUM, (anc. geog.), a town of the Carpe. tani in the Hither Spain; at the diftance of feven miles from the head of the Anas or Guadiana: Now Monticl, a citadel of New Caftile; and the territory called Ager Laminitanus, is now el Campo de Montiel, (Clufius)

LAMIUM, $D_{E A D}$-Nettle, in botany: A genas of the gymnofpermia order, helonging to the didynamia clafe of plants; and in the natural method ranking
under the 42 d order, Verticillata. The upper lip of Lams the corolla is entire, arched, the under lip bilobous; the throat with a dent or tooth on each fide the margin. There are eight fpecies; of which only two, viz. the album, white archangel or dead-nettle, and the purpureum or red archangel, deferve notice. The firtt grows frequently under hedges and in wafte places; the fecond is very common in gardens and corn-fields. The flowers of the firft, which appear in April and May, have been particularly celebrated in uterine fluors and other female weakneffes, and alfo in diforders of the lungs ; but they appear to be of very weak virtue; and they are at prefent fo little ufed in Britain as to have now no place in our pharmacopcias. The young leaves of both fpecies are boiled and eaten in fome places like greens.

LAMMAS-dAv, the firt of Augult ; fo called, as fome will have it, becaufe lambs then grow out of feafon, as being too big. Others dcrive it from a Saxon word, figmifying "loaf-mafs," becaufe on that day our forctathers made an offering of bread made with new wheat.
On this day the tenants who formerly held lands of the cathedral chuich in York, were bound by their tenure to bring a lamb alive into the church at highmais.
LAMOIGNON (Chretien Francis de) marquis of Baville, and prelident of the parliament of Paris, was born in 1644. His father would not truft the education of his fon to another, but took it upon himfelf, and entered into the minutell particulars of his firft ftudies: the love of letters and a folid tafte were the fruits the fcholar reaped from this valuable education. He learned rhetoric in the Jefuit's college, made the tour of England and Holland, and returned home the admiration of thofe meetings regularly held by perfons of the firt merit at his father's houfe. The feveral branches of literature were however only his amufement : the law was his real employ; and the cloquence of the bar at Paris owes its reformation from bombait and affected erudition to the plain and noble pleadings of M. Lamoignon. He was appointed the king's advocate general in 1673 ; which he difcharged until 1698 , when the prefidenthip of the parliament was conferred on hima. This poft he held nine years, when he was allowed to refign in favour of his eldeft Con: he was chofen prefident of the royal academy of infcriptions in 1705. The only work he fuffered to fee the light was his Pleader, which is a monument of his eloquence and inclination to polite lecters. He died in 1709.

LAMP, a veffel containing oil, with a lighted wick.
Lamps were in general wfe amongh the Jewz, Greeks, and Romans. The candleftick with leven branches, placed in the fanctuary by Mofes, and thofe which Solomon afterwards prepared for the temple, were cryflal lamps filled with oil, and fixed upon the branches. The lamps or candletticks made ufe of by the Jews in their own houfes were generally put into a very high tand on the ground. The lamps fuppofed to be ufed by the foolifh virgins, \&c. in the golpel, were of a different kind. - According to critics and antiquaries, they were a fort of torches, made of iron or potter's earth, wrapped about with old linen. and moiltened from time to time with oil. Matth. xxys

## L A M [ 587] L A M

1,2. The lamps of Gideon's foldiers were of the fame kind. The ufe of wax was not unknown to the Romans, but they generally burnt lamps; hence the proverb Tempus et oleum perdidi, "I have loft my labour." Lamps were fometimes burnt in honour of the dead, both by Greeks and Romans.

Dr St Clair, in the Philof. Tranf. $n^{\circ} 2+5$, gives the defcription of an improvement on the conmon lamp. He propofes that it thould be made two or theree inches decp, with a pipe coming from the bottom almoll as high as the top of the veffel. Let it he filled fo high with sater that it may cover the hole of the pipe at the bottom, that the oil may not get in at the pipe and fo be lutt. Then let the oil be poured in fo as to fill the reffel almoll brim. full; and to the veffel mult be adapted a cover having as many holes as there are to be wicks. When the veffel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the fame height or very near it ; the weight of the water being to that of the oil as $20_{1}^{8}$ 8 to 19 , which in two or three inches makes no great difference. If the water runs falter than the oil waftes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and seep it at the fame height.

From experiments made in order to afcertain the expence of burning chamber oil in lamps, it appears, that a taper lamp, with eight threads of cotton in the wick, confumes in one hour ${ }^{\frac{3}{5} \frac{25}{2} 50}$ oz. of fpermaceti oil, at 2 s . 6 d . per gallon; fo that the expence of burning 12 hours is 4.57 farthings. This lamp gives as good a light as the candles of eight and ten in the pound; it feldom wants fnuffing, and cafts a flrong and fleady light. A taper, chamber, or watch lamp, with four ordinary threads of cotton in the wick, confumes 0.1067 oz . of fpermaceni oil in one hour ; the oil at 2 s .6 d . per gallen, makes the expence of burning 12 hours only 2.34 farthings.

Perpetua! Lamps. The teftimonies of Pliny, St Autin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and fome moderns have attempted to find out the fecret, but hitherto in vain. Indeed it feems no ealy matter to find out either a perpetual wick or a perpetual oil. The curious may read Dr Plot's conjectures on the fubject in the Philof. Tranf. $n^{\circ} 166$; or in Lowthorp's abridgment, vol. iii. p. 636 . But few, we believe, will give themfelves the trouble of fearching for the fecret, when they confider that the credulity of Pliny and of St Auftin was fuch, that their teflimony does not feem a fufficient inducement to us to believe that a lamp was ever formed to burn 1500 or 1000 years: much lefs is it credible that the ancients had the fecret of making one burn for ever.

- Rolling Lamp: A machine A B, with two moveable circles $1 \mathrm{E}, \mathrm{F}$ G, within it ; whofe common centre of motion and gravity is at K , where their axes of motion crofs one another. If the lamp K C, made presty heavy ard moveable about its axis HI, and whofe centre of gravity is at C , be fitted within the inner circle, the common centre of gravity of the whole machine will fall between K and C ; and by rea!on of the pivots $A, B, D, E, H, I$, will be always at liberty to defcead: hence, though the whole machine be rolled a-
long the ground, or moved in any manner, the flame will always be uppermoft, and the oil cannot fpill.

It is in this manner they hang the compafs at fea; and thus fhould all the moon-lanterns be made, that are carried before coaclose, chaifes, and the like.

Argand's Loamp. This is a very ingenious contrivance, and the greatelt improvement in lamps that has yet been made. It is the invention of a citizen of Geneva; and the principle on which the fuperiority of the lamp depends, is the admiffion of a larger quantity of air to the flame than can be done in the common way. This is accomplifhed by making the wick of a circular form ; by which means a current cf air rufhes through the cylinder on which it is placed with great force; and, alung with that which has accefs to the outfide, excites the flame to fuch a degree that the finoke is entirely confumed. Thus both the light and lieat are prodigioufly increafed, at the fame time that there is a very confiderable faving in the expence of oil, the confumption of the phiogiton being exceedingly augmented by the quantity of air admitted to the flame; fo that what in common lamps is diffipated in fmoke is here converted into a brilitiant flame.

This lamp is now wery much in ufe; and is applied: not only to the ordinary purpofes of illumination, but alfo to that of a lamp furnace for chemical operations, in which it is found to exceed every other contrivance yet invented. It confifts of two parts, ziz. a refervoit for the oil, and the lamp. it felf. The refervoir is ufual!y in the form of a vafe, and has the lamp proceeding from its fide. The latter confifs of an upright metallic tube about one inch and fix-tentins in diameter, three inches in length, and open at both ends. Within this is another tube about an inch in diameter, and nearly of an equal length; the fpace betwixt the two being left clear for the paffage of the air. The internal tube is clofed at the bottom, and contains another fimilar tube about half an inch in diameter, which is foldered to the bottom of the fecond. It is perforated throughout, fo as to admit a current of air to pafs through it; and the oil is contained in the face betwixt the tube and that which furrounds it. A particular kind of cotton cloth is ufed for the wick, the longitudinal threads of which are much thicker than the others, and which nearly fills the fpace into which the oil flows; and the mechanifm of the lamp is fuch, that the wick may be raifed or depreffed at pleafure. When the lamp is lighted, the flame is in the form of a hollow cylinder ; and by reafon of the Atrong influx of air through the heated metallic tube, becomes extremely bright, the faroke being entirely confumed for. the reafons already mentioned. The heat and light are fill farther increafed, by putting over the whole a glafs cylinder nearly of the fize of the exterior tube. By diminifhing the central aperture, the heat and lighe are proportionably diminifhed, and the lamp begins to. fmoke. The accefs of air both to the external and internal furfaces of the flame is indecd fo very neceffary, that a fenfible difference is perceived when the hand is held $\epsilon$ ven at the diftance of an inch below the lower. aperture of the cylinder; and there is allo a certaig length of wick at which the effect of the lamp is ftrongelt. If the wick be very fhort, the fame, tho ${ }^{2-}$ white and brilliant, emits a difagreeable and pale kind
:2,anp. of light; and if very long, the upper part becomes brown, and fmoke is emitted.
The faving of expence in the ufe of this inflrument for common purpoles is very confiderable. By fome experiments it appears that the lamp will contiuue to burn three hours for the value of one penny; and the following was the refult of the comparifon between the light eriited by it and that of a candle. The latter having been fuffered to burn fo long without fuuf. fing, that large lumps of coally matter were formed upon the wick, gave a light at 24 inches ditance equal to the lamp at 120 inches; whence it appeared that the light of the lamp was equal to 28 candes in this fate. On frumfing the candle, boweser, its light was fo much augmented, that it became neceffiry to remove it to the diftance of 67 incbes before its light became equal to that of the lan:p at 129 inches; whence it was concluded that the light of the lamp was fomewhat lefs than that of four candes freff fnuffed. At another trial, in which the lamp was placed at the diftance of $\mathbf{t} 3 \frac{1}{2}$ inctics, and a candle at the dillance of 55 inches, the lightiss were equal. In thefe experiments the caniles made ufe of were $10 \frac{1}{ \pm}$ inches long, and $2 \frac{5}{T 0}$ inches in diameter. When the candle was newly fruff. ed, it appenred to have the advantage ; but the lamp foon gut :he fuperiority; and on the whole it was concluded, that the lamp is at leaft equivalent to half a dozen of tallow candles of fix in the pound ; the expence of the one being only two pence lalfpenny, and the other eight pence in feven hours.
The beft method of comparing the two lights to. gether feems to be the following Place the graater light at a conliderable dilance from a white paper, the fimaller one being brought nearer or removed farther off as occafion requires. If an angular body be held before the paper, it will project two fladows: thefe two fladows can coincide only in part ; and their angular exteremitics will, in all pofitions but one, be at Some dillance from each other; and heing made to coincide in a certain part of their bulk, they will be bordered by a lighter fhadow, occafigned by the exclution of the light from each of the two luminnus bodies refpectively. Thefe lighter fhadows, in faet, are fpaces of the white paper illuminated by the different luminous bodies, and may eailiy be compared togetber, becaufe at a certain point they actually touch one another. If the fpace illumiuated by the fmaller light ap. pear brighteft, the light mult be removed farther off, but the contraiy if it appear more obfcure.
On cutting open one of Argand's wicks longitudiually, and thus reducing the circular flame to a ftraight lined one, the lights appeared quite equal in power; but the circular one had by far the greatell effect in dazzling the eyes; though when the inn, flame was made to shiae on the paper, not by the broadfidc, but in the direfiion of its length, it appeared more dazzling than the other. On placing this long flame at night angles to the ra; of Argand's lamp, it projected no fhadow ; but when its length was placed in the dircction of the ray, it gave a hhadow bordered with two broach, well defined, and brisht lines.

The broad wicked lamp feens to have the advant ye of the other, as requiring leis alpparatus: and in.deced by this contrivance we may at the mond trifing expence hare a lamp capable of giving any degree ot light we
pleafe. The oniy difadvantage attending either the Lampads one or the other is, that they cannot eafily be carried from one place to another; and in this refpect it does not feem poflible by any means to bring lamps to an equality with candles.

Lamp-Black, among colourmen. Sce Colour-MaLing, no 18, 10.-Sublances paiated with lamp-black and oil, are found to refift the effects of electricity to a fuprifing degree; fo that in many cafes even lightning itfelf feems to have been repelled by them. Sec Lighting; Thender; Chemietry, n7 700. and Electricity, p. 4.78. col. 1.
I. AMPADARY, an officer in the ancient church of Conftartinople, fo called from his employment, which was to take care of the lamps, and to carry a taper before the emperor or patriarch when they went to church or in procefiton.

LAMPAS, in farrier;: See there, § xxxv.
LAMPREY. See Petromyzon.
LAMPRIDITS (Elius), a Latin hiforian, who lived under the emperors Dioclefian and Conftantine the Great. We have, of his writing, the lives of four emperors, Antoninus, Commodus, Diadumenus, and Heliogabalus. Some attribute the life of Alexander Sevenus to him; but the MS. in the palatine library afcribes it to Spartian.

Lampridius (Benedict), of Cremona, a celebraced Latin poet of the thth century. He taught Greek aad Latin at Rome and at Padua, unti! he was invited to Mantua by Frederic Gonzaga to underake the tuition of his fon. We have epigrams and lyric verles of this writer, both in Greek and Latin, which were printed feparately, as well as among the Delicie of the Italian prets.

LAMPSACUS, or LAmpsacum, (anc. geog.), a conficerable city of Myfia; more anciently called Pilyca, (Homer), becaule abounding in pine-trees, a circumftance confirmed by Pliny ; fituated at the nortly end or estrance of the Hellefpont into the Propontis, with a commodioua harbour, oppolite to Callipolis in the Thracian Cherfonefus. It was affigned by Artaxerxes to Themittocles, for furnihing liis table with wine, in which the country abounded. It was faved from the ruin threatened by Alexander becaufe in the interefl of Perfia, by the addrefs of Anaximenes the hiftorian, fent by his fellow-citizens to avert the king's difpleafure ; who hearing of it, folemnly declared he would do the very reverfe of Anaximenes's requef, who therefore begged the king utterly to deftroy it, which he could not do becaufe of his oath. Lampifacius the epithet, denoting laficius, the character of the people: flill called LIampfocus. E. Long. 280. N. 1.at. 40.12.
LAMPYRIS, the fire-fly, a genus of infects belonging to the colenptera order; the characters of which are : The antenne are filiforin ; the flytra ase flu xible ; the thorax is flat, of a femiorbicular form, furrounding and concealii.s the head. The regments of the abdon.en terminate in papills, which are turned up towards the elytra and partly fold one over the cther. The females in general are apterous.
There are 18 fpccics : of which the noll remarhable is the noetiluca. The male of this infefe is lefib than the female: is head $i$ : fhaped exactly in we f.me manner, and coscied likenite by the plate of the tho. rax, only it appears rather longer than that of the fe. CCLVII

## L A M

yris male. Doth the head and antennse are black. The thorax of the male, which is finaller and thorter than that of the female, has the folds and papille on its filee much iffs remarkable : but the greatelt difference that is feund beiween the two fexis is, that the male is $\mathrm{c}=$ vered with broun elytra, thagreened and malied with two lines longitudinally. Tlie elytra are longer than the sholomes, and under them lie the wings. Thite two lait rings of the aldomen are not fo bright as thofe of the femate, only there appear four luninous points, two upon each of the two laft rings.
The infect called glosy worm, and which is frequently met with towads evening, in the munth of June, in weods ainl meadows, is the ferale belonging to this fperics. By the flining light wheh it emits, it attracts the male; a wonderful inflance of the divine provitence. It is apparent that their faising light eicpends on a liquor plazed at the lower extremity of the infect, which when in motion, the light is muse lisely and fhining, and of a finer giten. 'Ithis light the infect withdraws at pleafure, either by unfolding or contracting itedf. As a proof that the light depends on a plofpliorous matter, you may crufh the animal. which, though dead and bruifcd, leaves a !uminous fubilance on the hand, that only lofes its luftre when dried.

The parfect infect fiez about during the evening in autumn, and frequents the grality plantations of jomiper trees.

LAMY, or Lamp, (Bernard), was born at Mons in 1640, and fludied there under the fathers of the oratory; with whius way of life he was fo pleafed, that he went to Paris in 1658 , and entered into the inlitution. He liad a great talte for the feiences, and fludied them all; he eutered into the priefthood in t 667, and tauglit philofophy at Saumur and Angiers; which latter place he was obliged to quit by an urder procured from court for adopting the new philofophy inllead of that of Arifotle. In 1676 he went to Grenoble, where cardinal Camus was then bifhop; who eonceived fuch an etteens for hin, that he retained hims near his perfon, and derived confiderable fervices from him in the governmeat of his ciocefe. After cuntinuing many years there, he went to reinde at Ronen, where he died in 1715. He wrote feveral fcientiincal warks, befices others in divinity.

LaNCARIM spring, the name of a medicated water of Glamneganfire. It has its name from a town neas which it rites; and has been very long famous in the place for the cure of the king's evil. The body of water is aboat an ell broad, and runs between two Fills coveed with wood. About 12 yards from this fyring the rill fails from a rock of about eight or nine feet liigh, with a confiderable noife. The fpring is very clear, and rifcs cut of a pure white marle. The cures that have been performed there, are proofs of a real power in the water; but there is fome queftion whether the water, or its mution and coldneft, does the good; for the people who come for relief always drink of the fpring, and bathe the part afterward in the fall below. It is generally fuppofed that the limeftone rocks communicate a virtue to it by which it cures internally; but it has been often found, that the bulding a limb difurdered with the evil in the frong

## L A N

current of a mill taill has cured it, and there is the Lancoficies. fame advantage in the fall of this water.

LANCASH1RE, a large naritime province of England, wathed by the hillh fea on the wefl, borderins on the north with part of Cunberlaral and Wentmoreland; bounded an the eall by the WGA Riding of Yurkhire, and on the well by Chentitc; extending 73 miles in length and 41 in breadth, comprelending 6 hundreds, 63 patilhes, 27 market-10wns, $89,+$ villages $s_{2}$. abnut $+3,000$ houfes, and about 260,000 inlabitants.

The tiltern parts of the province are rocks, and in the nothern diftricts we fee many fingle mountains remarkably high, fuch as Ingleborough hill, Cloughbehill, l'endle-lill, and Longridge-t:ill. Nor is there any want of wood in this ceuntry, either for timber or fad; witnefs Wierfale foreft and Bowland foreft to the northward, and Sirron's wood in the fouthern part of Lancafhire.

This comery is well watered with rivers and lakes. Among the lakes or meres of Lancalhire, we reckon the Winander-mere, and the Kinington mere, which, thougl neithar fo large nor fo well llored wihh fifh, yet affords plenty of excellent char. There was on the fouth fide of the Ribble another lake called Martor, feveral miles in circumference, which is now drained, and converted into pafture ground. In this operation, the workmen found a great quantity of fifh, together with eight canoes, refermbling thofe of America, fuppofed to lave been ufed by the ancient Britih fifhermen. D.tiaces thefe meres or la'kes, this county abounds with morafis and moffer, from which the inhabitants dig excellent peat or turf for fuch, as well a marle for manuring the ground, and trunks of nid fir-trees, fuppofid to have lain there fince the general deluge. Some of the fe are fo impsegnated with turpentine, that when divided into fplinters, they burn like candles, and are ufed fur that purpofe by the common people. There is a great variety of misicral waters in this county, fome peniodical fprings, and one inflarce of a violent eruption of water at Kirky in Fonrnefs. The mof remas kable chaly beate fpaws are thofe of Latham, WVigan, Stockport, Burnley, Loltom, Phumpton, Middicton, Strangeways, Lancaller, Larbrick, and Chorly. At Ancliff, in the neighbourhood of Wigan, is a fountain called the Burning Well, from whence a bituminous vapour exhalcs, which being fet on fire by a candle burns like brandy, fo as to produce a hicat that will boil eggs to a ha. I confitence, while the water itfelf retains its uriginal coldnefs*. There is at Barton * See Burn a fountain of falc-water, fo ftrongly impregnated with ${ }^{\text {ing }}$ Wolls the mineral, as to yield fix times as much as can be extracted from the fame quantity of fea water. At Rogham, in Fourncfs, there is a purging faline fountain; and in the neighbourhood of Raffal, where the ground is frequently overflowed hy the fea, a ftream defcends from Hagbur-hills, which in the fpace of feven years is faid to convert the marle into a haid freeftone fit for building. The air of Lancafhire is purc, healthy, and agreeable, except among the fens and on the fa-thore, where the atmofphere is loaded with putrid exhalations, producing malignant and intermitting fevers, fcurvy, rheumatifm, dropfy, and confumption. The foil is various in different parts of the county, poor and rocky on the hills, fat and fertile in the valleys,

Inncahire. atd champaign country. The colour of the peat is white, grey, or black, according to the nature of the compofition and the degrce of putrefagion which the ingredients have undergone. There is a bituminous earth about Orm^kirk, that fmells like the oil of amber, and indeed yields an oil of the fame nature, both in ite feent and medicinal effects, which moreover reduces raw flefh to the confifence of mummy; this earth burns like a torch, and is ufed as fuch by the country people. The metalis and minerals of this county conliat of lead, iron, copper, antimony, black lead, lapis calaminaris, fpar, green vitriol, alum, fulphur, pyrites, frcellone, and pit and canncl-coal.

The level country produces plenty of wheat and balley, and the fkirts of the hills yield good harvelts of excellent oats: very good hemp is raifed in divers parts of the province; and the palure which grows in the valley is fo peculiarly rich, that the cattle which feed upon it are much larger and fatter than in any other part of England. There is not any part of the world better fupplied than Lancahire with prnvifions of all kinds at a very reafonable rate; fuch as beef, veal, mutton, lamb, pork, poultry, and game of all forts, caught upon the moors, heaths, and commons, in the hilly part of the fhirc. Befides the fea fowl common to the Thires of England, fuch as ducks, eafterlings teal, and plover, many uncommon birds are obferved on the coalt of Lancafhire, the fea crow, variegated with blue and black, the puffin, the cormoyant, the curlew, the razor bill, the copped wren, the red-flanks, the fwan, the tropic bird, the king'sfifher, \&c.

The chief manufactures of this county are woollen and cotton cloths of vatious kinds, tickings, and cotton velvets, for which Manchefter is partionlarly famous. The principal rivers are the Merfey, which parts Cheflire and this county; and the Ribble, which rifes in Yorkfhire, and enters this county at Clithero, running fouth wefl by Prefton into the Irifh fea. Befides thefe there arc many leffer ftreams. The navigation made by his grace the duke of Bridgewater in this county, is highly worthy of notice. This was begun fo lately as about 20 years ago; it bears veffels of 60 tons hunden, and is carried over two rivers, the Merfey and the Itwell. The fough, or adit, which was neceflary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of 6 or 7 tons burden, and forms a kind of fubterraneous river, which runs about a mile and a half under ground, and communicates with the canal. This river leads to the head of the mines, is arched over with brick, and is juft wide enough for the paffages of the boats: at the month of it are two folding doors, which are clofed as foon as you enter, and you then proceed by candle-light, which cafts a livid gloom, ferving only to make darknefs vifible. But this difmal gloom is rendcred tiill more awful by the folemn echo of this fubterraneous water, which returns various and difcordant founds. One while you are flruck with the grating noife of engines, which by a curious contrivance let down the coals into the boats; then again you hear the fhock of an explofion, occafioned by the blowing up the hatd rock, which will not yield to any other force than that of gunpowder; the aext minute your Eorce than $\left.\begin{array}{c}\text { No } \\ \text { No } \\ \hline\end{array}\right)$.
ears are faluted by the fongs of merriment from either I, ancafai fex, who thus beguile their labours in the mine. You Lancant have no fooner reached the head of the works, than a new fcene opens to your view. There you behold men and women almoft in the primitive flate of nature, toiling in different capacities, by the glimmering of a dim taper, fome digging coal out of the bowels of the earth; fome again loading it in little waggons made for the purpofe; others drawing thofe waggons to the boats. To perfect this canal, without impeding the public roads, bridges arc built over it, and where the earth has been raifed to preferve the level, arches are formed under it : but what principally flrikes every beholder, is a work raifed near Barton-bridge, to convey the canal over the river Merfey. This is done by means of three tone arches, fo fpacious and lofty as to admit veffels failing through them; and indeed nothing can be more fingular and pleafing, than to obferve large veffels in full fail under the aqueduct, and at the fame time the duke of Bridgewater's veffle failing over all, near fifty feet abcve the navigable river. By this inland navigation communication has been made with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nuttingham, York, Lancafter, Weftmoreland, Chefter, Stafford, Warwick, Leicetter, Oxford, Worcefter, \&c.

Lancahhire was erected into a county-palatine by Edward III. who conferred it as an appendage on his fon John of Ghaunt, thence called duke of Lancofter: but the duchy contained lands that are not in Lancafhire, and among orher demefnes, the palace of the Savoy, and all that dillrict in London, which indeed belong to it at this day. The revenues of this duchy are ad. minittered by a court which fits at Weftemintter, and a chancery-court at Prefton, which has a feal diftinct from that of the county palatine. The title of Lananfer dillinguifhed the pofterity of John of Ghaunt from thofe of his brother, who fucceeded to the duchy of York, in their long and bloody conteft for the crown of England.-L ancalhire fends two members to parliament for the county ; and 12 for the fix boroughs ot Lancafter, Prelton, Newton, Wigan, Clitheroe, and Liverpool.

LANCASTER, the capital of the county of Lancalhire in England, is pleafantly fituated on the fouth fide of the river Lun, over which th. re is a thandfome Atone-bridge. It is an ancient town, and is fuppofed to have been the Longovicum of the Romans. King John confirmed to the burgeffes all the liberties he had graited to thofe of Briftol ; and Edward III. granted that pleas and feffions fould be held here, and no wherc elfe in the connty. It is governed by a mayor, recorder, 7 aldermen, 2 bailiffs, 12 capital burgeffes, 12 common burgeffes, a town-clerk, and 2 ferjeant at mace. The affizes are held in the caftle, where is alfo the county gaol. It trades to A merica with hardware and woollen manufactures in veffels of 70 tons. There is a market on Wednefday loy grant, and another on Saturday by prefcription, befides one cvery other Wednefday throughout the year for cattle; and three fairs, in May, July, and Uetober. Thc cafle is not large, but neat and Arong. Not very long ago,

## L A N [ 521 ] L A N

in digging a cellar, there were found feveral Roman utenfils and velfels for facrifices, as alfo the coins of Koman emperors; fo that it is fuppofed there was here a Roman fortrefs. On the top of the callle is a fquare tower, called Fobn of Gaunt's cibair, whence therc is a charming profpect of the adjacent country, and efpecially towards the fea, where is an extenfive view even to the Ifle of Man. There is but one church, a fine Gothic building. It is placed on the fame elevation, and from fome points of view forms one group, with the caftle, which gives the mind a mott magnificent idea of this important place. The late confiderable addi. tional new ftreets and a new chapel, with other improvements, give an air of elegance and profperity to the town; and the new bridge of 5 equal elliptical arches, in all 549 feet in length, adds not a little to the embellifhments and conveniency of the place. Adjoining to the caftle, the new gaol is erected on an improved plan. On the fide of the hill below it, hangs a piece of a Roman wall, called Wery woll. Here is a cuttom-houfe. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Darwent, Severn, Humber, Thames, Avon, \&cc. which navigation, includiog its windings, extend above 500 miles in the counties of Lincoln, Nottingham, York, Weftmoreland, Chefter, Stafford, Warwick, Leicefter, Oxford, Worcefler, \&c. For its peculiar government, fee DuchrCourt.

LANCE, Lancea, a fpear; an offenfive weapon worn by the ancient cavaliers, in form of a lialf pike. The lance contifted of three parts, the fhaft or handle, the wings, and the dart. Pliny attributes the invention of lances to the Etolians. But Varro and Aulus Gellius fay the word lance is Spanifh; whence others conclude the ufe of this weapon was borrowed by the people of Italy from the Spaniards. Dicdorus Siculus derives it from the Gaulifh, and Feftus from the Greek dor $x^{n}$, which fignifies the fame.

Lance, in ichthyology. See Ammodytes.
LaNCEOLATED leaf. See Botany, p. $44^{2}$.
LANCET, a chirurgical inftrument, thatp pointed and two-edged, chiefly ufed for opening vtins in the operation of phlebotomy or bleeding; alfo for laying open abfceffes, tumors, \&ic.
L.ANCH, a peculiar fort of long boat, ufed by the French, Spanifh, and Italian hipping, and in general by thofe of other European nations when employed in voyaging in the Mediterranean fea.

A lanch is proportionably longer, lower, and more fiat-bottomed than the long boat; it is by confequence lefs fit for failing, but better calculated for rowing and approaching a flat fhore. Its principal fuperiority to the long-boat, however, confilts in being by its conftuction much fitter to under. run the cable; which is'a very neceffary employment in the harbours of the Levant fea, where the cables of different fhips are faftened acrofs each other, and frequently render this exercife extrenely neceflary.

Lanch, is alfo the movement by which a fhip or boat defcends from the thore, either when fhe is at firft built, or at any time afterwards.

To facilitate the operation of lanching, and prevent any interruption therein, the fhip is fupported hy two frong platforms, laid with a gradual inclination Vo2. IX. Part II.
to the water, on the oppofite fides of her keel; to which they are parallel. Upon the furface of this declivity arc placed two correfponding ranges of planks, which compofe the bafe of a frame called the cradle, whofe upper part envelopes the flip's bottom, whereto it is fecurely attached. Thus the lower furface of the cradle, conforming exactly to that of the frame below, lies flat upon it lengthwife, under the oppotite fides of the flip's bottom ; and as the former is intended to nide downwards upon the latter, carrying the thip along with it, the planes or faces of both are well daubed with foap and tallow.
The neceffary preparations for the lanch being made, all the blocks and wedges, by which the Mip was formerly fupported, are driven nut from under her $k$ cel, till her whole weight gradually fubfides upon the platforms above defcribed, which are accordingly called the ways. The fhores and ftanchions, by which fhe is retained upon the Itocks till the period approaches for lanching, are at length cut away, and the forews applied to move her if neceffary. The motion ufually begins on the inftant when the fores are cut, and the ftip nides downward along the ways, which are generally prolonged under the furface of the water, to a fufficient depth to float her as foon as the arrives at the fartheft end thereof.

When a fhip is to be lanched, the enfign, jack, and pendant, are always hoilted, the laft being difplayed from a faff ereeted in the middle of the fhip.

Ships of the firft rate are commonly conflructed in dry docks, and afterwards floated out, by throwing open the flood gates, and fuffering the tide to enter as foon as they are finimed.

LANCEROTA, one of the Canary illands, fubject to Spain, and fituated in W. Long. 13. 5. N. Lat. 28.40 . It is about 32 miles in length and 22 in breadth. The ancient inhabitants were negroes, very ftrong, active, and fwift of foot. There is a ridge of hills runs quite through it, on which arc fed a good number of theep and geats. They have but few black catcle, ftill fewer camels, and a very few fmall horfes. The valleys are dry and fandy, yet they produce a fmall quantity of wheat and barley. This ifland was firf difcovered in 1417 . In 1546 it was taken by the Englifh under the command of the earl of Cumberland; after which it was better fortified than before. There is in this inland a city called alfo Lancerota, which, at the time the earl of Cumberland was there, confinted only of about 100 houles, all poor buildings, gemerally of one thory, and covered with reeds or flraw laid upon a few rafters, and over all a coat of dirt hardened by the fun. There was alfo a church which had no windows in it, and was fupplied with light only by the door.

LANCIANO, a confidcrable town of Italy, in the kingdom of Naples, and in tbe Hithcr Abruzzo, wirh an archbifhop's fce; famous for its fairs, which are held in July and Auguit. It is feated on the river Feltrino near that of Sangor. E. Long. 15.5 . N. Lat. +2. 12.

LANCISI (John Marca), an eminent Italian phyfician, was born at Rome in 1654 . From his earlieft years he had a turn to natural hifory; and ftudied botany, chemiftry, anatomy, and medicine, with great vigour. In 1688 Pope Inaccent XI. appointed him

## L A N

Lancret his phyfician and private chamberlain, notwithltanding his vicar for the inftallation of doctors in phylic, which

Pope Clement XI. gave him as long as he lived, as well as continued to him the appointments conferred on him by his predeceffor. He died in 1710 , after giving his fine library of more than 20,000 volumes to the hofpital of the Holy Ghoft for the ufe of the public. This noble benefaction was opened in 1716 , in the prefence of the pope and molt of the cardinals. He wrote many works which are efteemed, the principal of which were collected together, and printed at Ge neva in 1718, in two volumes quarto.

LANCRET (Nicholas), a French painter, born at Paris in 1690. He was the difciple of Watteau and Gillot, and painted converlations. He was indefatigable in his profeffion, executed with great truth after Nature, grouped his figures well, and handled a light pencil. He died in 1743 .

LANCRINCK (Profper Henry), a painter of confiderable note, born in 1628 , and educated in the fchool at Antwerp. He tudied principally after $T$ itian and Salvator Rofa; and met with encomagement in England fuitable to his merit. His landfeapes fhow a good invention, good colouring, and harmony : they are chiefly of rough rude country, with broken ground and uncommon fcenery. He gave way too much to pleafure, and died in 1692.
L. AND, in a general lenfe, denotes terra firma, as diftinguifhed from fea.

Land, in a limited fenfe, denotes arable ground. See Agriculture.

Land, in the fea-language, makes part of feveral compound terms; thus, land.laid, or, to lay the land, is juft to lole fight of it. Land-locked, is when land lies all round the thip, fo that no point of the compals is open to the fea. If the is at anchor in fuch a place, the is faid to ride land-locked, and is therefore concluded to ride fafe from the violence of the winds and tides. Land mark, any mountain, rock, fteeple, tree, \&c. that may ferve to make the land known at fea. Land is 乃out in, a term ufed to fignify that another point of land linders the fight of that. from which the fhip came. Land-to, or the fhip lies landto ; that is, the is fo far from fhore, that it can only juft be difcerned. Land-turn is a wind that in almolt all hot countries blows at certain times from the thore in the night. To fet the land; that is, to fee by the compals how it bears.

LAND-Tax, one of the annual taxes raifed upon the fubject. Sce Tax.

The land tax, in its modern thape, has fuperfeded all the former methods of rating either property or perfons in refpect of their property, whether by tenths or fifteenths, fubfidies on land, hydages, fcutages, or talliages; a fhort explication of which will, however, greatly affift us in underftanding our ancient laws and hiftory.

Tenths and fifteenths were temporary aids iffing out of perfonal property, and granted to the king by parliament. They were formerly the real tenth or fifteently part of all the moveables belonging to the fubject; when fuch moveables, or perfonal eftates, were a very different and a much lefs confiderable thing than what they ufually are at this day. Tenths
are faid to have been firft pranted under Henry 11. who took advantage of the faffionable zeal for croifades to introduce this new taxation, in order to defray the expence of a pious expedition to Paleftine, which he really or feemingly had projected againft Sa. ladine emperor of the Saracens, whence it was originall $S$ denominated the Saladine tenth. But afterwards fifteenths were more, ufually granted than tenths. Otiginally the amount of thefe taxes was uncertain, being levied by affeffments new made at every frefh grant of the commons, a commiffion for which is preServed by Matthew Paris: but it was at length reduced to a certainty in the eighth year of Edward III. when, by virtue of the king's commiffion, new taxations were made of cvery townfhip, borough, and ciry in the kingdom, and recorded in the exchequer; which rate was, at the time, the fifteenth part of the value of every townitip, the whole amounting to about 29.000 l . and therefore it ftill kept up the name of a fiftienth, when, by the alteration of the value of moncy and the increafe of perfonal property, things came to be in a very different fituation. So that when, of later years, the commons granted the king a fifteenth, every parifh in England immediately knew their proportion of it ; that is, the fame identical fum that was affeffed by the fame aid in the eighth of Edward III. ; and then raifed it by a rate among themfelves, and returned it into the royal exchequer.

The other ancient levies were in the nature of a modern land tax: for we may trace up the original of that charge as ligh as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in bis army for 40 days in every year. But this perfonal attendance growing troublefome in many refpects, the tenants found means of compounding for it, by firft fending others in their ftead, and in procefs of time by making a pecuniary fatisfaction to the crown in lieu of it. This pecuniary fatisfaction at laft came to be levied by affeffments, at fo much for every knight's fee, under the name of fcutages; which appear to have been levied for the firlt time in the fifth year of Henry II. on accoưnt of his expedition to Touloufe, and were then (Sir Wm. Blackttone apprehends) mere arbitrary compofitions, as the king and the fubject could agree. But this precedent being afterwards abufed into a means of oppreffion (by levying fcutages on the landholders by the king's authority only, whenever ourr kings went to war, in order to hire mercenary troops and pay their contingent expences), it became thereupon a matter of national complaint ; and King John was obliged to promife in his nagna carta, that no fcutage fhould be impofed without the confent of the common council of the realm.

Of the fame nature with fcutages upon knights-fees were the affeffments of hydage upon all other lands, and of talliage upon cities and burghs. But they all gradually feli into difule, upon the introduction of futfidies, about the time of King Richard 11. and King Henry lV. Thefe were a tax, not immediately impofed upon propesty, but upon perfons in refpect of their reputcd eltates, after the nominal rate of 4 s . in the pound for lands, and 2 s .6 d . for goods; and for thote of aliens in a double proportion. But this aftefsment was alfo made according to an ancient valuation;
wherein

## L A N [ 523 ] L A N

Land. wherein the computation was fo very moderate, and the rental of the kingdom was fuppofed to be fo exceeeding low, that one fubfidy of this fort did not, according to Sir Edward Coke, amount to more than 70,000 . whereas a modern land-tax at the fame rate produces two millions. It was anciently the rule never to grant more than one fublidy and two fifteenths at a time: but this sule was broke through for the firft time on a very preffing occafion, the Spanifh invafion in 1588 ; when the parliament gave Queen Elizabeth two fublidies and four fifteenths. Afterwards, as money funk in value, more fubfidies were given; and we have an inftance, in the firlt parliament of $1 \sigma_{4} c$, of the king's deliring 12 fufidies of the commons, to be levied in three years ; which was looked upon as a fartling propofal : though Lord Clarendon tells us, that the fpeaker, ferjeant Glanvile, made it manifeft to the houfe, bow very inconfiderable a fum 12 fubfidies amounted to, by telling them he had computed what he was to pay for them ; and when he named the fum, he being known to be poffeffed of a great eftate, it feemed not worth any farther deliberation. And, indeed, upon calculation, we fhall find, that the toial amount of thefe 12 fubfidies, to be 1 aifed in three years, is lefs than what is now raifed in one year by a land-tax of 2 s . in the pound.

The grant of fcutages, talliages, or fubfilies by the commons, did not extend to fpiritual preferments; thofe being ufually taxed at the fame time by the clergy themfelves in convocation: which grants of the chergy were confirmed in parliament ; otherwife they were illegal, and not binding; as the fame noble writer obferves of the fubfidies granted by the convocation, which continued fitting after the diffolution of the firft parliament in $16+0$. A fubfidy granted by the clergy was after the rate of 4 s . in the pound, according to the valuation of their livings in the king's books; and amounted, Sir Edward Coke tells us, to about 20,000 . While this cuftom continued, convocations were wont to fit as frequently as parliaments: but the laft fubfidies, thus given by the clergy , were thofe confirmed by flatute 15 Car. II. c.. ıo. fince which another method of taxation has gencrally prevailed, which takes in the clergy as well as the lai$t y$ : in recompenfe for which, the beneficed clergy have from that period been allowed to vote at the election of knighis of the Mire ; and thenceforward allo the practice of giving ecclefiaftical fubfidies hath fallen into total difufe.

The lay-fubfidy was ufually raifed by commiffioners appointed by the crown, or the great officers of ftate: and therefore in the beginning of the civil wars between Charles I. and his parliament, the latter, having no other fufficient revenue to fupport themfelves and their meafures, introduced the practice of laying weekly and monthly affeffments of a fpecific fum upon the feveral counties of the kingdom; to be levied by a pound-rate on lands and perfonal eftates: which were occafionally continued during the whole ufurpation, fometimes at the rate of 120,0001 . a month, fometimes at infelior rates. After the Reftoration, the aucient method of granting fubfidies, inftead of fuch monthly affeffments, was twice, and twice only, renewed; viz. in $166_{3}$, when four fubfidies were granted
by the temporality and four by the clergy; and in 1670 , when 800,0001 . was raifed by way of fubfidy, which was the latt time of raifing fupplies in that manner. For the monthly afeffinents being now eftablifhed by cuftom, being raifed by commilfonerz named by parliament, and producing a more certain revenue ; from that time forwards we hear no more of fubfidies, but occafional affeffments were granted as the national emergencies required. Thefe periodical affeffments, the fubfidies which preceded them, and the more ancient Ccutage, hydage, and talliage, were to all intents and purpofes a land-tax; and the affeffinents were fometimes exprefsly called fo. Yet a popular opinion has prevailed, that the land lax was firft introduced in the reign of King William III.; becaufe in the yeas 1692 a new affeffment or valuation of eftates was made throughout the kingdom: which, though by no means a perfeat one, had this effea, that a fupply of 500,0001 . was equal to 1 s . in the pound of the value of eftates given in. And, accord. ing to this enhanced valuation, from the year 1693 to the prefent, a perind of near a century, the land-tax has continued an annual charge upon the fubject; about half the time at 4 s . in the pound, fometimes at 3 s . fometimes at 2 s . twice at is. but without any total intermiffion. The medium has been 3 s .3 d . in the pound; being equivalent to 23 ancient fubfidies, and amounting annually to more than a million and a half of money. The method of railing it is by cliarging a particular fum upon each county, according to the valuation given in, A.D. 1692 ; and this fum is affeffed and raifed upon individuals (their perfonal eftate, as well as real, being liable thereto), by commiffioners appointed in the act, being the principal land holders in the county and their officers.

An act paffes annually for the raifing, in general, $2,03 \%, 627 \mathrm{l} .9$ s. $10 \frac{1}{2} \mathrm{~d}$. by the above faid tax at $q 3$. in the pound; whereof there fhall be raifed in the fe. veral counties in England, according to the proportions expreffed in the aft, $1,989,673 \mathrm{l} .7 \mathrm{~s} .10 \frac{1}{7} \mathrm{~d}$.; and in Scotland, $47,95+1$. Is. 2 d . by an eight months cefs of 5994 l .5 s. $1 \frac{3}{4} \mathrm{~d}$. per menfem, to be raifed out of the land-rent, and to be paid at four terms, as fecified in the act, by two months amount each time.

LaND. Waiter, an officer of the cuitom-houfe, whofe duty is, upon landing any merchandife, to examine, tafte, weigh, meafure thern, \&c. and to take an account thereof. In fome ports they alfo execute the office of a coaft-waiter. Thiey are likewife occafionally Ityled fearchors, and are to attend and join with the patent fearcher in the execution of all cockets for the fhipping of goods to be exported to foreign parts ; and in cafes where drawbacks on bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent fearchers, are to certify the fripping thereof on the debentures.

LANDAFF, a town or village of Glamorganfhire in South Wales, with a bifhop's fee, and on that account has the title of a city. It is feated upon an afcent on the river Tafl, or Tave, near Cardiff; but the cathedral ftands on a low ground, and is a large flately building. The original flructure was built about the beginning of the izth century. The building now ufed as the cathedral includes part of the $3 \mathrm{U}_{2}$
body

## L A N [ 524 ] L A N

Landuu body of the ancient one; but is in other relpects as Thomas Simpfon of Worlwich, a circumfance which modern as the prefent century, about the middle of which the old church underwent fuch reparation as was almol equivalent to rebuilding. The rains are at the weft end of the modem cluurch, and confit of the original wellern door-way, and part of the north and fouth lides. The arch over the door is circular, and has a well carved epifcopal batue immediatcly overit. On the upper part of the front under which this door ftands is a whole length figure of the Virgin Mary, with a crofs on the apex of the building. In this front are two rows of neat-pointed arches for windows; and on the worth and fouth lides above men. tioned are two circular door cales half funk in the earth. Thefe uins exhibit an afpect very different from the prefeni cathedral, the new part of which the architect formed principally on the Roman model, without confidering how incongruous this fyle of architecture is with the plan purfued in the ancient part.-Landaff is a place of but fmall extent, and has no market. It is a port town, however, and carries on a grod trade, as it has a very tolerable harbour that opens intu the Severn river about four miles diftant. 'Ile tuins of the hifhop's palace flow it to have been coftellated. It was built in 1120, and was deftroyed by Henry IV. W. Loug. 3. 20. N. Lat. 51.33.

LANDAU, an ancient, handfome, and very ftrong town of France, in Lower Alface. It was formerly imperial, and belonged to Germany, till the treaty of Munfter, when it was given up to France. It is feated on the river Zurich, in a pleafant fertile country. E. Long. 8. 12. N. Lat. 49. 12.

LANDEN, a town of the Auftrian Netherlands, in Brabant, famous for a battle gained over the French by the allies, in July 1693 , when 20,000 noen were killed. It is feated on the river Beck, in E. Lon 5.5 . N. Lat. 5e. 45 .

LANDEN (JOHN, F. R.S.) an eminent mathematician, was born at Peakirk, near Petcrborough in Northamptonthire, in January 1719 . He became very early a proficient in the mathematics, for we find him a very refpectable contributor to the Ladies Diary in 1744; and he was foon among the foremolt of thofe who then contributed to the fupport of that fmall but valuable publication, in which almolt every Englifh mathematician, who has arrived at any degree of eminence for the lalt half century, has contended for fame at one sime of his life or other. Mr Landen continued his contributions to it at times, and under one fignature or other, till within a few years of his death.

It has been frequently obferved, that the hiftories of literary men confilt chiefly of an hifory of their writings, and the obfervation was never more fully verified than it will be in this article concerning Mr Landen.

In the 4 ith volume of the Philofophical Tranlactions for the year 1754, Mr Landen gave "An invelligation of Come theorems which fuggeit feveral very remarkable properties of the circle, and are at the fame time of confiderable ufe in refolving fractions, the denominators of which are certain multinomicils into more fimple ones, and by that means facilitate the computation of fluents." This ingeninus paper was handed to the Society by that eminent mathematician the late
will convey to thofe who are not themfelves judges of it fome idea of its merit. In the year 1755 , he publifhed a volume of about 160 pages, intitled "Mathematical Lucubrations." The title to this publication was made choice of as a means of informing the world, that the fludy of the mathematics was at that time rather the purfuit of his leifure hours than his principal employment; and indsed it continued to be fo the greatelt part of his life, for about the year 1762 he was appointed agent to the right honourable the earl Fitzwilliam, and refigned that employment only two years betore his death. Had it been otherwife, it feems highly probable he would have extended his refearches in the mathenatics, to which he was molt enthuliaftically devoted. much farther than any other perfon has done. His lucubrations contain a variety of tracts relative to the rectification of curve lines, the funmation of feries, the finding of fluents, and many other points in the higher parts of the mathemarics. About the latter end of the year 1757 , or the beginning of $\mathbf{1 7 5 8}$, he publifhed propofals for printing by fubfeription "The Retidual A nalyfis, a new branch of the Atgebraic art :" and in $175^{\circ}$ he publifhed a fimall tract in quarto, intitled "A Difcourfe on the Retidual Analytis," in which he refolved a variety of problems, to which the method of fluxions had been ufually applied by a mode of reafoning entirely new ; compared thofe folutions with folutions of the fame problems, inveltigated by the fluxionary method; and flowed that the folutions by his new method were, in general, more natural and elegant than the fluxionary ones.

In the 51 it volume of the Philofophical Tranfactions for the year 1760, he gave "A new method of computing the fums of a great number of inlinite feries." This paper was alfo prefented to the fociety by his ingenious friend the late Mr Thomas Simpfon. In 1764, he publifhed the firft bonk of "The Refidual Analyfis," in a to volume of 218 pares, with feveral copperplates. In this treatife, belides explaining the principles which his now analylis was founded on, he applied it to drawing tangents and finding the properties of curve-lines; to deferibing their involutes and evolutes, hinding the radius of curvature, their greatell and lalt ordinates, and points of contrary Huxure; to the determination of their cafps, and the drawing of affymptotes: and he propoled in a fecond book to extend the application of this new analytis to a great variety of mechanical and plyfical fubjects. The papers which were to have formed this book lay long by him; but he never found leifure to put them in order for the prefs.

On the 16 th of January $1766,-\mathrm{Mr}$ Landen was elected a fellow of the Royal Society, and admitted on the 24 th of April following. In the 5 Sth volume of the Philofophical Tranfactions for the year 1768 , he gave a "Specimen of a new method of comparing curvilineal areas ; by means of which many areas did not appear to be comparable by any other method;" a circuinftance of no fmall importance in that part of natural philofophy which relates to the doctine of motion. In the Guth volume of the fame work for the year 1770, he gave "Some new theorems for

## I. A N [ 525 ] L A N

computing the whole areas of curve lines, where the ordinates are expreffed by fractions of a certain form," in a more concife and elegant mamer than had been done hy Cotes, De Moivre, and others who had confidered the fuhject before him. In the Gat volume for 1771 , he has invetligated feveral new and ufeful theorems for computing certain thents, which are affignable by arc, of the conic fections. This fubject had been conlidered befure boih by Mr Maclaurn and Mr 1)'Alembert; but fome of the theosems which were given by thele colebrated mathematiciaus, being in part expreffed by the difference between an arc of an liyperbola and its tangent, and that difference being not directly attainable when the are and its tangeni both become ininite, as they will do when the whole fluid is wanted, although fuch fluent be finite; thefe theorems therefore fail in thofe cafes, and the computation becomes impracticable without farther help. This defec: Mr Landen has removed by alfigning the limit of the difference between the hyperbolic arc and its tangent, while the point of conract is fuppofed to be remuved to an infinite diflance from the vertex of the curve. And he conciudes the paper with a curious and remarkable property telating to pendulous bodies, which is deducible from thofe theorems. In the fame year he publined, "Animat. veifions on Dr Stewart's computation of the fun's dillance from the carth."

In the 65 th volume of the Plitofophical Tranfactions for 1775 , he gave the investization of a general thearem, which he had promifed in $17, \mathrm{r}$, for finding the Icregth of any-a:c of a conic hyperbola by means of twe elliptic arcs : and obferves, that by the theorems there inveltigated, both the elatic curve and the curve of equable recefs from a given point, may be conflrueted in thofe cales where Mr Maclaurin's elegant meth d fails. In the 67th volume for $17: 7$, he gave "A new theory of the motion of badits revolvirg about an axis in free fact, when that motion is dif. tubed by lome extrancous force, either percuifive or ascelcrative." At this time he did not know that the fubject had been hancled by any perfon before hion; and he confidered only the motion of a fphere's fpheroid and cylinder. The publication of this paper, however, was the caufe of his being told, that the ductrine of rotatory motion had been confidered hy M. D'Alembert: and purchating that author's Opufcules Mothematiques, he there learned that M. D'Alembert was not the only one who had confidered the matter before him; for M. D'Alembert there fpeaks of fome mathematician, though he does sut mention his name, who, after reading what had been written on the fubject, duubted whether there be any folid whatever, befide the fuhere, in which any line, paffing through its centre of gravity, will he a permanent axis of rotation. In confeg!ence of this, Mr Landen two's up the fubject again; and though he did not then give a folution to the general problcm, siiz, "To determine the mutions of a boajy of any form whatevcr, revolving without rellraint about any axis pafling though its centre of gravity," he fully removed eviry dount of the kind which had heen farted by the pirfon allused to by M. D'Alembert, and pointed out Exveral bodies, which, under certain dimentions, have that remakable propesty. This paper is given, among many, others
equally curions, in a volume of Memoirs which he publithed in the year 1780 . Dut what renders that volame yet more valuable, is a very extenfive appendix, containing "Theorems for the calculation of fuents." The tables which contain the fe thcorens are more complete and extenfive than any which are to be found in any other author, and are chiefly of his own inveitigaing; being fuch as had occurred to him in the courfe of 8 long and clufe application to mathematical ftudies in almoll every branch of thofe feiences. In 1781,1782 , and 1783 , he publifhed thee litule tracts on the furmation of converging feries, in which he ex. platied and thowed the extent of fome theorems which had been given fur that purpofe by M. de Moivre, Mr Sterlines, atad his old fricnd Thomas Sumpion, in anfwet to tome things which he thought hat been witizen to the difparigement of thofe excellent mathematiciaus. It was the opinion of fome, that Mr Landen did not thos !ef mathematacal fill in explaining and illulkrating thete theorems, than he has done in his writings on oriyinal fubjects; and that the authors of them were as little aware of the extent of theiuwn theoreras as the reft of the world were before Mr Landen's ingenuity made it ubvious to all.

About the beginning of the year 1782. Mr Landen had made luch improvements in his theory of rotatory motion, as cnabled him, be inought, to give a folution of the general problem fecified above; but finding the refult of it to differ very materially from the refule of the fulution which had been given of it by $M$ D'Alembert, and being not able to fee clearly where that gentleman had eried, he did not venture to make his own folution public. In the courfe of that year, having procured the Memoirs of the Berlin Academy for 1757, which contain M. Enler's folution of the problem, he fonnd that this gentleman's folution gave the fame refult ds nad heen deduced by MI. D'Alembert; but the perfpicuity of M. Euler's imaner of wrating enabled fun to difcover where he had erred, which the obicurity of the other did not do. The agreement, however, of two writers of fach eftablifhed reputaion as M. Euler and M. D'Alembert made him tony dubious of the tuth ot his uwn folution, and induced him to revife the proceis again and argan witl the utmolt citcumfpection; and being every time more convinced that his own folution was right and theirs wrong, he at length gave it to the public in the 75 th volume of the Photophical Pranactions for 1785 .

The extreme difficulty of the ;ubjea, joined to the concife mamer in which Mr Landen had been obliged to give his folution in order to confine it within proper limits for the Tranactions, rendered it too difficult, or at leait too laborious, a piece of bufinefs for moit mathematicians to read it ; and this circumitance, joined to the ellablifned reputation of Fuler, induced many to think that his Sulution was right and Mr Landen's wrong; and there did not want attempts to prove it. But nutwithfan ting theie attempts were manifelty wrong, and that every one who perufed then faw it, they convinced Mr Laiden that there was a neceffity for giving his folition at greater length, in order to render it more generally underitood. About this time alio he met ty chance with the late P. Friti's Cofmographis Ploysica et IItuthentatia; in the iecund part of which there is a folution of thas problem, agreeing in

## L A N

Landen the refult with thofe of M. Euler and D'Alembert, which is not furprifing, as P . Frifi employs the fame priaciple that they did. Here Mr Landen learned that M. Euler had revifed the folution which he had given formerly in the Berlin Memoirs, and given it another form and at greater length in a volume publithed at Gryphifwell in 1765 , intitled, Theoria Motus corporum folidorum feut rigidorum. Having therefore procured this book, Mr Landen found the fame principles employed in it, and of courfe the fame conclufion refulting from them that he had found in M. Euler's former folution of the probiems: but as the reafoning was given at greater length, he was enabled to fee more dittinctly how M. Euler had been led into the mitake, and to fet that miftake in a ftronger point of view. As he had been convinced of the neceffity of explaining his iceas on the fubject more fully, fo he now found it neceffary to lofe ne time in fetting about it. He had for feveral years been Ceverely afllicted with the fone in the bladder, and toward the latter part of his life to fuch a degree as to be confined to his bed for more than a month at a time: yet even this dreadful diforder did not abate his ardour for mathematical fudies; for the fecond volume of his Memoirs, juft now publifhed, was written and revifed during the intervals of his diforder. This volume, befide a folution of the general problem concerning rotatory motion, contains the refolution of the problem concerwing the motion of a top; an inveftigation of the motion of the equinoxes, in which Mr Landen has firtt of any one pointed out the caufe of Sir Ifaac Newton's miflake in his folution of this celebrated problem; and fune other papers of confiderable importance. He juit lived to fre this work finifhed, and received a copy of it the day before his death, which happened on the 15 th of January 1790 , at Milton, near Peterborough, in the filf year of his age.

LANDERNEAU, a town of France, in Lower Bretagne, feated on the river Elboro, 20 miles eaft of Breft. In an inn here is a well which ebbs and flows like the fea, but at contrary times. E. Long. 4. 13. N. Lat. 48.25 .

LANDGRAVE (formed of the German land " earth," and graff or grave, " judge" or "count"); a name formerly given to thofe who executed juttice in behalf of the emperors, with regard to the internal pulicy of the country. The title does not feem to have been ufed before the it th century. Thefe judges were firl appointed within a certain diftrict of Germany: in procefs of time the title became hereditary, and thefe judges affiumed the fovereignty of the feveral diltricts or countries over which they prefided. Landgrave is now applied by way of eminence to thofe fovereign princes of the empire who poffefs by inhcritance certain eftates called landgravates, and of which they receive the invefliture of the emperor. There are four princes who have this title, viz. thofe of Thuringia, Heffia, Alface, and Leuchtenberg. There are allo other landgraves who are not princes but counts of the empire. See Count.

LANDGRAVIATE, or Landgratate, the office, authority, jurifdiction, or territory, of a landgrave.

LANDGUARD-fort feems to belong to Suffolk, but is in the limits of Effex, and has a fine profpect of
the coafts of both counties. It was erected, and is L a maintained, for the defence of the port of Harwich over againft it ; for it commands the entry of it from the fea up the Maning-tree water, and will reach any Thip that goes in or out. It is placed on a point of land fo furrounded with the fea at high-water, that it looks like a little ifland at leaft one mile from the fhore. The making its foundation folid enough for fo good a fortification colt many years labour and a prodiginus expence. It was built in the reign of King James I. when it was a much more confiderable fortification than now, having four baftions mounted with 60 very large guns, particularly thofe on the royal baftion, which would throw a 28 pound ball over Harwich. Here is a fmall garrifon, with a governor, and a platform of guns. This fort is refitted and greatly enlarged for the conveniency of the officers of ordnance, engineers, and matroffes; and a barrack built for the foldiers.

Landisfarn, or Lindesfarn. See HolrIfland.
LANDRECY, a town of the Irench Netherlands in Hainault, ceded to France by the treaty of the Pyrenecs, and is now very well fortified. It was befieged by Prince Eugene in 1712, but to no purpofe. It is feated un a plain on the river Sambre, in E. Long. 3.47. N. Lat. 50. $4 \cdot$

LANDSCAPE, in painting, the view or profpect of a country extended as far as the eye will reach. See Painting, n'u. and 22.; and Drawing, Sect. 10.

LANDSCROON, a fea-port town of Sweden, in South Gothland, and territory of Schonen, feated on the Baltic Sea, within the Sound, 22 miles north of Copenhagen. E. Long. 14.20. N. Lat. 55-42.

LANDSDOWN, a place in Somerfethire, near Bath, with a fair on Ostober soth for cattle and cheefe.

LANDSHUT, a ftrong town of Germany in Lower Bavaria, with a frong caftle on an adjacent hill. It is feated on the river Ifer, in E. Long. 1. 15 . N. Lat. 48. 23. There is another fmall town of the fame name in Silefia, and in the duchy of Schweidnitz, feated on the river Zieder, which falls into the Bauber: and there is alfo another in Moravia, feated on the river Morave, on the contines of Hungary and Aullria.
LANDSKIP. See Landscafe.
LANERKSHIRE, a county of Scotland, called alfo Clydefdale, from the river Clyde, by which it is watered. It is bounded on the north by the couniy of Dumbarton ; on the ealt by Stirling, Linlithgow, Edinburgh, and Peebles, thires; on the fouth by Dumfries; and on the welt by Ayr and Renfrew flires. Its extent from north to fouth is about 40 miles, from eaft to weft 36 .-The river Clyde, defcending fron s: the fouthern part of this county, divides it into two lin almoft equal paits; and after a courfe of about $50^{31}$ miles, meets the tide a little below Glafgow: (fiee Glasgow). Proceeding up the river from Glafgow, the country is rich and well cultivated. Bothwe! cafle, now in ruins, ftands on an eminence which overlooks the Clyde. Some of its walls are fill remaining, which meafure 15 feet in thicknefs and 60 feet in height. This vaft fabric was once the abode of a man the moft notorioufly marked of any in the annals of Scot-

## L A N [ 527 L A N

- Scotland for the audacity and fplendor of his crimes. Between this caftle and the priory of Blantyre on the oppolite fide of the Clyde, there is faid to have been in ancient times a fubterrancous paffage under the river. A little ahove flands Bothwell-bridge, noted for the defeat of the Covenanters by the duke of Monmouth in 1679 . - Eaf from Bothwell caltle, in an elevated firuation, flands the Kirk of Shots, amid a wild and barren country. This dreary wafte is covered with heath: and though a bigh fituation, is fiat, and very marhy in many places. It is chiefly employed as fheep-walks; and notwithftanding the vicinity of coal and lime, feems farce capable of cultivation. This want is, however, compenfated by the abundance of iron-ftone and coal, which are here brought together by the hand of nature. Nor is this advantage confined to the barren tract in the north-eaf corner of the fire. The whole county abournds with thefe valuable minerals; and two iron works are erected on the banks of the Clyde, one a little above Glafgow and another at Cleland near Hamilton. But the molt confiderable work of this kind in the county is that of Clcugh, a few miles fouth eaft from the Kink of Shots. A village is here built for the accommodation of the warkmen. It is called Wilfontown from the name of the proprietors. - The fmall borough of Lanerk is fituated on the brow of a hill, on the north-eall fide of the Clyde, commanding a fine profpect over the river. In this neiglabourhood are fome of the greatelt cotton manufactorics in Scotland. The Clyde near this place runs for feveral miles between high rocks covered with wood; and in its courfe exhibits many allonifhing cataracts: (fee the article Clyde). - From Lanerk, paffing the village of Cartairs, a few miles to the ealt we meet the fmall town of Carnwath. In this neigh. bourhood, and along the Clyde to the fouth-eaft, there is much cultivation and rich pafture. - To the fouth of Carnwath is the town of Biggar ; where is feen the ruin of a collegiate church founded in 1545 . -The lands about the villages of Coulter and Lammington are fertile; but farther up the Clyde we meet with nothing but Cheep-walks and pafture-grounds in tracing it to its fource.

In the fouthern part of the thise, generally called Clydefuale, the country is not lefs wild. Among the mountains here, or sather in a hollow near their fummit, we meet with the village of Leadhills, by fome faid to be the higheft human habitation in the ifland of Gieat Britain. Here, however, refide many hundreds of miners with their families. Thefe miners, though in a great meafure excluded from fociety by their fituation, yet not only find means to procure a comfortable fubfilkence, but alfo pay more attention to the cultivation of the mind than many of their countrymen fituated feemingly in more favourable circumfances for the attainnent of knowledge. As an evidence of this, they are very intelligent, and have prosided a circulating libiary for the inftruction and amufement of the little community belonging to the village.- Amid thefe mountains particles of gold have fometimes been found wathed down by the rains and ftreams of water: but this defert tract is chiefly vaInable for producing metals of inferior worth. "Nothing (fays Mr Pennant) can equal the gloomy appear-
ance of the country round. Neither tree, nor fhrub, nor verdure, nor pieturefque rock, appear to amufe the eye. The fpectator mult plange into the bowels of thefe mountains for entertainment." The vcins of lead lie moflly north and fouth; and their thicknefs, which feldom exceeds 40 feet, varies greatly in different parts. Some have been found filled with ore within two fathoms of the furface; others fink to the depth of 90 fathoms. The earl of Hopeton, the proprietor, has in his poffeffon a folid mafs of lead ore from thefe mines weighing five tons. His lordhip has alfo, it is faid. a picce of tative gold that weighs two ounces, which was found here. The lead finelted at this place is all fent to Leith, where it has the privilege of being exported free of duty. The fcanty pafture afforded by this barren region feeds fome fheep and cattle ; but thofe in the neighbourhood of the mines fometimes perifh by drinking of the water in which the lead ore has bean wafhed: for the lead-ore communicates a deleterious quality to the water, though that liquid acquires no hurtful taint from remaining in leaden pipes or cilterns. North from this mountainous region lies Crawfordmuir.

About nine miles north of Leadhills, on the ealt fide of the fmall river Douglas, which falls into the Clyde a few miles below. Itands Douglas caftle, for many ages the refidence of the fecond family in Scotland. A modern building has been erected on the fame fite, in imitation of the ancient caftle. Near it fands the town of Douglas. A few miles to the north-eaft is Tinto, a remarkable conic mountain, round the bafe of which the Clyde makes a noble fweep. Weftward, beyond Douglas, the fmall river Netham defiends into the Clyde through the pupulous parith of Lifmahago.-Hamilton houfe, the feat of the duke of Hamilton, flands in a plain between the rivers Clyde and Avon. It is a magnificent Aructure, furrounded by many venerable oaks. In the vicinity is the town of Hamilton, which contains many handfome houfes: (fee Hamilton). Here are feen the ruins of a collegiate church, founded in 1451. At a little diftance from Hamilton-houfe is an elegant appendage to it called Chatslberault, the name of the aucient poffeffions held by the family in France. This building is feated on the river Avon, and is furrounded by woods and deep dells, and every rural beauty that can produce a pleaing effect on the imagination. - On the weft of Hamilton is the little town of Kilbride; and to the fouth that of Strathavon, furrounded by the fertile tract from which it derives its name. In our way from Hamilton to Glafgow we meet with the ancient borough of Rutherglen, inhatited chiefly by weavers and other manufacturers: and the village of Govan flands on the fame fide of the river on the road from Glafgow to Reifrew.
L.ANESBOROUGH, a town of Ireland, fituated in the county of Longford and province of Leintter. It is a borough, and returns two members to parliament; patronage in the Dillon family. This place is fituated on the river Shannon, 62 miles from Dublin; and has a barrack for a troop of horfe. There is a yearly fair here in February. The town gave tiale of vifcount to the family of Lane, and now gives title of earl to that of Butler. There is a bridge over the Shannon

Lanfranc Shannon at Lanefborough into the county Rofcom$I I$ mon. N. Lat. 53. 40. W. Long. 8. 6.
$\underbrace{\text { Langeland. }}{ }^{\text {mon. }}$ LANFRANC, an Italian, born at Pavia, became arclibifhop of Canterbury in 1070. He difputed againft Berengarius in the council held at Rome in 1059 , and wrote again't him concerning the real prefence in the eucharift. He had other difputes, \&c. and died in ro8g.
Lanfranc (John), an eminent Italian hiltory painter, born at Parma in 1581 . He was firt the difciple of Augutin Caracci; and, after his death, of Hannibal, whofe talle in defign and colouring he fo happily attained, that he was intrufted to execute fome of his defigns in the Farnefian palace at Rume. Thefe be finified in fo mafterly a manner, that the difference is imperceptible to this day between bis work and that of his mafter. His genius directed him to grand compofitions, which he bad a peculiar facility in deligning and in painting either in frefco or in oil: he did indeed afpire to the grace of Correggio, but could never arrive at his excellence; his greateft power being manifefted in compofition and fore-fhortening. He was deficient in correctnefs and expreffion; and his colouring, though fometimes admirable, was frequently too dark. By order of Pope Urban VllI. he painted in St Peter's church at Rome the reprefentation of that faint walking on the water, which afforded the pope fo much fatisfacion that he knighted him. He died in 1647 .
LANGBAINE (Gerard), D. D. a learned EngJifh writer, was born in 1608 . He was educated at Queen's-collcge, Oxfort'; and became keeper of the archives of that univerfity, provoft of bis college, and doctor of divinity. He was highly efteemed by archbithop UTher, Selden, and feveral other learned men; and died in 1657.8 . He publifhed, 1. An edition of Longinus, in Greek and Latin, with notes. 2, A review of the corenant; and other works.

Langeane, (Gerard), an eminent writer, the fon of the former, was born in 1656 . He was put apprentice to Mr Symonds, bookfeller in St Paul's church-yard: but was foon after ealled from thence by his mother upon the death of his eldeft brother, and by her entered a gentleman-commoner of Univer-fity-college, Oxford, in 1672. Here he run out a good part of his eftate; but afterwards corrected his manner of living, and for fome years lived in retirement near Oxford. During this time he improved his tafle for dramatic poetry; and at firt wrote fome fnall pieces without his name, but afterwards pub. lifhed feveral works which be publicly owned. In 1690 he was elected inferior beadle of arts in the univerfity of Oxford; and, in January following, was chofen fuperior beadle of law, but died foon after in 1092. He wrote, I. The hunter, a difcourfe on huriemanhip. 2. A new catalogue of Englifh plays, with their beft editions, and divers remarks on the originals of moft plays, and on the plagiaries of feveral authors. 3. An account of the Englifh dramatic poets.

LANGEI.AND (Robert), an old Englifh poct of the 1 th century, and one of the firle difciples of Wicklife the reformer. He is faid to have been born in: Shrophiire, tut we bave no account of his family. 2Ie arote The vifions of Pitrce Plozuman; a piece $\mathrm{N}^{1}{ }^{17+}$.
which abounds with imagination and humour, though Laz dreffed to great difadvantage in very uncouth verlification and obfolete language. It is written without rbyme, an ornament which the poet has endeavoured to fupply by making every verfe begin with the fame letter. Dr Hickes obferves, that this kind of alliterative verfification was adopted by Langeland from the practice of the Saxon poets, and that thefe vifions abound with Saxonifms: he fyles him celeberrimus ille fatirographus, morum vindex acerrimus, \&cc. Chaucer and Spencer have attempted imitations of his vifions, and the learned Selden mentions him with honour.

Langeland, an ifland of Denmark in the Baltic fea, in the ftrait called the great belt, and between Zealand, Saland, and Fyonia. It produces plenty of corn, and the principal town is Rutcoping. E. Long. 1t. IO. N. Lat. 55. O.
LANGETZ, a town of France in Touraine, noted for its excellent melons. It is feated on the river Loire, in E. Long. J. 23. N. Lat. 42. 20.

LANGHORNE (John), D. D. was born at Kirkby-Stephen in Weftmoreland. His father was the reverend Jofeph Langhorne of Winiton, who died when his Con was young. After entering into holy orders, he became tutor to the fons of Mr Cracroft, a Lincolnfhire gentleman, whofe daughter he married. This lady in a thort time died: and the lufs of her was very pathetically lamented by her hufband in a monody; and by another gentieman, Mr Cartwright, in a poem intitled "Conftantia." Dr Langhorne held the living of Blagden in Somerfet fhire at the time of his death, which happened April 1. 1779. He was the author of feveral literary productions; amonglt others, of Poems in 2 vols, 1766 ; Sermons in 2 vols, 1773 ; Effufions of Fancy, 2 vols; Theodofius and Conftantia, 2 vols; Solyman and Almena ; Frederick and Pharamend, or the Confolations of Human Life, 1769 ; a Differtation on the Eloquence of the Pulpit; and another on Religious Retirement; and he was editor of the Works of St Evremond, of the Poems of Collins, and fome other articles.

LANGIONA, a large, rich, and frong town of Afla, capital of the kingdom of Laos, with a large and magnificent palace where the king refides. E. Long. 96. 45. N. Lat. 22. $3^{8 .}$

LANGOBARDI, a people of Germany fituated between the Elbe and the Oder, in the Marche of Brandenburg, whom their paucity ennobled; in regard that being encompaffed by many and powerful nations they preferved themfelves, not fo much by fubmiffion, as by dint of arms and encountering dangers, (Tacitus).

LANGPORT, in Somerfethire, 132 miles from London, is a well-frequented town on the Parrot, between Bridgewater and Crewkern. It fent members to three parliaments, and is governed by a portreeve and a recorder. Here are lighters conftantly fetch, ing coals, \&c, from Bridgewater; and it is a tage for the Taunton waggon, which drops the goods here from London to be carried farther by water. Eels are taken in valt plenty out of the holes of the banks of the river in frofly weather. The market here is on Saturday, and there are four fairs in the year.
L.ANGREL-s нот, at fea, that confifting of two bars of iron joined by a chain or flackle, and having

## L A N [ 520 ] L A N

res haif a bail of iron fixed on each end ; by means of which apparatus it does great execution among the enemy's rigeing.
LANGRES, an ancient and confiderable town of France in Champagne, with a bilhop's fee. The entlery wares made liere are in high efteem. It is feated on a mountain near the river Mearne, in E. Long. 4. 24. N. Lat. 47. 52 .

LANGTON (Stephen), was born in England, but educated at Paris, and was greatly eftcemed for his learning by the king and nobility of France. He was chancellor of Paris, a cardinal of Rome, and in the reign of king John was made archbihop of Canterbury by Pope Innocent III. in oppofition both to the monks of Canterbury and to the king. I.angton was one of the molt illutrious men of his age for learning; and continued arclibihop 22 years, dying in 1228. A catalogue of his books is given by Bale and Tanner.
LANGUAGE, in the proper fenfe of the word, tion. firnifies the expreffion of our ideas and their various relatiens by certain articulate founds, which are ufed as the figns of thofe ideas and relations. By articulate founds are meant thofe modulations of fimple voice, or of found emitted flom the thorax, which are formed by meane of the mouth and its feveral organs, the teeth, the tongue, the lips. and the palate. In a more general fenfe the word language is fometimes uff to denote all founds by which animals of any kind exprefs their particular feelings and impulfes in a manner that is intelligible to their own fpecies.
Nature has endowed every animal with powers fufficient to make known sill thofe of its fenfations and defires, with which it is neceflary, for the prefervation of the individual or the continnance of the kind, that others of the fame fिecies fhould be acquainted. For this purpofe, the organs of ali vocal animals are fo formed, as, upon any particular impulfe, to utter founds, of which thofe of the fame fpecies inftinctively know the meaning. The fummons of the hen is inflantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a fimilar mode of communication may be obferved between the parents and the offspring, and between one animal and its cuftomary affociate. But it is not among animals of the fame fpecies only that thefe inllinctive founds are mutually underflood. It is as neceffary for animals to know the voices of their enemies as the voices of their friends; and the roaring fron of the lion is a found of which, previous to all expe tine rience, every beaft of the foreft is naturally afraid. ies of Between thefe animal voices and the language of men there is however very little analogy. Human language is capable of expreffing ideas and notions, which there is every reafon to believe that the brutal mind cannot conceive. "Speech (fays Arifotle) is made to indicate what is expedient and what inexpedient, and in confequence of this what is jult and unjuft. It is therefore given to men; becaute it is peculiar to them that of good and evil, juft and unjut, they only (with refpect to other animals) poffefs a fenfe or fecling." The voices of brutes feem intended by nature to exprefs, not diflinct idtas or moral modes, but only fuch feelings as it is for the good of the fpecies that they fhould have the power of making known; and in this, as in all other refpects, thefe vrices are analogous; not to our fpeaking, but to our weeping,
laughing, finging, groaning, fcreaming, and other Langunges natural and audible expreffions of appetite and paffion. -A Another difference between the language of men and the voices of trute animals confifts in articulation, by which the forner may be refolved into diftinet elementary founds or fyllables; whereas the latter, being for the mofl part unarticulated, is not capahle of fuch a refolution. Hence Honer and Hefiod characterize man by the epithet $\mu=5$ gow, or "voice dividing." as denoting a power peculiar to the human fpecies: for though there are a few birds $\dagger$ which utter founds that $\dagger$ The parto
 utters but one fuch found, which feems to be employed Incia bird rather as notes of natural mufic than for the purpofe called cock ko of giving information to others; for when the bird is $* 0, \& c$. agitated, it utters cries which are very different, and have no articulation. - A third difference between Not fron the language of men and the fignificant cries of brute nature or animals, is, that the fomer is from art and the latter infinc, but from nature. Every human language islearned by imitation, and is intelligible only to thofe who either intabit the country where it is vernacular, or have been taught it by a maller or by books: but the voices in queltion are not la arned by imitation; and being wholly inflinctive, the $y$ are intelligible to all the animals of that fpecies by which they are uttered, though brought together from the mof diftant countries on earth. That a dog, which had never hard another bark, would notwith. Itanding bark himfeif, and that the barkinga or yelps of a Lapland dog would be inflinctively underflood by the dogs of Spain, Calabria, or any other country, are facts which admit not of doubt : but there is no reafun to imagine that a man who had never heard any language fpoken would himfelf fpeak; and it is well known that the language fpoken in one cuuntry is unintelligible to the natives of another country where a differenc language is fpoken. Herodotus indeed records a fact which, could it be depended upon, wonld tend to uverturn this reafoning, as it infera a natural relation between ideas and certain articulate founds. He tells us, that Pfammetichus king of Egypt, in order to difcover which was the oldeft language, caufed two children, newly born of poor parents, to be brought up by a Thepherd among his cattle, with a frict injunction that they fhould never hear a human voice; and that at the end of two years the children pronounced at the fame time the word $\beta_{5 \times x \times 5}$, which in the Phrygian language fignified tread. Either this is one of the many fables which that credulous hiftorian collected among the Egrptians, or the conduct and reafoning of Pfammetichus were very abfurd; for it is added, that from this circumflance he inferred that the Phrygians were the moft ancient people, and that they fpoke the primitive language. The only rational purpofe for which fuch an experiment could be inflituted, would be to difcover, not which is the oldea or the lateft language, but whether there be fuch a thing as a language of nature or inftinct : but in fuch a language it is obvions that there could be no word to denote bread, becaufe in what is calied the fate of nature bread is unknown. The experiment of Pfammetichus was probably never made; but in the woods of different countries folitary favages have at different times been caught, who, though they apparently pofferfed all the fagacity which is natural to man, and though

## L A N

tanguace. their organs both of hearing and of fpeech were pcrfect, never ufed articulate founds as figns of fenfations or ideas. They uttered indeed the inarticulate cries which are inftinctively exprefive of pleafure and pain, of joy and forrow, more dittinctly and forcibly than men civilized ; but with refpect to the very rudiments of language, they were what Horace repreients all mankind to have been originaily, 一mutum et turpe pectus. Indeed it feems to be obvions, that were there any inIt inctive language, the firt words uttered by all childien would be the fame; and that every child, whether born in the defert or in fociety, would underfland the language of every other child however educated or however neglected. Nay more, we may veature to affirm, that fuch a language, though its general ufe might, in fociety, be fuperfeded by the prevailing dialect of art, could never be wholly loft; and that no man of one country would find it difficult, far leis impoffible, to communicate the knowledge of his natural and moft preffing wants to the men of any other country, whether barbarous or civilized. The exercife of cultivated reafon, and the arts of civil life, have indeed eradieated many of our original inftinets, but they have not eradicated them all: (fee Instinct.) There are external indications of the internal feelings and defires, which appear in the mot polifhed fociety, and which are confeffedly inftinctive. The pafluns, emotions, fenfations, and appetites, are natusally expreffed in the countenance by characters which the favage and the courtier can read with equal readinefs. The look ferene, the fmoothed brow, the dimpled fmile, and the glifening eye, denote equanimity and good will in terms which no man mitakes. The contracted brow, the glaring eye, the fullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to difguife thefe inflinctive indications of their temper, and

$$
\begin{aligned}
& \text { "To carry fmiles and fur.hine in their face, } \\
& \text { "When difcontent fies heavy at their heart," }
\end{aligned}
$$

conflitutes a great part of modern and refined educa. tion. Yet in fpite of every effart of the utmolt fill, and of every motive refulting from interef, the molt confummate hypocrite, or the moft backneyed politician, is not always able to prevent his real difpofition from becoming apparent in bis countenance. He may indeed, by long practice, have acquired a very great command both over his temper and over the inflinctive figns of it ; but at times nature will predom:nate over art, ard a fudden and violent paffion will flam in his face, fo as to be vifible to the cye of every beholder. If thefc obfervations be juft, and we flatter ourfelves with the belief that no man will call them in queftion, it feems to follow, that, if mankind were prompted by inftinct to ufe articulate founds as indications of their paffions, affections, fenfations, and ideas, the language of nature could never be wholly forgotten, and that it would fometimes predominate over the language of art. Groans, fighs, and fome inarticulate lively founds, are naturally exprefive of pain and pleafure, and equally intelligible to all man-
kind. The occafional ufe of thefe no art can wholly Langui banifh; and if there were articulate founds naturally expreffive of the fame feelings, it is not conceivable that art or education conld banifh the ufe of them, merely becaufe by the organs of the mouth they are broken into parts and refolvable into Cyllables.

It being thus evident that there is no inftindive articulated langrage, it has become an inquiry of fome importance, how mankind were firft indured to fabricate articulate founds, and to employ them for the purpofe of communicating their thoughts. Children learn to fpeak by infenfible imitation; and when advanced fome years in life, they tudy foreign languages under proper inftructors: but the firft men had no fpeakers to imitate, and no formed language to fudy; by what means then did they learn to Ipeak? On this Either quettion only two opinions can paffibly be formed. vealed Either language muft have been originally revealed from heave heaven, or it nult be the fruit of human induftry. The vented greater part of Jews and Chrilitians, and even fome of $m$ :n, the wifelt pagans, have embraced the former opinion; which feems to be fupported by the authority of Mo'fes, who reprefents the Supreme Being as teaching our firft parents the names of animals. The latter opinion is held by Diodorus Siculus, Lucretias, Hotace, and many other Greek and Roman writers, who con. fider language as one of the arts invented by man. The firft men, fay they, lived for fome time in woods and caves after the manner of beafts, uttering only confufed and indiftinct noifes; till, affociating for mutual affillance, they came by degrees to ufe articulate founds mutually agreed upon for the arbitrary figns or marks of thofe ideas in the mind of the fpeaker which he wanted to communicate to the hearer. This opinion fprung from the atomic cofnogony which was framed by Mochus the Phenician, and afterwards im. proved by Democritus and Epicurus; and though it is part of a fyttem in which the forlt men are reprefented as having grown out of the earth like trees and other vegetables, it has been adopted by feveral modern writers (a) of high rank in the republic of letters, and is certainly is itfelf wortby of examination.

The moft learned, and on every account the mott refpectable author who now fupports this opinion, can - for didly acknowledges, tbat if language was invented, it of hu was of wery difficult invention, and far beyond the inven reach of the groffet favages. Accordingly he holds, that though men were originally folitary animals, and had no natural propenfity to the focial life; yet before language could be invented they mult have been affociated for ages, and have carried on of concert fone common work. Nay, he is decidedly of opinion, that before the invention of an art fo difficult as language, men muft not only have herded together, but have alfo formed fome kind of civil polity, have exifted in that political fate a very long time, and have acquired fuch powers of abflraction as to be able to form general ideas. (See Logic and Metaphystcs). But it is obvious, that men could not have inltituted civil polity, or have carried on of concert any common work, without communicating their defigns to each other : and there are four ways by which the author thinks that this could
(A) Father Simon, Voltaire, L'Abbe Condilliac, Dr Smith, and the author of the Origin and Progrefs of Language.
puage. Lave been done before the invention of fpeech; viz. ift, inarticulate cries, expreffive of fentiments and paffons; 2 d, gefures, and the exprefion of countenance; 3 d , imitatize foisnds exprellive of audible things ; and, 4 th, painting, by which vifible objects may be reprefented. Of thefe four ways of communication it is plain that only two lave any connection with langnage, viz. inarticulate cries and imitative founds; and of thefe the author abandons the latter as having contributed nothing to the invention of articulation, though he thinks it may have helped to advance it progrefs. "I am difpofed (fays he) to believe, that the framing of words with an analogy to the found of the things expreffed by them belongs rather to languages of art than to the firit languages fpoken by rude and barbarous nations." It is therefore inarticulate cries only that :mult have given rile to the formation of language. Such cries are ufed by all asimals who have any ufe of voice to exprefs their wants; and the fact is, that all barbarous nations have cries expreting different things, fuch as joy, grief, terror, furpife, and :the like. Thefe, together with gettures and expreffion - of the countenance, were undoustedly the methods of communication firlt ufed by men: and we have bat to Tuppofe (fays our anthor) a great number of our fpecies carrying on fome common bulinefs, and converfing together by figns and cries; and we have men juft in a flate proper for the invention of language. For if we Euppere their numbers to increafe, their wants would increafe alfo; and then thefe two methods of commurication would become too confined for that larger Ephere of life which their wants would make neceffary. The only thing then that remained to be done was to give a greater variety to the inftinctive cries; and as the natural progrefs is from what is eafy to what is more difficult, the firft variation would be merely by tones from low to high, and from grave to acute. But this variety could not anfwer all the purpoles of fpeech in fociery; and being advanced fo far, it was natural that an animal fo fagacious as man fhould go on farther, and come at laft to the only other variation remaining, namely articulation. The firt articulation would be very fimple, the vaice being broken and dif. tinguifhed only by a few vowels and confonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to fuppofe, that the firf languages were for the greater part fpoken from the throat; :hat what confonants were ufed to vary the cries, were molly guttural ; and that the organs of the mouth would at tirlt be very little employed. From this account of the origin of language it appears, that the firft founds articulated were the natural cries by which men lignified their wants and defires to one another, fuch as calling one another for certain purpofes, and other fuch things as were moft neceffary for carrying on any joint work: then in procefs of time other cries would be articulated, to fignify, that fuch and fuch actions had been performed or were performing, or that fuch and fuch events had happened relative to the common bulinefs. Then names would be invented of fuch objects as they were converfant with; but as we cannot fuppofe la.
vages to be deep in abftraction or תkilful in the art of Language. arranging things according to their genera and fpecies, all things however fimilar, except perbaps the individuals of the loweft fpecies, would be exprefled by different words not related to each other either by derivation or compofition. Thus would language grow by degrees; and as it greu., it would be more and more broken and articulated by confonants; but ftill the words would retain a great deal of their original nature of animal cries. And thus things would go on words unrelated fill multiplying, till at laft the language would become too cumberfome for ufe; and then art would be obliged to interpofe, and form a language upon a few radical words, according to the rules and method of etymology.

Thofe (B) who think that language was originally Arguments revealed from heaven, confider this account of its hu-for $\mathrm{i}=\mathrm{s}$ diman invention as a feries of mere fuppofitions hanging vine origiss loofely together, and the whole fufpended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucretius, and Cicero, which are frequently quoted in its fupport, are in their eftimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any hiftorian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yefter. day, gives them no advantage in this inquiry over the philofophers of France and England. Aritotle has defined man to be 弓eov $\mu$ m $\mu$ h/xov: and the definition is certainly fo far juft, that man is much more remarkable for imitation than invention; and therefore, fay the reafoners on this fide of the queftion, had the human race been originally mutum et turpe pecus, they would have continued fo to the end of time, unlefs they had heen taught to fpeak by fome fuperior intelligence. That the firt men fprong from the earth like vegetables, no modern philofopher lias ventured to affert; nor does there any where appear fufficient evidence that men were originally in the ftate of favages. The oldeft bnok extant contains the only rational cofnoo gony known to the ancient nations; and that book reptefents the firf human inhabitants of this earth, not only as reafoning and fpeaking animals, but alfo as in a flate of high perfection and happinefs, of which they were deprived for difobedience to their Creator. Mofes, fetting atide his claim to infpiration, deferves, from the confiltence of his narrative, at lealt as much credit as Mochus, or Democritus, or Epicurus; and from his prior antiquity, if antiquity could on this fubject have any weight, he would deferve more, as having lived nearer to the period of which they all write. But the queftion refpecting the origin of language may be decided withont relling in authority of any kind, merely by confidering the nature of fpeech and the mental and corporeal powers of man. Thofe who maino tain it to be of human invention, fuppofe men at firft to have been folitary animals, afterwards to have herded together without government or fubordination, then to have formed political focietics, and by their own exertions to have advanced from the groffett ignorance to the refinements of fcience. But, fay the reafonera $3 \times 2$
whofe

$\underbrace{\text { Zanguage, }}$ whofe caufe we are now pleading, this is a fuppofition contrary to all hiftory and all expericnce. There is not upon record a fingle inflance well authenticated of a people emerging by their own efforts from barbarifin to civilization. There have indeed been many nations raifed from the flate of favages; but it is known that they were polified, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themfelves. The original favages of Grecce were tamed by the Pelafgi, a foreign tribe ; and were afterwards further politihed by Orpheus, Cecrops, Cadmus, scc. who derived their knowledge from Egyp: and the Eaft. 'The ancient Romans, a ferocious and motley crew, received the bleffings of law and religion from a fuceeflion of foreign kings; and the conquelfs of Rome at a later period contributed to civilize the reft of Eur ope. In America, the only two nations which at the iuvafion of the Spaniards could be faid to have advanced a fingle flep from barbarifm, were indebted for their fuperiority over the other tribes, not to the gradual and unaffitited progrefs of the human mind, but to the wife inflitutions of foreign legiflators.
This is not the proper place for tracing the progrefs of man from the favage fate to that of political fociety (Sce SAvAcE State); but experience teaches us, that in every art it is mucle eafieq to improve than to invent. The human mind, when put into the proper track, is indeed capable of making great advances in arts and fciences; but if any credit be due to the records of hittory, it has not, in a people funk in ignorance and barbarity, fufficient vigour to difeover that track, or to conceive a flate oifferent from the prefent. If the rudef inhabitants of Anscrica and other countries have continued, as there is every reafon to believe they have continued, fur ages in the fame unvaried fate of barbarifm; how is it imarrinatt that people fo much ruder than they, as to be ignorant of all language, fhould think of inventing an art fo difficult as that of fpeech, or even to frame a conception of the thing? In building, fifhing, hunting, navigating, \&c. they might initate the inflinctive arts of other animals; but there is no other animal that expreffes its fenfations and affcçions by arbitrary articulate founds.- It is faid, that before language could be invented, mankind muft have exited for ages in large political focieties, and have carried on of concert forne common work: but if inarticulate cries, and the natural vifible figns of the paffions and affections, were modes of communication fufficiently accurate to ksep a large fuciety together for ages, and to dircet its members in the execution of fome common work, what could be their inducement to the invention of an aut fo ufelefs and dificult as that of language? Let us however fuppofe, fay the advocates for the caufe which we are now fupporting, that different nations of fivages fet about inventing an art of comnunicating their thourhts, which experience had tanght the in was not abfolutely neeeffary; how came thicy all, without exception, to think of the one art of artuculating the voice for this purpoie? Inarticulate cries, o.tt of which language is fabricated, have indeed an intlinctive cennection with our paffions and affections; but there are gellures and expreflions of countenance with wliciclour paffions and affections are in the fame manner connected. If the natural
cries of paffion could be fo!modificd and enlarged as to be capable of communicating to the hearer every idea in the mind of the fpeaker, it is certain that the natural geftures could be fo modified as to anfwer the very fame purpofe (fee Pantomimı) ; and it is Atrange that among the feveral nations who invented languages, not one fhould have thumbled upon fabricating vifible figns of their ideas, but that all thould have agreed to denote them by atticulated founds. Every nation whofe language is narrow and rude fupplies its defects by violent gefticulation; and therefore, as much lefs genius is exerted in the improvement of any art than was requifite for its firf invention, it is natural to fup. pofe, that, had men been left to devife for themfelves a method of communicating their thoughts, they would not have attempted any other than that by which they now improve the language tranfinited by their fathers. It is vain to urge that articulate feunds are fitter for the purpofe of communicating thought than vifible gefticulation: for though this may be truc, it is a truth which couid hardly occur to favages, who had never experienced the fitnefs of either; and if, to counterbalance the fuperior fitnefs of articulation, its extreme difficulty be taken into view, it muth appear little lefs than miraculous that every favage tribe fhould think of it rather than the tafier method of artificial gefticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring eafe to utility ; but their modes of life give fuch a pliancy to their bodies, that they could with very little trouble bend their limbs and members into any pofitions agreed upon as the figns of ideas. This is fo far from being the cafe with refpect to the organs of articulation, that it is with extreme difficulty, if at all, that a man ad. vanced in life can be taught to articulate any found which he has not been accuftomed to hear. No, foreigner who comes to England after the age of thirty, ever pronounces the language tolerably well; an Englthman of that age can hardly be taught to utter the guttural found which a Scotchunan gives to the Greek $\chi$, or even the French found of the vowel $u$ : and of the folitary favages who bave been caught in different forefts, we know not that there has been one who, after the age of manioood, learned to articulate any language fo as to make himfelf readily underfood. The prefent age has indeed furnithed many inftances of deaf perfons being taughtto fpeak intelligibly by fkilful mafters moulding the organs of the mouth into the pofitions proper for articulating the voice; but who was to perform this talk among the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of fpeech but by fuch helps as favages cannot ohtain; and therefore, if fpeech was invented at all, it muit have been either by children who were incapable of invention, or by men who were incapatle of freech. A thoufand, nay a million, of childen could not think of inventing a language. While the organs are pliable, there is not underftanding enough to frame the conception of a language; and $b_{r}$ the time that there is underftanding, the organs are become too ftiff for the tafli. And therefore, fay the advocates for the divine origin of language, reafon as

## L A N [ 53.3$]$ L A N

aguage well as hiftory intimates, that mankind in all ages mult have been feeaking animals; the young having conllantly acquired this art by imitating thofe who were elder; and we may warrantably conclude, that our firlt parents received it by immediate infpiration.

To this account of the origin of language an objection readily offers itfelf. If the fis it language was commonicated by infpiration, it muft have been perfeet, and held in reverence by thofe who fpake it, i. e. by all mankind. But a vaft variety of languages have prevailed in the world ; and fome of thefe which remain are known to be very imperfect, whillt there is reafon to believe that many others are loft. If different languages were originally invented by different nations, all this would naturally follow from the mixture of thefe nations; but what could induce men poffeffed of one perfect language of divine original, to forfake it for barbarous jargons of their owu invention, and in evesy refpect inferior to that with which their forefathers or themfelves had been infpired?

In anfwer to this objection, it is faid, that nothing hat cir- was given by infpiration but the faculty of fpeech and rasces the elements of language; for when cnce men had : a zud language, it is eafy to conceive how they might have ous lan modified it by their natural powers, as thoufands can muldimprove what they could not invent. The firft language, if given by infpiration, mull in its principles bave had all the perfection of which language is fufceptible; but from the nature of things it could not poffibly be very copious. The words of language are cither proper names or the figns of ideas and relations; but it cannct be fuppofed that the All-wife Inftructor would load the memories of men with words to denote things then unknown, or with the figns of ideas which they had not then acquired. It was fufficient that a foundation was laid of fuch a nature as would fupport the largeft fuperitructure which they might ever after have occafion to raife upon it, and that they were taught the methot of building by compofition and deivation. This would long preferve the language radically the fame, though it could not prevent the introduction of dififerent dialects in the different countries over which men fpiead thenfelves. In whatever region we fuppofe the human race to have been originally placed, the increare of their numbers would in procelo of time either diliperfe them into different nations, or extend the one nation to a valt ditance on all fides from what we miay call the feat of government. In eithcr cafe they would every where meet with new ebjects, which would occafion the invention of new names; and as the difference of clinate and other natural caufes would compet thofe who removed caftward or northward to adopt modes of life in many refpects different from the modes of thofe who travelled towards the weft or the fouth, a vail number of words would in one country be fabricated to denote complex conceptions, which mult neceffaily be unintelligible to the body of the people inlabiting countries where thofe conceptions had never been formed. Thus would various dialeets be una voidably introduced into the original language, even whilt all mankind remained in one focity and under one goverument. But after feparate and independent focieties were formed, thefe variations would become more numerous, and the feveral dialeets would deviate farther and farther from each other, as well as from the idiom and genius of
the" parent tongue, in proportion to the difance of Langasgo. the cribes by whom they were fpoken. If we fuppofe a fow people either to have been banihed together from the focicty of their brethren, or to have wandered of their own accord to a ditance, from which through tracklefs forefts they could not return (and fuch emigrations have often taken place), it is ealy to fee how the molt copious language muft in their nouths have foon become narrrow, and how the offspring of infpiration mut lave in time become fo deformed as hardly to retain a feature of the anceltor whence it originally fprung. Men do not long retain a practical nkill in thofe arts which they never exercife; and there are abundance of facts to prove, that a fugle man caft upon a defart inand, and having to provide the neceffaries of life by his own ingenuity, would foon lofe the art of fpeaking with Huency his mother-tongue. A fmall number of men calt away together, would indeed retain that art fomewhat longer; but in a fpace of time not very long, it would in a great meafure be loit by them or their poiterity. In this ftate of banimment, as their time would be almolt wholly occupied in hunting, firhing, and others means within their reach to fupport a wretched exiftence, they would have very litt!e keifure, and perhaps lefs defire, to preferve by converiation the remembrance of that eafe and thole comforts of which they now found themfelves for ever deprived; and they would of courfe foon forget all the words which in their native language had been ufed to denote the accommodations and elegancics of polified life. This at leatt feems to be certain, that they would not actempt to teach their childien a part of language which in their circumftances could be of no ufe to them, and of which it would be impofible to make them comprehend the meaning ; for where there are no ideas the figns of ideas cannot be made intelligible. From fuch colonies as this difperfed over the earth, it is probable that all thufe nations of favages have arifen, which have induced fo many philofophers to imagine that the flate of the favage was the original llate of man ; and if fo, we fee that from the language of infpiration mull have unavoidably fprung a number of different dialects all extremely rude and natrow, and retaining nothing of the pareut tongue, except perhaps the names of the molt confpicuous objests of nature, and of thofe wants and enjoyments which are infeparable from humanity. The favage fate has no artificial wants, and furnifhes few ideas that require terms to exprefs them. The habits of folitude and lilence incline a favage rarely to \{peak; and when he fpeaks, he ufes the fame terms to denote diffurent ideas. Speech therefore, in this rude condition of men, mult be extremely narrow and extremely various. Every-new region, and every new climate, fuggetts different idcas, and creates different wants, which mult be crpreffed either by terms entirely new or by old terms uled with a new fignification. Hence inult originate great diverfity, even in the furt elements of fpeech, among Hence the all favage nations, the words retained of the original variety of language being ufed in various fenfes, and pronounced, tongues as we may believe, writh various accents. When any which have of thofe favage tribes emerged from their barbarifm, prevailed ia whether by their own efforts or by the aid of people more enlightened than themfelves, it is obvious that the improvement and copioufnefs of their language

## I. A N

id anguage, would keep pace with their own progrefs in knowledgc and in the arts of civil life; but in the infuite multitude of words which civilization and refinement add to language, it would be little lefs than miraculous were any two nations to agree upon the fame founds to reprefent the fame ideas. Superior refinement, indeed, may induce imitation, conquefts may impofe a language, and extenfion of empires may melt down different nations and different dialects into one mafs; but independent tribes naturally give rife to diverfity of tongues, nor does it feem poffible that they fhould retain more of the original language than the words expreffive of thofe objects with which all men are at all times equally concerned.

The variety of tongues, therefore, the copioufnefs of fome, and the narrownefs of others, furnifh no good objection to the divine origin of language in general; for whether language was at firt revealed from leaven, or in a courfe of ages invented by men, a multitude of dialects would inevitably arife as coon as the human race was feparated into a number of ditinct and independent nations. - We pretend not to decide for our readers in a queftion of this nature: we have given the befl arguments on both fides which we could either devife or find in the writings of others: and if it be feen, as we doubt not it will, that our own judgment leans to the fide of revelation, let it not be haftily condemned by thofe whofe knowledge of languages extends no farther than to Greece and Rome, and France and England; for if they will carry their philological inquiries to the eaft, they may perhaps be able to trace the remains of one otiginal language through a great part of the globe at this day (c).

Language, whatever was its origin, mult be fubject to perpetual changes from its very nature, as well as
from that variety of incidents which affeet all fublu. Lang nary things; and thole changes mu!t always corre. fpond with the charge of circumflanees in the people by whom the language is \{poken. When any parci- guage cular fet of ideas becones prevalent among any fociety any pe of men, words mult be adopted to exprefs tbem; and an ind from thefe the language mult affume its character. theirn Hence the language of a brave and martial people is bold and nervous, although perhaps rude and uncultivated; while the languages of thofe nations in which luxury and effeminacy prevail, are flowing and harmonious, but devoid of force and energy of expreffion.

But although it may be confidered as a general rule, some that the language of any people is a very exact index ceptio of the ftate of their minds, yet it admits of fome paro the pr ticular exceptions. For as man is naturally an imita-dingr tive animal, and in matters of this kind never has recourfe to invention but through neceffity, colonies planced by any nation, at whatever dittance from the mother country, always retain the fame general founds and idiom of language with thofe from whom they are feparated. In procefs of time, however, the colonifts and the people of the mother-country, by living under different climates, by being engaged in different occupations, and by adopting, of courfe, different modes of life, may lofe all knowledge of one another, affume diferent national characters, and form each a diftinct language to themfelves, totally different in genius and ftyle, though agreeing with one another in the fundamental founds and general idiom. If, therefore, this particular idiom, formed before their feparation, happen to be more peculiarly adapted to the genius of the mother country than of the colonies, thefe will labour under an inconvenience on this account, which they may never be wholly able to overcome; and this
(c) Numberlefs inflances of this might be given, but our limits will permit us to produce only a very few. In the Sbanferit, or ancient language of the Gentoos, our fignifies a day: (See Halled's preface to the code of Gentoo lazus). In other eatern languages, the fame word was ufed to denote both light and fire. Thus in the Chaldee, ur is fire; in the Egyptiun, or is the fun or light, (Plut. de Ofr. et Iful.): In the Hebrew, aus is Jight: in the Greek, arp is the air, often light: in Latin, Aura is the air, from the 平ulic Greek; and in Irijb it is aear. From the very fame original we have the Greek word \#up, and the Englifh fire. - In Hebrezw, or fignifies to raife, lift up one's felf, or le raijed: hence plainly are derived the Greck opa, to raife, exsite, and the Latin orior to arife; whence orsens the cafl, and Eng. orient, oriental; alfo Lat. origo, and Eng. origin, origimate, $\mathbb{E e}$.-The word Khunt in the Shanferit dialect, fignifies a fmall territory, which is retained in Kuros, Kent, Canton, Cantabria. The word Khan, kin, cean, gan, gen, gin, is of the fame kind, and pervades Afia and Europe from the Ganges to the Garrone. The word light Englifh, lucht Flemih,
 and erde, are all one word from Paleftine and Chaldee to Britain and Germany.- The Chaldeans turned the Hebrew word shur or shor, which fignifies an ox, into thor, as likewife did the Phenicians (Ste Plut. Litt. Syll.); hence the Greek ravoos, the Latin taurus, the French taurean, and the Italian and Spauifh toro. The Hebrew word bit or beith, which fignifies cavity, capacity, the concave or infide of any place, has fpread itfelf far and wide, fill retaining nearly the original fignification; in the Perfian language it is bad, bed, bhad, and fignifies a boufe or alode. In all the dialects of the Gothic tongue, Bode fignifies the fame thing; hence the Englifh abile, abode, booth, boat, and the French battean. In all thefe inftances there is a friking refemblance in found as well as in fenfe between the derived and the primitive words; but this is not always the cafe, even when of the legitimacy of the derivation no doubt can lie entertained. It has been flown (fec Bofzell's Life of Fobnfon), that the French jour, a day, is derived from the Latin dies; but it may be certainly traced from a high.r fource. In many of the oriental dialects, dr, bright, is a iame of the $\int u n$; hence the Greck $\Delta t s$, Fupiter, and the Latin dies, a day. From dies comes diurnus; in the pronunciation of which, either by the inaccuracy of the fpeaker or of the hearer, diul is readily confounded with giu; then of the ablative of this adjective, corruptly pronounced giurno, the Italians make a fubflantive grorno, which by the French is readily contracted into giour cr jour. lirom the fame root dt , comes $\Delta i 0 s_{5} \alpha_{1}$ ov, the Eolic $\Delta i F o s_{3}$ the Latin divus, and the Celtic dhia, Godo

## L A N［ 535 ］L A N

gagge．ineonvenience murt prevent their language from ever attaining to that degree of perfection to which，by the genius of the people，it might otherwife have been carried．Thus various languages may have been form－ ed ont of one parent tongue；and thus that happy concurrence of circumflances which has raifed fome languages to a high degree of perfection，may be ea－ tily accounted for，while many iueffectual efforts have heen made to raife other languages to the fame degree of excellencc．
As the knowledge of languages conflitutes a great part of erudition，as their beauty and deformities fur－ nifh employment to tafte，and as thefe depend much upon the idions of the different tongues，we fhall pro－ ceed to make a few remarks upon the advantages and defects of fome of thofe idioms of language with which we are beft acquainted．－As the words iniom and gli－ wius of a language are often confounded，it will be neceflary to inform the reader，that by idiom we would here be underitood to mean that general mode of arranging words into Sentences websiel prevurils in any parti－ cular lavguage；and by the centus of a language，we mean to exprefs the particular fet of idcas wobich the words of any language，cither from their formation or multiplicity，are moff naturally apt to excite in the mind of any one who bears it properly uttered．Thus，although the Englifb，French，Italiun，and Spanif，languages nearly agree in the fame general inion，yet the par－ ticular Gentus of each is remarkably diffirent ：The Englifb is naturally bold，nervous，and flrongly articu－ lated；the French is weaker，and more flowing；the Italian more foothing and harmonious；and the Spa－ $n i / k$ more grave，fonorous，and flately．Now，when we examine the feveral languages which have been moft eftermed in Europe，we find that there are on－ ly two intoms among them which are eflentially di－ flinguifhed from one another；and all thofe langua－ ges are divided between thefe two idioms，following fometimes the one and fometimes the other，either wholly or in part．The languages which may be faid to adhere to the firt IDIom，are thofe which in their conftruction follow the order of nature；that is，ex－ prefs their ideas in the natural order in which they occur to the mind；the fubject which occafions the ac－ tion appearing firft then the action，accompanied with its feveral modifications；and，laft of all，the object to which it has reference．－Thefe may properly be called analogous languages；and of this kind are the Erg． lifh，French，and mott of the modern languages in Europe．－The languages which may be zeferred to the other idiom，are thofe uhich follow no other order in their confluction than what the talle or fancy of the compofer may fuggeft；fometimes making the object， fometimes llie action，and fometimes the modification of the action，to precede or follow the otber parts． The confufion which this might occafion，is avoided by the particular manner of inflecing their words，by which they are made to refer to the others with which they ought to be conneEted，in whatever patt of the fentence they occur，the mind being left at liberty to connect the feveral parts with one anotber afier the whole fen－ tence is concluded．And as the words may be licre tranfpofed at pleafure，thofe languages may be called transpositive languages．To this clafs we muft，in an efpecial mannor，refer the Lattin and Greck lan－
guages．－As each of thefe inioms has feveral adivanta－Language． ges and defects peculiar to itfelf，we fhall endeavour to point out the moft confiderable of them，in order to afcertain with greater precifion the particular charader and excellence of fome of thofe languages now priuci－ pally fooken or itudied in Europe．

The partiality which our forefathers，at the revi－ val of letters in Europe，naturally entertained for the Greek and Roman languages，made them look upon every dillinguifining peculiaity belonging to them as one of the mony cautes of the amazing luperiority which thofe languages evidently enjoyed above every other at that time fpoken in Europe．－This blind deference fill continues to be paid to them，as our minds are early prepofleffed with thefe ideas，and as we are taught in our earlieft infancy to believe，that to entertain the leaft idea of our own language being equal to the Greek or Latin in any particular whatever，would be a certain mark of ignorance or want of talte．－Their rights， therefore，like thofe of the church in former ages，re－ main till to be examined；and we，without exerting our reafon to difcover truth from falfehood，tamely fits down fatisfied with the idea of their undoubted pre－ eminence in every refpect．But if we look around us for a moment，and obferve the many excellent produc－ tions which are to be met with in almoft every language of Europe，we mult be fatisfied，that even thefe are now pofieffed of fome powers which might afferd at lealt a prefumption，that，if they were cultiated with a pro－ per degree of attention，they might，in fome rcfpects，be made to rival，if not to excel，thofe beautiful and jully admired remains of antiquity．Without endearouring to derogate from their merit，let us，with the cool eye of philofophic reafoning，endeavour to bring before the facred tribunal of Trutb fome of thofe opinions which have been moft generally received upon this fubject， and ret the determination of the caufe on her impartial decifion．

The learned reader well knows，that the feveral changes which take place in the arrangement of the words in every transpositive language，could not be admitted without occationing great confulion，un－ lefs certain claffes of words were endowed with particu－ lar variations，by means of which they might be made to refer to the other words with which they ought na－ turally to be connected．From this caule proceeds the neceffity of feveral variations of verbs，nouns，and adjec－ tives；which are not in the leaft effential or neceffary in the analogous languages，as we have pretty fully ex－ plained under the article Grammar，to which we refer for fatisfaction on this head．We thall in this place confider，whetber thefe variations are an advantage or a difadvantage to language．

As it is generally fuppofed，that every language whofe verbs admit of infeciion，is on that account much more perfect thau one where they are varied by auxz－ liaries；we fhall，in the firf place，examine this with fome degree of attention；and that what is faid on this head may be the more intelligible，we fhall give $5:-$ amples from the Latin and Englifh languages．We make choice of there languages，becaufe the Latin is more purely tranfpofitive than the Greek，and the Eng－ lifh admits of lefs infection than any other language that we are acquainted with．

If any prefercice be due to a language from the

14
he era The eranf． guldivelans guages compared w thte－ fockto
X.anguage. one or the other method of conjugating verbs, it muft in a great meafure be owing to one or more of thefe Diverfity of three caufes:-Either it muft admit of a greater vafounds, va tiety of founds, and confequently more room for harriety of ex-monious diverfity of tones in the language:-or a prelfions. and preci. fion of ucaning. greater freedom of exprefion is allowed in uttering any fimple idea, by the one admitting of a greater variety in the arrangement of the words which are neceflary to exprefs that idea than the other does:-or, laftly, a greater precilion and accuracy in fixing the meaning of the perfnn who ufes the language, arife from the ufe of one of thefe forms, than from the urle of the other: for, as every other circumftance which may ferve to give a diverfity to language, fuch as the general and moll prevalent founds, the frequent repetition of any one particular letter, and a variety of other circumflances of that nature, which may ferve to debafe a particular language, are not influenced in the leaf by the different methods of varying the verbs, they cannot be here confidered. We flall therefore proceed to make a comparifon of the advantages or difadvantages which may accrue to a language by inflecting its verbs with regard to each of thefe particulars, - varicty of found, vatiety of arrangement, and accuracy of meaning. founds,

The firf particular that we have to examine is, Whether the one method of expreffing the variations of a verb admits of a greater varicty of founds? In this refpect the Latin feems, at firf view, to have a great advantage over the Englifh: for the words amo, amaban, amaveram, amavero, amem, \&cc. feem to be more different from one another than the Englifh tranf. lations of thefe, I love, I didl love, I had loved, I faall bave loved. I nay love, \&c.; for although the fyllable AM is repeated in every one of the firt, yet as the laf fyllable ufually frikes the ear with greater force, and leaves a greater impreffion than the firft, it is very probable that many will think the frequent repetition of the word love in the laft inftance, more ftriking to the ear than the repetition of an in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the founds of the different tenfes of a Latin verb, than there is between the words that are equivalent to them in. Englifh. But as we here confider the variety of foutds of the language in general, before any juf conclufion can be drawn, we muft not only compare the different parts of the fame verb, but alfo compare the different verbs with one another in each of thefe languages. And here, at frit view, we perceive a molt ftriking diftinction in favour of the analogous language over the infleited: for as it would be impoffible to form a particular fet of inflections different from one another for each particular verb, all thofe languages which have adopted this method have been obliged to reduce their verbs into a fmall number of claffes; all the words of each of which claffes, commonly called conjugations, have the feveral variations of the modes, tenfes, and perfons, expreffed exactly in the fame manner, which mutt of neceffity introduce a fimilarity of founds into the language in general, nuch greater than where every paricular verb always retains its own dittinguinhing found. 'To be convinced of this, we need only repeat any number of verbs in Latin and Englifh, and obferve on which fide the preference with eefpect to variety of founds mull fall.
$\mathrm{N}^{\circ} 174$.

I A N

The fimilarity of founds is here fo obvious in the Latin, as to be perceived at the firf glance; nor can we be furprifed to find it fo, when we confider that all their regular verbs, amounting to 4000 or upwards, mult be reduced to four conjugations, and even thefe differing but little from one another, which mult of neceflity produce the famcnefs of founds which we here perceive; whereas, every language that follows the antural order, like the Englifh, inftead of this fmall number of uniform terminations, have almoft as many diftinct founds as original verbs in their language.

But if, inflead of the prefent of the indicative mood, we fhould take almoft any other tenfe of the Latin verb, the fimildrity of founds would be fill more perceptible, as many of thefe tenfes have the fame termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

| Pone-bam; | $I$ did put, | $I p u t$. |
| :---: | :---: | :---: |
| Dona-bam; | I did give, | 1 gave. |
| Cane-bam; | I did fing, | I fung. |

| Ride-bam; | I did laugh, | I laughed. |
| Imple bam; | I did fill, | I filled. |
| Abltine-bam; | $I$ did forbear, | $I$ forbore. |

It is unneceflary to make any remarks on the Latin words in this example : but in the Englift tranflatiot we have carefully marked in the firft column the words without any inflection; and in the fecond, have pue down the fame meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other either ancient or modern. Were it neceflary to purrfue this fubject farther, we might obferve, that the perfoca tenfe in all the conjugations ends univerfally in I, the pluperfect in eram, and the future in am or bo; in the fubjunctive mood, the imperfeg univerfally in rem, the perfoul in Erim, the pluperfoed in isem; and

## L A N

ageo the future in ERO: and as a fill greater famenefo is oblervable in the different variations for the perfons in thede tenfes, feeing the funt perfon plural in all tenfes ends in mus, and the lecond perfon in tis, with little variation in the other perfons; it is evident that, in refpect of diverfity of founds, this method of conjugating verbs by inflefion, is greatly inferior to the more natural method of expreffing the varions connections and relations of the verhal attributive by different words, ulially called auxiltaries.

The fecond particular, by which the different me; of thads of marking the relation of the verbal attributive ons can affect language, arifes from the variety of expreffions which either of thefe may admit of in uttering the fame fentiment. In this refpect, likewife, the method of conjugating by inflection feems to be deffeient. Thus the prelent of the indicative mood in Latin can at moft be exprefled only in two ways, viz. Scrisu, and ego scriso; which ought perhaps in ftrietnefs to be admitted only as one: whereas, in Englifh, we can vary it in four different ways, viz. Ift, I waire; 2 d/ly, I do write; gally, Write I do; qthly, Write do I (D). A nd if we condider the further variation which thefe receive in power as well as in found, by having the emphafis placed on the different words; inltead of four, we will lind eleven different variations: thus, $\cap \Omega$, I aurite, with the emphalis upon the $I ;-$ adly, I write, with the emphafis upon the word write. Let any one pronounce thefe with the different emphatis neceffary, and he will be immediately fatisfied that they are not only difinct from each other with refpect to meaning, but alfo with regard to found; and the fame muk be underltood of all the other parts of this example.
3. I do curite,
8. Write $I$ Do,
2. I Do zurite,
5. I do write,
9. VFITE do $I$,
10. Write do $I$,
6. W Wite $I$ ilo,
11. W'rite do 1.
7. Wive I so,

None of the Latin tenfes admit of more variations* than the two above neentioned: bor do almoll any of the Enylith admit of fewer than in the above ex. ample; an 1 feveral of thele phrales, which nut be confidered as exact tranfations of fome of the tenfes of the Latin vert, admit of many more. 'Thus the inoerfect of the fuhjundive mood, which in Latin admits of the above two variations, admits in Englith of the following :

> 1. I mighb bave arititen.
> 2. Written I mirbt bave.
> A. Writen mighe have $I$.
> 3. Haze suritten 1 might.
> 5. I quritten might bure.

Yol. IX. Part 1 I.

And if we likewife confider the variations which may Language. be produced by a variation of the emphalis, they will morn be as under.

1. I might have curitten.
2. Imgeq bave zuriten.
3. I might HAVE ruritten.
4. I might buve written.
5. Written / might lave.
6. I'ritten I minht bave.
7. I'ritten I might lacue.
8. Written I mighth hare.
9. Have auritue: I might.
10. Have irkitten Imight.

It. Have written I misht.
13. Whitaenmight bave $\Gamma$.
14. Written might bave $I$.
15. Writuen might HAVE 1 .
16. Written might bave 1 .
17. I written mizbt bave.
18. ITRKITENMighthave.
19. I quritten might bave.
20. I written might H.sVE.
21. HAbE writterz might $I$.
22. Havenrigten might $I$.
23. Have written might $I$.
24. Have written might I.

In all 24 variations, inftead of two. - If we likewife confider, that the Latins were obliged to employ the fame word, not only to exprefs "I might have written, but alfo, "I could, I wonld, or I hoould have written;" each of which would admit of the fame variations as the word mights ; wi have in all ninely fix different expreffions in Englifh for the fame phrafe which in Iatin admits only of two, unlefs they have recourle to other forced turns of expreffion, which the defects of their verbs in this particular has compelled them to invent.
But if it fhould be objected, that the lat circumfance we have taken notice of as a defect, can only be confidered as a defect of the Latin language, and is not to be attributed to the inflecion of their verbs, feeing they might have had a particular tenfe for each of thefe different words might, could, remild, and /hould; we anfwer, that, even admitting this excufe as valid, the fuperiority of the analogous language, as fuch, ftill remains in this refpect as 12 to 1.-Yet even this concefion is greater than ought to liave been made: For as the difficulty of forming a fufficient va-i=ty of words for all the different mudifications which a verb may be made to underga is too great fur any rude people to overcome; we find, that every nation which has adopted this mode of infection, not excepting the Grecks themfeives, has been obliged to remain fatiza fed with fewer words than would have been neceffary even to cffect this purpofe, and make the fame word ferve a double, treble, or even quadruple office, as in the Latin terfe which gave rife to thefe obfervations: So that, however in phyfical nocefinty this may not be chargeable upon this particular mode of conttruction, 3 et in monal certainty it muft always be the cafe; and therefore we may fafely conclude, that the mode of varying verbs by infiection affords lefs vatiety in the arrangument of the words of the particular phrafes, $3 Y$
than
(D) We are 〔ufliciently aware, that the laft variation cannot in ttictnefs be confidered as good language; althonght many examples of this manner of ufing it in ferious compofitions, both in poetry and profe, might be eafily praduced from the belt authors in the Englifh languge.- Dut hawever unjultiliable it may be to wre it in ferinus compulition; yet, when judicionlly emplayed in works of liumour, this and other forced expreftons of the like nature produce a fine effect, by giving a burkfue air to the language, and beatifully contrafting it to the purer dition of folid reafoning. The fagacious Shakefpeare has, un many occafoons, firswed how fuccefsfully thefe may be employed in compofition, particularly in drawing the character of ancient Pifol in Henry V. Without this liberty, Butler would have fonnd greater difficulty in drawing the inimitable character of Hudibras.- Let this apology fuffice for our having inferted this and other variations of the fame kind; which, alhough they may be often improper for ferious compolition, have fill their ufe in language.

## L A N

ranguage. than the method of varying them by the help of auxiliaries.

18 precifion of meaning, in which the Englif is fuperior to the Latin $\tan$ ${ }_{5}$ uage.

But if there fhould fill remain any fhadow of doubt in the mind of the reader, whether the method of varying the velbs by infection is inferiuse to that by auxiliaries, with regard to diverfity of founds, or variety of expreflion; there cannot be the leall doubt, but that with refpect to precifion, diftinctnefs, and accuracy, in cxpreffing any idea, the latter enjoys a fuperiority beyond all comparifon. - Thus the Latin verb Ama, may be Englifhed either by the words, I love, or 1 do love, and the emphafis placed upon any of the words that the circumiftances may require ; by means of which, the meaning is pointed out with a force and energy which it is altogether impoffible to produce by the ufe of any fingle word. The following line from Shakefpeare's Othello may ferve as an example:

## Perdition catch ny foul, but $I$ do love thee:

In which the frong emphafis upon the word do, gives it a force and energy which conveys, in an irrefiltible manner, a molt perfect knowledge of the fituation of the mind of the fpeaker at the time.- That the whole energy of the expreffion depends upon this feemingly infignificant word, we may be at once fatistied of, by keeping it away in this manner :

## Perdition catch my foul, but $I$ lore thee.

How poor-how tame-how infignificant is this, when compared with the other! Here nothing remains but a tame affertion, ufhered in with a pompous exclamation whicl could not here be introduced with any degree of propriety. Whereas, in the way that Sbakefpeare has left it to us, it has an energy which nothing can furpafs; for, overpowered with the irrefiltihle foree of Defdemona's charms, this Itrong exclamation is extorted from the foul of Othello in fpite of himfelf. Surprifed at this tender emotion, which brings to his mind all thofe amiable qualities for which he had fo much efteemed her, and at the fame time fully impreffed with the firm perfuation of her guilt, he burlts out into that feemingly inconfiftent exclamation, $E x$ cellent zuretch! and then he adds in the warmth of his furpife,-thinking it a thing moft aftonifhing that any warmth of affection thould till remain in his breaft, he even confirms it with an oath, - Perdilion catch my foul, but I Do lore thee. -"In fpite of all the falfehoods with which I know thou hatt deceived mee -in fpite of all the crimes of which I know thee guilty-in fpite of all thofe reafons for which I cught to hate thee-in fite of nyfelf,-Atill l find that I love,-yes, I do love thee." We look upon it as a thing altogether impofifle to transfufe the energy of this expreffion into any language whofe verbs are regularly inflected.

In the fame manner we might go through all the other tenfes, and how that the fame fuperiority is to be found in each.-Thus, in the perfect tenfe of the Latins, inftead of the fimpleamavi, we fay, I hare LOVED; and by the liberty we have of putting the emphafis up on any of the words which cempofe this phrafe, we can in the molt accurate manner fix the precife idea which we mean to excite: for if we fay,

## L A N

i bave laved, with the emphalis upon the word $I$, it Lar at once points out the perfon as the principal object in that phrafe, and makes us naturally look for a contralt in fome other perfon, and the cther parts of the phrafe becomes fubordinate to it ;-" He bas loved thee much, but 1 bave loved thee infinitely more." The Latins too, as they were not prohibited from joining the pronoun with their verb, were alfo acquainted with this excellence, which Virgil has beautifully ufed in this verfe:

> - Nos patriam fuzimus;
Tv, Tityre, lentus in umbra, sic.

But zve are not only cnabled thus to diftinguith the perfon in as powerful a manner as the Latins, but can alfo with the fame facility point out any of the other circumitances as principals; for if we fay, with the emphafis upon the word bave, "I have loved," it as naturally points out the time as the principal object, and makes us look for a contraft in that peculiarity, I have: "I baveloved indeed;-my imagination has been led aftray-my veafon bas been perverted:-but, nozv that time has opened my eycs, I can fmile at thefe imaginary diftreffes which once perplexed me." - In the fame manner we can put the emphafis upon the other word of the phrafe laved,-" I bave soven." - Here the paffion is exhibted as the principal circumflance; and as this can never be excited without forne object, we naturally wifh to know the object of that palfion-"Who! what have you loved ?"" are the natural queltions we would put in this cafe. "I have loved - Eliza." - In this manner we are, on all occalions, enabled to exprefs, with the utmoft precilion, that particular idea which we would with to excite, fo as to give an energy and perfpicuity to the language, which can never be attained by thofe languages whofe verbs are conjugated by inflection: and if to this we add the incoavenience which all inflected languages are fubject to, by having too fmall a number of tenfes, fo as to be compelled to make one word on many occafions fupply the place of two, three, or even four, the balance is turned lill more in our favour.-Thus, in Latin, the fame word amabo ftands for Ball or will love, fo that the readet is left to guefs from the context which of the two meanings it was molt likely the writer had in view.-In the fame manncr, may or can love are expreffid by the fame word Amem ; as are allo might, could, zoould, or foullt love, by the fingle word amarem, as we have already obferved ; fo that the reader is left to guefs which of thefe four meanings the writer intended to exprefs: which occaiions a perplexity very different from that clear precifion which our language allows of, by not only pointing out the different words, but alfo by allowing us to put the emphafis upon any of them we pleafe, which fuperadds energy and force to the precifion it would have had without that affiftance.

Upon the whole, therefore, after the mot candid examination, we mult conclude, that the method of conjugating verbs by inflection is inferior to that ting which is performed by the help of auxiliarics; -be-by i , caufe it does not afford fuch a diverfity of founds, - tinn nor allow fuch variety in the arrangement of expref-whi fion for the fame thought, - nor give fo great dillinc. perf tion and precifion in the meaning.-It is, however, ryics. ${ }^{2}$

## L A N

## [

uage. attended with one confiderable advantage above the other method: for as the words of which it is formed are neceffarily of greater length, and more fonorous, than in the analogous languages, it admits of a more flowing lharmony of expreffion; for the number of monofyllables in this laft greatly checks that pompous dignity which naturally refults from longer words. Whether this fingle advantage is fufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine :but we may renark, before we quit the fubject, that even this excellence is attended with fome peculiar inconveniences, which thall be more particularly pointed out in the fequel.
But perhaps it might ftill be objected, that although the comparifon we have made above may be fair, and the conclufion jult, with regard to the Latin and Englifh languages ; yet it does not appear clear, that on that account the method of corjugating verbs by inAlecion is inferior to that by auxiliaries; for although it be allowed that the Latin language is defective in point of tenfes; yet if a language were formed which had a fufficient number of inflected tenfes to anfwer every purpofe; if it lad, for inttance, a word properly formed for every variation of each tenfe; one for $I$ love, aunthe: for $I$ do love; one for $I$ Ball, another for $I$ wwill love; one for $I$ migbt, another for $I$ could, and roculd, and foould love ; and fo on through all the other tenfes; that this language would not be liable to the ohjections we have brought againft the iuflection of verbs ; and that of courfe, the ohjections we have brought are only valid againt thofe languages which have followed that mode and 'executed it imperfectly. -We anfwer, that although this would in fome meafure remedy the evil, yet it would not remove it entirely. For, in the firft place, unlefs every verb, or every fmall number of verbs, were conjugated in one way, laving the found of the words in each tenfe, and divifion of teufes, as we may fay different from all the other conjugations, -it would always occafion a famenefs of found, which would in fome meafure prevent that variety of founds fo proper for a language. And even if this could be efficted, it would not give fuch a latitude to the expreffion as auxiliaries allow: for al. though there fhould be two words, one for $I$ might, and another for $I$ could love; yet as thefe are fingle words, they cannot be varied; whereas, by auxiliaries, either of thefe can be varied 24 different ways, as has been fhown above. In the laft place, no fingle word can ever exprefs all that variety of meaning which we can do by the hilp of our auxiliaries and the emphafis. I bave loved, if exprefled by any one word, could only denote at all times one diftinct meaning; fo that to give it the power of ours, three diftinct words at leat would be veceffary. However, if all this were done; that is, if there were a dittinet conjugation formed for

## 539 ] <br> L A N

every 40 or 50 verbs:-if each of the tenfes were languager properly formed, and all of them different from every other tenfe as well as every other verb; and thefe all carried through each of the different perfons, fo as to be all different from one another; -and if likewife there were a diftinct word to mark each of the feparate meanings which the fame tenfe could be made to affume by means of the emphatis; and if all this infinite variety of words could be formed in a diftinct manner, different from each other, and harmonious; this language would have powers greater tha: any that could be formed by auxiliaries, if it were pofible for the human powers to acquire fuch a degree of knowledge as to be able to employ it with facility. But how could this be attained, fince upwards of ten thoufand words would be neceflary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of fuch a language ( E )!-How mucb, therefore, ought we to admire the fimple perfpicuity of our language, which enables us, by the proper application of ten or twelve feemingly trifling words, the meaning and ufe of which can be artained with the utmont eafe, to exprefs all that could be expreffed by this unwieldy apparat"s? What can equal the fimplicity or the power of the one method, but the well-known powers of the $2+$ letters, the knowledge of which can be obtained with fo much eafe-and their powers know no limits? -or, what can be compared to the fancied perfection of the other, but the tranfeript of it which the Chinefe feem to have formed in their unintelligible language?

Having thus confidered pretty fully the advantages and defeets of each of thefe two methods of varying verbs, we cannot help feeling a fecret wilh arife in our mind, that there had been a people fagacions enough to have united the powers of the one method with thofe of the other ; nor can we help being furprifed, that among the changes which took place in the feveral languages of Europe after the downfal of the Roman monarchy, fome of them did not accidentally ftumble on the method of doing it. From many concurring circumftances, it feems probable that the greateit part, if not all the Gothic nations that over ran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have fpreng from them, have fo far borrowed from the Latiin, as to have fome of the tenfes of their verbs inflected: yer the Englifh alone have in any inflance combined the joint powers of the two: which could only be done by forming infle tions fne the different tenfes in the faine manncr as the Latins, and at the fame time retaining the original method of varying them by auxiliaries; by which means either the one or the other mechod could have been employed as occafion required. We have luckily two tenfes formed
(E) This affertion may perhaps appear to many very much exaggerated: but if any fhould think fo, we only beg the favour that he will fet himfelf to mark all the variations of tenfes, mode, perfon, and number, which an Englih verb can be made to affume, varying each of thefe in every way that it will admit, both as to the diverfity of expreffion and the emphafis; he will foon be convinced that we have here faid nothing more than enough.

## L A N

Language. in that way; the prefent of the indicative, and the aorift of the paff. In almolt all our verbs there can be declined either with or without auxiliaries. Thus the prefent, withont an ausiliary, is, Ilove, I write, I focal ; with àn ausilizry, $I$ do write, $I$ do love, $I$ do fpeak. In the fame manner, the paft tenfe, by inflection, is, I loved, I wurote, I fole ; by auxiliaries, I dill love, I did fpeak, $I$ did write. Every author, who knows any thing of the power of the Englifh language, knows the ufe which may be made of this diftinction. What a pity is it that we flould have ftopt fhort fo foon! how blind was it in fo many other nations to imitate the d.fects, without making a proper ufe of that beautiful language which is now numbered among the dead!

After the verts, the next moll confiderabl: variation we find between the analogous and tranfpofitive languages is in the rouns; the latter varying the different cafes of thefe by inficaion; whereas the former exprefs all the different variations of them by the help, of other words prefixed, called prepofitions. Now, if we confider the advantages or difadvantages of either of thefe methods under the fame hitads as we have done the verbs, we ftall find, that with regard to the lirlt particular, viz. variety of founds, almolt the fame remarks may be made as upon the verbs; for if we compare any particular noun by itfelf, the variety of found appears much greater between the different cafes in the tranfoffitive, than between the tranfation of thefe in the analogons language. Thus mex, regis, p.egi, regen, \&c. are more dillinct from one another in point of found, that the tranfation of thefe, a king, of a king, to a king, a ling, \&c. But if we proceed one ftep further, and confider the variety which is produced in the langrage in general by the one or the other of thefe methods, the cafe is entirely reverfed. For as it would have been impoffible to form diftinet variations, different from one another, for each cafe of every noun, they have been obliged to reduce all their nouns invo a few general claffes, called declenfions, and to give to all thofe included under each clals the fame ter-

I
much the reverfe with regard to the variety it allows I in the arranging the words of the phrafe. Here, indeed, the tranfpofitive language fhines forth in all its glory, and the analogous mult yieid the palm whith. Inferion out the fmalleft difpute. For as the nominative cafe gard te (or that nown which is the caufe of the energy ex. orralige preffed by the verb) is different from the accufative (or ment ${ }^{\text {mord }}$ that noun upon which the energy expreffed by the verb fenordsenc is exerted), thicfe may be placed in any fituation that bus the writer fhall think proper, without occafioning the fmallett confufion: whereas in the analogous languages, as thefe two different flates of the noun are expreffed by the fame word, they cannot be dittinguithed but by their pofition alone: fo that the noun which is the efficient caufe mult always precede the verh, and that which is the paffive fubject mult follow ; which greatly cramps the harmonious flow of compofition.-Thus the Latins, without the fnailefl perplexity in the meaning, could fay either Brutum amavit Caffras, or Caffus amanit Bratum, or Brutum Cafius amavit, or Caffius Brounnz canaril. As the temination of the word Caf. fius always points out that it is in the nominative cafe, and therefore that he is the perfon from whom the energy proceeds; and in the fame 'naminer, as the termination of the word Brutum points out that it is in the accufative cafe, and coniequently that he is the object upon whom the energy is exertel ; the meaning continues fill diftinct and clear, notwithftanding of all thefe feveral variations: whereas in the Englifh language, we could only fay Caffius loval Bratus, or, by a more forced phrafeology, Caljius Brutus loved: Were we to reverfe the cafe, as in the Latin, the meaning alfo would be reverfed; for if we fay Brutus loved $\mathrm{Ca} f$ fius, it is evident, that, inftead of being the perfon beloved, as before, Brutus now becomes the perfon from whom the energy proceeds, and Cafius becomes the object beloved. - In this refpect, therefore, the analogous languages are greatly inferior to the tranfpofitive; and indeed it is from this fingle circumftance alone that they derive thcir chief excellence.
But although it thus appears evident, that any language, which has a particular variation of its nouns to diftinguifh the accufative from the nominative cafe, has an advantage over thofe languages which have none; yet it does not appear that any other of their cafes adds to the variety, but rather the reverfe: for, in Latin, we can only fay Amor Dei; in Englifh the fame phrafe may be rendered, either, -the love of God-of God the love, - or, by a more forced arrangement, God the love of. And as thefe oblique cafes, as the Latins called them, except the accufative, are clearly dittinguifhed from one another, and from the nominative, by the prepofition which accompanies them, we are not contined to any particular arrangement with regard to thefe as with the accufative, but may place them in what order we pleafe, as in Milton's elegant invocation at the beginning of Paradife Loft :

Of man's firt difobedience, and the fruit Of that forbidden tree, whofe mortal tathe Brought death into the world, and all our wo, With lofs of Eden, till one greater man Reltore us, and regain the Eliffful feat, Sing, heavenly Mufe.
In this fentence the tranfpofition is almof as great as

## L. A N

re. the Latin language would admit of, and the meaning as diftinet as if Milton liad begun with the plain language of profe, thus,..." Heavenly mufe, fing of man's firf difobedience," \&c.

Before we leave this head, we may remark, that the little attention which feems to have been paid to this peculiar advantage derived fiom the ufe of an acculative cafe different from the nominative, is fomewhat furprifing. The Latins, who had more occalion to attend to this with care than any other nation, and even the Greeks themflives, have in nany cales overlooked it, as is evident from the various initances we meet with in their languages where this is not diftinguifhed. For all nouns of the neuter gender both in Cereek and Latin have in every declenfion their nominative and acculative fingular alike. Nor in the plural of fuch noms is there any diftitection between the fe two cales; and in Latin all nouns whatever of the third, fourth, and fifit diclentions, of which the number is very confiderable, have their nominative and accufative plural alike. So that their language reaps no advautage in this refpect from almolt one half of their nouns. Nor liave any of the modern languages in Europe, however mueh they may have horrowed from the ancient languages in other refpects, attempted to copy from them in this particular ; from which perhaps more advantage would have been gained, than from cupying all the wher fuppofed excellencies of their language. - But to return to our fubjed.

It remains that we confider, whether the inflection fu- of nouns gives any advantage over the method of defiun ning them by prepofitions, in point of diftinctnefs and nrecifinn of meaning? But in this refpect, too, the analogous languages mult come off victorious. Indeed this is the particular in which their greatet excellence conlifts, nor was it, we believe, ever difputed, but that, in point of accuracy and precifion, this niethod mult excel all others, however it may be defective in other refpects. We obferved under this head, when fpeaking of veibs, that it might perhaps be poffible to form a language by inflection which thould be capable of as great accuracy as in the more fimple order of auxiliaries: but this would have been fuch an infinite labour, that it was not to be expected that ever human powers would have been able to accomplifh it. More eafy would it have been to have formed the feveral infeetions of the nouns fo different from one another, as to have rendered it impoffible ever to millake the meaning. Yet even this has nint been attempted. And as we find that thofe languages which: have adopred the method of inflecting their verbs are more imperfect in point of precifion than the other, fo the fame nay be faid of inflefting the nouns: for, not to mention the energy which the analogous languages acquire by putting the accent upon the noun, or its prepefition (when in an oblique cafe), according as the fubject may require, to exprefs which variation of metaning uo particular variety of words have been inwented in any infected language, they are not even complete in other refpects. 'The Latin, in particular, is in many cafes defective, the fame termination being employed in nany intances for dif. ferent cafes of the fame noun. Thus the genitive and datise lingular, and numinative and vocative plural, of the firft decler fion, are al! exactly alike, and com only be diflinguifned from one another by the formation
of the fentences $-\cdots$ as are alfo the nominative, voca. Linguare. tive, and ablative fingular, and the dative and ablative plural. In the fecond, the genitive fingular, and no. minative and vocative plaral, are che fame; as are alfo the dative amd ablative fingular, and dative and ablative plural ; except thofe in UM, whofe nominative, acculative, and rocative lingular, and nominative, accu. fative, and vocative plural, are alike. The other three declentions arree in : many of their cafes as the fe do : which evidently tends to perplex the ineaning, unlefs the hearer is particularly attentive to, and well a cquaintcd with, the particular conftrudtion of the other parts of the fentence; all of which is tutally removed, and the clearelt certainty exhibited at unce, by the help of prepolitions in the analogous languages.

It will hardly be neceffary: to enter into fuch a mimute examination of the advantages or difadvantages attending the variation of adjectives; as it will appear evident, from what has been already faid, that the endowing them with terminations fimiliar $t 0$, and correfponding with, funftantioes, mult tend fill more to increafe the fimilarity of founds in any language, than any of thofe particulars we have already taken notice of ; and were it not for the liberty which they have, in tranfofitive languages, of feparating the adjcetive from the fubllantive, this muft have occafioned fuch a jingle of fimilar founds as could not fail to have been moft difgufting to the ear: but as it would have been impoffible in many cafes, in thofe languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unlefs their adjectives could have been leparated from the fubftantives ; therefore, to remedy this inconvenience, they were forced to devife this unnatural method of inflecting them alfo; by which means it is eafy to recognife to what fubftantive any adjective has a reference, in whatever part of the fentence it may be placed. In thefe languages, therefore, this inflection, both as to gender, number, and cafe, becomes abfolutely neceffary; and, by the diverfity which it admitted in the arranging the words of the feveral phrafes, might counterbalance the jingle of limilar founds which it introduced into the language.

Having thus examined the mof Atriking particu lars in which the tranfpofive and analogous lanpuaces differ, and endeavoured to thow different guages difer, and endeavoured to how the general ten-idions of
dency of every one of the particulars feparately, it language would not be fair to difmifs the fubject without confidering each of thefe as a whole, and pointing out their gencral tendency in that light: for we all know, that it often happens in human inventions, that every part which compofes a whole, taken Ceparately, inay appear extremely fine; and yet, when all thele parts are put together, they may not agree, but produce a jarring and confufion very different from what we might have expecied. We therefore iniagine a few remarks upon the genius of each of the fe two diftinct idoms of language confidercd as a whole will not be deemed ufelefs.

Although all languages agree in this refpect, that 25 they are the means of conveying the ideas of one man The tranf. to another ; yet as there is an intinite variety of ways omfive idiin which we might wifh to convey thefe ideas, fome for fulemn times by the eafy and familiar mode of converfation, compofi and at other times by more folemn addreffes to the tion,

## L A N [ 542 ] $\quad$ A N

Langunge. underflanding, by pompous declamation, \&c. it may to fpeak it with facility; even the rudef among the Lan $\underbrace{}_{\text {fo happen, that the geniuts of one language may be }}$ inore properly adapted to the one of thefe than the other, while another language may excel in the oppofite particular. This is exaetly the cafe in the two general upioms of which we now treat. Every particular in a a tranfpoftive language, is peculiarly calculated for that folemn dignity which is neceflary for pompous orations. Long founding words, formed by the infiction of the different parts of fpecech, --flowing periods, in which the attention is kept awake by the harmony of the founds, and in expee:7ation of that word which is to unravel the whole, -- if compofed by a fkilful artiit, are admirably fuited to that folemn dignity and awful grace which conflitute the effence of a

The anale gous for private converfa tion and written dialogue.
public harangue. On the contrary, in private converfation, where the nind wihhes to unbend itfelf with eafe, thefe become fo many clogs which encumber and perplex. At there noments we wifh to transfufe our thoughts with eafe and facility - we are tired with every unneceflay fyllable -and wifh to be freed from the trouble of attention as much as may be. Like our flate-robes, we would wih to lay afide our pormpous language, and enjoy ourfelves at home with freedom and eafe. Here the folemnity and windings of the tranfpofitive language are burdenfome; while the facility with which a fentiment can be expieffed in the analogous language is the thing that we wifh to acquire. Accordingly in Terence and Plautus, where the beau ties of dialogue are moft charmingly difplayed, tranfpofition is fparingly ufed. In this humble, though znof engaging fpliere, the analogous language moves unrivalled $; \cdots$ in this it wifhes to indulge, and never tires. But it in vain attemps to rival the iranfpofitive in dignity and pomp: The number of monofyllables interrupt the flow of harmony; and although they may give a greater variety of founds, yet they do not naturally poffefs that dignified gravity which fuits the other language. This, then, mult be confidered as the friking particular in the genius of thefe two different idiom s , which marks their characters.

If we confider the effects which thefe two different characters of language mult naturally produce upon the people who employ them, we will foon perceive, that the genius of the analogous language is much more favourable for the molt engaging purpofes of life, the civilizing the human mind by mutual intercourle of thought, than the tran/pofitive. For as it is chiefly by the ufe of fpeech that nuan is raifed above the brute creation ;-as it is by this means he improves every faculty of his mind, and, to the obfervations which he may himfelf have made, has the additional advantage of the experience of thofe with whom he may converfe, as well as the knowledge which the human race have acquired by the accumulated experience of all preceding ages;-as it is by the enlivening glow of converfation that kindred fouls catch fire from one another, that thought produces thought, and each improves upun the other, till they foar beyond the bounds which human reafon, if left alone, could ever have afpired to;-we mult furely confider that language as the molt beneficial to fociety, which moft effectually removes thefe bars that obttruct its progrefs. Now, the genius of the analogous languages is fo eafy, fo fimple and plain, as to be within the reach of every ane who is born in the kingdom where it is ufed
to fpeak it with facility; even the rudef among the Lan
vulgar can hardly fall into any confiderable grammatical errors: whereas, in the tranfpofitive languages, fo many rules are neceffary to be aitended to, and fo much variation is produced in the meaning, by the gightelt variations in the found, that it requires a ludy far above the reach of the illiterate mechanic ever to attain. So that, how perfect foever the language may be when fpnken with purity, the bulk of the nation mult ever labour under the inconvenience of rudenefs and inaccuracy of fpeech, and all the evils which this naturally produces.-Accordingly, we find, that in Rome, a man, even in the higheft rank, received as much honour, and was as much diftinguifhed among his equals, for being able to converfe with eafe, as a modern author would be for writing in an eafy and elegant fyle; and Cæfar among his contemporaries was as much elteemed for his fuperiority in fpeaking the language in ordinary converfation with eafe and elegance, as for his powers of oratory, his fkill in arms, or his excellence in literary compofition. It is needlefs to point out the many inconveniences whi-h this muft unavoidably produce in a ftate. It is fufficient to obferve, that it naturally tends to introduce a val diftinction between the different orders of men; to fet an impenetrable barrier between thofe born in a high and thufe born in a low thation; to keep the latter in iguorance and barbarity, while it elevates the former to fuch a height as mult fubject the other to be eafily led by every popular demagogue. - How far the hiftory of the nations who have followed this idiom of language confirms this obfervation, every one is left to judge for himfelf.

Having thus confidered Language in general, and pointed out the genius and tendency of the two moit diftinguifhed поомs which have prevailed; we thall clofe thefe remarks with a few obfervations upon the particular nature and genius of thofe languages which are now chiefly fpoken or ftudied in Eurupe.
Of all the nations whofe memory hitory has tranfmitted to ns, none have been fo eminently dittinguifhed tione for their literary accomplifhments, as well as acquain-thofe tance with the polite arts, as the Greeks; nor are we guag as yet acquainted with a language poffeffed of fo many whic advantages, with fo few defecto, as that which they now ufed, and which continues fill to be known by their pududia name.-The neceflary connection between the progrefs Euro of k nowledge and the improvement of language has been already explained; fo that it will not be furprifing to find their progrefs in the one keep pace with that of the other: but it will be of utility to point out fome advantages which that dillinguifhed people poffeffed, which other nations, perhaps nut lefs diftinguifhed for talents or tafte, have not enjoyed, which have contributed to render their language the moft univerfally admired in ancient as well as in modern $t$ mes.

It has been already obferved, that the original inhabitants of Greece, who were grofs favages, and whofe lan- The guage of courfe would be very rude and narrow, were firft fuper tamed by the Pclafgi, an eaitern or an Egyptian tribe. Gree From the ealt it is well known that arts and fciences guag were fpread over the relt of the world, and that Egypt iogit was one of the countries firl civilized. The lan- caur guage therefore imported into Greece by the Pelafgi would be pure from the fountain head, and much
age. more perfect in itsi ftructure than if it had been tranfmitted through many nations. But this was not the only circumliance lighly fortunate for the Grcek language. Eefore it had time to be fully ellablifhed among the people, its afperities which it had in common with the other dialeets of the ealt, were polifhed away by fuch a fucceffion of pocts, muficians, philofophers, and legiftators, from different countries, as never appeared in any other nation at a period fo early as to give their genius and talle ite full influence. In this refpect, no people were ever fo eminently ditinguilhed as the ancient Greeks, who had their Orpheus, their Linus, their Cecrops, and their Cadmus, who introduced their different improvements at a time when the nation had no ftandard of tafte formed by itfelf. Hence the original founds of the Greek language are the moll harmonious, and the mot agreeable to the ear, of any that have hitherto been invented. They are indeed agrecable to every perfon who hears them, even when the meaning of the words is not underllood; whereas almoft all other languages, till they are underftood, appear, to an ear which has not been accuftomed to them, jarring and difeordant. This is the fundamental excellence of that juftly admired language; nor have the people failed to improve this to the utmolt of their power, by many aids of their awn invention. The Greek language is of the tranfpofitive kind: but a people fo lively, fo acute, and fo loquacious, could ill bear the ceremonions reftraint to which that mede of language naturally fubjected them; and have therefore, by various methods, freed it in a great meafure from the fliffnefs which that produced. In inflecting their nouns and verbs, they fometimes prefix a fyllable, and fometimes add one; which, befides the variety that it gives to the founds of the language, adds greatly to the diftinctnefs, and admits of a more natural anangement of the words than in the Latin, and of confequence renders it much fitter for the eafinefs of private converfation : and indeed the genius of the people fo far prevailed over the idiom of the language, as to render it, in the age of its greateft perfection, capable of almoft as much eafe, and requiring almon as little tranfpofition of words, as thofe languages which have been called analogous. But as those nations who fpoke this language were all governed by popular affemblies, and as no authority could be obtaited among them hat by a fill in rhetoric and the powers of perfuafion; it became neceffary for every one, who wilhed to acquire power or confideration in the thate, to improve himfelf in the knowledge of that language, in the ufe of which alone he could expeét honours or reputation. Hence it happened, that while the vivacity of the people rendered it ealy, the great men ftudionfly im. proved every excellence that it could reap from its powers as a tran/pofitive language ; fo that, when brought to its utmolt peifection by the amazing genius of the great Demothenes, it attained a power altogether unknown to any other language. - Thas happily circumftanced, the Greek language arrived at that envied preensinence which it ftill jully retains. From the progrefs of atts and fciences; from the gaiety and inventive genius of the people ; from the number of free flates into which Greece was divided, each of which iovented words of its own, all of which contributed to the general ftock; and from the natural communica-
tion which took place between thefe fates, which ex larguage. cited in the ftrengefl degree the talents of the people; it acquired a copioufnels unknown to ary ancient lan guage, and excelled by few of the moderns.- In point of harmony of numbers, it is altogether unrivalled; and on account of the eafe as well as dignity which, from the caufes above mentioned, it acquired, it admits of perfection in a greater number of particular kinds of compofition tlan any other language known. -The irrefiftible force and overwhelming impetuofity of Demolthenes feems not more natural to the genius of the language, than the more flowery charms of Plato's calm and harmonious cadences, or the unaderned fimplicity of Xenophon; nor does the majeftic pomp of Homer feem to be more agreeable to the genius of the language in which he wrote, than the more humble ftrains of Theocritus, or the laughing feftivity of Anacreon: Equally adapted to all purpofes, when we perufe any of thefe authors, we would imagine the language was moft heppily adapted for his particular ftyle alone. The fame powers it likewife, in a great meafure, poffeffed for converfation ; and the dialogue feems not more natural for the dignity of Sophocles or Euripides, than for the more eafy tendernefs of Menander, or buffoonery of Ariflophanes.-With all thefe advantages, however, it mult be acknowledged, that it did not poffefs that unexceptionable clearnefs of meaning which fome analogous languages enjoy, or that characteriftic force which the emphatis properly varied has power to give, were not thefe defects counterbalanced by other caufes which we thall afterwards point out.

The Romans, a people of fierce and warlike difpo-Thee ${ }^{I}$, atin fitions, for many ages during the infancy of their re-language public, more intent on purfuing conquells and military nferior to glory than in making improvements in literature or the Greets the fine arts, beflowed little attencion to their language. Of a difpofition lefs focial or more fhlegmatic than the Gieeks, they gave thomflyes no trouble about rendering their language fit for converfation; and it remained ftrong and nervous, but, like their ideas, was limited and confined. More difpofed to command refpect by the power of their arms than by the force of perfuation, they defpifed the more effeminate powers of fpeech: fo that, before the Punic wars, their lan. guage was perhaps more referved and unicourtly than any other at that time known.- But after their rival Carchage was deftroyed, and they had no longer that powerfnl curb upon their ambition; when ricles flowed in upon then by the multiplicity of their conquetts; - luxury began to prevail, the ftern aufterity of their manners to relax, and felfifh ambition to take place of that difinterefted love for their country fo eminently confpicuous amorig all orders of men before that pe-riod.- Popularity began theo to be courted : ambitious men, finding themfelves not poflefled of that me. rit which infured them fuceefs with the virtuous $f \in$. nate, amufed the mob with artfill and feditious hav rangues; and by making them believe that they were poffeffed of all power, and had their facred rights encroacked upon by the fenate, led them about at their pleafure, and got themfelves exalted to honours and riches by thefe infidious arts. It was then the Romans firf began to perceive the ufe to which a com.nand of language could be put. Ambitious men.

Q argrage then fudied it with care, to he able to accomplifh been folenn have been fubjected to the yoke of for Langus their ends; while the mare virtunus were obliged to acquire a faiti in this, that they might be able to reped the attacks of their adverfaries. - Thus it happened, that in a flort time that prople, from having entirely neglected, began to ftudy their language with the greatell affiduity; and as Greece happened to be fuojected to the Roman yoke about that time, and a friendly intercourfe was eflab' Shed betweer thefe two countries, this greatly confpired to nourifh in the minds of the Romans a taite for that art of which they lad lately become fo much enamaured. Gretce had long before this period teen corrupted by luxury; their talle for the fine arts had degencrated into unneceffary refinement; and all, their patriotifin conlithed in popular harangues and unmeaning declamation. Oratory was then fludied as a refined art; and all the fubleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. 3 but while they were thus idly trying who flould be the bord of their own people, the nerves of government were relaxed, and they became an eafy prey to every invading power. In this fituation they became the fubjects, under the title of the allies, of Rame, and introduced among them the fame tatte for naranguing which prevailed among themfelves. Well acquainted as they were with the powers of their own language, they fet themfelves with unwearied affiduity to polifh and improve that of their new mallers: but with all their affidnity and pains, they never were able to make it arrive at that perfection which their own language had acquired; and in the Augufan age, when it had arrived at the fummit of its glory, Cicero bitterly complains of its want of copinufnefs in many part:culars.

But as it was the defire of all who tludied this language with care, to make it capable of that tlately digrity and pomp neceflary for public liarangues, they followed the genius of the language in this particular, and in a great meafure neglected thofe leffer delicacies which furm the pleafure of domeltic enjoyment; fo that, while it acquired more copioufnefs, more harmony, and precifion, it remained fliff and inflexible for converfation: nor could the minute diflinction of nice grammatical rules be ever biought down to the apprelenfion of the vulgar ; whence the language fpoken anong the lower clafs of people remained rude and unpolifhed even to the end of the monarchy. The Huns who over-run Italy, incapable of acquiring any knowledge of fuch a difficult and abitrule language, never adopted it ; and the native inhabitants being made acquainted with a language more matural and eafily acquired, quickly adopted that idiom of fpecelt introduced by their conquerors, although they till retained many of thofe words which the confined nature of the barbarian language made neceflary to allow them to exprefs their ideas. - And thus it was that the language of Rnine, that proud mittrefs of the world, from an original defect in its formation, althnugh it had been carried to a perfection in other refpesis far fuperior to ary northern language at that time, eafily gave way to them, and in a few agcs the knowledge of it was loit among mankind : while, on the contiary, the more cafy nature of the Greek language has fill been able to keep fome light footing in the world, although the nations in which it has N ${ }^{\circ} 1 \% 4$.
reign dominion for upwards of two thoufand years, and their conntry has been twice ravayed by barbarous nations, and more cruelly depreffed than ever the Ronraus were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more Atrictly tranfpolitive than that of any other language yet known, and was attended with all the defects to which that idion is naturally fubjected : nor could it boalt of fuch favourable alleviating circumtances as the Greek, the prevailing founds of the Latin being far lefs harmonious to the car; and although the formation of the words are fuch as to adinit of full and diftinet founds, and formodulated as to lay no reAtraint upon the voice of the fpeaker; yet, to a perfom unacquainted with the language, they do not cenvey that enchanting harmony to remallable in the Greek language. The Latin is flately and folemn; it does not excite difgult; but at the fame time it does not cham the ear, fo as to make it lifton with delightul attention. To one acquainted with thie language indeed, the nervous boidncte of the thoughts, the harnoniows rounding of the periods, the full folemn fwelling of the foumis, fo dilitinguifable in the moft eminent writers in that language which have been preferved to us, all confpire to make it pleafing and agreeable.In thefe adinired works we meet with all its beauties, without perceiving any of its defecis; and we naturally admire, as perfect, a language which is capable of producing fuch excellent works. - Yet with all thefe feeming excellencies, this language is lefs copious, and more limited in its ily le of comporition, than many mus. dern languages; far lefs eapable of precilion and acecuracy than almolt any of thefe; and infinitely behind them all in point of eafinefs in converiation. But thefe points have been fo fully proved already, as to require no further illuftration.-Of the compofitions in that language which have been preferved to us, the Orations of Cicero are beit adapted to the genius of the language, and we there fee it in its utmott perfection. In the Pbilojophical W'orks of that great author we perceive fome of its defects; and it requires all the powers of that grcat man to render his Epjifles agreeable, as thefe have the genius of the language to llruggle with. - Next to oratory, hiltory agrees with the genius of this language; and Cefar, in his Commentaries, has exhibited the language in its pureft elugance, without the aid of pomp or foreign orta-ment.-Among the poets, Virgil has bell adapted his works to his language. The flowing harmony and pomp of it is well adipted for the epic ll rain, and the correct delimacy of his tatle rendered him perfectly equal in the tank. But Horace is the only pret whofe force of genius was able to overcome the bars which the language threw in his way, and fucceed in lyric pattry. Were it not for the billiancy of the thoughts, and acutenefs of the remarks, which fo eminently diftinguifh this author's compoficions, his ojes would long cre now have iunk into utter oblivion. Bur fo confcrous have all the Roman poets been of the unfituefs of their language for cafy dialogue, that almolt none of them, after Plautus and Terence, have attempted any dramatic compofitions in that language. Nor lave we any reafon to regret that they neglected this 5

## I. A N [ 545 ]

grage. branch of poetry, as it is probable, if they had ever become fond of thefe, they would have been obliged to have adopted fo many imnatural contrivances to tender them agreeable, as would have prevented us (who of crurfe would have confidered ourfelves as bound to follow them) from making that progrefs in the drama which fo particularly diftinguifhes the productions of modern times.
The modern Italian language, from an inattention of too common in literary futjects, has been ufually called a child of the Latin language, and is commonly be. lieved to be the ancient Latin a little debafed by the mixture of the barbarous language of thofe people who corquered Italy. The truth is, the cafe is directly the reverfe: for this language, in its general idiom and fundamental principles, is evidently of the anglogous kiod, firlt introduced by hofe fircee invacicrs, although it has borrowed many of its wordk, and fome of its modes of phrafeology, from the Latin, with which they were fo intimately blended that this could fcarcely he aroided; an it has been from remarking this night connection fo obvious at firft fight, that fuperficial obfervers have been led to draw this general conclufion, fo contrary to fact.

When Italy was over-run with the Lombards, and the empire deftroyed by thefe northern invaders, they, as conquerors, continued to fpeak their own native language. Fierce and illiterate, they would not foop to the fervility of fudying a language fo clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical diftinctions: while the Romans of neceffity were obliged to lludy the language of their conquerors, as well to obtain fome relief of their grierances by prayers and fupplications, as to deflroy that odious diftinction which fubfiked between the conquerors and conquered while they continued as diftinct people. As the language of their new mallers, although rude and confmed, was natural in its order, and eafy to be acquired, the Latins would foon attain a competent 1 kill in it : and as they bore fuch a proportion to the whole number of people, the whole language would partake fumewhat of the general found of the former: for, in fpite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccuftomed founds; and as it behcred the language of the barbarians to be much lefs copious than the Latin, whenever they found themfelves at a lofs for a word, they would naturally adopt thofe which moft readily prefented themfelves from their new fubjeets. Thus a language in time was formed, fomewhat refembling the Latin both in the general tenor of the founds and in the meaning of many words: and as the barbarians gave themfelves little trouble about language, and in fome cafes perhaps hardly knew the general analogy of their own language, it is not furprifing if their new fubjects fhould find themfelves fometimes at a lofs on that account : or if, in thefe fituations, they followed, on fome occafions, the analogy fuggefted to them by their own: which accounts for the Itrange degree of mixture of beterogeneous grammatical analogy we meet with in the Italian as well as Spanifh and French languages. The idiom of all the Gothic languages is purely analogous; and in all probability,

Voz. IX. Part II.
before their mixture with the Lating and other people langaze. in their provinces, the feveral grammatical parts of fpeech fullowed the plain fimple idea which that fuppofes; the verbs and nouns were all probably va:ied by auxiliaries, and their adjectives retained their fimple unalterable flate:-but by their mixture with the Latins, this limple form has been in many cafes altered; their verbs became in fome cafes inflected; but their nouns in all thefe languages fill retained their original form; although they have varied their adjectives, and foolifly clogged thcir nouns with gender, according 33 to the Latin idioms. From this heterogeneous and Has the do fortuitous (as we may fay, becaufe injudicious) mix. ficts of ture of parts, refults a language poffefing almoft all parent the defects of each of the languages of which it is com-tungues. pofed, with few of the excellencies of either : for it has neither the eafe and precifion of the analogrous, nor the pomp and boldnefs of the tranfopfitue, languages; at the fame time that it is clogged with almoft as many rules, and liable to as great abufes,

Thefe obfervations are equally applicable to the French and Spanifh as to the Italian language. With regard to this lafl in particular, we may obferve, that as the natural inhabitants of Italy, before the laft invafion of the barbarians, were funk and enervated by luxury, and that by depreffion of mind and genius which anarchy always produces, they had become fond of feafting and entertainments, and the enjoyment of fenfual pleafures conitituted their higheft delight; and their language partook of the fame debility as their body. - The barbarians too, unaccultomed to the fcductions of pleafure, foon fell from their original bolunefs and intrepidity, and, like Hannibal's troops of old, were encrvated by the fenfual gratifications in which a nation of conquerors unaccultomed to the reftraint of government freely indulged The foftnefs of the air, the fertility of the climate, the unaccufumed flow of riches which they at once acquired, together with the voluptuous manner of their conquered fubjcets; all confpired to enervate their minds, and render them foft and effeminate. No wonder then, if a language new-moulded at this juncture fhould partake of the genius of the people who formed it ; and intead of participating of the martial boldnefs and ferocity of either of their anceltors, thould be foftentd and enfeebled by every device which an effeminate people could invent.-The ftrong couronants which terminated the words, and gave them life and boldne!s, be. ing thought too harfh for the delicate ears of the fe fons of floth, were banifhed their language; while fonorous vowels, which could be protracted to any length in mufic, were fubitituted in their itcad. -Thus the And ${ }^{34}$ Italian language is formed flowing and harron:ous, thuyg but deltitute of thofe nerves which conflitute the tlowing and ftrength and vigour of a language : at the fame time, ours, is too the founds are neither enough diverfified, nor in them. feelice for felves of fuch an agreeable tone, as to afford great the higherf pleafure without the aid of mulical notes; and the ipecies of imall pleafure which this affords is ftill leffened by the compor little variety of meafure which the great fimilarity of the terminations of the words occafions. Hence it happens, that this language is fitted for excelling in fewer branches of literature than almoft any other : and although we have excellent hiftorians, and more than ordinary poets, in ltalian, yet they labour under

3 Z
great

Language. great inconveniences, from the langtage wanting nerves and ftatelinefs for the former, and fufficient variety of modulation for the latter. It is, more particularly on this account, altogether unfit for an epic poem : and though attempts have been made in this way by two men whofe genius, if not fettered by the language, might have been crowned with fuccefs; yet thefe, notwithllanding the fame that with fome they may have acquired, muft, in point of poetic harmony, be deemed defective by every impartial perfon. Nor is it poffible that a language which hardly admits of poetry without, rhime, can ever be capable of producing a perfect poem of great length; and the ftanza to which their poets have ever confined themfelves, mult always produce the moft difagreeable effect in a poem where unreftrained pomp or pathos are neceffary qualifications. The only fpecies of poetry in which the Italian language can claim a fuperior excellence, is the tender tone of elegy : and here it remains unrivalled and alone; the plaintive melody of the founds, and fmooth flow of the language, being perfectly adapted to exprefs that foothing melancholy which this fpecies of poetry requires. On this account the plaintive feenes of the Paflor Fido of Guarini have jufty gained to that poem an univerfal applaufe; although, unlefs on this account alone, it is perhaps inferior to almoft cvery other poem of the kind which ever appeared. We muft obferve with furprife, that the Italians, who have fettered every other fpecies of poetry with the fevereft thackles of rhime, have in this fpecies thowed an example of the molt unreftrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it : yet with amazement we perceive, that fcarce an attempt to imitate them has been made by any poet in Europe except by Milton in his Ly cidas; no dramatic poet, even in Britain, having ever adopted the unreftrained harmony of numbers to be met with in this and many other of their beft dramatic compofitions.

The excellency of the Spanilh congue.

Of all the languages which fprung up from the mixture of the Latins with the northern people on the deftruction of the Roman empire, none of them approach fo near to the genius of the Latin as the Spanifh docs. For as the Spaniards have been always remarkable for their military prowefs and dignity of mind, their language is naturally adapted to exprefs ideas of that kind. Sonorous and folemn, it admits nearly of as much dignity as the Latin. For converfation, it is the moft elegant and courteous language in Europe.

The humane and generous order of chivalry was firt invented, and kept its footing longef, in this nation; and although it run at laft into fuch a ridiculous excefs as defervedly made it fall into univerfal difrepute, yet it left fuch a ftrong tincture of romantic heroifm upon the minds of all ranks of people, as made them jealous of their glory, and ftrongly emulous of cultivating that heroic politenefs, which they confidered as the higheft perfection they could attain. Every man difdained to flatter, or to yield up any point of honour which he poffeffed; at the fame time, he rigoroufly exacted from others all that was his due. Thefe circumftances have given rife to a great many terms of refpect, and courteous condefcenfion, without meannefs or flattery, which give their dialogue a refpectful politenefs and elegance unknown to any other

European language. This is the reafon why the cha- Lang racters fo fincly drawn by Cervantes in Don Quixotte are ftill unknown to all but thofe who underftand the language in which he wrote. Nothing can be more unlike the gentle meeknefs and humane heroifm of the knight, or the native fimplicity, warmth of affection, and refpectful loquacity of the fquire, thanthe inconfiftent follies of the one, or the impertinent forwardnefs and difrefpectful petulance of the other, as chey are exhibited in every Englifh tranflation. Nor is it, as we imagine, poffible to reprefent fo much familiarity, united with fuch becoming condefcenfion in the one, and unfeigned deference in the other, in any other Ellropean language, as is neceffary to paint thefe two admirable characters.

Although this language, from the folemn dignity and majeftic elegance of its ftructure, is perhaps better qualified than any other modern one for the fublime ftrains of epic poetry ; yet as the poets of this nation have all along imitated the Italians by a moft fervile fubjection to rhime, they never have produced one poem of this fort, which in point of pocly of ftyle deferves to be tranfmitted to pofterity. And in any other \{pecies of poetiy but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made confiderable progrefs in it, before the thirft of gain debafed their fouls, or the defirc of univerfal dominion made them forfeit that liberty which they once fo much prized; fince they became enervated by an overbearing pride, and their minds enflaved by fuperflition, all the polite arts have been neglected: fo that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a fate of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

It will perhaps by fome be thought an unpardon. The $\mathrm{F}_{\mathrm{t}}$ able infult, if we do not allow the French the prefe. languap rence of all modern languages in many refpects. But deficien dignity fo far muft we pay a deference to truth, as to be obli- energy ged to rank it among the pooreft languages in Eilrope. Every other language has fome founds which can be uttered clearly by the voice : even the Italian, although it wants energy, ftill poffeffes diftinctnefs of articulation. But the French is almoft incapable of either of thefe beauties; for in that language the vowels are fo much curtailed in the pronunciation, and the words ruo into one another in fuch a manner, as necef farily to produce an indiftinctnefs which renders it incapable of meafure or harmony. From this caufe, it is in a great meafure incapable of poetic modulation, and rhime has been obliged to be fubftituted in its ftead; fo that this poorett of all contrivances which has ever yet been invented to diftinguifh poctry from profe, admitted into all the modern languages when ignorance prevailed over Europe, has fill kept fome footing in the greateft oart of thefe, rather through a deference for eftablifhed cuftoms than from any neceffity. Yet as the French language admits of fo little poetic modulation, rhime is in fome meafure neceffary to it; and therefore this poor deviation from profe has been adopted by it, and dignified with the name of Pos-
ruage. try. But by their blind attachment to this artifice, the French have neglected to improve fo much as they might have done the fmall powers for harmony of which their language is poffeffed; and by being long accultomed to this falfe tafte, they have become fond of it to fuch a ridiculous excefs, as to have all their tragedies, nay even their comedies, in rhime. While the poet is obliged to enervate his language, and check the 有ow of compofition, for the fake of linking his lines together, the judicious aftor finds more difficulty in deftroying the appearance of that meafure, and preventing the clinking of the rhimes, than in all the reft of his takk. - After this, we will not be furprifed to find Voltaire attempt an epic poem in this fpecies of poetry ; although the more judicious Fenelon in his Telemaque had fown to his countrymen the only fpecies of poefy that their language could admit of for any poom which afpired to the dignity of the epic frain.- Madam Defhouliers, in her Idyllie, has fnown the utmof extent of harmony to wbich their language can attain in fmaller poems: indeed in the tendernefs of an elegy, or the gaicty of a fong, it may fucceed; but it is fo deltitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric ftrain,-as the ineffectual efforts even of the harmonious Rouffeau, in his tranflation of the Pfalms of David of this famp, may fully convince us.

With regard to its powers in other fpecies of compofition, the fententious rapidity of Voltaire, and the more nervous dignity of Rouffeau, afford us no fmall prefumption, that, in a fkilful hand, it might aequire fo much force, as to tranfmit to futurity hiforical facts in a ftyle not altogether unworthy of the fubject. In attempts at pathetic declamation, the fuperior abilities of the compofer may perhaps on fome occafions excite a great idea; but this is ever cramped by the genius of the language: and although no nation in Europe can boalt of fo many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compofitions of this kind.

But notwithflanding the French language labours under all thefe inconveniences; although it can neither equal the dignity or genuine politenefs of the Spanih, the nervous boldnefs of the Englith, nor the melting foftnefs of the Italian; although it is defti-
tute of poctic harmony, and fo much cramped in found Languare. as to be atfolutely unfit for almofl every fpecies of mufical compofition (F) ; yet the fprightly genius of that volatile people has been able to furmount all thefe difficulties, and render it the language moft generally eftecmed, and moft univerfally fpoken, of any in Europe: for this people, naturally rope; for this people, naturally gay and loquacious, fitted for and fond to excefs of thofe fuperficial accomplifhments verfation. which engage the attention of the fair fex, have invented fuch an infinity of words capable of expreffing vague and unmeaning compliment, now dignified by the name of politens $/ s$, that, in this Atrain, one who ufes the French can never be at a lofs; and as it is eafy to converfe more, and really fay lefs, in this than in any other language, a man of very moderate talents may dittinguifh himfelf much more by ufing this than any other that has ever yet been invented. On this account, it is peculiarly well adapted to that fpecies of converfation which mult ever take place in thofe general and promifcuous companies, where many perfons of both fexes are met together for the purpofes of relaxa. tion or amufement ; and muft of courfe be naturally admitted into the courts of princes, and affemblics of great perfonages; who, haviag fewer equals with whom they can affociate, are more under a neceffity of converfing with ftrangers, in whofc company the tender ftimulus of friendfhip does not fo naturally expand the heart to mutual truft or unreftrained confidence. In thefe circumftances, as the heart remaineth difengaged, converfation muft neceflarily flag; and mankind in this fituation will gladly adopt that language in which they can converfe moft eafily without being deeply interefted. On thefe accounts the French now is, and probably will continue to be, reekoned the mof polite language in Europe, and thercfore the molt generally Audied and known : nor fhould we envy them this ditinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrafes.

The Englifh is perhaps poffefled of a greater de- The exceigree of excellence, blended with a greater number of tencies and defects, than any of the languages we have bitherto defedts nf mentioned. As the people of Great Britain are a the Engbold, daring, and impetuous race of men, fubject to lifh tongue Arong partions and from the af med independence which reigns amonglt all ranks of people $3 Z 2$
throughout
(F) An author of great difeernment, and well acquainted with the Erench language, has lately made the fame remark; and as the loftinefs of his genius often prevents him from bringing down his illuftrations to the level of ordinaty comprchenfion, he has on this and many other occafions been unjuftly accufed of being fond of paradoxes. - But as mufie never produces its full effect but when the tones it aflumes are in unifon with the idea that the words naturally excite, it of neceffity follows, that if the words of any language do not admit of that fuloefs of found, or that fpecies of tones, which the paffion or affection that nay be deferibed by the words would naturally require to excite the fame idea in the mind of one who was unaequainted with the language, it will be impoffible for the mufic to produce its full effect, as it will be cramped and confined by the found of the words;-and as the French language does not admit of thofe full and open founds which are neceffary for pathetic expreffion in mufic, it muft of courfe be unfit for mufical compolition.- It is true indeed, that in modern times, in which fo little attention is befowed on the fimple and fublime charms of pathetic expreffion, and a fantaltical tingling of unmeaning founds is called $m u / i c$-where the fenfe of the words are loft in fugues, quavers, and unneceffary repetition of particular fyllables, -all languages are nearly fitted for it; and among thefe the French : nor is it lefs to be doubted, that, in the eafy gaiety of a fong, this language can properly enough admit of all the mufical expreflion which that fpecies of compofition may require.

## L A N

Language throughout this happy ille, little fulicitous about contralling thefe paffions ;-our language takes its ftrongeft characteriflical diftinction from the genius of the people; and, being bold, daring, and abrupt, is ad. anirably well adapted to exprefs thofe great emotions which fpring up in an intrepid mind at the profpect of interelling events. Peculiarly happy too in the full and open found of the vowels, which forms the charateriltic tone of the language, and in the tlrong ufe of the afpirate H in almot all thofe words which are nfed as exclamations, or marks of flrong emotions upon interefting occalions, that particular clafs of words called interjections have, in our language, more of that fulnefs and unretrained freedom of tones, in which their chitf power confifts, and are puthed forth from the inmoft receffes of the foul in a more forcible and wuretrained manner, than any other language whatever. Hence it is more peculiarly adapted for the great and intercfing feenes of the drama than any language that has yet appeared on the globe. Nor has any other nation ever arrived at that perfection which the Englifh may juftly claim in that refpect; for however faulty our dramatic compofitions may be in fome of the critical niectics which relate to this art, -in nervous force of diction, and in the natural expreflion of thafe great emotions which conflitute its foul and energy, we claim, without difpute, an unrivalled fuperiority. Our language too, from the great intercoulfe that we have had with almolt all the nations of the globe by meaus of our extenfive commerce, and from the eminent degree of perfection which we have attained in all the arts and fciences, has acquired a copioufnefs beyond what any other modern language can lay claim to: and even the molt partial favourers of the Greek language are forced to acknowledge, that in this refpect it mult give place to the Englifh. Nor is it lefs happy in that facility of conflaction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an idiom purely analogous, it has deviated lefs from the genius of that idiom, and poffeffes more of the characteriftic advantages attending it than any other language that now exitts: for, while others, perhaps by their more intimate connection with the Romans, have adopted fome of their tranfpofitions, and clogged their language with unneceffary fetters, we have preferved ourfelves frec from the contagion, and ftill retain the primitive fimplicity of our language. Our zerbs are all varied by anxiliaries (exeept in the inflance we have already given, which is fo much in our favour); our nouns remain free from the perplexing embarrafiment of genders, and our pronouns mark this dillinction where neceffary with the mofl perfect accuracy; our artieles allo are of courfe freed from this unnatural encumbrance, and our adjectives preferve their natural freedom and independence. From the $\int$ e caules, our language follows an order of conftruction fo natural and eafy, and the rules of fyntax are fo few and obvious, as to be within the reach of the molt ordinary capacity. So that from this, and the great clearnefs and diffinctnefs of meaning with which this mode of conftruction is neceffarily accompanied, it is much better adapted for the familiar intercourfe of private fociety, and liable to fewer errors in uling it,
than any other language yet known; and on this ac- Lang count we may boalt, that in no nation of Europe do the lower clafs of people fpeak their language wich fo much accuracy, or have their minds fo much enlightened by knowledge, as in Great Britain. What then fhall we fay of the difcernment of thofe grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and timple rules which it requires in fyntax? As juftly inight we complain of an inven. tion in mechanies, which, by means of one or two fimple movements, obvious to all ordinary capacity, litile liable to-accidents, and eafily put in order by the rudet hand, fhould poffefs the while powers of a com. plex machine, which had required an infmite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various ac. cidents to which it was expofed by ufing it be repaird, by the powers of an ingenious artift, as com. plain of this characteritic excellence of our lauguage as a deffet.

But if we thus enjoy in an eminent degree the advantages attending an analogous langnage, we likewife feel in a confiderable meafure the defects to which it is expofed; as the number of monofyllables with which it always mult be embarraffed, notwithftanding the great improvements which have been made in our language fince the revival of letters in Europe, prevents in fome degree that fwelling fulnefs of found which fo powerfully contributes to harmonious dignity and graceful cadences in literary compofitions. And as the genius of the people of Britain has always been more difpoled to the rougter arts of command than to the fofter infinuations of perfuation, no pains have been taken to correct thefe natural defects of our langnage; but, on the contrary, by an inattention of which we have hardly a parallel in the hiftory of any civilized nation, we meet with many inftances, even within this lalt century, of the harmony of found being facrificed to that brevity fo defirable in converfation, as many elegant words have been cuitailed, and harmonious fyllables fuppreffed, to fubflitute in their fiead others, Thorter indeed, but more barbarous and uncouth. Nay, fo little attention have our forefathers beftowed upon the harmony of founds in our langunge, that one would be tempted to think, on looking back to its primitive ftate, that they had on fome occafions itudionfly debaled it. Our language, at its firit formation, feems to have laboured under a capital defect in point of found, as fuch a number of S's enter into the formation of our words, and fuch a number of letters and combinations of other letters affume a fimilar found, as to give a general hifs through the whole tenor of our language, which muft be exceedingly difagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct tafte, and endeavoured, if poffible, to diminifh the prevalence of this difgulting found. But fo far have they been from thinleing of this, that they have multiplied this letter exceedingly. The plurals of almoft all our nouns were originally formed by adding the harmonious fyllable en to the
fingular

## I A N

grage. fingular, which has given place to the letters; and intlead of boujen formerly, we now lay houfes. In like manner, many of the variations of our verbs were formed by the fyllable eth, which we liave likewife changed into the fame difagrecable letter; fo that, inftrad of lorecth, mozeth, writeth, walketh, \&xc. we lave changed them into the more modih form of loves, mowes, suriits, wadles, \&cc. Our very auxiliary vetbs have fuffered the fame change; and iuftead of hath and doth, we now make ufe of has and does. From thefe caufes, notwithfinanding the great improvements which have been made in language, within thefe few centuries, in other refpects; yet, with regard to the pleatingnefs of found alone, it wás perhaps much more yerfect in the days of Chaucer than at prefent: and although cuilom may have Iendered thefe founds fo fa. miliar to our ear, as not to affect us much ; yet to an unprijudiced perfon, unacquainted with our language, we have not the Imallett doubt but the language of Bacon or Silhey, would appear mure harmonious ilan that of Robertion or Huwe. This is indeed the fundameutal ocfect of our language, and loudly calls for refornation.
But notwithlanding this great and radical defeet with regard to pleafinguefs of founds, which muft be fo llrongly perceived by every ore who is unacquainted with the meaning of our words; yet to thofe who underliand the language, the exceeding copioufnefs which it allows in the chovice of words proper for the occaion, and the nervous force which the perfipicuity and graceful elegance the emplafis beftows upon it, makes this iffet be totally overlooked; and we could produce fuch numerous works of profe, which excel in alnofl every diffcrent fyle of compofition, as Would be tirefone to enumerate: every reader of catte and difcernment will be able to recoliect a fufficient number of writings which excel in point of ftyle, between the graceful and becoming gravity fo confpicuous in all the works of the author of the Whole Dnaty of ATan, and the animated and nervous diction of Robertion in his Hittory of Charles the Fiffh, - the more fuwery flyle of Shaftefbury, or the Attic fimplicity and elegance of Addifon. But although we can equal, if not furpafs, every modern language in $w \times r$ rks of profe, it is in its poctical puwers that our language fhines forth with the greateft lultre. The brevity to which we mult here neceflarily confine ourfelves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwife it would be eafy to fhow, that every other modern language labours under great reflaints in this refpect which ours is freed from ; -that our language admits of a grater variety of poetic movements, and diverfity of cadence, than any of the admired languages of antiquity ; that it diftinguilhes with the greateft accuracy between accent and quantity, and is poffeffed of every other poetic excellence which their languages were capable of: fo that we are poffered of all the fources of harmuny which they could boalt; and, beindes all thefe, have one fuperadded, which is the caufe of greater variety and more forcible exprefion in numbers than all the rett; that is, the unlinited power given by the emphalis over quantity and cadence; by means whereof, a neeelfary ynion between found and fenfe, numbers and meaning,
in verfification, unknown to the ancients, has heen- Iancuage. brought about, which gives our language in this re- -r-un〔pect a fuperiority over all thole juflly admired lan. guages. But as we cannot here furhier purfue this iubject, we fhall only obferve, that thefe great and dittinguifaing excellencies far mone than connterbalance the inconveniences that we have already mentioned : and although, in mere pleafnntnefs of founds, or harmonious how of fylllables, our language may he inferiur to the Greek, the Latin, Italian, and Spanith; yet in point of manly dignity, graceful varicty, intuitive diftinct nefs, nervous energy of exprefion, unconftrained fieedom and liarmony of poctic numbers, it will yield the palm to none. Our immortal Milton, flowly riiling, in graceful majefy flands up as equad, if not fuperior in thefe refpets io any poet, in any other language, that ever yet exifted;-whise Thomfon, with more humble aim, in melody more fmoth and flowing, fuftens the foul to harmony and peace :-the plaiutive moan of Hammond calls forth the tender tear and fympathetic figh ; while Gray's more foothing melanclu'y fixes the fober mind to filent contem-plation:-more tunder ftill than thefe, the amiable Shentlon comes; and from his Duric reed, till free from courtly affeciation, flows a ltrein to pure, fo fimple, and of fuch tender harmony, as even Arcadian thepherds would be proud to own. But far before the relt, the daring Slakeefpeare fteps forth confpichous, clothed in native dignity; and, prefling forward with unremitting ardour. boldy lays clain to both dramatic crowns held out to him by Thalia and Melpomcne: -his rivals, far behind, look up, and envy him for thefe unfading glories; and the allonifhed natimns rouas, with ditant awe, behold and tremble at his daring light. - Thus the language, equally obedient to all, bends with eafe under thelr hands, whatever form they would have it alfume; and, like the yielding wax, readily receives, and faithfully tranfmitz to poterity, thofe impreffions which they have flamped upon it.
Such are the principal outlines of the language of Great Britain, fuch are its beauries, and fuch its moft capital defects; a language inure peeculiarly circumflanced than any that has ever yet appeared. - It is the language of a great and powerful nation, whofe fleets furround the globe, and whofe merchants are in every port ; a people admired or revered by all the world:-and yet it is lefs' knowa in every foreign country than many of the other languages in Europe. In it are written more perfect reatifes on every art and fcience than are to be found in any other language ; yet it is lefs fought after or eltecmed by the literati in any part of the globe than almoft any of thefe. Its fuperior powers for every purpofe of language are fuf. ficiently obvious from the models of perfection in almolt every particular which can be produced in it :yet it is neglected, defpifed, and vilified by the people who ufe it ; and many of thcfe authors who owe almoft the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highent contempt. Neglected ans defpifrd, it lias been trodden under foot as a thing attogether unworthy of cultivation or attention. Yet in fipite of all thefe inconveniences, in fipite of the many wounds it has thas seceived, it fill holds up ita

## L A N [ $55^{\circ}$ ] L A N

Ranguage, head, and preferves evident marks of that comelinefs and vigour which are its characterittical diftinction. Like a healthy oak planted in a rich and fertile foil, it has fprung up with vigour: and although neglected, and fuffered to be over-run with weeds; although expofed to every blait, and unprotected from every violence; it fill beareth up under all thefe inconveniences, and fhoots up with a robult healthinefs and wild luxuriance of growth. Should this plant, fo found and vigorous, be now cleared from thofe weeds with which it has been fo much encumbered; - fhould every obftacle which now buries it under thich fhades, and hides it from the view of every paffenger, be cleared away:- fhould the foil be cultivated with care, and a Atrong fence be placed around it, to prevent the idle or the wicked from breaking or diftorting its branches; who can tell with what additional vigour it would flourifh, or what amazing magnitude and perfection it might at lall attain!-How would the aftoniflaed world behold, with reverential awe, the majeltic gracefulnefs of that object which they fo lately defpifed!

Beauly of Language confidered in regard to Compofstion. The beauties of language may be divided into three claffes: 1. Thofe which arife from found; 2 . Thofe which refpect fignificance; 3. Thofe derived from a refemblance between found and fignification.

## Elements

 of Crit.which diminitheth in appearance the fize of every ob. Langu: ject except the firft : but when beginning at the greateft object, we proceed gradually to the leaft, refemblance makes us imagine the fecond as great as the firlt, and the third as great as tbe fecond; which in appearance magnifies every object except the firt. On the other hand, in a feries varying by large differences, where contraft prevails, the effects are directly oppofite : a great object fucceeding a fmall one of the fame kind, appears greater than ufual; and a little object fucceeding one that is great, appears lefs than ufual $\ddagger$. $\mid$ See $R$ Hence a remarkable pleafure in viewing a feries afcend. fermbanc ing by large differences; directly oppofite to what we feel when the differences are fmall. The lealt object of a feries afcending by large differences has the fame effect upon the mind as if it food fingle witbout making a part of the feries : but the fecond object, by means of contraft, appears greater than when viewed fingly and apart ; and the effect is perceived in afcending progreffively, till we arrive at the laft object. The oppofite effect is produced in defcending ; for in this direction, every object, except the firft, appears lefs than when viewed feparately and independent of the feries. We may then affume as a maxim, which will hold in the compofition of language as well as of other fubjects, That a flrong impulfe fucceeding a weak, makes a double impreffion on the mind; and that a weak impulfe fucceeding a ftrong, makes fcarce any impreffion.

After eftablifhing this maxim, we can be at no lofs about its application to the fubject in hand. The following rule is laid down by Diomedes $\dagger$. "In verbis $\dagger D_{c} A$ obfervandum eft, ne a majoribus ad minora defcendat parfece. oratio; melius enin dicitur, Vir ef optimus, quam, orat. 1 Vir optinus eft." This rule is alfo applicable to entire members of a period, whicb, according to our author's expreffion, ought not, more than fingle words, to proceed from the greater to the lefs, but from the lefs to the greater. In arranging the members of a period, no writer equals Cicero: The following exainples are too beautiful to be furred over by a reference.

Quicum quxftor fueram,
Quicum me fors confuetudoque majorum, Quicum me deorum hominumque judicium conjunxerat. Again :

## Habet honorem quem petimus,

Habet fpem quam prxpofitam nobis habemus,
Habet exittimationem, multo fudore, labore, vigiliifque, collectam.

## Again:

## Eripite nos ex miferiis,

Eripite nos ex faucibus corum,
Quorum crudelitas noftro fanguine non poteft expleri. De oratore, l. 1. § 52 .

This order of words or members gradually increafing in length, may, fo far as concerns the pleafure of found, be denominated a climax in found.

With refpet to the mufic of periods as united in a difcourfe this depends chiefly on varicty. Hence a rule for arranging the members of different periods

## L A N

uniformity of found and cadence, the arrangement, the cadence, and the length of the members, ought to be diverfified as much as poffible: and if the members of different periods be fufficiently diverfified, the periods themelves will be equally fo.
II. With refper to fignififation. The beautics of language with refpeat to fignification, may not improperly be diflinguified into two kinds: firlt, the beauties that arife from a right choice of words or materials for conftructing the period; and next, the beauties that arife from a due arrangement of thefe words or materials.
r. Communication of thought being the chief end of language, it is a rule, That perfpicuity ought not to be facrificed to any other beauty whatever. Nothing therefore in language ought more to be ftudied, than to prevent all obfcurity in the expreffion; for to bave no meaning, is but one degree worfe than to have a meaning that is not underflood. We fhall here give a few examples where the obfcurity arifes from a wrong choice of words.

Livy, fpeaking of a rout after a battle, "Mulique in ruina majore quam fuga oppreffi obtruncatique." This author is frequently obfeure by expreffing but spart of his thought, leaving it to be completed by his reader. His defcription of the fea-fight, l. 28. cap. 30. is extremely perplexed.

Ac fpem fronte ferenat. Virg.
The rule next in order is, That the language ought to correfpond to the fubject : heroic actionis or fentiments require elevated language; tender fentiments ought to be expreffed in words foft and flowing; and plain language void of ornament, is adapted to fubjects grave and didactic. Larguage may be confidered as the drefs of thought; and where the one is not fuited to the other, we are fenfible of incongruity, in the fame manner as where a judge is dreffed like a fop, or a peafant like a man of quality. Where the impreffion. made by the words refembles the impreffion made by the thought; the fimilar emations mix fweetly in the mind, and double the pleafure; but where the impreffions made by the thought and the words are diffimilar, the unnatural union they are forced into is difagreable.

This concordance between the thought and the,
words has been obferved by every critic, and is fo Language. well undertood as not to require any illultration. But there is a concordance of a peculiar kind that has fcarcely been touched in works of criticifm, though it contributes to neatnefs of compofition. It is what follows.

In a thought of any extent, we commonly find fome parts intimately united, fome fightly, fome disjoined, and fome directly oppofed to cach other. To find there conjunctions and disjunctions imitated in the expreffion, is a beauty ; becaufe fuch imitation makes the words concordant with the fenfe. This doetrine may be illuftrated by a familiar example: When we have occafion to mention the intimate connection that the foul hath with the body, the expreffion ought to be, the foul and body; becaufe the article the, relative to both, makes a connection in the expreffion, refembling in fome degree the connection in the thought : but when the foul is ditinguifhed from the body, it is butter to fay the foul and the body; becaufe the disjunction in the words refembles the disjunction in the thought. We proceed to other examples, beginning with conjunctions.
" Conflituit agmen; et expedire tela animofque, equitibus juffis," \&c. Livy, l. 38. § 25 . Here the words that exprefs the conneeted ideas are artificially connected by fubjecting them both to the regimen of one verbs And the two following are of the fame kind.
" Quum ex paucis quotidie aliqui eorum caderens aut vulnerarentur, et qui fuperarent, feffi et corporibus et animis effent," \&cc. Ibid. § 29.
Pof acer Mneftheus adducto confitit arcu,
Alta petens, paritcrque oculos telumque tetendit. Aneid, v. 507.
But to juftify this artificial connection among the words, the ideas thcy exprefs ought to be intimately connetted; for otherwife that concordance which is required between the fenfe and the expreffion will be impaired. In that view, the following paffage from Tacitus is exceptionable; where words that fignify ideas very litcle connected, are however forced into an artificial union. "Germania omnis a Gallis, Rhætiifque, et Pannoniis, Rheno et Danubio fluminibus; a Sarmatis Dacifque, mutuo metu aut montibus feparatur."
Upon the fame account, the following paffage feems. equally exceptionable.

The fiend look'd up, and knew
Mis mounted fale aloft; nor more, but fled
Marming, and with him fcd the fhades of night.
Parudife Loft, $B$. iч, at the end.
There is no natural connection between a perfon's $\mathrm{A}_{5}$ ing or setiring, and the fueceftion of day light to darknefs; and therefore to connect artificially the terms that fignify thefe things cannot have a fweet effect.

Two members of a thought conneted by their relation to the fame action, will naturally be expreffed by two members of the period governed by the fame verb; in which cafe thefe members, in order to improve their. connection, ought to be contructed in the fame manner. This beauty is fo common among good writers as to have been little attended to; but the neglect of it is remarkably difagreeable: for example, "He dis Better thus: "He did not mention Leonora, nor her father's death."

Where two ideas re fo conneEted as to require but a copulative, it is pleafant to find a comection in the words that exprefs thefe ideas, were it even fo flight as where both begin with the fame letter. Thus,
"The peacock, in all his pride, does not difplay half the colour that appears in the garments of a Britifh lady, when the is either dreffed for a ball or a birthday." Spect.
" Had not my dog of a fteward run away as he did, without making up his accounts, I had aill been immerfed in fin and fea-coal." $l b$.

> My life's companion, and my bofom-friend,
> One faith, one fame, one fate hall both attend.
> . Dryden, Tranflation of Seneid.

Next as to examples of disjunetion and oppofition in the parts of the thought, initated in the expreffion; an imitation that is diftinguifhed by the name of antithefis.

Speaking of Coriolanus foliciting the people to be made conful:

With a proud heart he wore his humble weeds.
Coriolanus.
"Had you rather Cæfar were living, and die all Alaves, than that Cxfar were dead, to live all free men?"

Julius Cafar.
He hath cool'd my friends and heated mine cnemies.
Sbakijpeare.
An artificial connection among the words, is undoubtedly a beauty when it reprefents any peculiar connection among the conflituent parts of the thought; but where there is no fuch counection, it is a poritive deformity, becaule it makes a difcordance between the thought and expreffion. For the fame reafon, we ought alfo to avoid every artificial oppofition of words where there is none in the thought. This laft, termed verbal antithefis, is fludied by low writers, becaule of a certain degree of livelinefs in it. They do not confider how incongroous it is, in a grave compofition, to cheat the reader, and to make him expect a contralt in the thnught, which upon examination is not found there.

A fault directly oppofite to the latt mentioned, is to conjoin artificially words that exprefs ideas oppofed to each other. This is a faule too grofs to be in common practice; and yet writers are guilty of it in fome degree, when they conjoin by a copulative things tranfacted at different periods of time. Hence a want of neatnefs in the fullowing expreffion: "The nobility too, whom the king had no means of retaining by fuitable offices and preferments, had been feized with the general difcontent, and unwarily threw themfelves into the fcale which began already too much to preponderate." Hume. In periods of this kind, it appears more neat to exprefs the paft time by the participle paflive, thus: "The nobility having becn feized with the general difcontent, unwarily threw themfelves," \&c. or, "The nobility, sho had been feized, $\&<$. unwarily threw themfeives," \&c.

It is unpleafant to find even a negative and affirmative propofition connetted by a copulative:
$\mathrm{N}^{\circ} 174$.

## I A N

If it appear not plain, and prove untrue,
Deadly divorce Itep between me and you.
Shakefpeare.
In mirth and drollicry it may have good effect to connee verbally things that are oppofite to each other in the thought. Example; Henry IV. of France intruducing the Marefchal Biron to fome of his friends, "Here, gentlemen (Fays he) is the Marefchal Biron, whom I freely prefent both to my friends and enemies."

This rule of fudying uniformity between the thought and expreffion may be extended to the conftruction of fentences or periods. A fentence or pariod ought to exprefs one entire thought or mental propofition; and differert thoughts ought to be feparated in the expreflion by placing them in different fentences or periods. It is therefore offending againft neatnefs, to crowd into one period entire thoughts requiring more than one; which is joining in language things that are feparated in reality. Of errors againft this rule take the following examples.
" Behold, thou art fair, my beloved, yea pleafant: alfo our bed is green."

Burnet, in the hiltory of his own times, giving Lord Sunderland's character, fays; "His own notions were always good; but he was a man of great expence."
"I have feen a woman's face break out in heats, as the has been talking againft a great lord, whom the had never feen in her life; and indeed never knew a party-woman that kept her beauty for a twelvemonth." Spec.

Lord Bolingbroke, fpeaking of Strada: "I fingle him out among the moderns, becaufe he had the foolifh prefumption to cenfure Tacitus, and to write hiftory himfelf; and your lordhip will forgive this fhort excurfinn in honour of a favourite writer."
To crowd into a fingle member of a period different fubjects, is Aill worfe than to crowd them into one period:

> Trojam genitore Adamato
> Paupere (manfiffetque utinam fortuna) profectus.

SEneid iii. 614.
From conjunctions and disjunctions in general, we proceed to comparifons, which make one fpecies of them, beginning with limilies. And here alfo, the intimate connection that words have with their meaning requires, that in defcribing two refembling objects, a refemblance in the two members of the period ought to be ftudied. To begin with examples of tefemblances expreffed in words that have no refemblance.
"I have obferved of late, the Ayle of fome great minifters very much to exceed that of any other productions." Swift. This, intead of Audying the refemblance of words in a period that expreffes a comparifon, is going ont of one's road to avoid it. InAtead of produaions, which refemble not minillers great nor fmall, the proper werd is zuriters or autbors.
"I cannot but fancy, however, that this imitation, which paffes fo currently with otber juldments, mult at fome time or atber have fluck a little with your lordMrip." Sluaftell. Better thus: "I cannot but fancy, however, that this imitation, which paffes fo currently with others, mult at fome time or other have fluck a dittle with your loriJhip?"
"A

## L A N $\quad\left[\begin{array}{lll}553\end{array}\right] \quad$ L A N

uage. "A glutton or mere fenfualit is as ridiculous as the other two chataters." ILl.
"They wifely prefer the gencrous efforts of goodzuill and afferion, to the reluctant compliances of ficch as obey by force." Bolingb.
It is a ftill greater deviation from congruity, to affeet not only variety in the words, but alfo in the conffruction.
Hume fpeaking of Shakefpeare: "There may remain a fufpicion that we over-rate the greatnefs of his genius, in the fame manner as bodies appear more gigantic on account of their being difproportioned and mifhapen." This is Audying variety in a period where the beauty lies in uniformity. Better tlus: "There may remain a fufpicion that we over rate the greatnefs of his genius, in the fame manner as we over-rate the greatnefs of bodies that are difproportioned and mihhapen."
Next of comparifon where things are opprfed to each other. And here it muft be obvious, that if refemblance ought to be fudied in the words which exprefs two refembling obfects, there is equal reafon for fudying oppoition in the words which exprefs contrafted objects. This rule will be beft illuftrated by examples of deviations from it.
"A friend exaggerates a man's virtues; an enemy inflames his crimes." Spect. Here the oppofition in the thought is negletted in the words; which at firft view feen to import, that the friend and enemy are employed in different matters, withont any relation to cach other, whether of refemblance or of oppofition. And therefore the contratt or oppofition will be better marked by expreffing the thought as follows: " A friend exaggerates a man's virtues, an enemy his crimes."
" The wife man is happy when he gains his own approbation; the fool when he recommends himifelf to the applaufe of thofe about him." $I b$. Better: "The wife man is happy when he gains his own approbation, the fool when he gains that of others."
We proceed to a rule of a diferent kind. During the courfe of a period, the feene ought to be continued without variation : the changing from perfon to perfon, from fubject to fubjeet, or from perfon to fubject, within the bounds of a fingle period, diftrats the mind, and affords no time for a folid impreffion.
Hook, in his Ronan hillory, fpeaking of Eumenes, who had been beat to the ground with a ftone, fays, "After a thort time be came to himiclf; and the next day they put him on board his hip, zwhich conveyed him firlt to Corintb, and thence to the ifland of $I E$ gina."
The following period is unpleafant, even by a very night deviation from the rule: "T That fort of inftruction which is acquired by inculcating an important moral truth," \&c. This expreffion includes two perfons, one acquiring, and one inculcating; and the fcene is changed without neceffity. To avoid this bleminh, the thought may be expreffed thus: "s That fort of inftruction which is afforded by inculcating," acc.
The bad effet of fucl a change of perf,n is remark. able in the following paffage: " The Britons, daily barafled by cruel iaroads from the Pitts, were forced
Vol. IX. Part II.
to call in the Saxons for their defence, who confequent-Language. ly reduced the greatelt part of the ifland to their own power, drove the Britons into the molt remote and mountainous parts, and the ref of the country, in cuftoms, religion, and language, became wholly Saxon." Swift.

The following paffage has a change from fubject to perfon: "This profitution of praife is not only a deceit upon the gral's of mankind, who take their notion of characters from the learned; but alfo the better fort mult by this means lofe fome part at lealt of that defire of fame which is the incentive to generous actions, when they find it promifcuoully beltowed on the meritorious and undeferving." Guardian, $\mathrm{N}^{\mathrm{o}} 4$.

The prefent liead, which relates to the choice of materials, Thall be clofed with a rule concerning the ufe of copulatives. Longinus ohferves, that it animates a period to drop the copulatives; and he gives the following example from Xenophon: "Clofing their fhields together, they were pufh'd, they fought, they new, they were flain." The reafon may be what follows. A continued found, if not loud, tends to lay us afleep: an interrupted found roufes and animates by its repeated impulfes: thus feet compofed of fyllables, being pronounced with a fenfible interval between each, make more lively impreffions than can be made by a continued found. A period of which the members are connected by copulatives, produceth an effect upon the mind approaching to that of a continued found; and theretore the fuppreffing copulatives muft animate a defcription. It produces a different effect akin to that mentioned : the members of a period connected by proper copulatives, glide fmoothly and gently along ; and are a proof of fedatenefs and leifure in the fpeaker: on the other hand, one in the hurry of paffion, neglecting copulatives and other particles, expreffes the principal inage only; and for that reafon, hurry or quick action is bett expreffed without copulatives:

> Veni, vidi, vici.

Ferte citi flammas, date vela, i:noeliite remos.
Aneicl. iv. 593.
Quis globus, O cives, caligine volvitur arra?
Ferte citi ferrum, date tela, fcandite muros.
Hollis adeft, eja.
压neid. ix: $3 \pi$
In this view Longinus juftly compares copulatives in a period to ftrait tying, which in a race obltructs the freedom of motion.

It follows, that a plurality of copulatives in the fame period ought to be avoided; for if the laying afide copulatives give force and livelinets, a redindancy of them mat render the period languid. 'The following inftance may be appealed to, though there are but two copulatives: "Upon looking over the letters of my female correfpondents, I find feveral from women complainiag of jealous hufbands; and at the fame time proteiting their own innocence, and defiring my advice upon this occafion." Spect.

Where the words are intended to exprefs the collnefs of the fpeaker, there indeed the redundancy of copulatives is a beauty:

- Dining one day at an alderman's in the city, Peter - obferved him expatiating after the manner of his bie 4 A
- thren
" (faid the fage magiftrate) is the king of meat: beef " compreliends in it the quinteffence of partridge. and " quail, and venilon, and pheafant, and plum.pudding, "sud cuftard." Tale of a Tub, § 4. And the suthor fhows great delicacy of tate by varying the expreffion in the mouth of 1 'eter, who is reprefented more animated: "Bread (fays he), dear brothers, is the " ftaff of life; in which bread is contained, inclufive, " the quinteffence of beef, mutton, veal, venifon, par" tridge, plum-pudding, and cuftard."

Another cafe mult aifo be excepted. Copulatives have a good effect where the intention is to give an impreffion of a great multitude confiliting of many divifions; for example:' 'The army was compofed of Grecians, and Carians, and Lycians, and Pamphylians, and Phrygians.' The reafon is, that a leifurely furvey, which is expreffed by the copulatives, makes the parts appear nore numerous than they would do by a hafty furvey: in the latter cafe, the army appears in one group; in the former, we take as it were an accurate furvey of each nation, and of each divit on.
2. To pave the way for the rules oi arrangement, it will be heie neceflary to explain the difference between a natural fyle and that where tranfpofition or inververlion prevails. In a natural flyle, relative words are by juxtapofition connected with thofe to which they relate, going before or after, according to the peculiar genius of the language. Agair, a circumitance connected by a prepofition, follows naturally the word with which it is connected. But this arrangement may be varied, when a different order is more beautiful: a circumitance may be placed before the word with which it is connecled by a prepofition; and may be interjected even between a relative word and that to which it relates. When fuch liberties are frequently taken, the flyle becomes inverted or tranfpofed.

But as the liberty of inverfion is a capital point in the prefent fubject, it will be neceffary to examine it more narrowly, and in particular to trace the feveral degrees in which an inverted ftyle recedes more and more from that which is natural. And firf, as to the placing a eircumpance before the word with which it is connected, this is the eafieft of all inverfion, even fo cafy as to be confiftent with a Ayle that is properly termed natural: witnefs the following examples.
"In the fincerity of my hcart, I profefs," \&cc.
"By our own ill management, we are brought to fo low an ebb of wealth and credit, that," \&c.
" On Thurfday monning there was little or nothing tranfacted in Change-alley."
"At St Bride's church in Fleetीreet, Mr Woolfton (who writ againf the miracles of our Saviour), in the utmoft terrors of confcience, made a public recantation."

The interjecting a circumftance between a relative word and that to which it relates, is more properly termed inverfion; becaufe, by a disjunction of words intimately connected, it recedes farther from a natural ftyle. But this licence has degrees; for the disjunction is more violent in fome cafes than in others.
In nature, though a fubject cannot exift without its qualities, nor a quality without a fubject; yet in our conception of thefe, a material difference may be remarked. We cannot conceive a quality but as belong.
which is formed of the fubject. But the oppofite hold, not; for though we cannot form a conception of a fubject void of all qualities, a partial conception may be formed of it, abftracting from any particular quality: we can, for example, form the idea of a tine A. rabian horfe without regard to his colour, or of a white horfe without regard to his fize. Such partial conception of a fubject is Itill more eafy with refpect to action or motion, which is an occafional attribute only, and bas not the fame permanency with colour or figure: we cannot form an idea of motion independent of a body; hut thcre is nothing more eafy than to form an idea of a body at reft. Hence it appears, that the degree of inverfion depends greatly on the order in which the related words are placed: when a fublfantive occupies the firlt place, the idea it fuggefts mutt fubfite in the mind at lealt for a moment, independent of the relative words afterward introduced; and that moment may without difficulty be prolonged by interjecting a circumitance between the fubflantive and its connections. This liberty therefore, however frequent, will fcarce alone be fufficient to denominate a flyle inverted. The cafe is very different, where the word that occupies the firft place denotes a quality or an action; for as thefe cannot be conceived without a fubject, they. cannot without greater violence be feparated from the fubject that follows; and for that reafon, every fuch feparation by means of an interjected circumftance belongs to an inverted fyle.

To illulltate this doctrine, examples are neceffary. In the following, the word firf introduced does not imply a relation:

$$
\begin{aligned}
& \text { Her former trefpafs fear'd. } \\
& \text { Powerful perfunaders, quicken'd at the fcent } \\
& \text { Of that alluring fruit, urg'd me fo keen. } \\
& \text { Moon that now meet'f the orient fun, now fil'凡 } \\
& \text { With the fix'd ftars, fixed in their orb that fies, } \\
& \text { And ye five other wand'ring fres that nove } \\
& \text { In myftic dance not without fong, refound } \\
& \text { His praife. } \\
& \text { Where the word firf introduced imports a relation? } \\
& \text { the disjunction will be found more violent: }
\end{aligned}
$$

Of man's firt difobedience, and the fruit Of that forbidden tree, whofe mortal tafte Brought death into the world, and all our we, With lofs of Eden, till one greater man Refore us, and regain the blisful feat, Sing heav'nly mufe.
-f Upon the firm opacous globe Of this round world, whofe firf convex dividee The luminous inferior orbs, inclos'd From chaos and the inroad of darknefs old, Satan alighted walks.

## L A N

Language would have no great power, were it confined to the natural order of ideas : By inverfion a thoufand beauties may be compafed, which mult be relinquifhed in a natural arrangement.

Rules. 1. In the arrangenient of a period, as well as in a right choice of words, the firlt and great object being per Ppicuity, the rule above laid down, that perfpicuity ought not to be facrificed to any other beauty, holds equally in hoth. Ambiguities occafioned by a wrong arrangement are of two forts; one where the arrangement leads to a wrong fenfe, and one whete the fenfe is lefs doubtful. The firft, being the more culpable, frall take the lead, beginning with examples of words put in a wrong place.
"How much the imagination of fuch a prefence mult exalt a genius, we may obferve merely from the influence which an ordinary prefence has uver men." Shaficfb. This arrangement leads to a wrong fenfe: the adverb merely feems by its polition to affect the preceding word; whereas it is intended to affect the following words, an ordinary prefence; and therefore the arrangement ought to be thus: "How much the imagination: of fuch a prefence mult exalt a genius, we may oblerve from the influence which an ordinary prefence merely has over men." [Or better],-" which even an ordinary prefence bas over men."
" Sixtus the Fourth was, if I mittake not, a great collector of books at leaft." Boling. The expreffion here leads cvidently to a wrong fenfe; the adverb at leaf, ought not to be connected with the fublantive books, but with collefor, thus: "Sixtus the Fourth was a great collector at leall, of books."

Speaking of Louis XIV. "If he was not the greatefl king, he was the beft actor of majelty at leatt that ever filled a tbrone." $1 d$. Better thus: "If he was not the greatelt king, he was at leaft the bell aktor of majetty," Scc. This arrangement removes the wrong fenfe occafioned by the juxtapofition of majefly and at leaff.

The following examples are of a wrong arrangement of members.
" I have confined myfelf to thofe methods for the advancement of piety, which are in the power of a prince limited like ours by a Arict execution of the laws." Swift. The Atructure of this period leads to a meaning which is not the author's, viz. power limited by a frict exccution of the laws. That wrong fenfe is removed by the following arrangement: "I have conGned myfelf to thofe methods for the advancement of piety, which, by a frict execution of the laws, are in the power of a prince limited like ours."
"This morning, when one of lady Lizard's daughters was looking over fome hoods and ribhands brought by her tirewoman, with great care and diligence, I employed no lefs in examining the box which contained them." Guardian. The wrong fenfe occafioned by this arrangement, may be eafily prevented by varying it thus: "This morning, when, with great care and diligence, one of Lady Lizard's daughiers was looking over fome hoods and ribbands," \&c.
"A great fone that I happened to find after a long fearcli by the fea-florc, lerved me for an anchor." Seciff. One would think that the fearch was confined to the fea-thore; but as the meaning is, that the great
thone was found by the fea-fhore, the period ought to Lencuage, be arranged thus: "A great flone that, after a long fearch, I happencd to find by the fea-flore, ferved me for an anchor."
Next of a wrong arrangement where the fenfe is left doubtful; beginuing, as in the former fort, with examples of a wrong arrangement of words in a member.
"Thefe forms of converfation by degreces multiplied and grew troublefome." Spec. Here it is left doubtful whether the modification ly degrees relates to the preceding member or to what fulluws: it fhould be, "Thefe forms of converfation multiplied by degrees."
". Nor does this falfe modelty expofe us only to fuch actions as are indifcreet, but very often to fuch as are highly criminal." Spect. The ambiguity is remuved by the fullowing arrangement: "Nor does this falfe modefty expofe us to fuch actions only as are indif. creet," \&c.
"The empire of Blefufcu is an illand fituated to the northeeaft fide of Lilliput, from whence it is parted only by a channei of 800 yards wide." Scuif:. The ambiguity may be removed thus:
" from whence it is parted by a channel of 800 yards wide only."

In the following examples the fenfe is left doubtful by wrong arrangement of members.
"' The miniter who grows lefs by his elevation, like a little fatue placed on a mighty pedeftal, will always have his jealoufy Arong a,hout him." Bolingb. Here, fo far as can be gathered from the arrangement, it is doubtful, whether the object introduced by way of fimile relates to what goes before or to what tollows. The ambiguity is removed by the following arrangement: "The minitter who, like a little ftatue placed on a mighty pedeltal, grows lefs by his elevation, will always," \&cc.

Speaking of the fuperflitious practice of locking up the room where a perfon of diftinction dies: "The knight, feeing his habitation reduced to fo fmall a compafs, and himfelf in a manner fhut out of his own houre, upon the death of his mother, ordered all the apartments to be flung open, and exorcifed by his chaplain," Spec. Better thus: "The knight, feeing his habitation reduced to fo fmall a compafs, and himfelf in a manner fhut out of his own houfe, ordered, upon the death of his mother, all the apartments to be flung open."
Speaking of fome indecencies in converfation: "As it is impofible for fuch an irrational way of conver. fation to laft long among a people that make any profeffion of religion, or how of modsity, if the comntry gentlemen get into it, they will certainly be left in the lurch." Ib. The ambiguity vanilhes in the fullowing arrangement: gentlemen, if they get into it, will certainly be left in the lurch."
" And fince it is neceffary that there fhould be a perpetual intercourfe of baying and felling, and dealing upon credit, where fraud is pernitted or connived at, or butb no lazu to funifb it, the honeft dealer is always undone, and the knave gets the advantage." Scuif. Better thus: "And fince it is neceffary that there fhould be a perpetval intercourfe of buying and felling, and dealing upon credit, the honelt dealer,

## L. A N

$\underbrace{\text { Language. where fraud is permitted or connived at, or hath no }}$ $\underbrace{\text { law to punifh it, is always undone, and the knave gets }}$ the advantage."

From thefe examples, the following obfervation will occur: That a circumftance ought never to be placed between two capital members of a periud; for by fuch lituation it mult always be doubtful, fo far as we gather from the arrangement, to which of the two members it belongs: where it is interjected, as it ought to be, between parts of the member to which it belongs, the ambiguity is removed, and the capital members are kept diftinct, which is a great beauty in compolition. In general, to preferve nembers dillinet that fignify things ditinguifhed in the thought, the belt method is, to place firlt in the confequent member, fome word that cannot conneet with what preendes it.

If it fhall be thought, that the objections here are too fcrupuluus, and that the defeet of perfpicuity is eatily fupplied by accurate punctuation; the anfwer is, That punctuation may remove an ambiguity, but will never produce that peculiar beauty which is perceived when the fenfe comes out clearly and diftinetly by means of a happy arrangement. Such influence has this beauty, that. by a natural tranfition of perception, it is communicated to the very found of the words, fo as in appearance to improve the inufic of the period. But as this curious fubject comes in more properly ellewhete, it is fufficient at prefent to appeal to experience, that a period, fo arranged as to bring out the fenfe clear, feems always more mufical than where the fenfe is left in any degree doubtful.

The next rule is, That words expreffing things connected in the thought, ought to be placed as ntar together as polfible. This rule is derived immediately from human nature, prone in every inftance to place together things in any manner connected: where things are arranged according to their connections, we have a fenfe of order; otherwife we have a fenfe of diforder, as of things placed by chance: and we naturally place words in the fame order in which we would place the things they fignify. The bad effect of a violent feparation of words or members thus intimately connected, will appear from the following examples.
"' For the Englith are naturally fanciful, and very often difpoled, by that gloominefs and melancholy of temper which is fo frequent in our nation, to many wild notions and vifions, to which others are not fo liable." Spect. Here the verb or affertion is, by a pretty long circumftance, violently feparated from the fubject to which it refers: this makes a harth arrangement; they lefs excufable that the fault is eafily prevented by placing the circumftance before the verb, after the following manner: "For the Englifh are naturally fanciful, and by that gloominefs and melancholy of temper which is fo frequent in our nation, are often difpofed to many wild notions, \&c."
"From whence we may date likewife the rivalhip of the houfe of France, for we may reckon that of Valois and that of Bourbon as one upon this occafion, and the houle of Auftria, that continues at this day, and has oft coft co much blood and fo much treafure in :he courle of it." Bolingbr.
"It cannot be impertinent or rid!culous therefore in

## 56 ] I A N

fuch a country, whatever it might be in the abbot of Langu St Real's, which was Savoy, I think ; or in Peru, under $\underbrace{\sim}_{\text {- }}$ the incas, where Garcilaffo de la Vega fays it was lawful for none but the nobility to ftudy-for men of all degrees to inftruet themfelves in thofe affairs wherein they may be actors, or judgers of thofe that act, or controllers of thofe that judge." Ibid.
"If Scipio, who was naturally giveu to women, fur which anecdote we have, if I mittake not, the authority of Polybius, as well as fome verfes of Nc vius preferved by Aulus Gellius, had been educated by Olympias at the court of Philip, it is improbable that he would have reftored the beautiful Spaniard." Ibid.

If any one have a curiofity for mure fpecimens of this kind, they will be found without number in the works of the fame anthor.

A pronoun, which faves the naming a perfon or thing a fecond time, ought to be placed as near as poffible to the name of that perfon or thing. This is a branch of the foregoing rule ; and wich the reafon there given, another occurs, viz That if other ideas intervene, it is difficult to recal the perlon or thiug by reference.
" If I had leave to print the Latin letters tranfmitted to me from foreign parts, they would fill a volume, and be a full defence againit all that Mr Pa tridge, or his accomplices of the Portugal inquifition, will be ever able to object; who, by the way, are the only enemies my predictions have ever met with at home or abroad." Better thus: ___-_" and be a fult defence againft all that can be objected by Mr Patridge, or his accomplices of the Purtugal inquilition; who, by the way, are," scc.
"There being a round million of creatures in human figure, throughout this kingdom, aubofe whole fubfiftence," \&c. Sruift. Better: "There being, throughont this kingdom, a round milhion of creatures in human figure, whole whole fubfitence," \&ec.

The following rule depends on the commuaication of enotions to related objects; a principle in human nature that hath an extenlive operation : and we find this operation, even where the objects are not otherwife related than by juxtapolition of the words that exprefs them. Hence, to elevate or deprefs an object, one method is, to join it in the expreflion with another that is naturally high or low : witnefs the following fpecch of Eumenes to the Roman fenate.
" Caufam veniendi fibi Romam fuiffe, proter cupiditatem vifendi deos bomincfque, quorum beneficio in ea fortuna effet, fupra quam ne optare quidem auderet, etiam ut coram monert fenatum it Perfei conatus obviam iret." Livy. To juin the Romans with the gods in the fame enunciation, is an artful ftroke of flattery, becaufe it tacitly puts them on a level.

On the other hand, the degrading or vilifying an object, is done fuccefsfully by ranking it with one that is really low: "I hope to have this entertainment in readinef3 for the next winter; and doubt not but it will pleafe more than the opera or puppet-Rhow." Sper.
"Manifold have been the judgments which Heaven from time to time, for the chaftifement of a finful people, has inflicted upon whole nations. For when the degeneracy becomes common, it is but juit the punifhment fhuuld be general. Of this kind, in our owa unfortunate country, was that defiructive peftilence,

## L A N

nge. whofe mortality was fo fatal as to fweep away, if Sir - William Petty may believed, five millions of Chrittian fouls, befides women and Jews." Arbuthnot.
"Such alfo was that dreadful conflagration enfuing in this famous metropolis of London, which confumed, according to the computation of Sir Sanuel Moreland, 100,000 houfes, not to mention churches and ftables." luil.
"But on condition it might pars into a law, I would gladly exempt both lawyers of all ages, fubaltern and field officers, young heirs, dancing-matters, pick puckets, and players." Sruift.

Sooner let earth, zir, fea, to chaos fall,
Nen, monkeys, lap-dogs, parrots, perifh all.
Rape of the Lock.
Circumflances in a period refemble fmall fones in a building, employed to fill up vacuities amorg thofe of a larger fize. In the arrangement of a period, fuch under-parts crowded together make a'poor figure ; and never are graceful but when interfperfed among the capital parts,
" It is likewife urged, that there are, by compu tation, in this kingdom, above 10,000 parfons, whofe revenues, added to thofe of my lords the bimops, would fuffice to maintain, \&c." Swift. Here two circumitances, viz. ly computation, and in this kingdom, are crouded together unneceffarily. They make a better appearance feparated in the following manner: "It is likewife urged, that in this kingdom there are by computation, above 10,000 parfons," \&c.

If there be room for a choice, the fooner a circumftance is introduced, the better; becaufe circumttan. ces are proper for that coolnefs of mind, with which we begin a pcriod as well as a volume : in the progrefs, the mind warms, and has a gleater telifh for matters of importance. When a circumflance is placed at the beginning of the period, or near the beginning, the tranfition from it to the principal fubject is agreeable: it is like afcending, or going upward. On the other hand, to place it late in the period has a bad effect ; for after being engaged in the principal fubject, one is with reluctance brought down to give attention to a circumftance. Hence evidently the preference of the following arrangement, "Whether in any country a choice altogether unexceptionable has bsen made, feems duubtful;" before this other, "Whether a choice altogether unexceptionable has in any country been made," \&c.

For this reafon the following period is exceptionable in point of arrangemert. "I have confidered formerly, with a good deal of attention, the fubject upon which you command me to communicate my thoughts to you." Boliug. Which, with a light alteration, may be improved thus: "I have formerly, with a good deal of attention, confidered the fubject," \&c.
Swift, fpeaking of a virtuous and learned education : "And although they may be, and too often are, drawn by the temptations of youth, and the opportunities of a large fortune, into fome irregularitics, zulen they come forward into the great coorld; it is ever with reluctance and compunction of mind, becaufe their bias to virtue fill continues." Better; "And although, when they cone forward into the grtat woorld, they may be, and tuc orten," \&c.

## L A N

In arranging a period, it is of importance to deter Lanpuazemine in what part of it a word makes the greatelt figure, whether at the beginning, during the courfe, or at the clofe. The breaking filence roufes the attention, and prepares for a deep imprefion at the beginning : the beginning, however, mult yield to the clofe; which being fucceeded by a paufe, affords time for a word to make its deepeft impreffion. Hence the following rule, That to give the utmult force to a period, it ought, if poffible, to be clofed with that word which makes the greateft figure. The opportunity of a paufe thould not be thrown away upon acceffcries, but referved for the principal object, in order that it may make a full impreffion: which is an additional reafon againt clofing a period without a circum lanc:There are, however, periods that admit not fach a ftructure; and in that cafe the capital word ought, if poffible, to be placed in the front, which next to the clofe is the molt advantageous for making an impref. fion. Hence, in directitg our difcourfe to a man of figure, we ought to begin with his name; and one will be fenfible of a degradation when this rule is neglected, $a_{s}$ it frequently is for the fake of verfe. We give the following examples.

Integer vitx, fcelenifque purns,
Non eget Mauri jaculis, neque arcu,
Nec venenatis gravida fagittis,
Fufce, pharetra. Horat. Carm. 1. 1. ode 22.
Je crains. Diew, cher Abner, et n'ai point d'autre crainte.
In thefe examples, the name of the perfon addreffed to, make a mean figure, heing like a circumftance flipt into a corner. That this criticifm is well founderd, we need no other proof than Addifon's tranflation of the laft example :

> O Abner! I fear my God, and I fear none but him. Gucrdian, no 117.

O father, what intends thy land, fhe cry'd, Againft thy only fon? What fury, O fon, Poffeffes thee to bend that mortal dart Againtt thy father's liead?

$$
\text { Puradije Iofl, book ii. l. } 727 \text {. }
$$

Every one mult be fenfible of a dignity in the invocation at the beginuing, which is not attained by that in the middle. It is not meant, however, to cenfure this paffage : on the contrary, it appeass beautiful, by dittinguifhing the refpect that is due to a father from that which is due to a fon.

The fubflance of what is fait in this and the foregoing fection, upon the method of arranging words in a period, fo as to make the decpeft impreflion with refpece to found as well as fignoification, is comprehended in the following obfervation: That order of words in a period will alivays be the mott agrecable, where, without obfcuring the fenfe, the moft important images, the molt fonorous words, and the longeft mem. bers, bring up the rear.

Hitherto of arranging fingle words, fingle members, and lingle circumftances. But the enumeration of many particulars in the fame period is often neceffary: and the quettion is, In what order they fhould be placed? And, firt, wish refpect to the cnumera-

Language ting particulars of equal rank: As there is mo caufe for prefcring any one befose the reft. it is indifferent to the mind in what order they be vicwed; therefore it is indifferent in what order they be named. 2 dly , If a number of objects of the fame kind, differing only in fize, are to be ranged along a fraight line, the moft agreeable order to the eye is that of an increafing fe. ries: in furveying a number of fuch objects, beginning at the leaf, and procecding to greater and greater, the mind fivells gradially with the fucceffive objects, and in its progrefs has a very fenfible pleafure. Precifely for the fame reafon, words exprcflive of fuch objects ouglit to be placed in the fame order. The beauty of this figure, which may be termed a climax in fonfe, has eicaped Lord Bolinglroke in the firlt member of the following period: "Let but one, great, brave, difinterefted, active man arife, and he will be received, followed, and almoft adored." The following airangement has fenfibly a better effect : "Let but one brave, great, active, difinterefted man arife," \&c. Whether the fame rule ought to be followed in enumerating men of difterent ratiks, feems doubtful: on the one hand. a number of perfons prefented to the eye in form of an increafing feries, is undoubtedly the moft agreeable order; on the other hand, in every lift of names, we fet the perfon of the greatef dignity at the top, and defcend gradually through his inferiors. Where the purpofe is to honour the perfons named according to their rank, the latter ought to be followed; but every one who regards himfelf only, or his reader, will choofe the former order. 3 dly, As the fenfe of order directs the eye to defcend from the principal to its greate'l acceflory, and from the whole to its greateft part, and in the fame order through all the parts and acceffories, till we arrive at the minuteft; the fame order ought to be followed in the enumeration of fuch particulars.

When force and livelinefs of expreffion are demanded, the tule is, to fufpend the thought as long as porfible, and to bing it out full and entire at the clofe: whiclı cannot be done but by inverting the natural arrangement. By introducing a word or member before its time, curiofity is raifed about what is to follow; and it is agrecable to have our curiofity gratified at the clofe of the period: the pleafure we feel refembles that of feeing a flroke exerted upon a body by the whole collected force of the agent. On the other hand, where a period is fo conftructed as to admit more than one complete clofe in the fenfe, the curiofity of the reader is exhaufted at the firit clofe, and what follows appears languid or fuperfluous: his difappointment contributes alfo to that appearance, when he finds, contrary to expectation, that the period is not yet finifhed. Cicero, and after him Quintilian, recommend the verb to the lat place. This method evidently tends to fufpend the fenfe till the clofe of the period; for without the verb the fenfe cannot be complete: and when the verb happens to be the capisal word, which it frequently is, it ought at any rate to he the laft, according to another rule above laid down. The following period is placed in its natural order: "Were inltruction an effential circumftance in epic poetry, I doubt whether a fingle inftance could be given of this fpecies of compofition in any language." The period thus arranged admits a full clofe pon the word compofition; after which it goes on lan-
guidly, and clofes without force. This blemifh willtangu be avoided by the following arrangement: "Were inItruction an effential circumftance in epic poetry, I doubr whether, in any language, a fingle inllance could be given of this fpecies of compolition."
"Some of our moft eminent divines have made ufe of this Platonic notion, as far as it regards the fubfiltence of our paffions after death, with great beauiy and ftrength of reafon." Spea. Better thus: "Some of our molt eminent divines have, with great beauty and firengtly of reafon, made ufe of this Platonic notion," \&c.
"Men of the bett fenfe have been touched, more or lefs, with thefe groundlefs horiors and prefages of futurity, upon furveying the mof different works of nature." Ib. Better, "Upon furveying the molt indifferent works of nature, men of the bett fenfe," \&c.
"She foon informed him of the place he was in; which, notwithltanding all its horrors, appeared to him more fweet than the bower of Malomet, in the company of his Baifora." Guarlian. Better, "She foon, \&c. which appeared to him, in the company of his Balfora, more fwect than the bower of Mabomet."

Nune of the rules for the compoftion of periods are more liable to he abufed than thofe latt mentioned; witnefs many Latin writers, among the modurns efpecially, whofe ityle, by inverlions too violent, is rendered harfh and obfcure. Sufpention of the thought till :he clofe of the period, ought never to be preferred hefore perfpicuity. Neither ought fuch fufpenfion to be attempted in a long period; becaufe in that cafe the mind is bewildered amidtt a profution of words : a traveller, while he is puzzled about the road, relifhes not the fineft profpect: "All the rich prefents which Aftyages had given him at parting, keeping only fome Median horfes, in order to propagate the breed of them in Perfia, he diftributed among his friends whom he left at the court of Ecbatana." Trav. of Cyrus.
III. Beauties from a refemblance between Sound and Significution. 'l'here being-frequently a ftrong refemblance of one found to another, it will not be furprifing to furd an articulate found refembling one that is not articulate: thus the found of a how-ftring is imitated by the words that exprefs it:

> The Atring let fy ,
> Truang'd ßort and fluarp, like the fhrill Cwallow's cry. Ody $/ \int e^{2}$, xxi. 449.

The found of felling trees in a wood:
Loud founds the ax, redoubling ftrokes on ftrokes, On all fides round the forelt hurls her oaks Headlong. Deep echoing groan the thickets brown, Then rufling, crackling, crafbing, thunder down.

Iliad, xxiii. 144.
But when loud' furges la $h$ the founding flore,
The hoarfe rough verfe fhould like the torrent roar.
Pope's Effay on Criticifin, 369.
Dire Scylla there a fcene of loorror forms,
And here Charybdis fills the deep with Itorms:
When the tide ruthes from her rumbling caves,
The rough rock roars; tumultuous boil the wa ves.
Pope.
No perfon can be at a lofs about the caufe of this beauty; it is obvioufly that of imitation.

That there is any other natural refemblance of found to fignification, mult not be taken for grauted. There is no refemblance of found to motion, nor of found to fentiment. We are, however, apt to be deceived by artful pronunciation : the fance paffage may be pronounced in many different tones, elevated or humble, fweet or harfh, brifk or melancholy, fo as to accord with the thought or fentiment : fuch concord muft be diftinguifhed from that concurd beeween found and fenfe which is perceived in fome expreflions independent of artful pronuaciation; the latter is. the poet's work, the former mult be ateributed to the reader. Another thing contributes thill more to the deceit: in language, found and fenfe being intimately conuected, the properties of the one are readily communicated to the other; for example, the quality of grandeur, of fiveetnefs, or of melancholy, though belonging to the thought foley, is transferred to the words, which by that means refemble in appearance the thought that is exprefled by them. That there may be a refemblance of articulate founds to fome that are not articulate, is felf-evident; and that in fact there exit fuch refemblances fuccefffully empluyed by writers of genius, is clear from the foregoing examples, and from many others that might be given. But we may fafely pronounce, that this natural refemblance can be carried no farcher ; the objects of the different fenfes differ fo widely from each other, as to exclude any refemhlance; found in particular, whether articulate or inarticulate, refembles not in any degree taite, fmell, nor motion; and as little can it refemble any internal fentiment, feeling, or emotion. But mult we then admit, that nothing but found can be imitated by found? Taking imitation in its proper fenfe, as importing a refemblance between two objects, the propofition muit be admitted: and yet in many paffages that are not deferiptive of found, every one mult be fenfible of a peculiar concord between the found of the words and their meaning. As there can be no doubt of the fact, what remains is to enquire into its eaufe.

Refembling caufes may produce effects that have no refemblance; and caufes that have no refemblance may produce refembling effects. A magnificent building, for example, refembles not in any cegree an heroic action ; and yet the emotions they produce are concordant, and bear a refemblance to each other. We are ftill more fenfible of this refemblance in a fong, when the mufic is properly adapted to the fentiment: there is no refemblana: bet ween the thought and found; hut there is the Itrongett refemblance between the emotion raifed by mufic tender and pathetic, and that raifed by the complaint of an unfuccelsful lover. Applying this obfervation to the prefent fuoject, it appears, chat, in fome inftances, the found even of a fingle wurd makes an impreffion refembling that which is made hy the thing it fignifies: witnefs the word rumning, compofed of two fhort fyllables; and more remarkably the words rapidity, impetuofity, prccipitation. Brutal manners produce in the fpectator an emotion not unlike what -is produced by a har $\mathrm{h}_{\mathrm{h}}$ and rough found; and hence the beauty of the figurative expreffion, rugge.t manners. Again, the word little, being pronounced with a very fmall aperture of the

## 559 I A N

mouth, has a weak and faint found, which makes an Langunge. impreffion refembling that made by a diminutive object. This refemblance of effects is fill more remarkable where a number of words are connected in a puriod: words pronounced in fucceffion make often a Arong imprefion; and when this impreffien liappens to accord with that made by the fenfe, we are fentible of a complex emotion, peculiarly pleafant; one proceeding from the leutiment, and one froin the melody or found of the words. But the chief pleafure proceeds from having thefe two concordant eniutions combined in perfect harmony, and carried on in the mind to a full clofe. Except in the fingle cafe where found is defcribed, all the examples given by critics of fenfe teing innitated in Cound, refcive into a 1 efemblance of effects : emotions raifed by found and fignitication may liave a refemblance; but found itfelf cannot have a refemblance to any thing bist found.

Procceding now to particulars, and beginning with thowe cafes where the emotions have the ftrongeft refemblance, we obferve, firt, That by a number of fyllables in fucceflion, an cmotion is fometimes raifed, extremely fimilar to that raifed by fucceffive motion; which may be evident even to thofe who are defective in tafte, from the following fact, that the term movement in all languages is equally applied to both. In this manner, fucceflive motion, fuch as walking, running, galloping, can be imitated by a fuccefino of long or thort fyllables, or by a due mixture of both : for example, flow motion may be jully imitated in a verfe where long fyllables prevail ; efpecially when aided by a flow pronunciation :

Illi inter fefe magna vi brachia tollunt.
Gcorg. iv. 174.
On the other hand, fivift motion is imitated by a fucceffion of fhort fyllables;

Quadrupedante putrem fonitu quatit ungula cam. pum:
Again:
Radit iter liquidum, celeres neque commovet alas.
Thirdly, A line compofed of monofylables makes an impreftion by the frequency of its paufes, timilar to what is made by laborious interrupted motion:
With many a weary itep, and many a groan, Up the high hill he heaves a huge round done.

Ody.Ves, xi. 736.
Firt march the heavy mules fecurely f , w;
O'er hills, o'er dales, o'er craggs, v'er rucks they go.
Iliad, xxiii. 138.
Fourthly, The incpreflion made by rough founds in fucceffion, refembles that made by rough or tumultuous motion : on the other hand, the amprefion of fmooth founds refembles that of gentle motion. The following is an example of both.
Two craggy rocks projecting to the main, The roaring winds tempeltuous rage reffrain; Within, the waves in fofter murmurs glide, And fhips fecure without their haulfers ride.

Odydey, iii. Its.
Another example of the latter:

# L A N. [ 560 ] L A N 

Fifthly, Prolonged motion is expreffed in an Alex. andrine line. The firft example fhall be of a flow motion prolonged:
A ncedlefs Alcxandrine ends the fong;
That, like a wounded frake, drags its flow length along.

$$
I b .356 .
$$

The next example is of forcible rotion prolonged:
'The waves behind impel the waves before,
Wide-rolling, foaming high, and tumbling to the fhore. Iliad, xiii. $100+$.
The lat flall be of rapid motion prolonged :
Not fo when fwift Camilla fcours the plain,
Flies o'er the unbending corn, and flims along the main.

Efay on Criticifin, 373 .
Again, fpeaking of a rock torn from the brow of a mountain :

Still gathering force, it fmokes, and, urg'd amain, Whirls, leaps, and thunders down impetuous to the plain.

$$
\text { Iliad, xiii. } 197
$$

Sixthly, A period confiting mofly of long fyllables, that is, of fyilables pronounced flow, produceth an emotion refembling faintly that which is produced by gravity and folemnity. Hence the beauty of the following verfe:

## Olli fedato refpondet corde Latinus.

It refembles equally an object that is infipid and uninterefting.

Tædet quotidianarum barum formarum.
Terence.
Seventhly, A flow fucceffion of ideas is a circumftance that belongs equally to fettled melancholy, and to a period compufed of poly fyllables pronounced flow ; and hence, by fimilarity of emotions, the latter is imitative of the former :
In thofe deep folitudes, and awful cells, Where heav'nly-penfive Contemplation dwells, And ever-nufing Melancholy reigns.

Pope, Eloifa to Abelarl.
Eighthly, A long fyllable made fhort, or a fhort fyllable made long, raifes, by the difficulty of pronouncing contrary to cuftom, a feeling fimilar to that of hard labour :
When Ajax frives fome rock's vaff weight to throw, The line too labours, and the words move flow.

$$
E \int f a y \text { on Criticifm, } 370 .
$$

Ninthly, Haifh or rough words pronounced with difizulty, excite a feeling fimilar to that which proceeds fron the labour of thought to a dull writer :
$\mathrm{N}^{2}{ }^{1}+1$

Juft writes to make his barrennefs appear,
And frains from hard-bound brains eight lines a $\cdot$ year. Pope's Epiflle to Dr Arbutbrot, 1. 181.
We fhall clofe with one example more, which of all makes the finell fiyure. In the firf fection mention is made of a climax in found; and in the fecond of a climax in fenfe. It belongs to the prefent fubject to ubferve, that when thefe coincide in the fame paffage, the concordance of found and fenfe is delightful: the reader is confcious of pleafure not only from the two climaxes feparately, but of an additional pleafure from their concordance, and from finding the fenfe fo juftly imitated by the found. In this refpect, no periods are more perfect than thofe borrowed from Cicero in the firft fection.

The concord between fenfe and found is not lefs agreeable in what may be termed an anticlimax, where the progreis is from great to little; for this has the effect to make diminutive objects appear Aill more diminutive. Horace affords a llriking example :

Parturiunt montes, nafcetur sidiculus mus.
The arrangement here is fingularly artful: the firft place is occupied by the verb, which is the capital word by its fenfe as well as found: the clefe is referved for the word that is the meaneft in fenfe as well as in found: and it muit not be overlooked, that the refembling founds of the two laft fyllables give a ludicrous air to the whole.

In this article we have mentioned none of the beauties of language but what arife from words taken in their proper fenfe. Beauties that depend on the metaphorical and figurative power of words, are treated under the feparate articles of Figures, Personification, Apostrophe, Hyperbole, Metaphor, \&c. See alfo Oratory.

Purity of Langlage. Both the Greeks and Romans were particularly careful of preferving the purity of their language. It feems amongft the Romans to have been a point which they thought worthy the attention of the flate itfelf; for we find the Cumeans not daring to make ufe of the Latin language in their public acts without having firlt obtained leave in form. Tiberius himfelf would not hazard the word monopolium in the fenate without making an excufe for employing a foreign term. Seneca gives it as a certain maxim, that wherever a general falfe tafte in fyle and expreffion prevails, it is an infallible fign of a corrup. tion of manners in that people: A liberty of introducing obfolete words, or forming new ones, is a mark, he thinke, of an equal licentioufnefs of the moral kind. Accordingly it is obferved, there are fcarce more than eight or ten inftances of new words to be produced from the moft approved Roman writers, in the courfe of two or theee centuries. If this mode of reafoning concerning the morals of the flate was introduced and applied in our own country, no nation on the face of the earth could appear mure abandoned; for no nation is more fond of adopting new words, though our language is fufficiently copious. This delicacy of Seneca appears to be carried a little too far, and his manner of ellimating the morals of the people muft be a little fallacious. The Greeks were very remarkable for

## L A N

began with the fum of 100 crowns, hut foon obtaine confiderable donations; and the duke of Orleans. re gent of the kingdom, granted him a lottery, and laid the firlt tlone of the porch in 1718 . It was confecrated in $\mathbf{1 7 + 5}$, after M. Languet had fpared neither labour nor expence to render it one of the fineft churches in the world bowh for architecture and ormament. An other work which did him no lefs honour was the Muifon de l'enfant Gffus. This ellabl flement contitts of two parts; the firlt compoled of about 35 poor ladies of good families, and the fecond of more than 400 poor women and children of town and country. The order and econony in this houfe, for the education and employment of fo many perfons, gave cardinal Fleury fo high an idea of the vicar of St Sulpice, that he propofed to make him fuperintendant-general of all the hofpitals in the kingdom; which, however, was declined. Never man took more pains than he did to procure charitable donations and legacies, which he diffributed with admitable diferction: he is faid from good authority to have diburfed near a million of lives to the poor annually. When there was a general dearth in 1725, he fold, in order to relieve the poor, his houfchold goods, pittures, and fome curious pieces of furniture that he lad procured with difficulty; and when the plague raged at Marfeilles, he fent large fums into Provence för the relief of the diftreffed. M. Languet was not only fingular in this warm, difinterefted, benevolent conduet, but alfo in another circumllance equally tare; and this was in the refufal of feveral bifhoprics that were offered him: he refigned even his vicarage in 1748 ; but continued to preach every Sunday at his own parifh-church, and to fupport the Maifon de l'enfant Yefus, to his death, which happened in 1750 It is obferved, that his piety and charity did not proceed from poverty of talents; for he was fenfible and lively in converfation, and his genius often dilcovered itfelf in his agreeable repartees.

LANGUOR, antong phyficians, fignifies great weaknefs and lofs of Arength, attended with a dejection of mind; fo that the patients can fcarce walk or even ftand upright, but are apt to faint away.
Linham. See Latenhan.
LANIARD (from Lanier, Fr.), a fhort piece of cord or line faftened to feveral machines in a fhip, and ferving to fecure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun-ports, the laniard of the buoy, the laniard of the cat-hook, \&c. - The principal laniards ufed in a hip, however, are thofe employed to extend the frouds and Itays of the matts by their communication with the dead-eyes, fo as to form a fort of mechanical power refembling that of a tackle. - 'Thefe laniards are fixed in the dead-eyes as follows: one end of the laniard is thrult through one of the holes of the upper dead-eye, and then knotted, to prevent it from diawing out ; the other is then paffed through one of the holes in the lower dead-eyc, whe ace, returning upward, it is inferted through the fecond hole in the upper dead-eye, and next through the fecond in the lower dead eye, and finally through the third holes int both dead eyes. The end of the laniard being then dirceted upwards from the lowt $\mathfrak{A}$ dead-eye, is ttretched as fiff as poflible by the application of tackles; and that the feveral parts of it may flide with more

## LA N [ 562$] \quad$ L A N

Lanigcrous facility through the holes in the deadeyes, it is inches and a half in length. The irides are hazel; the Laniv

II
Lantus. well fmeared with hog's-lard or tallow, fo that the ftrain is immediately communicated to all the turns at once.
I. ANIGEROUS, an appellation given to whatever kears wool.
L. ANISTA, in antiquity, is fometimes ufed to fignify un executioner; but more frequently for a maftergladiator, who taught the ufe of arras, and had always people under them ready to exhibit fhows of that kind. For this purpofe, they either purchafed gladiators, or edueated children, that had been expofen, in that art.

LANIUS, the Shrike, or Butcher-bird, in orni-
Plates thology; a genus belonging to the order of accipitres, cclxib and the characters of which are thefe: The beak is fomeCCLXIII. what Atrait, with a tooth on each fide towards the apex,
and naked at the bafe; and the tongue is lacerated.

1. The excubitor, great cinereous fhrike, or greater butcher-bitd, is in length 10 itiches. The plumage on the upper parts is of a pale afh-colour; the under, white: through the eyes there is a black Atripe: the fcapulars are white : the bafe of the greater quills is white, the reft black: the tail is fomewhat cuneiform; the two middle feathers are black; the outmolt on each fide, white; thofe between are black, with the ends more or lefs white: thee legs are black. Its bill is black, one inch long, and hooked at the end ; the apper mandibie furnifhed with a Sharp procefs: the noftrils are oval, covered with black brilles pointing downwards: the mufcles that move the bill are very thick and ftrong; which makes the head very large. This apparatus is cuite requifite in a fpecies whofe method of killing its prey is fo fingular, and whofe manner of devouring it is not lefs extraordinary : fmall bitds it will feize by the throat, and ftrangle; which probably is the reafon the Germans alfo call this bird wurcbangl, or "the fuffocating angel." It feeds on fmall birds, young neftlings, bcetles, and caterpillars. When it has killed the prey, it fixes them on fome thorn, and when thus fitted pulls them to picces with its bill: on this account the Germans call it thorntraer and thornfreker. When confined in a cage, they will often treat their food in much the fame manner, flicking it againft the wires before they devour it. - This bird inhabits many parts of Europe and North America. The female makes its neft with heath and mofs, lining it with wool and goffamer ; and lays fix eggs, about as big as thofe of a thrufh, of a dull olive-green, fpotted at the thicke!t end with black. In fpring and furmmer it imitates the voices of other binds, by way of decoying them within reach, that it may deftroy them; but beyond this, the natural note is the fame throughout all feafons. If a trap-fall be baited with a living fmall bird, it proves a decoy, by which it may be taken in winter. It is obferved to be mute when kept in a cage, though feemingly content. - In countries where they are plenty, the bußandmen value them, on fuppofition of their deftroying rats, mice, and other vermin. 'They are fuppofed to live five or fix years; and are often trained up for catching fmall birds in Ruffia. In Carniola they are migratory, coming in May and departing in September; which is the cafe alfo in refpeet to the few which are met with in England.
2. The collurio, or leffer butcher-bird, is feven
bill refembles that of the preceding fpecies: the head and lower part of the back are of a tine light grey: acrofs the eyes from the bill runs a broad black ftroke: the upper part of the back, and coverts of the wings, are of a bright ferruginous colour: the breatt, belly, and fides, are of all elegant hloffom colour: the wo middle feathers of the tail are longett, and entirely black; the lower part of the others white. and the exterior webs of the outmoft feather on each fide wholly fo. In the female, the ftroke acrofs the eyes is of a reddih brown ; the head of a dull ruft colour mixed with grey ; the brealt, belly, ard lides, are of a dirty white, marked with femicircular dufky lines: the tail is of a deep brown; the outward feather un each fide excepted, whofe extcrior webs are white. It is rather larger than the male. This hird is much mare common than the former fpecies. Mr I atham fufpects its being a bird of paffage, never having feen it in winter. It lays fix white eggs marked with a rufous hrowa circle towardsthe large end: The neft is generally in a bedge or low bufh ; near which, it is faid, no fmall bird choofes to build; for it not only feeds on infects, but alfo on the young of other birds in the neft, taking hold of them by the neck, and ttrangling them, beginning to eat them firft at the brain and eyes. It is fonder of grafshoppers and beetles than of other infects, which it eats by morfels, and, when fatisfied, ficks the remainder on a thorn; when kept in a cage, it does the fame againft the wires of it, like the former fecciss. It is called in the German language by a name fignifying "great head." or "bull head," from the fize of that part. It will alfo feed on fheep's kidneys, if in a cage, eating a whole one every day. Like the cinereous thrike, it only mocks the nutes of other birds, having none of its own ; and this merely, like that, to decoy. It is faid to be in this imitative att an adept ; if money is counted over at midnight in the place where one of thefe is kept, fo as to make a jingling noife, it begins to imitate the fame found. When fitting on the neft, the female is foon difcovered; for on the approach of any one, fhe fets up an horrible outcry.
3. The cocnilefcens, or fork-tailed Indian butcherbird of Lidwards, is in length about feven inches and a half: the bill is blackifh brown, and bent; the upper mandible befet with black hairs turring forwards: the plumage on the upper parts of the body is a fine black, with a glofs of blue and in fome lights green; the under parts are white : the greater quills and tail are of a Eerruginous black; the tail is pretty much forked, and the outer feather fpotted with dirty white. It in. babits Bengal, where it is called fingab. It is called alfo by the Indians the king of the crozes, from its purfuing thefe birds from place to place with a great noife, and pecking them on the back till they efcape.
4. The Antiguan thrike (or Pie-griefobe d'Antigue of Sonnerat) is about the fize of a lark. Its bill is large and black; the upper mandible very long, and the curvature fo exceffive that one would rather take it for a monitrofity than common to any one fpecies : the irides are dufley: the head is black; the back, of a yellowifh rufous colour: the throat and breait are white; the quills, and ballard wing-coverts, black; and the wings reach only to the beginning of the tail,
which is very long and wedge-flaped; the two middle feathers are wholly black; the legs are dunky black. It inlabits Panay, one of the Philippine ifands, but principally about Antigue, one of the provinces thereof.
5. 'I'he jocofus, or jocofe thrike, is in length feven inches and a half. The bill is blackifh, rather itraighter than in moil of the genus, and furnifhed only with a very fine notch near the tip: the crown of the head is blaek, except \{ome long brown feathers, which form a kind of creft : the fides of the head, throat, and fore part of the neck, are white; frum each corner of the mouth there is a black line, continued backwards; and under each eye is a fmall fpot of lively red : the mpper parts of the body are brown; the under parts, dinty white; the vent, rofe-colour: on the lower part of the neck and breatt there is a kind of a brown band: the quills are brown: the tail is greatly wedge fhaped, and in colour brown, except the four outer feathers on each fide, which have white tips: the legs and claws are black. This is a Chinefe bird, and called in thofe parts by the name of kowkai-kon. It feeds upon rice and infects, particularly cochroaches.
6. The infaultus, or rock-fhrike, is in length feven inches and three quarters. The bill is about an inch long, and blackin: the head and neck are of a dark alh-colour, marked with fmall rufous fpots: the upper part of the back is a dark brown; the lower much paler, inclining to 2 m , efpecially towards the tail: the quills and wing-coverts are dufky, with pale margins: the breaft, and under parts of the body, are orange, marked with fmall fpots, fome white and others brown: the tail is three inches in length; the two middle feathers are brown, the others rufous: the legs are blaekih: the wings and tail are even. This is the defcription of the female. The male is faid to differ very little, except in being of a brighter colour. -This fpecies is met with in many parts of Europe, from Italy on the one liand, to Ruffia on the other; and is found in fome parts of Germany, the Alpine mountains, thole of '「yrol, and fuch-like places. The manners of this bird feem difputed. Buffor fays that it perches on a ligh fone, and as foon as a markiman appears with his gun, removes to a greater diftance, and fo on as often as he approaches; which renders this fpecies difficult to come at. Drunnich and Linnxus, on the contrary, fay that it is a bold bird, attending the traveller while at his mea!, on purpofe to feed on his fcraps. It has an agreeable note of its own, approaching to that of the hedge-fparrow, and will alfo learn to initate that of others. It makes the neft among the boles of the rocks, \&cc. hiding it with great art; and lays three or four eggs, feeding the young with worms and infects, on which it alfo feeds itfelf. It may be taken young from the neft, and brought up as the nightingale.
\%. The fauftus, or white-wreathed frike, is about the fize of a common thrufn. Its bill is pale: the upper parts of the body are grey; the under fernuginous: from the eyes to the hind head there paffes a whitifh line, compofed of numerous white feathers, rendering it truly characteritic: the wings are rounded; the quills brownifh, with grey edges, which are croffed with numerous flender brown lines: the tail is rounded, brown, and croffed with numerous bars of darker brown: the legs are pale. This elegant fpecies inhabits China, where it is known by the name of auhom.
maj. It may be ohferved, among others, in Clinefe Lanius, paper-hangings, where the white line feems to encum. pals the back part of the head like a wreath.
7. The Dominican thrike for Pie-gricfolse Dominiquaine of Sonnerat), is bigger than a parron, and rather longer. The bill is greyith, conical, and Arong; the bafe befet with britlles, pointing forwards: the head, neck, breaft, back, wings, and tail, are black; the belly and rump white: the wings reach near an inch beyond the middle of the tail: the thighs are black. It inhabits the Philippine iflands, and is a bold courageous bird : it flies very quick, and with great rapidity; frequently hovering in the air like a fwallow. It is a great enemy to the raven; to whom, though much bigger, he bids detiance, and even provokes him to combat : the battle often lalts half an hour, and ends with the retreat of the raven; rather, perhaps, from being teafed out than much injured by the little enemy.
8. The nengeta (Guirarou, Buff.) is in length nine or ten inches. Its hill is dufsy, and befet with briftles at the bafe: the irides are fapphire-coloured; and from the angles of the mouth, through the eges, there runs a black ftreak : the upper parts of the body are of a dark brownifh afh-colour; the under parts cine. reous white: in the middle of the wing are a few white feathers : the quilis and tail are nearly black; and all the feathers of the lant, except the two middle ooes, are ooliquely tipped with white : the legs are of a dark afh colour; the claws black. - Thefe birds are found at Surinam and Brafil. They are common likewife at Guiana, where they frequent watery places, and are found in great numbers together. They are obferved, at frequent intervals, to fet up a great cry all together; which affords a happy and certain prefage to the thirfty traveller, in the immenfe forelts of Guiana, of water being at hand.
9. The tyrannus, or tyrant frike, is about the fize of a thrufh. Its bill is a blackifh brown, befet with brittles at the bafe: the irides are brown: the npper parts of the plumage grey brown; the under, white: the breaft inclines to ath-colour : the head is blackith on the upper part; the bafe of the feathers on that part in the male is orange, but feldom vifible except it erects the fea:hers, when there appears a Atreak of orange down the middle of the crown: the tail is brown, marginated with rufous: the legs and claws are black brown. The feusale fcarcely differs, exceps in the head; the bafe of the crown feathers being jellow inftead of orange; ; the colours are not quite fo deep, and it is a trifle lefs in lize. It inhabits Vir-ginia.- There is a variety which inhabits St Domingo and Jamaica. Thefe birus are called titiri, pipiri, or quisquiri, from their cry, which refembles thofe words. The firt is called the black-beaded or great-billed pipiri; the fecond, the yellow. beaded pipiri or pipiri of paffage. The fint though in plenty are feldom feen but in pairs; the fecond in great troops, about the month of Augult, when they are very fat, and killed in great numbers for the table, as their fefh is accounted good eating.-All authors agree in the manners of thefe birds, which are ferocious to a great degree while the hen is fitting: no bird whatever dare approach their nell : they will attack the firlt which comes near, without referve, and ufually come off conquerors. From hence by fome they are called king-birds.

The Carolina tyrant of Catefby is little, if at all, dif. ferent from the preceding, in regard to fpeeifie character. But he fays that it makes its nell rather expofed, on trees and bufhes, frequently on the faffafras; whereas the pipiris nake ufe of the hole of a tree, for the fake of concealing it. In Carolina it is a bird of paffage, coming in fpring, and making one neft in a year, which is commonly in June, and after bringing up its young, retires in autumn. Thefe birds frequent alfo the red cedars; are feldom found in woods, but often in hedge rows and fences of fields, and for the moft part within 200 yards of eael other. They do not molelt their own fpeeies; but the moment either crow, or even eagle, appears, all within reaeh join forces, and begin the attack in all parts of his body at once, never defitting till they lave driven him to a great diftance.
11. The albus, or white Panayan frrike, is about double the fize of a la:k. It bill is black : the head, neck, baek, belly, and fhoulders, are white: the relt of the wings and tail black; and acrofs the greater quills there is a white band : the legs are blaek. It inhabits the ifle of Panay.

There are above 40 other 〔pecies of this genus, befides many varieties.

## LaNiER, or Lannar. See Falco.

l.ANSDOWNE (Lord). See Granville.
I. $\triangle$ NSQUINE I', the name of a game at cards, of French origin.

It may be played at by any indiferiminate number of people, though a fingle pack of eards is ufed during the deal. The dealer, who poffefles an advantage, Thuffles the cards, and after they have been cut by another of the party, deals out two cards on his left hand, turning them up, then one for himfelf. and a fourth that he places on the table for the company, who is ealled the rejonifance. On this card any, or all the company, the deal'r excepted, may put their money, which thic dealer is compelled to antwer. The dealer continues furning the cards upwards, one by one; till two of a fort come up, that is to fay, two aees, two deuces, \&cc. which, to privent miltakes, or their being confidered as fingle eards, he places on eaeh fide of his own eard; and as often as two, three, or the fourth fort of a card come up, he invariably places, as before mentioned, on each lide of his owis card. The company has a right to take and put money upon any fingle card, unlefs the dealer's card thysild happen to be double, which is often the cafe, by his carod being the fanie as one of the two hatud-cands, which he firtt dealt out on his left hand:thus he continues dealung till he brings either their cards or his own Whilit the ciealer's own caro remains undra $\wedge n$, be wins; and which ever card is curned up firft, lofes. If he deals nut the two cards on his left hand, which ave fyled the hand cards, before his own, he is intitled to deal again. This advantage amounts to no more than his being exempied from lofing, when he turns up a fimilar card to his own, immediately after he has tumed up one for himfelf.

Laufquinct is often played without the rejouifance, the dealer giving every one of the party a card to put their money upon. It is alfo often played by dealing only two cards, one for the company and the other for the dealer.
It fhould likewife be opferved, that a limitation is

## 5641 L A N

generally fixed for the fum to be placed upon any card or number of eards, either in gold or filver, beyond which the dealer is not obliged to anfwer.

LANTANA, or Indian sage, in botany: A genus of the angiofpermia order, belonging to the didynamia clafs of plants ; and in the natural method ranking under the 40 th order, Perfonate. The calyx is indiftinetly quadridentated; the fligma as it were broken and turned back like a hoof; the fruit is a plum with a bilocular kernel. There are feveral fpecies, confifting of Chrubby exotics from Afriea and America for the green-houfe or flove; growing to the height of a yard or two, and adorned with oblong, oval, and roundifh fimple leaves, with monopetalous, tubular, four-parted fowers of differenc colours. They may be propagated either by feeds or euttings. - The camara, or wild fage, is remarkable for the beauty of its flowers; which are yellow, tinged with red. The involucrata, or fea-fide fage, has fmall aft coloured leaves and a mott agreeable fmell. They are both natives of the Weft Indies, the former growing wild among the bufhes, and the latter found near the fea: Their leaves, particularly thofe of the fea-fide fage, are ufed by the black people in teas for colds, rheums, and weaknefs of the fomaeh.-There are feven other fpecies.

LANTERN, or Lanthorn, a device to carry a candle in; bcing a kind of cover ufually made of white irori, with fahes of fome tranfparent matter, as glafs, horn, \&e. to tranfmit the light.

Dark Lantern, one with only one opening, whieh may alfo be clofed up when the light is to be entirely hid, or opened when there is oceafion for the affiftance of the light to difeover fome object.
Magic L.antern, an optic maehine, whereby little painted images are reprefented fo much magnified, as to be accounted the effect of magic by the ignorant. See Dioprics, Art. x. p. 37.

Lantern, in architecture, a little dome raifed over the roof of a building to give light, and ferve as a erowning to the fabric.

The term lantern is alfo ufed for a fquare eage of carpentry, placed over the ridge of a corridor or gallery, between two rows of thops, to illumine them, like that of the royal exchange London.

Lantern, on fhip-board, a well known machine, of which there are many in a hhip, particularly for the prupofe of directing the courfe of other fhips in a fleet or convoy; fuch art the poop and top lanterns, \&c.

Feag of Lanterns, in Clina, is a celebrated feaft held on the 15 th day of the firf month; fo called from the infinite number of lanterns hung out of the houfes and Arects; which, it is faid, is no lefs than two hundred millions. On this day are expofed lanserns of all prices, whereof fome are faid to cott 2000 crowns. Some of thit grandees retrench fomewhat every day out of their table, out of their drefs, equipage. \&c. to appear the more magnificent in lanterns. Chey are adcrned with gildin上, fculpture, painting, japanniug, \&c. And as to their fize, it is extravagant; fome being from 25 to 30 feet diameter: they reprefent halls and clambers, and two or three fuch machines together would make handfome houfes; fo that in China they are able to eat, lodge, receive vifits, have balls, and act plays in a lantern. To illumine them, they fhould have bonfires; but as that would be inconvenient, they content themfelves with
lighting
－triliquan c Jhrik．

Énminiercrum．$\%$ ．

I. A $O \quad\left[\begin{array}{c}56 \\ \text { them an infinite number of torches }\end{array}\right.$ lighting up in them an infinite number of torches or lamps, which at a diffance have a beautiful effect. In the fe they exhibit various kinds of fhows, to divert the people. Befides thefe enormous lanterns, there is a multitude of others fmaller, which ufually confilt of fix faces or lights, each about four feet high, and one and a lalf broad, framed in wood finely gilt and adorned; over thefe they fretch a fine tranfparent filk, curioufy painted with flowers, trees, and fometimes human figures: the painting is very extraordinary, and the colours extremely bright ; and when the torches are lighted, they appear highly beautiful and furpriling.

Ifantern Fy, in natural hifory. See Fulgora.
LANUGO, the foft down of plants, like ithat growing on the fruit of the peach tree. See Hals.

LAOCOON (fab. hid), a fon of Priam and Hecuba, or according to others of Antenor or of Capys. As being prieft of Apollo, he was commiffioned by the Trojans to offer a bullock to Neptune to render him propitious. During the facrifice two enormous ferpents iflued from the fea, and attacked Laocoon's two fons who flood next to the altar. The father immediately attempted to defend his fons; but the ferpents falling upon him fqueezed him in their complicated wreathes, and he died in the greatell agonies. This punifhment was faid to have been inflicted upon him for diffuading the Trojans to bring into the city the fatal wooden horfe which the Greeks fad confecrated to Minerva, as alfo for his impiety in hurling a javelin againf the fides of the horfe as it entertd within the walls. According to Hyginus, he fuffered the above punifhment for his marriage againf the confent of Apollo, or, according to others, for his polluting the temple, by his commerce with his wife Antiope, before the flatue of the god.

Laocoon, in the hitory of the arts, is a celebrated monument of Greek fculpture executed in marble by Polydorus, Athenodorus, and Agefander, the three famous artifts of Rhodes. This remain of antiquity was found at Rome in the ruins of the palace of Titus, in the beginningof the fisteenth century, under the pontificate of Julius II. and fince depofited in the Farnefe palace. Laocoon, the prieft of Apollo and Neptune, is here reprefented with his two fons, with two hideous ferpents clinging round his body, gnawing it, and injecting their poiion: Virgil has given us the following defcription of the fact :

## Serpens amplexus utergue

Implicat, 疍 miferos morfudepafcitur artus:
Cori piunt, fpirifque ligont ing entitus, \& jam
Dis medium amplexi, lis collo fquamea circum
Terga dati, Juperant capite \& cervicilus altis.
This facue exhibits the molt aftonithing dignity and tranquillity of mind in the midt of the moll excruciating torments: Pliny * fays of it, that is, opus onmilus,

The Laocoon, Dr Gillies $\dagger$ obferves, may be regarded as the triumph of Grecian fculpture ; fince bodily pain, the grofict and molt ungovernable of all our paffions, and that pain united with anguifh and torture of mind, are yet expreffed with fuch propriety and dignity, as afford leffons of fortitude fuperior to any taught in the fchools of philofophy. The horrible flriek which Virgil's Laocoon emits is a proper circumfance for poetry, which fpeaks to the fancy by
inages and ideas horrowed from all the fenfes, and has Laodicara, a thoufand ways of ennobling its ohject; but the ex- Laomedn. preflion of this fhriek would have totally degraded the Itatue. 'It is foftened, therefore, into a patient figh, with eyes turned to heaven in fearch of relitf. The intolerable agony of fuffering nature is repre. fented in the lower part, and particularly in the extremities of the body ; but the manly breall Aruggles againft calamity. The contention is ftill more plainly perceived in his furrowed forehead; and his languifh. ing paternal eye demands affilance, lefs for himfelf than for his miferable children, who look up to him for help.

LAODICAA on the Levcus (anc. geog.), a town of Phrygia, at tirlt called Diofplis, then Khoas. It was built by Antiochus fon of Stratonice, and called after his confort Laodice. It was long an inconfiderable place ; but increafed toward the age of Aupultus Cxfar, after having fuffered in a fiege from Mithridates. 'I'he fertility of the foil, and the good fortune of fome of its citizens, raifed it to greatnefs. Hiero, who adorned it with many offerings, left the people his heir to more than 2000 talents. After that benefactor followed Zeno, the rhetorician; and lis fon Polemo, as renowned a fophif as ever lived. This pelfon flourifled at Smyrna; but was buried here by the Syrian gate, near which were the fepulchres or collins of his anceftors. Laodicea, though inland, grew more potent than the cities on the coatt, and became one of the larget towns in Phrygia. It was often damaged by earthquakes, and reftored by its own opulence or by the munificence of the Roman errperors. - Thefe refources failed, and the city, it is probable, became early a fcene of ruin. About the year 1097 it was poffefted by the Turks, and fubmitted to Ducas general of the Emperor Alexis. In It 20 the Tusks facked fome of the cities of Phrygia by the Mæander, but were defeated by the Emperor John Comnenus, who took Laodicæa, and built anew or repaircd the walls. Absut $116 t$ it was again unfortified. Many of the inlabitants were then killed with their bifhop, or carried with their cattle into captivity by the 'Turks. In 190 the German emperor', Frederick Barbarofla, going by Loodicea with his army toward Syria on a croifade, was received fo kind. ly, that he prayed on his knees for the profperity of the people. Abnut ! 96 this region with Caria was dreadfully ravaged by the Turks. The Sultan, on the invafion of the Tartars in 1255 , gave Laodicea to the Romans; but they were unable to defend it, and it foon returned to the Turks. It is now totally ruined and deferted. Several remains of its aneient grandeur are, however, Aill to be feen; particularly the ruins of two theatres and an amphitheatre. -The memory of this place is confecrated in fcripture, being one of the feven churches to which St John in the Apocalyple addreffes himfelf, commended by St Paul.

Laodicat on the fea (anc. geog.), according to Strabo, was a town of Seleucis in Syria, extremely weil built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from Laodice, mother of Seleucus the founder of it.

LAOMEDON, king of Troy, whofe hiftory is in. volved in fables. He was fon of llus king of Troy; and married Strymo, called by fome Placia, os

## L A P

ix somedne Leuctppe, by whom he had Podarces afterwards known by the name of Priam, and Hefione. He built the walls of Troy, and was affitted by Apollo and Neptune, whom Jupitcr had banifhed from heaven, and condemned to be lubfervient to the will of Laomedon for one year. When the walls were finifhed, Laomedon refufed to reward the labours of the gods; and foon after his territories were laid wafte by the fea or Neptune, and his fubjects were vifited by a peltilence fent by Apollo. Sacrifices were offered to the offended divinities; but the calamities of the Trojans increafed, and nothing could appeafe the gods, according to the words of the oracle, but annually to expofe to a fea monter a Trojan virgin. :Whenever the monlter appeared, the marriageable maidens were affembled, and the lot decided which of them was doomed to death for the good of her countiy. When this calamity had continued for five or fix years, the lot fell upon Hefione Laomedon's daughter. The king was unwilling to part with a daughter whom he loved with uncommon tenderncfs, but his refufal would irritate more - Arongly the wrath of the gods. In the midtt' of his fear and hefitation, Hercules came and offered to deliver the Trojans from this public calamity, if Lavmedon would pronife to reward him with a number of fine horfes. The king confented; but when the monfter was deftroyed, he refufed to fulfil his engagements, and Hercules was obliged to befiege Troy and take it by force of arms. Laomedon was put to death after a reign of 29 years; his daughter Hefione was gizen in marriage to Telamon, one of the conqueror's attendants; and Podarces was ranfomed by the Trojans, and placed upon his father's throne. According to Hyginus, the wrath of Neptune and Apollo was kindled againft Laomedon, becaufe he refufed to offer on their altars as a facrifice all the firt born of his cattle, according to $a$ vow he had made.

LAON, a confiderable town of the ifle of France, and capital of the Laonis, with a caftle and bihop's fee. Its principal trade confifts in corn and wine; and it is very advantageoully feated on a mountain in F.. Long. 3. $4^{2}$. N. Lat. 49. 34.
L.AOS, a kingdom of A fia beyond the Ganges; bounded on the north, by China; on the eaft, by Tonquin and Cochin-China; on the fouth, by Cambodia: and on the welt, by the kingdom of Siam, and by the territories of the king of Ava. This country is full of forefts, and abounds in rice, fruits, and fifh. The inhabitants are well made, robuft, of an olive complexion, and mild in their difpofition; but very fupetfitious, and much addieted to women. Their principal occupation is tilling the ground and fifhing. The king flows himfelf but twice a year, and has large revenues from the elepbant's teeth found in bis dominions. Their religion is a kind of idolatry, and much the fame as in China. Langiona is the capital town.

LAPATHUS, Lapethus, or Lepithus (anc. geog.) ; a town of Cyprus, about the middle of its norch fice, with a port or fation for fhips, and a cognominal river. It was built by a colony of Phonicians, according to Scylax; by Bclus king of Tyre, according to A lexander Ephefius. According to Strabo, it was built by a colony of Spartans; and one of the sine kings refided bere, the laft of whom was Pififtra-
tus, who commanded the naval army of Alesander the Lapl
Great. There was a temple here dedicated to Venus. The territory round it is called Lapithia by Diodonus and Ptolemy ; Lapithii, the people, tainted with a degree of fatuity; hence Lapatbius denotes fatuus, (Hefychius). - Now a village called 1 Lapithan; but, according to the Abbe Mariti, the longett and moftextenfive in the inand. Befides the advantage of a fine fituation, it furnifhes the bell productions in the country; and though Cyprus is in general not very abundant in fruits, Lapitha feems a favoured foot in this refpect, and may be called the sarden of the ifland.
L.APLDARY, an artificer, who cuts precious Atones.

The art of cutting precious flones is of great antiquity. The French have carried this art to a very great perfection, but not in any degree fuperior to the Britifh.
There are various machines employed in the cutting of precious ftones according to their quality. The diamond, which is extremely hard, is cut on a wheel of foft fteel, turned by a mill, with diamond dull, temper--ed with olive-oil, which alfo ferves to polifh it.

The oriental ruby, fapphire, and topaz, are cut on a copper-wheel with diamond duft tempered with olive-oil, and are polifhed on another copper-wheel with tripoli and water. The hyaciuth, emerald, amechylt, gainets, agates, and other itones not of an cq́ual degree of hardncfs with the other, are cut on a leaden wheel with fmalt and water, and polifhed on a tin-wheel with tripoli. The turquois of the old and new rock, girafol, and opal, are cut and polifhed on a wooden wheel with tripoli alfo.

The lapidaries of Paris have been a corporation fince the year 1290. It is governed by four jurats, who fuperintend their rights and privileges, sifit the matter-workmen, take care of the matter-piece of workmanhip, bind apprentices, and adminifter the freedom.

Ladidary is alfo ufed for a virtuofo neilled in the nature, kinds, \&c. of precious ftones; or a merchant who deals in them.

Lapidakr Style, denotes the ftyle proper for monuo mental or other infcriptions.

This is a kind of medium between profe and verfe; the jejune and the brilliant are here equally to be avoided. Cicero has preferibed the rules of it : Accedat oportet oratio varia, velbemens, plena spiritus. Omnium fententiarum gravitate, oimnium verborum ponderibus, ift utendum.
The lapidary ftyle, which was loft with the ancient monuments, has been retrieved at the beginning of this age by Count Emanuel Teforo: it is now ufed various ways at the beginning of books; and even epifles dedicatory are compofed in it, of which we have no example among the ancients.

LAPIDESCENT, any thing which has the faculty of petrifying, or turning bodies to a ftony nature. Naturalifts fpeak of a lapidefcent principle, a lapidefcent fpirit, a lapidefcent juice, \&c.

LAPIS, in general, is ufed to denote a ftone of any kind.

Lapls, in Roman antiquity, a geographical meafure denoting a mile; becaufe miles were diftiuguifhed by erecting a flone at the end of each; fiom the number

## $\pm \mathrm{A}$

number marked on which, the length of way from Rume might be known. The device is by Plutarch afcribed to Caius Gracchus. This was more accnrately executed by Augultus, who crected a gilt pillar in the forum, at which all the public ways of Italy, diftinguifhed by ftones, were terminated. The fame thing was done in the Romaan provinces. Hence the phrafes tertius lapis, centefinus lupis, \&ec. for three, a hundred, \&ce. miles: and fometimes the ordinal numher without lapis, as ad duoducinum, \&c. at tewlve miles dillance.

Lapis Alfius, in the natural hillory of the ancients, the name of a flone called alfo farcophagus, from its power of couluming flefh. Sce Sarcophagus.

Lapis Pomonirnfis, the Bolognian Itune. See Chemistry, $n^{6} 1081$, 1082.
L.apis Lazuli. Sce Lazuli.
L.apis Lyncurius. See Lyncurius.

Lapis Mlutabilis. See Hydrophanes.
Latpis Hepaticus. Sice Lifer-Stone.
Lapis Iydius. Sec Touch-stone, Trapp, and Lafis Lrnius.

Lafis Olfulianus. See Obsidianus and Gallimaeeus.
L.apis Nefbriticus. See 7adr-Stone.
L.apis Speutaris. See Specularis.

LAPITHA, (anc. geog.) a people of Theffaly. See the next article.
LAPITHUS, (fab. hift.), a fon of Apollo, by Stilbe. He was brother to Centaurus; and married Orfinome, dangliter of Euronymus, by whom he had Phorbas and Periphas. The name of Lapithæ was given to the numerous children of Plorbas and Pcriphas, or rather to the inhabitants of the country of which they had obtained the fovereiguty. The chief of the Lapithæ affembled to clicbrate the nuptials of Pcrithous, one of their number. Among thiem were Thefeus, Dryas, Hopleus, Mopfus, Phalerus, Exadius, Prolochus, Titarefius, \&c. The Centaurs were alfo invited to partake the common feflivity; and the amufements would have been harmlefs and innocent, had not one of the intoxicated Ceutaurs offered violence to Hippodamia the wife of Perithous. The Lapithr. refented the injury, and the Centaurs fupported their companions; upon which the quarrel beeame univerfal, and ended in blows and flaughter. Many of the Centaurs were flain, and they at lait were obliged to retire. Thefeus amung the Iapithx fhowed hinfelf brave and intrepid in fupporting the caufe of his friends; and Neffor alfo was not lefs active in the protection of chaflity and innocence. Hefiod has deferibed the battle of the Centaurs and Lapithr ; as has alfo Ovid, in a more copious manner. The invention of bits and bridles for hoofes is attributed to the Lapithe.

LAPLAND, the moft northerly country of Europe, extending from the north cape in $71^{\circ} 30^{\prime} \mathrm{N}$. Lat. to the White Sea under the arctic cirele, is inhabited by the fame pcople, though the country is Fubject to different powers. Norwegian Lapland, under the deminion of Denmark, lies betwcen the northern fea, the river Pais, and the lake Enarak. Swedifh Lapland comprehends all the country from the Baltic to the mountains that feparate Norway from Sweden. It is divided into fix diftricts, denominated march or territory; and thefe are diftinguifhed by the
names of rivers, fuch as Aungnémanland, Elma, Lapland. Pcta, Luki, Tnrna, and Kiemi. The eattern part, -J Subject to the Czar of Mufoovy, fituated between the lake Enarak and the White Sea, is divided iuto three dittinct prefectures; narncly, that of the fea couall towards the north, calied Nourmankoi Lcporie; the "TerRoi Leporie, upon the coalt of the White Sea; and the third, or iuland, known by the name of Bellamon refkoi Leporic. In Swedill Lapland, which is the inot ennfideratle of the three, the provinces or marcks are fubdivided into fmaller diftricts called biars, coufifting each of a certain number of families; among which the land is pareelled out by government, or the prefect of the didrict appointed by the king of Sweden.

Lapland may be termed a huge congeries of frightful rocks and ftupendous mountains; interfperfed, however, with many pleafant valleys, watered by arn infinite number of rivulets that run into the rivers and lakes, which difclarge themfelves into the gulf of 13ochnia. The narnes of the principal lakes in Lapland are the Great Uma, the Great Windel, the Oreavan, the Stor-avan, the Great Lula ; the lakee of Kartom, Kali, Torno, Enara, and Kimi. Some of thefe extend 60 leagues in length, and contain a great number of illands: Stur-avan is faid to contain 365 ; and Enara contains an archipelago of iflands fo large, that no Laplander has lived long enough to vifit each particular ifland. The natives believe this country to be the terreftrial paradife; and indeed nothing could be more enchanting than fuch valt profpects of mountains, hills, forelts, lakes, rivers, \& c. if the country was in a moderate climate; though even here, in fummer the rofes are feen blowing wild on the banks of the lakes and rivers, with all the beautiful glow of colour which appears in thofe cultivated ill our gardens. But all the intervals between the mountains are not ingrofled by thefe agreeable profpeis; great part of the flat country is covered with brown dufky forefts of fir and pine trees; and thefe are often fkirted by wide extended morafles, the flagnating waters of which in fummer produce myriads of mifchievous infects, that are more intolerable than even the cold of winter.

The cold of Lapland is very intenfe during the winter, freezing even brandy and the watery pari of fpirit of wine, if the latter is not highly rectified : all the lakes and rivers are frozen to a prodigious thicknefs; and the whole face of the country is covered with fnow to the depth of four or five feet. While this continues loofe, it is impoffible to travel; for a man's eyes are not only blinded with it, but if a Arong wind fhould rife he will be buried in the drifts of fnow : yet fhould a partial thaw take place for a few hours, the furface of this fnow is formed by the fucceeding froft into a bard impenetrable cruft, over which the Laplander travels in his fledge with great celerity. While the thaw prevails, the air is furcharged with vapours, and the climate is rainy ; but while the north wind blows, the fiky is beautifully ferene, and the air very clear.

The heat of fummer is almoit as intolerable in Lap. land as the cold of winter. At the northern extremity of the country the fun never fets for three months in fummer, and in winter there is an uninterispted night of the fame duration ; but this is qualified in fuch a manner by a conflant revolution of dawn and twilight, by a ferenc fiy, moon.light, and aurora borea-

Iapisnd. lis, refiected from the white furface of the earth covered with fnow, that the inhabitants are enabled to hunt, fifh, and proceed with their ordinary orcupations. The country abounds with excellent fprings; and is remarkable for fome furprifing cataracts, in which the water rumbles over frightful precipices, and dafles amoug rocks with amazing impetuofity and noife.
The foil of Lapland is generally fo chilled and barren, that it produces little or no grain or fruit-trees of any kind. This flerility, however, is not fo much owing to the foil, which is in many places of a rich mould, as to want of induftry; for in lome diftriets the Swedes have tilled and manured pieces of ground that bear plentiful crops of rye. There is alfo great plenty of berries: fuch as black currants; what is called the Norwegian mulberry, growing upon a creeping plant, and much effeemed as an antifcorbutic ; rafp-berries, cran-berries, juniper berries, and bilberrics. The tops of the mountains are fo much expofed to intenfe cold, and tempefts of fnow and hail, that no tree will grow near the funmmit; but in parts that are more theltered, we fee fine woods of bircb, pine, and fir, difpofed by nature as if they had been planted by art in rows at regular diftances, without any undergrowth or incumbrance below. Befides thefe trees, fone parts of Lapland produce the fervice tree, the willow, the poplar, the elder, and the cornel. Among the plants of this country the principal is the angelica; which is greatly efeemed by the natives, who ufe it in their food. Here is likewifc the acetofa or forrel, which grows in great plenty, and is of much fervice on account of its antifcorbutic properties. They have alfo other kinds of herbs peculiar to the country, different kinds of grafs, heath, fern, and mofs; which are all enunierated by Linnæus in his Flora Laporica. But the vegetable which is in greateft plenty, and of the mon extenfive ufe among them, is the lichen rangifcrus. The rein-deer is wholly fuftained in winter by this vegetable; and the Laplanders themiclves boil it in broth as a cordial and reforative. They likewife ufe one fort of it as a foft, eafy, and wholefome bed for their newborn children.

Some filver and lead mines have been difcovered in the provinces of Pitha and Lula; and two of copper, together with excellent veins of iron, in the dillrict of Torno; but they are not at prefent worked with any confiderable advantage. In fome places there are veins of filver and gold mixed; but thete mines are worked only for a few months in the fummer, becaufe the froft hinders the engines from playing. Here are found beautiful cryitals, of a furpriting magnitude, fo hard and fine, that when polifined they refemble real diamonds. In fome places amethylts and topazes are alfo found, but pale and cloudy ; alfo a great quantity of very curions ftones, which are too hard to be worked by the tool of the mafon. Some of thefe found on the banks of rivers and lakes, when they happen to bear the leaft refemblance to the figures of animals, the Laplanders remove to more confpictuus places, and adore as deities. The province of Torno affords fome curious flones of an octargonal fhape, regular, fhining, and polifhed by the hand f nature. In fome rivers they fifh for pearls, which are generally pale ; but fome of them are as bright as the oriental pearls

No ${ }_{175}$.
and much larger and rounder. Thefe pearls are found Lap in mufcle-fhells; and the fifhery is not in the fea, but in rivers.
Lapland, as well as Norway, is infented with a great number of grey wolves and bears, with whom the inhabitants wage perpetual war. The moft honourable exploit among the Laplanders is that of killing a bear : and the heroes adorn their caps with a fmall plate of lead or pewter for every: bear they have hain. The country abounds alfo with elks, beavers, and otters, which live here unmolefted, and find plenty of fifh for their fubfiltence. The forefts of this country furnifk haunts to a great number of beautiful mariens and fquirrels; which laft change their colour every winter from brown to grey. Lapland is alfo the native country of the zibeling or fable, whofe flin is extremely valuable. Here are likewife ermines, weafel3, hares, large black cats which attend the Laplanders in hunting, and little prick-eared curs trained to the game. But the molt remarkahle animal of Lapland is the reindecr, of which an account is given in the article Cervus $n^{\circ}$ 4. Thefe animals, fo ufeful in various refpects to the nstives, are kept at no expence. In fummer they feed upon graffes and alpine plants; in winter, as already meutioned, upen the lichen rangif crus, or rein-deer lichen, and its varietics, which are fo abundant as in many parts almoft totally to cover the ground for the fpace of feveral miles, and which the fagacious animal difcovers under the frow by the peculiar acutenefs of its finell. Moft of thofe ufed for draught are caltrated when very young, and are larger and fatter than the bucks. The woods, mountains, and rivers are well flocked with wild-forvl; fuch as bullard, partridge, growfe, heatheock, pheafants, lapwings, fwans, wildgrefe, wild-ducks, and all forts of aquatic birds that build and breed in northern climates. In the beginning of the fipring the fwans go thither in numerous fights from the German ocean; the lap- wings follow in fuch fiwarms tha: they darken the fky as they pafs along, and feream fo loud that they may be heard at a great diffance. The rocks and muntains are likewife frequented by eagles, hawks, falcons, kites, and other birds of prey.-The rivers abound with delicious falmon from the gulph of Bothnia, trout, bream, and perch of exquifite flavnur and amazing magnitude; and the inhabitants of Wardhus, or Danifh Lapland, are well fupplied with thin from the northern ocean. With refpect to infects, the fies hatched in the moraffes and woods in fummer are fo numerous, that they often obfcure the face of day; fo venomous, troublefome, and intolerable, that the rein-deer fly to the tops of the highelt mountains for fhelter, and the Laplanders betake themfelves to the fea-fide, which is the leaf infefted by thefe peftilent vermin. M. de Maupertuis, in his account of the voyage he made to Lapland, in company with the other French mathematicians fent thither by the king to meafure a degree of the meridian, gives us to underftand, that on the tops of the mountains in Torno the flies were fo troublcfome, that even the Finland foldiers, who are counted the moft hardy troops in the fervice of Sweden, were obliged to cover their faces with the firts of their coats from the attacks of thefe animals, which 'fwarmed to fuch a degree, that the monent a piece of fith appeared is was blackened all

## L A P

and. over. Some of thefe flies are very large, with green heads, and fetch blood from the fkin whorever they Atrike. The Laplanders fhroud themfelves in the fmoke of a large fire kindled for that purpofe; yet even this difagreeable expedient was not fufficient to defend the French philofophers : they were obliged, not withltanding the exceffive heat, to wrap up their heads in garments made of the fkins of rein-deer, called in that country lapmudes, and te cover themfelves with a thick rampart of fir boughs; yet all thefe precautions proved ineffectual. M. de Maupertuis obferved a lake quite covered with little yellowifh grains, refembling millet feed, which he fuppofed to be the chryfalifes of fome of thefe infects.

The Laplanders are very low in ftature, and are likewife remarkable for having large heads. They are alfo ill fhaped, and their features harfh. They are, however, flrong, hardy, and robuft, infomuch that they will bear incredible fatigue; and it is remarked that the floutef Norwegian is not able to bend the bow of a Laplander. The women are much lefs homely than the men, and many of them are noted for a delicate and florid complexion.

Thefe people are fimple, honeft, hofpitable, and timorous : their timidity, however, refpects war alone; for to many other fpecies of dangers they expofe themfelves with furprifing intrepidity, whether in afcending and defcending mountains and precipices with their fnow-fhoes and in fledges, or in venturing amidtt whirlpools and cataracis in little flender boats made of thin fir-boards, faftened together with thongs of leather, finews of wild beaits, or tough and flexible twigs of willow and ofier. Thefe boats are of different tizes, from two to fix yards in length, managed with oars, and caulked with mofs fo tight as to keep out the water. The Laplanders are partly fetted, and in part wild and roving: the latter live in tents made with coarfe cloth ; the former are fixed in fmall villages near the lakes, and chicfly follow firhing. They huild their cottages fomewhat in the thape of a cone, by placing a circle of large tiees or poles aflant in the earth, and clofe to each other, fo that their tops meet, and form a fmall vent for the iftue of the fnoke: they cover the ground within with branches of trees. In fpring their food contits principally of the eggs of water-fowl, which are extremely plentiful in thofe parts; in fummer and autumn, of the birds themfelves, and of various other of the partridge tribe; and in winter of the milk and flefh of the rein deer and dried fifh. They had cill lately no bread; but in lieu thereof ufed the inser rind of the pine-tree dried and ground, and dried fifh reduced to powder. They make confections and decoctions of berries, angelica, and forrel, which they juflly reckon to be prefervatives againft the fcurvy. The Laplander is fecured in the poffeffion of unin. terrupted health by temperance and exercife, which, together with the feverity of the climate, brace his nerves to a very unufual pitch of flrength, and fortify his conflitution in fuch a manner, that he often lives to the age of 100 , without feeling the leaft pang of diftemper, or even perceiving his vigour in the leat impaired; for it is not uncommon to fee a Laplander in extreme old age hunting, fowling, ikaiting, and performing all the fevereft exercifes with uadiminifhed agility.

[^21]The fummer garb of the men confilts of a long lapiand. coat of coarfe cloth, reaching down the niiddle of the leg, and girded round the wait with a belt or girdle ; from which hang a Norway knife, and a pouch containing flints, matches, tobacco, and other necellaries: the girdle itfelf being decorated with brafs rings and chains. Their caps are made of the Rkin of the northern diver, with the feathers on; and their floes of the rein-deer fkin , with the hair outwards. They wear no linen: but the garments of the better fort are of a finer cloth, and they delight in a variety of colours, though red, as the moft glaring, is the moft agrecable. In winter they are totally cafed up in coats, caps, boots, and gloves, made of the rein-deer 1kins. In the Flora Lapponica, Linnxus fays, "Perhaps the curious reader will wonder bow the people in Lapland, daring the terrible cold that reigas there in winter can preferve their lives; fince almoft all birds, and even fome wild beafts, defert it at that time. The Laplander, noi only in the day, but through the whole winter nights, is obliged to wander about in the woods with his herds of rein-deer. For the reindeer never come under cover, nor eat any kind of fodder, but a particular kind of liverwort. On this account the herdfmen are under a neceffity of living con tinually in the woods, in order to take care of their cattle, left they thould be devoured by wild beafts. The Laplander eafily does without more light, as the fnow reflects the tays that come from the fars, and as the Aurora Borealis illuminates the air every night with a great variety of figures. No part of our body is more eafily deftroyed by cold than the cxtremities of the limbs, which are moft remote from the fun of this microcofm, the heart. The kibes that happen to our hands and feet, fo common in the northern parts of Sweden, prove this. In Lapland you will never fee fuch a thing; although were we to judge by the fituation of the country, we fhould imagine juft the contrary, efpecially as the people wear no fockings, as we do, not only fingle, but double and triple. The Laplander guards himfelf againtt the cold in the following manner. He wears breeches made of rein-deer fking with the hair on, reaching down to his heels, and fhoes made of the fame materials, the hairy part turned outwards. He puts into his fhoes flender-eared broad-leafed cyperus grafs, (carex veficaria, Spec. P\% or the Bladder Carex), that is cut in fummer and dried. This he firft combs and rubs in his tands, and then places it in fuch a manner that it not only covers his feet quite round, but his legs alfo; and being thus guarded, he is quite fecured againtt the intenfe cold. With this grafs they fuff their gloves likewife, in order to preferve their hands. As this grafs keeps off the cold in winter, fo in fummer it hinders the feet from fweating, and at the fame time preferves them from being annoyed by ftriking againt flones, \&c. for their thoes are very thin, being made, not of tanned leather, but the raw hide."

The womens apparel differs very little from that of the other fex; only their girdles are more ornamented with rings, chains, needle-cafes, and toys that fometimes weigh ' 20 pounds. In winter, both men and women lie in their furs ; in fummer, they cover themfelves entirely with coarfe blankets to defend them from the gaats which are intolerable. The Laplanders

Lapland. are not only well difpofed, but naturally ingenious. They make all theirbown furniture, their boats, fedges, bows and arrows. They form neat boxes of thin birch boards, and inlay them with the horn of the rein-deer. The Swedes are very fond of the Lapland bafkets made of the roots of trees, flit in long thin pieces, and twifted together fo nicely that they will hold water. Among the manufactures of this country we likewife number curious horn-fpoons, and moulds in which they caft the trinkets of tin which adorn their girdles. Over and above thefe domeftic occupations, the men within doors perform the office of cooks in dreffing vi\&tuals for the family. The women aft as taylors and embroiderers; they make clothes, fhoes, and boots, and harnefs for the rein deer: they fpin thread of fur, and knit it into caps and gloves that are very foft and warm. They draw tin into wire through a horn; and with this they cover the thread which they ufe in embroidering the figures of bealts, flowers, trees, and flars upon their caps and girdles.

The Laplanders make furprifing excurfions upon the fnow in their bunting expeditions. They provide themfelves each with a pair of ikates, or fnowfhoes, which are no other than fir-boards covered with the rough nkin of the rein-deer, turned in fuch a manner that the hair rifes againft the fnow, otherwife they would be too Alippery. One of thefe fhoes is ufually as long as the perfon who wears it ; the other is about a foot fhorter. The feet ftand in the middle, and to them the moess are faltened by thongs or witbes. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood to prevent its piercing too deep in the fnow; and with this he ftops bimfelf occafionally. By means of thefe accoutrements he will travel at the rate of 60 miles a-day without being fatigued; afcending fteep mountains, and fliding down again with amazing fwifterefs.

The Laplander not only travels a-foot, but is provided with a carriage drawn by the rein-deer, in which he journeys with ftill greater rapidity. The fledge, called pulka, is made in the form of a fmall boat, with a convex bottom, that it may fide the more eafily over the fnow : the prow is fharp and pointed; but the fledge is flat behind. The traveller is fwathed in this carriage like an infant in a cradle, with a ftick in his hand to fteer the veffel, and difengage it from pieces of rock or flumps of trees that may chance to encounter it in the route. He mult alfo balance the fledge with his body, otherwife he will be in danger of being overturned. The traces, by which this carriage is faftened to the rein-deer, are fixed to a collar about the animal's neck, and run down over the breaft between the fore and hind legs, to be connected with the prow of the fledge: the reins, managed by the traveller, are tied to the horns; and the trappings are furnifhed with little bells, the found of whicb is agreeable to the animal. With this drauglit at his tail, it has been reported that the rein-deer will fly like lightning over hill and dale at the rate of 200 miles a-day. But this reprefentation is greatly exaggerated. According to the beft accounts, the common pace of the rein-deer is only at the rate of about four miles an hour; though, if he be preffed, he will travel 10 or 12 Swedifh miles (70 or 84 Englifh miles) in a day; but by fuch hard
driving is generally deftroyed. It, however, fre- Lapla quently happens, that he will perfevere in his jour. ney 50 miles without intermiffion, and without taking any refreshment, except occafionally moittening his mouth with the fnow. Before he fets out, the Laplander whifpers in his ear the way he is to follow, and the place at which lie is to halt, firmly perfuaded that the beaft underflands his meaning: but, in fpite of this intimation, he frequently Itops fhort long before he has reached the journey's end; and fometimes he overfhoots the mark by feveral leagues. In the beginning of winter the Laplanders mark the moft frequent. ed roads, by frewing them with fir-boughs; and in. deed thefe roads are no other than pathways made through the fnow by the rein-deer and the pulkhas: their being frequently covered with ne, fnow, and alternately beaten by the carriage, confolidates theminto a kind of caufeway; which is the harder if the furface has felt a partial thaw, and been crufted by a fubfequent froft. It requires great caution to follow thefe tracts; for if the carriage deviates to the right or left, the traveller is plunged into an abyifs of fnow. In lefs frequented paits, where there is no fuch beaten road, the Laplander directs his courfe by certain marks which be has made on the trees.

The chief occupation of the Laplanders is hunting, and this exercife they perform in varinus ways. In fummer they hunt the wild beafts with fmall doge, trained to the diverfion. In winter they purfue them by their tracks upon the fnow, 作ating with fo great velocity, that they very often run down the prey. They catch ermines in traps, and fornetimes with dogs. They kill fquirrels, martens, and fables, with blunt darts, to avoid wounding the fisin. Foxes and beavers are flain with fharp-pointed darts and arrows; in fhooting which, tbey are accounted the beft markfmen in the world. The larger beafts, fuch as bears, wolves, elks, and wild rein-deer, they either kill with firearms purchafed in Sweden or Norway, or take in fnares and pits dug in the forefts. Their particular Jaws relating to the chace are obferved with great punctuality. The beaf becomes the property of the man in whofe fnare or pit he is caught; and he who difcovers a bear's den has the exclufive privilege of hunting him to deatb. The conquelt of a bear is the moft honourable atchievement that a Laplander can perform ; and the flefh of this animal they account the greateft delicacy on earth. The bear is always difpatched with a fufil, fometimes laid as a fnare, ready cocked and primed; but more frequently in the bands of the hunter, who runs the moft imminent riks of his life fhould he mifs his aim of wounding the beaft mortally. The death of a bear is celebrated by the Laplanders as a fignal victory. The carcafe is drawn to the cabin ar hut of the victor by a rein-decr, which is kept facred from any other work for a whole year after this fervice. The bear is furrounded by a great number of men, women, and children, reciting a particular hymn or fong of triumph, in which they thank the vanquifhed enemy for having allowed himfelf to be overcome without doing any mifchief to his conqueror, and welcome his arrival : then they make an apofrophe to heaven, exprefling their acknowledgment to God, that he has created beafts for the ufe of men, and endued mankind with ftrength and courage so over-

## L A P

land coms and attack the fierceft of the brute creation. The hero is faluted by the women, who fpit chewed elderbark in his face. He is feafted three days fucceffively, and his cap is decorated with an additional figure wrought in tin wire.

The manner in which the young Laplander choofes a wife is equally remarkable and ludicrous. When he bas pitched upon a female, be employs fome fiiends as mediators with the father; and thefe being provided with fome bottles of brandy, the fuitor accompanies them to the hut of his future father-in-law, who invites the mediators to enter; but the lover is left with. out until the liquor be drank, and the propofal difcuffed: then he is called in, and entertained with fuch fare as the hut affords; yet without feeing his miftrefs, who retires and goes out on this occation. Having obtainat leave of her parents to make his addrefles in perfon, he puts on his beft apparel, and is admitted to the lady, whom he falutes with a kifs: then he prefents her with the tongue of a rein-deer, a piece of beaver's flefh, or fome other fort of provifion. She declines the offer, which is made in prefence of her fifters and relations; but makes a fignal to the lover to follow her into the fields, where the aecepts the prefents. Thus encouraged, he begs her permiffion to fleep with her in the but: if the confents, there is no further difficulty; if the difapproves of the propofal, the drops her prefents on the ground. When the lovers art agreed, the youth is permitted to vifit his inamorata as often as he fhall think proper: but every time he comes, he muft purchafe this pleafure with a frefh bottle of brands; a perquifite fo agreeable to the father. that he often poltpones the celebration of the nuptials for two or three years. At length the ceremony is performed at chureh by the prieft of the parith. Even after this event, the hufband is obliged to ferve his father-in-law a whole year; at the expiration of which he retires to his own habitation with his wife, and her patrimony of rein-deer, and receives prefents from all his friends and relations. From this period he fequellers his wife from the company of all itrangers, efpecially of the male fex, and watches over ber conduct with the mon jealous vigilance.

Many Lapland women are barren, and none of them are very fruitful. A woman, inmediately after delivery, fwallows a draught of whale fat: the child is wafhed with Inow or cold water, and wrapped up in a hare-fkin. The mother is feldom above five days in the fraw, and in fourteen is generally quite recovered: then the carries the child to church to be baptized. Before the can reach the refidence of the prieft, the is often ubliged to traverfe large forefte, mountains, lakes, and wide extended waltes of fnow. The infant is fattened in a hollowed piece of wood, tretched naked on a bed of fine mofs, covered with the foft fkin of a young rein detr, and ilung by two Itraps to the back of the mother, who always fuckles her own child. At home this little eracle is lung to the roof of the hut, and the child lulled affecp by iwinging it from one fide to the other. The buys from their infancy practife the how; and are not allowed to break their falt until they have hit the mark. The female children are as carly initiated in the bufinefs peculiar to their fex.

Thefe people, though for the moil part vigorous
and healthy, are not altogether exempted from dif. temper. They are fubject to fore eyci, and even to blindnefs, from the fmose of their huts, and the fire to which they are almolt continually expofed. Some wafte away in confumptions; others arc afflicted with rheumatic pains and the fcurvy; and a few are fubject to vertigo and apoplexy. For the cure of all their internal diforders, they ufe no other medicine than the decoetion of a certain fpecies of mofs; and when this cannot be procured, they boil the ttalk of angelica in the milk of the rein-deer. In order to remove a fixed pain, they apply a large mufhroom, burning hot, to the part affected; and this produces a blifter, which is fuppofed to draw off the peceant humour. To their wounds they apply nothing but the turpentine that drops from the firetree. When they are froft bitten, (though according to the above extract from Linneus this feldom or never happens), we are told that they thrult a red-hot iron into a cheefe made of reindeer's milk, and with the fat that drops from it anoint the frozen member, which generaily recovers. When a Laplander is fuppofed to be on his death-bed, his friends exhort him to die in the faith of Chrilt, and bear his fufferings with refignation, by remembering the paffion of our Saviour. They are not, however, very ready to attend him in his lait moments; and as foon as he expires, quit the place with precipitation, apprehending fome injury from his fpirit or gholt, which they believe remains with the corpfe, and take all opportunities of doing mifchief to the living. The deceafed is wrapped up in woollen or linen, according to his circumitances, and depofited in a coffin by a perfon felected for that purpole: but this effice he will not perform, unlefs he is firft fecured from the ill offices of the manes, by a cenfecrated brals ring tixed on his left arm. The Chrittian religion in this country has not yet difpelled all the rites of heathenif fuperitition: tosether with the body they put into the coffin an ax, a flint, and Iteel, a flafis of brandy, fome dried fin and venifon. With the ax the deceafed is fuppofed to hew down the bunfes or boughs that may obltruct his paffage in the other world: the Iteel and flint are defigned for atriking a light, fhould he find himfelf in the dark at the day of judgment; and on the provifion they think lie may fubtill during his journey.

The Mufcovite I.aplanders obferve other ceremonies, that bear an affinity to the fuperfitions of the Greek church. They not only fupply the defunct with money, but likewile provide him with money for the porter of paradife, and a certificate tigned by the priett, and directed to St Peter, fpecifying, that the bearer had lived like a good Chrittian, and ought to be admitted into heaven. At the head of the coffin they place a litthe image of St Nicholas, who is greatly reverenced in all parts of Mufcovy as a friend to the dead. Before the interment, the friends of the deceafed kindle a tire of Gir-boughs near the coffin, and exprefs their forrow in tears and lamentations. They walk in proceffion feveral times round the body, demanding, in a whining tone, the reafon of his leaving them on earth. They afk whether he was out of humour with his wife; whether be was in want of meat, drink, clothing, or other neceffaries; and whether he had not fucceeded in hunting and fifhing? 'Thefe,

## L A P [ 572 ] L A P

lapland. and other fuch interrogations, to which the defunct Lapland contains about eight churches, which in fome Laplsûs makes no reply, are intermingled with groans and hidenus howlings; and, between whiles, the prief fprinkles the corple and the mourners alternately with holy water. Finally, the body is conveyed to the place of interment on a fledge drawn by a rein-deer; and this, together with the cloaths of the deceafed, are left as the prieft's perquifite. Three days after the burial, the kinfmen and friends of the defunct are invited to an entertainment, where they eat the flefh of the rein-deer which conveyed the corpfe to the burying.ground. This being a facrifice to the manes, the bones are collected into a bafket and interred. Two thirds of the effects of the deceafed are irherited by his brothers, and the remainder divided among his fifters: but the lands, lakes, and rivers, are held in coparceny by all the children of both fexes, according to the divifion made by Charles IX. of Sweden, when he affigned a certain traet of land to each family.

The commerce of the Laplanders is more confiderable than one would expect in a defart country inhabited by a favage ignorant people. They export great quantities of fith to the northern parts of Bothnia and White Ruffia. They likewife trade with the neighbouring countries of Norway, Sweden, Mufcovy, and Finland, by felling rein-deer, fine furs, bafkets and toys of their own manufacture, dried pikes, and cheefe made of the rein-deer's milk. In return for thefe commodities they receive rixdollars, woollen cloaths, linen, copper, tin, flour, oil, hides, needles, knives, fpirituous liquors, tobacco, and otber neceffaries. The Laplanders march in caravans to the fairs in Finland and Norway: thefe are compofed of a long ftring of 30 or 40 rein deer and pulkhas tied to one another, the foremof being led by a Laplander a-foot. When they have chofen a fpot for an encampment, they form a large circle of their rein-deer and pulkhas ready yoked; and the animals lying down quietly on the fnow, are fed with mofs by their mafters. The people kindle great fires, around which, men, women, and children fit, and fup on dried fifh : but the more voluptuous fpread out bear- kin in under their tents, where they lie at their eafe and fmoke tobacco.

The revenue arifing from this country is of no great confequence: it is paid partly in rix-dollars, but chiefly in furs; nay, fome that can procure neither, pay the tribute in dried pikes. The produce of the mines forms likewife a confiderable article. Fifty fquirrelfkins, or one fox-fkin, with a pair of Lapland Thoes, are valued at one rixdollar. Part of the taxes is allotted for the maintenance of the Lapland clergy. -The frightful afpect of this country has been deemed a more effectual defence than artificial bulwarks and garrifons, of which here are none; or than the arms and courage of the natives, who are neither warlike in themfelves, nor in the leaft tinctured with difcipline.

The Laplanders call themfelves Salne Same, and Sa. men-Almatjel. Their country they denominate SameLanda, or Same-aednam; the Swedes ftyle it Lapland or Lappmarken, and the inhabitants Lappar. The natives of thofe diftrias under the dominion of Sweden and Denmark are Lutherans; while many of thofe who are fubject to Ruffia are flill Pagans. Swedifh
parts lie at fo great a diflance from each other, that 2 native is fiequently obliged to travel three days in order to attend divine fervice. The Laplanders, before their converfion to Chriftianity, which was not till lately introduced amongt them, poffefled no books or manufcripts, though they knew many traditional hiftories and fungs of ancient heroes and princes who once reigned over them ; but involved in great uncertainty, and mixed with the mott fahulous accounts. They have now a tranflation of the New Teftament in their language ; and many of the natives are able to read and write.

LAPLYSIA, or SEA.hare; a genus of marine Plate infects belonging to the order of vermes mollufca. The CCLXII body is covered with membranes reffected. It hath a Thield-like membrane on the back, a lateral pore on the right fide, the anus on the extiemity of the back, with four feelers referabling ears. The figure reprefents the depilans minor, which grows to two inches and a half in length, and to more than an inch in diameter : its body approaches to an oval figure, and is foft, punctated, of a kind of gelatinous fubftance, and of a pale lead colour; from the larger extremity there arife four oblung and thick protuberances: thefe are the tentacula; two of them fland nearly erect, two are thrown backward. It is not uncommon about our fhores, efpecially off Anglefea. It caufes, by its poifonous juice, the hair to fall off the hands of thofe that touch it ; and is fo extremely fetid as to create fick. nefs at ftomach.-The major, or greater fea-hare, grows to the length of eight inches.

LAI'SANA, Nipplewort: A genns of the polygamia xqualis order, belonging to the fyngenefia clafs of plants; and in the natural method ranking under the 49 th order, Compofise. The receptacle is naked; the calyx caliculated, with all the inferior fcales canaliculated or finely channelled. There are four fpecies, which grow commonly as weeds by the fides of ditches. The young leaves of the common kind, called dock-creffes, have the tafte of radifhes, and are eaten raw at Conftantinople as a falad. In fome parts of England the common people boil them as greens, but they have a bitter and difagreeable tafte.

LAPSE, in ecclefiaftical law, a flip or omiffion of a patron to prefent a clerk to a benefice within fix months of its being void: in which cafe, the benefice is faid to be in lap $\sqrt{e}$, or lapfed, and the right of prefentation devolved to the ordinary.

And if the ordinary neglect to prefent during the fame time, the right of prefentation accrues to the metropolitan, and to the king by neglect of the metropolitan. This right of lapfe was firf eftablifhed in the reign of Henry II. when the bifhops firit began to exercife univerfally the right of inftitution to churches: and therefore when there is no right of inftitution, there is no right of lapfe; fo that no donative can lapfe to the ordinary, unlefs it hath been augmented by the king's bounty ; but no right of laple can accrue, when the original prefentation is in the crown. In cafe the bencfice becomes woid by death, or ceffion through plurality of benefices, there the patron is bound to take notice of the vacancy at his own peril; but in cale of a vacancy by refignation or canonical deprivation, or if a clerk prefented be refufed for in-

## L A R

## 573 ] L A R

ing fufficiency, thefe being matters of which the bifhop alone is prefumed to be cognizant, here the law requires him to give notice thereof to the patrnn, otherwife he can take no advantage by way of lapfe; neither fhall any laple accrue thereby to the metropolitan or the king. If the bithop refufe or neglect to examine and admit the patron's clerk, without good reafon affigned or notice given, he fhall have no title to prefent by lapfe: and if the right of prefentation be litigious or contefted, and an action be brought againft the bifhop to try the title, no lapfe fhall occur till the queftion of right be decided. If the bifhop he both patron and ordinary, he fhall not have a double time allowed him to collate in : and if the bifhop doth not collate his own clerk immediately to the living, and the patron prefents, though after the fix months are lapfed, yet the prefentation is good, and the bifhop is bound to inftitute the patrnn's clerk. If the bifhop fuffer the prefentation to lapfe to the metropolitan, the patron alfo has the fame advantage if he prefents before the archhifhop has filled up the benefice: yet the ordinary cannot, after lapfe to the metropolitan, collate his own clerk to the prejudice of the archbifhop. But if the prefentation lapfes to the king, the patron Shall never recover his right till the king has fatisfied his turn by prefentation; for nullum tempus occurrit resi.

## LAPWING, in ornithology. See Tringa.

LAQUEARIUS, a kind of athleta among the ancients, who in one hand held a laqueus, i. e. a fort of Enare, wherewith to embarrafs and entangle his autagonift, and in the other a poignard to ftab him.

LAQUEUS, in furgery, a kind of ligature fo contrived, that, when ftretched by any weight or the like, it draws up clofe. Its ufe is to extend broken or difjointed bones, to keep them in their places while they are fet, and to bind the parts clofe together.

LARARIUM, was a chapel which the Romans frequently had in their houfes for the houfehold gods, called lares. Spartian fays, that Alexander the fon of Mammeus kept in his lararium the figure of our Sa . viour, together with his other idols.
L.AR-BOARD, among feamen, the left-hand fide of the thip when you fland with your face towards the bead.
LARCENY, or Theft, by contraction for latrociny, latrocinium, is diftinguifhed by the law into two forts: the one called fimple lurceny, or plain theft, unaccompanied with any other atrocious circumftance; and mixed or compound larceny, which alfo includes in it the aggravation of a taking from one's houfe or perfon.
I. Simple larceny, when it is the ftealing of goods above the value of twelvepence, is called grand larseny; when of goods to that value, or under, is pe. sit larceny: offences, which are confiderably diftinguifhed in their punifhment, but not otherwife. See Theft.
II. Mixed, or compound larceny, is fuch as has all the properties of the former, (fee Theft); but is accompanied with either one or both of the aggra. vations of a taking from one's boufe or perfon. Firft therefore of larceny from the boufe, and then of larceny from the perfon.

1. Larceny fiom the boufe, though it might feem
to have a higher degree of guilt than fimple larceny, larceny. yet is not at all diftinguithed from the other at com.$\underbrace{\infty}$ mon law : unlefs where it is accompanied with the circumftance of breaking the houfe by night; and then it falls under another defcription, viz. that of burglary, (fee Burglary). But now by feveral acts of parliament (the hiftory of which is very ingeniourly deduced by a learned modern writer $t$, who hath + Barfo fhown them to have gradually arifen from our im. 375. provements in trade and opulence), the benefit of clergy is taken from larcenies committed in an houfe in almof every inftance: except that larceny of the fock or utenfils of the plate glafs company from any of their houfes, \&c. is made only fingle feiony, and liable to tranfportation for feven years. The multiplicity of the general acts is apt to create fome confufion; but upon compariug them diligently, we may colleet, that the benefit of clergy is denied npon the following domeftic aggravations of larceny; viz. firt, in larcenies above the value of twelvepence, committed, I. In a church Blackf. or chapel, with or without violence, or breaking the Counnenso fame: 2. In a hooth or tent in a market or fair, in the day-time or in the night, by violence or breaking the fame, the owner or Come of his family being therein: 3. By robbing a dwelling. houfe in the daytime (which robbing implies a breaking), any perfon being thercin: 4. In a dwelling-houfe by day or by night, without breaking the fame, any perfon being therein and put in fear; which amounts in law to a robbery: and in both thefe laft cafes the acceffory before the fact is alfo excluded from his clergy. Secondly, in larcenies to the value of five Joillings, committed, $r$. By breaking any dweelling-houfe, or any out houfe, hop, or warehoufe thereunto belonging, in the day-time, al-, though no perfon be therein ; which alfo now extend' to aiders, abettors, and acceffories before the fact: 2. By privately ftealing goods, wares, or merchandife in any fhop, warehoufe, coach-houfe, or flable, hy day or by night; though the fame be not broken open, and though no perfon be therein: which likewife extends to fuch as aflif, hire, or command the offence to be committed. Lafly, in larcenies to the value of forty 乃illings in a dwelling-houfe, or its out-houfes, although the fame be not broken, and whether any perfon be thercin or not; unlefs committed againft theirmafters by apprentices under the age of 15 . This alfo extends to thofe who aid or affict in the commifion of any fuch offence.
2. Larceny from the perfon, is either by privately. ftealing, or by open and violent affault, which is ufually called rollerg.
The offence of privately ftealing from a man's perfon, as by picking his pocket or the like, privily, without his knowledge, was debarred of the benefit of clergy fo early as by the flatute 8 Eliz. c. 4. But then it muft be fuch a larceny as tlands in need of the benefit of clergy, viz. of above the value of 12 d .; clfe the offender hall not have judgment of death. For the ftatute creates no ncw offence; but only takes away the benefit of clergy, which was a matter of grace, and leaves the thief to the regular judgment of the ancient law. This feverity (for a moft fevere law it certainly is) feems to be owing to the eafe with which fuch offences are committed, the difficulty of guarding againt them, and the boldnefs with which they were

## LA R [ 574] L A R

prahifed (even in the queen's court and prefence) at the time when this ltatute was made: befides that this is an infringement of property in the manual occupatinn or corporal poffeffion of the owner, which was an offence even in a llate of nature. And therefore the faccularii, or cutpurfes, were more feverely punifhed than common thieves by the Roman and Athenians laws.

As to open and violent larceny from the perfon, fee Robbery.

LAR, a tewn of Perfia, in the province of Fars, with a cafle. It carries on a great trade in filk; and its territory abounds in oranges, lemons, and very large tamarinds. E. Long. 54. 15. N. Lat. 27. 30.

LARACHA, an ancient and Irong town of Africa , in the kingdom of Fez. It is feated at the mouth of a river of the fame name, with a good harbour. It was once in the poffeflion of the Spaniards; but the Moors took it from them. W. Long. 5. 55. N. Lat. 35.0.

LARDNER (Nathaniel), an eminent Englih diffenting divine, was born at Hawkhurf in Kent, June 6. 1684. After a grammatical education, to which great attention muft have been given, and in which a no lefs rapid progrefs mutt have been made, he was fent firlt to a diffenting academy in London, which was under the care of the Rev. Dr Johua Oldfield; and thence, in his ath year, to profecute his furdies at Utrecht, under the celebrated profeffors D'Uries, Grevius, and Burman. Here he remained fomewhat more than three years, and then removed for a hort fpace to Leyden. In 1703 he returned to England, continuing at his father's houfe to employ himfelf by clofe and diligent preparation for the facred profeffion which he had in view. Qualifed as he was, it was not till 1709 that he preached his firf fermon, from Romans i. I6.-"a text (his biographer remarks) than which there could not have been a more proper one for a man who was dellined in the order of Divine Providence to be one of the ableft advocates fur the authenticity and truth of the Cbriftian revelation that ever exifted."

A few years after this, Lardner was received into Lady Treby's family as domeftic chaplain and tutor to her fon, and continued in this confortable fituation till her ladyfhip's death in 1721 . This event threw him into circumftances of fome perplexity, having preached to fevertl congregations during his refidence with Lady Treby without the approbation or choice of any one congregation. Here we are told, "that it reflects no honour on the Diffenters, that a man of fuch merit thould folong have been neglected." But it has been obferved upon :his, that the pulpit was not the place in which Mr Lardner was calculated either to consey improvement or acquire reputation. Dr Kippis afterwards informs us, "that his mode of elocution was very unpleafant; that from his early and extreme deafnef he could have no fuch command of his voice as to give it a due modulation; and that he greatly dropped his words." it cannot then, as his biographer adds, be matter of furprife that he was not popular: nor, it may be addelt, can it be any reflection on the congregations to which he occafionally preached, that they did not choofe for their miniller a man, who, notwithftanding liis great learning and amiable
virtues, was fo deficient as a public feaker, that it lard was impoffible to hear him with any pleature, and fcarcely without pain.

Though Mr Lardner had no church at which he officiated as minitter, he was engaged with fome of his diffenting brethren in preaching a Tuefday evening lecture at the Old Jewiy. Acquainted probably with the direction of his fludics, they appointed him to preach on the proof of the Credibility of the Goopel Hiflory. This he difcuffed, we are told, in two fermons: and profecuting the fubject which he had taken up in thefe difcourfes, in Feb. 1727, he publifhed, in two. volumes octavo, the Firf Part of "The Credihility of the Gofpel Hittory, or the Fact occasionally mentioned in the New Teftament confirmed by Paffages of ancient Authors who were contemporary with our Saviour or his A poflles, or lived near their Time." An Appendix was fubjoined, relating to the time of Herod's dearh.

Thus Mr Lardner commenced author, and began his literary career with fingular reputation. "It is \{carcely neceffary to fay (oblerves Dr Kippis), how well this work was received by the learned world. Not only was it highly approved by the Proteflant Diffenters, with whom the author was more immediately connected, but by the clergy in general of the eftablifhed church; and its reputation gradually extended into foreign countries. It is indetd an invaluable performance, and hath rendered the moft effential fervice to the caufe of Chrittianity. Whoever perufes this work (and to him that does not perufe it, it will be to his own lofs) will find it replete with admirable inflruction, found learning, and jutt and candid criticifm." Thefe two, with the fubfequent fifteen, volumes nctavo, and the four thin quartos intitled Yewifo and Heathen Teflimonies, accupied him, with the interruption arifing from fome finaller productions, during the fpace of forty three years.

Di Kippis gives ns a particular account of the time when each volume was publifhed, and of the fubjects difcuffed in each. The following ufeful information which the Doctor introduces, in Ppeaking of the "Supplement to the Credibility," deferves well to be tranfcribed. "I cannot avoid Atongly recommending this work (fays he) to the attention of all young divines. Indeed, I think that it ought to be read by every theological đudent before be quits the univerfity or acaderny in which he is educated. There are three other works which will be found of eminent advantage to thofe who are intended for, or beginning to engage in, the Chriltian miniftry. Thefe are, Butler's Analogy, Bifhop Law's Confiderations on the Theory of Religion, and Dr Taylor's Key to Apoftrlical Writings, prefixed to his Paraphrafe on the Epille to the Romans. Without agreeing with every circumitance advanced in thefe works, it inay be faid of them with the greatelt truth, that they tend to open and enlarge the mind; that they give important views of the evidence, nature, and delign of revclation; and that they difplay a vein of reafoniag and inquiry which may be exrended to other objects befides thofe immediately confidered in the books themfelves.- It muft not be forgotten, that the Supplunent to the Credibility has a place in the excellent collection of treatife in divinity which has lately been publiined by Dr Wat-

## L A R

to fon bimop of Landaff. For a collection which cannot fail of beins eminently conducive to the inftruction and improvement of younger clergymen, and for the noble, manly, and truly evangelical preface by which it is preceded, this great prelate isentitled to the gratitude of the Chriftian world." It may not be improper to adu, that the Supplement to the Credibility was fone years ago publifhed feparately by the bnokfellers, under the title of The Hiflory of the Gofpels and Esijlles.

Applauded as Dr Lardner's works were, he received little recompence for them. Sume of the latter volumes of the Credibility were publifhed at a Iofs; and at latt he fold the copy-right and all the remaining printed copies to the bookfellers, for the trifling fum of L.150. His obje th, however, was not private emolument, but to ferve the interefts of truth and virtue; and it pleafed Divine Providence to Spare his life, both to complete his extenfive plan, and to fee the laft volume, the 4 th of the Tefimonies, publithed. This was in 1767 . He was feized with a decline in the fummer following ; and was carried off in a few days at Hawkburl, the place of his nativity, where he had a fmall paternal eflate, in the 85 th year of his age.
LAREDO, a fea-port town of Spain, in the bay of Bifcay, with a large fafe harbour. It is 30 miles weit of Bilboa, and $7^{2}$ north by weft of Burgos. W. Long. 3. 45. N. Lat. 43. 23.

LARENTINALIA, in antiquity, a feaft held among the Romans on the 23d day of December, but ordered to be obfec ved twice a year by Augultus; by fome fuppofed to have been in honour of the Lares, but by others, with more probability, in homour of Acea Laurentia; and to have been the fame with Laurentalia.
LARES, among the ancients, derived by Apuleius (De Deo Socratis), from lar, familiaris; a kind of domellic genii, or divinities, wormipped in houfes, and efteemed the guardians and protectors of families; fuppofed to refide more immediately in the chimney corner.
The Lares were diflinguifhed from the Penates; as the former were fuppofed to prefide over houle-keeping, the fervants in families, and domeftic affairs; and the latter were the protectors of the maffers of families, their wives and children. Accordingly the Lares were dreffed in fhort fuecinet habits, to fow their readinefs to ferve; and they held a fort of cornucopia in their hands, as a fignal of hofpitality and good houfe keeping. According to Ovid, there were generally two of them, who were fometimes reprefented with a dog at their feet.

Plutarch dittinguifhes good and evil Lares, as he had before done good and evil Genii. - There were alfo fome public, others private Lares.

Apuleius tells us the domeftic Lares were no more than the fouls of departed perfons, who had lived well, and difcharged the duties of their ftation; whereas thofe who had done otherwife, were vagabonds, wandering about and frightening people, called Larve and Lemures.

The Lares were alfo called Penates, and were worfhipped under the figures of little marmoufets, or images of wax, filver, or carthen ware.

The public Larea were alfo called Compitales, from compilun" "a ccofs-way ;" and Viales, from via "a way

575 ] L A R
or public road ;" as being placed at the meetings of Larea. roads and in the high-ways, and eftecmed the patrons and protectors of travillers.
Their private Lares took care of particular houfes and families: thefe they allo called Prafites, from prifo;

> 2uodipraffant oculis omnia tuturu fuis. Ovid Fall.

They gave the name Urlani, i e. "Lares of cities," to thofe who had cities under their care; and Hofilii, to thofe who were to keep their enemies off. There were alfo Lares of the country, called Rurales, as appears by feveral antique inferiptions.

The Lares were alfo genial gods, and were fuppofed to take care of children fiom their birth. It is for this reafon that when Macrobius tells us the Egyptians had four gods who prefidtd over the birth of children, viz. the Genius, Fortune, Love, and Neceffity, called Prafites, fome interpret him as if he had faid the Egyptians bad Lares; but they have mentioned that there was a great difference between the Lares of the Romans and the Preltites of the Egyptians. However, the learned Mr Bryant affirms that they were the fame.

The ancients differ extremely about the origin of the Lares. Varro and Macrobius fay that they were the children of Mania; Ovid makes them the iffue of Mercury, and the Naiad Lara, or Larunda; Apuleiug aflures us they were the poflerity of the Lemures; Ni gridius, according to Arnobius, made them fometimes the guardians and protectors of houfes, and fometimes the fame with the Curetes of Samothracia, which the Greeks call Idei daayliz. Nor was Varro more confiltent in his opinion of thcie gods; fometines making them the manes of heroes, and fometimes gods of the air.
T. Tatius king of the Sabines, was the firft who built a temple to the Lares. The chimney and fireplace in the houfe were particularly confecrated to them.
Tertullian tells us, the cuftom of worfhipping the Lares arofe from this, that they anciently interred their dead in their houfes; whence the credulous people took occafion to imagine their fotils continued there alfo, and proceeded to pay them divine honours. To this it may be added, that the cultom being afterwards introduced of burying in the highways, they might hence take occafion to regard them as gods of the highways.

The victim offered to the Lares in the public facrifices was a hog: in private, they offered them wine, incente, a crown of wool, and a little of what was left at the table. They alfo crowned them with flowers, particularly the violet, myrtle, and rofemary. Their fymbol was a dog, which was ufually reprefented by their fide, on account of its fidelity and the fervice it does to man in watching his houfe. They were fometimes alfo reprefented as clothed in a dog's תkin.

The term Lares, according to Mr Bryant, was formed from laren, an ancient word by which the ark was reprefented: and he fuppofes that the Lares and Manes were the fame domeftic deities under different names; and that by thefe terms the Hetrurians and Latins denoted the dii arkita, who were no other than their arkite anceftors, or the perfons preferved in the laren or ark ; the genius of which was 1 fis, the repu-

## L A R

Large ted parent of the world. He obferves farther, that they are defribed as dxmons and genii, who once lived on earth, and were gifted with immortality. Ar- nobius flyles them Lares quoflam genios $\mathcal{F}$ functorum animas; and he fays, that according to Varro, they were the children of Mania. Huetius (Demonft. Prop. 4. p. 139.) adds, that Mania had alfo the name of Larunda; and fhe is fyled the mother of the dxmons. By fome the is called Lara, and was fuppofed to prefide over familips; and children were offered at her altar in order to procure her favour. In lien of thefe they in after-times offered the heads of prppies and pods of garlic.

LARGE, a fea term applied to the wind when it croffes the line of a fhip's courfe in a favourable direction, particularly on the beam or quarter. Thus, if a hhip iteer weft, then the wind in any point of the compals to the eaftward of the fouth or north may be called large, unlefs when it is directly ealt, and then it is faid to be right aft. Sailing large is, therefore, advancing with a large wind, fo as that the fheets are flackened and flowing, and the bow-lines entirely difufed. This phrafe is generally oppofed to failing clofehauled.

## Largess. See Largitio.

LARGITIO, in Roman antiquity, was a dittribution of corn, provifion, cloaths, money, \&c. to the people. Graccbus, when tribune, to make himfelf popular, paffed a law for fupplying the Roman citizens with corn at a very low rate, out of the public granaries. Claudius, another tribune, with the fame views to popular applaufe, procured it to be diftributed gratis. - Cato, to win the common people from Cæfar, perfiuaded the fenate to do the fame, and 300,000 citizens fhared in the diatribution. Cxfar, after his triumph, extended his bounty to 150,000 , giving tbem each a mina. The Roman emperors enlarged aill further the lift of thofe who were to partake of their diftributions. Largitio is frequently taken ia a bad fenfe, to fignify a mafked bribery; whereby candidates purchafed votes, when they food for places of bonour or trult in the flate. The diftribution of money was called congiarium, and the diftributors divifores and fequefres.

LARGS, a village on the weft coaft of Scotland, oppofite to the ifland of Bute; rendered memorable by the defeat of the Norwegians here in tbeir laft invafion of this country.-This invafion was made in the year 1263 , with a fleet of 160 fail and an army of 20,000 men, commanded by Haquin king of Norway, whofe savages on the coalt of Ayr, Bute, and Arran, reaching the Scottifh court, an army was immediately affembled by Alexander III. and a bloody engagement enfued at this village, when 16,000 of the invaders were flain in the battle and fight, with 5000 Scots. Haquin efcaped to the Orkneys, where he foon after died of grief. The entreochments of the Norwegian camp may ftill be traced along the fhore of this place. The Scottifh commanders who fell in battle were buried in a rifing field, near the village; three or four perfons were interred in one grave, on each fide of which was a large ftone, a third was placed acrofs the grave, fupported at the extremities by the fide fones, and in this rude manner the warriors lay entombed. Some years ago the proprietor of the field demolifhed thefe repofitorics of the dead, leaving only one (a

[^22](pecial favour!), which ferves to give an idea of the 1 whole.

LARINO, a town of Italy, in the kingdom of Naples, in the Capitanata, with a bifhop's fee. E. Long. 15.51. N. Lat. 4 I. 48.

LARISSA, an ancient, rich, and celebrated town of Greece, in the province of Janna or Theffaly, with an archbifhop's fee of the Greek church, a palace, and feveral handfome mofques. According to Virgil, it was the country of Achilles. It was alfo the place where Philip the father of Alexander the Great refi-ded.-The inhabitants carry on a confiderable trade. The city is agreeably feated on the river Peneus, is E. Long. 23. 36. N. Lat. 38. 51.

Lakix, the larch-tree. See Pinus.
LaRK, in ornitbology. See Alauda, and BirdCatching.

The lark is not only a very agreeable bird for the cage, but will live upon almoft any food, fo that it have once a week a frefh tuft of three-leaved grafs. The proper method of keeping them in health is this: there muft be two pans of food, the one containing meat, the other oatmeal and hempfecd. A very good food is the following: boil an egg very hard, to which add the crumb of a halfpenny loaf, and as much hempfeed; let the egg be chopped very fmail, and the hempfeed bruifed in the mortar; when thefe are mixed, the bread is to be crumbled in among the relt, and the whole to be rolled together with a common roll-ing-pin, and kept for ufe. There muft be fome fine fmall gravel flrewed at the bottom of the cage, and rencwed at fartheft once in a week. This will prevent the bird's feet from getting hurt by being clogged with the dung ; and his balking in this will keep him allo from growing loufy, after which few come to good. There mult be a perch in the cage, and it mult either be lined with green bays, or made of fine matting, which the lark is very fond of. When the bird is firft taken, fome meat muft be ftrewed upon the fand in the bottom of the cage; for it will be fometimes almoft famifhed before it finds the meat in the pan.

The cock-bird of this kind is known from the hen by the loudnefs and length of his call, by his tallnefs as he walks about the cage, and by his doubling his notes in the evening, as if he was going with his mate to rooft. A better rule than all others, however, is his finging trong; for the hen wood-lark fings but very weakly. - Both the cock and hen of this kind are fubject to many diforders; the principal of thefe are cramps, giddincfs of the head, and breeding lice. Cleanlinefs is the beft cure for the firt and the Iaft of thefe complaints; but we know of no cure for the other. A good ftrong bird, however, will often lall very well five or fix years, and improve all the time.

## LARKSPUR. See Delphinium.

LARRIBUNDAR, a fea-port town of Afia, in Indoftan ; feated at the mouth of the river Sind, or Indus, with a harbour capable of receiving fhips of 200 tons burden. It is but a frall place, confifting of about too houfes built with wood; but has a fone fort, with a few guns. E. Long. 67.0. N. Lat. 25.0 .

LARVA, in natural bittory, a name given by Linneus to infects in that flate, called by other writers sruca or caterpillar. See Transformation of $I_{\text {NSEETS. }}$.

LARVE,

## I A R

LARVA, in antiquity, derived from the Hetrufcan word lar or lars, lignifying "prince or lord," denoted the ghofts of the deceafed, confidered as wicked and mifchievous. Hence is formed the term larvatus, i. e. larvi indutus or demoniac. The ingenious Mr Farmer urges the etymology and ufe of this term to prove, that the heathen demons were human ghofts.-The larve were alfo called lemures.
Larve, in mineralogy, the fame with petrifactions. See Petrifactions.

LARUS, the GULL, in ornithology; a genus beivs. longing to the order of anferes, the characters of XV. which are thefe: The bill is firait, cultrated, a little crooked at the point, and without teeth; the inferior mandible is gibbous below the apex; the noftrils are linear, a little broader before, and fituated in the middle of the beak. The different fpecies are principally diftinguifhed by their colour.
t. The marinus, or black-backed gull, is in length 29 inches; in breadth five feet nine. The bill is very ftrong and thick, and almoft four inches long; the colour a pale yellow; but the lower mandible is marked with a red fpot, with a black one in the middle. The head, neck, whole under-fide, tail, and lower.part of the back, are white: the upperpart of the back, and wings, are black; the quillfeathers tipt with white, the legs of a pale flefhcolour. It inhabits feveral parts of England, and breeds on the higheft cliffs. The egg is blunt at each end; of a dufky olive-colour; quite black at the greater end, and the reft of it thinly marked with dufky fpots. It is alfo common on moft of the northern coafts of Europe. It frequents Greenland; but chiefly inhabits the diftant rocks. It lays three eggs in May, placing them on the heaps of dung which the birds leave there from time to time. It is faid to attack other birds, and to be particularly an enemy to the eider duck. It very greedily devours carrion, though the moft general food is fifh. It is common alfo in America, as low as fouth Carolina, where it is called the old wiffe.
2. The cataractes, or Skua gull, is in length two feet ; the extent four feet and a balf; the weight three pounds: the bill is two inches one.fourth long, very much hooked at the end, and very fharp; the upper mandible covered more than half-way with a black cere or fkin, as in the hawk kind ; the noftrils are placed near the bend, and are pervious. The feathers on the head, neck, back, fcapulars, and coverts of the wings, are of a deep brown, marked with rult-colour (brighteft in the male). The breaft, belly, and vent, are ferruginous, tinged with afh-colour. The tail when fpread is circular, of a deep brown, white at the root, and with fhafts of the fame colour. The legs are covered with great black fcalons: the talons black, Arong, and crooked; the interior remarkably fo.This bird inhabits Norway, the Ferroe ifles, Shetland, and the noted rock Foula a little wed of them. It is alfo a native of the South Sea. It is the nofl formidable of the gulls; its prcy being not only fifh, but, what is wonderful in a web-footed bird, all the leffer fort of water-fowl, fuch as teal, \&c. Mr Schroter, a furgeon in the Ferroe ifles, relates that it likewife preys on ducks, poultry, and even young lambs. It has all the fiercenefs of the eagle in defending its young; when Voz, IX. Part II.
the inhabitants of thofe iffands vifit the neff, it at.
Lares. tacks them with great force, fo that they hold a knife erect over their heads, on which the feua will transfix itfelf in its fall on the invaders. The Rev. Mr Law, minitter of Birfa in Orkney, confirmed part of the above account : On approaching the quarters of thefe birds, they attacked hiin and his company with moft violent blows; and intimidated a bold dog of Mr Low's in fuch a manner, as to drive him for protection to his mater. The natives are often very rudely treated by them while they are attending their fheep on the hills; and are obliged to guard their hcads by holding up their flicks, on which the birds often kill themelelves. In Foula it is a privileged hird, becaufe it defends the flocks from the eagle, which it beats and purfues with great fury; fo that cven that rapacious bird feldom ventures near its quarters. The natives of Foula on this account lay a fine on any perfon who deftroys one : they deny that it ever injures their flocks or poultry; but imagine it preys on the dung of the arctic and other larger gulls, which it perfecutes till they moot for fear.-Thefe birds are alfo frequent in many high latitudes of the fouthern hemifphere : our circumavigators met with them in Falk land ifles, particularly about Port Egmont, whence called Port Egmont bens. In this place, and at Terra del Fuego, they were obferved to make their nefts among the dry grafs. After breeding-time, they difperfe over the ocean, and for the moth part are feen in pairs. They are met with in Kerguelen's land, and off the Cape of Good Hope, and other parts. In all places its manners are the fame in refpect to ferocity: it is frequently feen to attack the largeft albatrofs, beating it with great violence fo long as it remains on the wing; at which time this cowardly giant finds no other refource than to fettle on the water; upon which the fkua flies away.
3. The parafiticus, or dung-hunter, is in length 21 inches. The bill is an inch and a half long, pretty much hooked, and of a dufley colour: the noftrils are placed in a kind of cere: the top of the head is black; the fides of it, forehead, neck, and all beneath, white: acrofs the breaft there is a pale dufky bar: the upper parts of the body, wings, and tail, are black; the bafe of the quills white on the inner webs; and the two middle feathers of the tail are near four inclies longer than the reft : the legs are fcaly, not very fout; the colour of them is black. The female is faid to be entirely brown, paleit beneath; and the middle tail feathers only two inches longer than the others. This is a northern Species; and very common in the Hebrides, where it breeds on heath. It comes in May, and retires in Auguft; and if difturbed 月ies about like the lapwing, but foon alights. It is alfo found in the Orkneys; and on the coalls of Yorkfhire, where it is called the feafer. It is met with likewife on the northern coafts of Sweden, Denmark, and Ruffia, as far as Kamtchatka; and it is common in Greenlanc, where it frequents the open fea, as well as the bays. The female makes an artlefs neft of grafs and mofs, on at hillack in fome marfhy place, and lays two afh-coloured eggs, fpotted with black, the fize of thofe of a hen. This bird does not often fwim, and fies generally in a now manner, except it be in purfuit of other birds; which it often attacks, in order to make them dif-

## L A R . [ 578 ] L A R

Lartie. gorge the finh or other food, which this common plunderer greedily catehes up. Mofl authors have told us, that it is the dung of the birds which it fearches after in the purfuit ; but latter obfervations inform us that the circumfance is not true; though, from the fuppofition of its being fo, the bird has obtained the name of frunt-jager.
4. The fufcus, or herring.gull, weighs upwards of 30 ounces ; the length 23 inches, its breadth 52 : the bill is yellow, and the lower mandible marked with an orange-coloured fpot: the baek and coverts of the wings are afl-coloured ; the upper part of the five firt quill-feathers are black, marked with a white fpot near their end; the legs of a pale flefh colour. Thefe birds breed on the ledges of rocks that hang over the fea : they make a large nelt of dead grafs; and lay three eggs of a dirty white, fotted with black. The young are ah eoloused, fpotted with brown. They do not come to their proper colour the firft year: this is common to other gulls; which has greatly multiplied the 〔pecies among authors, who are inattentive to thefe particulars. This gull is a greai devourer of fifh, efpecially of that from which it takes its name: it is a conflant attendant on the nets, and fo boid as to feize its prey before the fifhermens faces.- The herring gull is common in this kingdom, and frequents the fame places as the black-backed. It is allo found in moft of the northern parts of Europe, as weil as about the Cafpian and Black feas and the rivers which fall into them, and about the great lakes of Siberia. It is found likewife in Iceland, Greenland, and Hudfon's Lay. In winter it migrates fouth, being found in Jamaica; and is faid to breed on fome of the iflands on the coalt of South Carolina.
5. The nevius, or wagel, is a large fpecies, being near two feet in length, and in breadth abont five; weight, near tliree pounds. The bill is black; two inches and a half long: the irides are dufky: the whole plumage is compofed of a mixed brown, afhrolour, and white; the middle of cach feather brown: the under parts of the body are the fame, but paler: the quills are black: the lower part of the tail is mottled black and white; near the end is a bar of tlack, and beyond chis the end is white : the legs are of a ditty fiff-colour, in fome white.-This fpecies frequents the fea-fhores of many parts of England, though not in any conliderable numbers. At times it is feen on the banks of the Thames along with other gulls; and is there fuppofed to be the female of the black-backed: but this has not yet been determined fufficiently by authors.
6. Thie lyybernus, or winter-gull, winter-mew, or coddy-moddy, weighs from 14 to 17 ounces: the length 18 inches, the breadth three feet nine. The irides are hazel: the bill is two inches long, but the fiendereft of any gull; black at the tip, and whitifh towards the bafe. The crown of the head, and hindpart and fides of the neck, are white, marked with oblong dufky fpots ; the forehead, throat, middle of the breaft, belly, and rump, white; the back and fcapulars of a pale grey, the laft \{potted with brown: the coverts of the wings are of a pale brown, edged with white; the firt quill-feather is black, the fucceeding ones are tipt with white: the tail is white, croffed near the
end with a black bar; the legs are of a dirty bluifh white. This kind frequents, during winter, the moilt meadows in the inland parts of England, remote from the fea. The gelatinous fubltance, kuown by the name of far-/Bot, or far-gelly, owes its origin to this bird, or fome of the kind; being nothing but the half digefted remains of carth-worms, which thele birds feed on, and often difcharge from their ftomachs.
7. The canus, or common gull, is in length 16 or 17 inches; in breadth $3^{6}$; weight one pound. The bill is yellow: the iridus are hazel, and the eye lids brown : the head, neck, under parts of the body, and tail, are white; the back and wings, pale grey: the outcr edge of the fiour firlt quills, and tips of the firit five, are black; but the fourth and bifth have a white foot at the tips ; the reft, except the three neareft the body, have the ends white: the legs are of a dull greenifh white. This feems to be the moft common of all the gulls, being found in vait numbers on our thores and rivers which are contiguous to the fea. It is feen alfo very far north, as far as Iceland and the Rufian lakes: it is met with in the neighbourhood of the Cafpian Sea, in various fhores of the Mediterra. ncan, and as far fouth as Greece: and it is found alfo in America, on the coall of Newfoundland. It breeds on the roeks and clifs, like others of the genus; and the eggs are two inches and a half in length, of a deep olive brown, marked with irregular deep reddifh blotches. It is a tame fpecies, anci inay be feen by hundreds on the fhores of the Thames and other rivers, in the winter and fpring, at low tides, picking up the varions worms and Small fifh left by the tides; and will often follow the plough in the fields contiguous, for the fake of worms and infects which are turned up, partieularly the cockchafer or dorbeetle in its larva flate, which it joins with the rooks in devouring molt greedily.
8. The tridactylus, or tarrock, is in length 14 inches, breadth 36 ; weight feven ounces. The bill is fhort, thick, and black : the head, neck, and under parts, are white: near each ear, and under the throat, there is a black fpot; and at the hind part of the neck a crefcent of black: the back and fcapulars are bluif grey; the wind coverts dufky edged with grey, fome of the larger wholly grey: the exterior fides and ends of the firft four quills are black, tips of the two next black, all the reft white: the ten middle feathers of the tail are white tipped with black, the two outermoft wholly white: the legs are of a dunky afh-colour; in lieu of the back toe, it has only a protuberance. This breeds in Scotland with the kittiwake; and inhabits other parts of northern Europe, quite to Iceland and Spitzbergen, the Baltic and White Sea, as alfo Kamtchatka. It is commonin Greenland in fummer. It comes in fpring, and frequents the fea-fhores; builds in the rocky crags of the bays; in June lays two eggs of a greenifl afh-colour fputted with brown; and retires from the fhores in autumn. It is obferved frequently to attend the whales and feals, for the false of the fifh which the laft drive before them into the fhallows, when thefc birds datt into the water fuddenly and make them their piey. They are very noify birds, efpecially during the time of incubation. They fwim well, and fly equally well, and for a long time together : they are often obferved
on portions of ice fwimming in the fea. Both the flefh and eggs are efteemed by the Greenlanders, and the Riius ufed as garments.
9. The riffa, or kittiwake, is in length 14 inches, in extent three feet two. When arrived at full age, the head, neck, belly, and tail, are of a fnowy whitenefs; behind each ear is fometimes a dufky foot: the back and wings are grey: the exterior edge of the firt quillfeather, and tips of the four or five next, are black: the bill is yellow, tinged with green; and the infide of the mouth is orange: the legs are dufky, with only a knob inlead of the back toe. It inhabits the romantic cliffs of Flamborough-head (where it is called petrel), the Bafs ine, the valt rocks near the cafle of Slains in the county of Aberdeen, and Prieftholm ifle. The young of thefe birds are a favourite difl in North Britain, being ferved up roatted, a little before diuner, in order to provoke the appetite; but from their rank tafte and fmell, feem much more likely to produce a contrary effect. This bird is likewife met with at Newfoundland ; in Greenland, Spitzbergen, Iceland, and the north of Europe; the aritic coaft of Afia; and Kanatchatka. By the Icelanders it is called riffa. Some authors affirm the kittiwake to be the tarrock in a flate of perfection; while others maintain the contrary.
10. The ridibundus, pewit, or black-head gull, is in length 15 inches, breadth three feet; weight in ounces. The bill is rather flender, and of a blood-red : the eyc-lids are red, and the irides hazel: the head and throat are dufky brown, in old birds black; and on each eye-lid is a fmall white fpot: the back and wings are of an afh-colour: the neck, all the under parts, and tail, are white: the ten firf quills are white, margined and more or lefs tipped with black; the others of an anh-colour, with white ends: the legs are of the colour of the bill, the claws black. This fpecies breeds on the fhores of fome of our rivers; but full as often in the inland fens of Lincolnflire, Cambridgefhire, and other parts of England. They make their neft on the ground, with rufhes, tead grafs, and fuch like ; and lay three eggs of a greenifh brown marked with red brown blotehes. After the breeding feafon, they again difperfe to the fea-coafts. They breed alfo in Northumberland and Scotland; and are found throughout Ruffia and Siberia, as far as Kamtchatka, but not farther to the north. They are feen throughout the winter at Aleppo, in great numbers; and fo tame, that the women are faid to call them from the terraces of thcir houfes, thowing up pieces of bread, which thefe birds catch in the air. They inhathit North America, coming into New England in May and departing in Auguit. The young birds in the neighbourhood of the Thames are thought good eating, and are called the red-legs. They were formerly more efteemed, and numbers were anrually taken and fattened for the table. Plott gives a marvellous account of their attachment to the lord of the foil they inhabit ; infomuch, that on his death they never fail to flift their quarters for a certain time. Whitelock, in his Annafs, mentions a piece of ground near Portfmouth, which produced to the owner 401 . a.year by the fale of pewits, or this fpecies of gull. Thefe are the fie. gulies that in old times were admitted to the
noblemens tables. The note of thefe gulls is like a hoarfe laugh.
11. The atricilla, or laughing-gull, is in length 18 inches, breadth three feet. It differs from that bird only in the legs, which are black intead of red. It is found in Ruffia on the river Don, particularly about Tichercafs. The note refembles a coarfe laugh, whence the name of the hird. Is met with alfo in different parts of the continent of America; and is very numerous in the Bahama iflands.
There are 9 or 10 other fpecies of this genus.
LARYNX, in anatomy, the upper part of the windpipe. See Anatomy, ${ }^{\circ}{ }_{1} 16$.
LASCARIS (Andrew John), furnamed Ryndacenus, of an ancient Greek family, went into Italy, after the taking of Conftantinople by the Turks in $1+53$. He was well rgceived by Laurence de Medicis, a diftinguifhed protector of learned men; and was twice fent to Conftantinople to collect the beft Greek manuferipts, by which means numberlefs fcarce and valuable treafures of literature were carried into Italy. At his return Louis XII. king of France prevailed on him to fettle in the univerfity of Paris, and fent him twice ambaffador to Venice. Ten years after, cardinal Johu de Medicis being elected pope, under the name of Leo X. John Lafcaris, his old friend, went to Rome, and had the direction of a Greek college. He died at Rome in 1535 , at about the goth year of his age. He brought into the Wett mof of the fine Greek manufcripts that are now extant, and compofed fome cpigrams in Greck and Latin.

Lascaris (Conftantine), one of the Greeks who were principally concerned in the revival of learning in the Wett, retired into Italy in 145t, and taught polite literature at Milan, whither he was called by Francis Sforza; he afterwards went to Rome, where he was well received by Cardinal Beffarion. He afterwards taught rhetoric and the Greek tongue at Naples; and ended his days at Meflina, leaving the fenace of that city many excellent manufcripts which he had brought from Contlantinople. He was interred at the public expence, and the fenate of Mefina erected a marble tomb to his memory. He wrote fome grammatical works.

LASERPITIUM, Lazar-wort: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Unbcclatz. The fruit is oblong, with eight membranaceous angles; the petals infexed, e marginated, and patent. There are nive fpecies, none of which are at all remarkable for their beauty, fo are only preferved in botanic gardens fur the fake of variety. They are natives of Germany, Italy, and the fouth of France. All of them abound with an acrid juice, which turns to an exceffively acrimonious refin. This was ufed by the ancients to take away black and bline fots that came by bruifes or blows, as alfo to take away excrefcences: it was alfo by fome of the ancients ufed internally; but produced fuch violent effecis, that the more prudent refrained from the ufe of it. It is generally fuppofed that the filphium of the ancients was procured from one of the fipecies of this genus; but of this we are at prefent ignorant.
LASH, or LACE, in the fea-language, fignifies to

## L A T

Laffitude bind and make fant ; as, to lafh the bonnet to the
courfe, or the drabbler to the bonnets; alfo the carpenter takes care that the fare yards be lafhed fatt
to the thip's fide ; and in a rolling fea, the gurners mind that the guns be well lafied, left they fhould break loofe. Lathers are properly thofe ropes which bind faft the tackles and the bretclings of the ordnance, when hauled or made faft within-board.

LASSITUDE, or weariness, in medicine, a motbid feufation, that comes on ipontaneonfly, without any previous motion, exercife, or labour. This is a frequent fymptom in acute dittempers: it anifes either from an increafe of bulk, a dimination of proper evacuation, or tuo great a confumption of the flids neceffary to maintain the fpring of the follids, or frum a vitiated fecretion of that juice.

LASSUS, or LAsUs, a dithyrambic poet, horn at Hermione in Peloponnefus abont 500 years before Chrilt. He is rectoned amony the wife men of Greece by fome. He is particularly known by the anfwer be gave to a man who afked him what could beft render life pleafant and comfortable? Expcrience. He was acquainted with mufic. Some fragments of his poetry are to be found in Athenæus. He wrote an ode upn the Centaurs, and an hymn to Ceres, without inferting the letter $S$ in the compolition.

LAST, in general, fignifies the burden or load of a hhip. It fignifies alfo a certain meafure of finh, corn, wool, leather, \&c. A laft of codfilh, white herrings, ineal, and afhes for foap, is twelve barrels; of corn or rapefeed, ten quarters; of gunpowder, twenty fuur barrels; of red herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve facks; of ftock-tifh, une thoufand; of flax or feathers, 1700 lb .

LASTAGE, or lestage, a duty exacted in fome fairs and markets, for carrying things bought whither one will. It fignifies alfo the ballaft or lading of a Thip; and fometimes is ufed for garbage, rubbifh, or fuch like filth.

LATERAN was originally the proper name of a man : whence it defcended to an ancient palace in Rome, and to the buildings fince erected in its place; particularly a church called St 7 obn of Lateran, which is the principal fee of the popedom.

Councils of the Later.an, are thofe held in the bafilica of the Lateran: of thefe there have been five, held in 1123, 1r39, 1179, 1215, and 1513 .

Canons Regular of the Congregation of the Lateran, is a congregation of regular canons, whereof that charch is the principal place or feat.

It is pretended there has been an uninterrupted fuc. ceffon of clerks, living in community from the time of the apolles: and that a number of thefe were eftablifhed in the Lateran in the time of Conftantine. But the canons were not intioduced till the time of Leo I. and thefe held the church 800 years, till the reign of Boniface, who took it from them, and placed fecular canons in their room: 150 years after, the regulars were seinflated.
$A$ LATERE, a term ufed to denate the qualifications of the cardinals whom the pope fends as legates into foreign countries. They are called legates a latere, as being his holineff's affitants and counfellors in ordinary. Thefe are the mof confiderable of the

580 ] L A T'
otherthree kinds of legates, being luch as the pope commiffions to take his place in councils; and fo called, in regard that he never gives this office to any but his favonrites and confidants, who are always a latere, at his fide. A legate a-latere has the power of conferling benefices without a mandate, of legitimating baftards to hold offices, and hay a crofs carried before him as the enfign of his anthority.

De Leagfre, legdies who are not cardinals, but yet are entrufted with an apottolical legation. See the article I_egate.

LATE-WAKE, a ceremnny ufed at funerals in the Hightands of Scosland. The evening after the death of any perfon, the relations and triends of the deceafed meet at the haufe, attended by bagpipe or fiddle; the nearel of kin, be it wife, lion, or daughter, opens a me. lancholy ball, dancing, and greesing (i. e. crying vis. lently) at the fame time, and this continues till daylight; but with fuch gambols and frolics among the younger part of the company, that the lofs which oce c:afluned them is often more than fupplited by the con. fequences of that night. If the co-pfe remains unbu. ried for rwo ntrhts, the fame rites are renewed. Thus, Seythian like, they rejnice $3 i$ the deliverance of their friends out of this life of mifery.

LATEEN-sail, a long triangular fail extended by a lateen yard, and frequently uled iny xebecs, p ileacres, fetees, and other vellels navigated in the Miediterra. nean fea.
LAl'H, in building, a long, thin, and narrow $\Pi^{\circ}$ p of wood nailed to the rafters of a ruof or cieling, in order to fulfain the covering.
J.ATH-Bricks, a particular fort of bricks made in fome parts of England, of 22 inches in length and 6 in breadth, which are ufed in the place of laths or fpars, fupported by pillars in cafts, for the drying of malt. This is an excellent contrivance; for belides that they are not liable to fire, as the wooden laths are, they retain the heat vally better; fo that being once heated, a very fmall quantity of fire will ferve to keep them fo.

LATHE, a very ufeful engine for the turning of wood, ivory, metals, and other materials. (See Turning ) The invention of the lathe in very ancient: Diodorus Siculus fays, the fint who ufed it was a grandfon of Dredalus, named Talus. Pliny alcribes it to Theodore of Samos; and mentions one Thericles, who rendered himfelf very famous by his dexterity in managing the lathe. With this inflrument the ancients turned all kinds of valcs, many whereof they enriched with figures and ornaments in baffu relievo. Thus Virgil:

> Lenta quibus torno facili fuperaddata vitis.

The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workinen who ufed it vafcolarii. It was a proverb among the ancients, to fay a thing was formed in the lathe, to exprefs its delicacy and jultnefs.

The lathe is compofed of two wooden cheeks or fides, parallel to the horizon, having a groove or npening between; perpendicular to thefe are two other pieces called puppets, made to flide between the cheeks, and to be fixed down at any point at pleafure. Thefe have two points, between which the piece to be turned is futained; the piece is turned round,

## I. A T

backwards and forwards, by means of a Aring put round it, and faftened above to the end of a pliable pole, and underneath to a tredle or board mored with the foot. There is alfo a rell which bears up the teol, and keeps it fleady.

As it is the ufe and application of this influment that makes the greatell part of the art of turning, we refer the particular defcription thereof, as well as the mannes of applying it in vaitious works, to that head. See Turning.

LATHRIEA, in botany: A genus of the anyriofpermia order, belonging to the didynamia clafs of plants; and in the natural method rankiner under the 4 oth order, Perfonatie. The calvx is quadrifid; there is a depreffed glandule at the bafe of the future of the germen. The capfule is unilocular.
LATHREVi, Leidgreve, or Tritiengreve, was an officer under the Sixon govertment, who had authority over a third part of the county; and whofe territory was therefore called tribbing, otherwife a leid or leithin, in which manner the county of Kent is fill divided; and the rapes in Suffex feem to anfwer to the fame. As to the jurifdiction of this officer, thofe matters that could not be determined in the hundred court, were thence brought to the trithing; where all the principal men of the three or more hundreds being alfembled by the lathreve, or trithingrevie, did debate and decide it ; or if they could not, then the lathreve fent it up to the county court, to be there finally determined.
LATHYRUS, chickling: A genus of the decandria order, belonging to the diadelphia clafs of plants; and in the natural method ranking under the $3^{2 d}$ order, Papilionacea. The tylus is plain, villous above, towards the end broa'er ; the upper two feg. ments of the calyx are ficter than the rett.
species. 1. The latifolius, or cwerlaating pea, hath thick, fibrons, peremial routs ; climbing, thick, branching annual italks, laving membianactous wings between the joints, rifing upon fupport by their cirri fix or eight feet high ; diphylluns leaves, of two !pearfhaped lobes, terminated by clafpers; and numerous large red or purple flowers on long foot ttalks, appearing plentifully from June till Oitober, fucceeded by abundance of feed. 2. The odorata, or fweet feented pea, hath a fibrous annual root ; a climbing talk, rifing upon fupport by its clafpers three or four feet high ; diphyllous leaves of two oval lobee, terminated by climbing tendrils; and flowers by two's on kong flower falks, of different colours in the varierits. 3. The tangitanus, or Tangier-pea, hath a fibrous annual root, a climbing falk rifing upon fupport for four or five feet high; diphyllous leaves, of two fpearthaped alternate lobes, terminated by tendrils; and frorn the joints of the falk large reddih fluwers by two's on long foot lalks.

Culture. All thcfe fpecies are of hardy growth ; and may be propagated by feed in the common ground, in patches where it is defigned the plants foould flower, for they do not fucceed fo well by tranfiplantation. They may be fowed in fpring; though, if fowed in autumn, the plants will flower earlier the following year.

LATTAR, in Roman antiquity, a fealt or ce. remony inflututed by Tarpuinius Superbus, ia ho-

## 58: ] L A T

nour of Jupiter Latiaris or Latialis. - Tarquin Inticlave, having made a treaty of alliance with the Latins, La'iner. propofed, in order for perpetuating it, to erect a common tenple, where all the allics, the Romans, Latins, Hernici, Volfici, Ece. Thould ainmbie them. felves every year, hold a kind of fair, exchange merchandizes, feaf, facrifice, and make me:ry together. Such was the inllitution of the Latiar. The founder only appointed one day for this fealt ; the Erft conful added another to it, uponcoucluding the peace with the Latins; and a third was added dfter the people who had retired to the Mons Sacer were returned io Rome; and a fourth, after appeafing the fedition raifed on occafion of the plubeians afpiring to the confulate.

Theie four days were called the I.ati, foriz; and atl things done during the coure of the ferix, as featly. faciifices, offerings, \&c. were called Latiares.

LATICLAVE, (Latitusium), in Roman antiquity, was an honourable diftinction, peculiar, in the times of the republic, to the fenators; but whether is was a particular kind of garment, or only an ornament upon it, the critics are not agreed: But the more general opinion is, that it was a broad fripe of purple fewed upon the fore-part of their tunic, and round the middle of the breaf. There were buttons fet on the lotus clavus or laticlave, which appeared like the heads of large nails, whence fome think it derived its name. -The fenators, præiors, and chief magiltrates of colonies and municipal cities, had a right to wear it. The pretexta was always worn over it ; but when the prator pronounced fentence of death, the pratexta was then put off, and the laticlave retained. The laticlaviunt differed from the anguficlavium, but anthors do not agree in what refpect this differcnce confilted; the mot general opinion feems to be, that the flips or Itripes of purple were narrower in the anguliclave.
LATIMER (Hugh), bihop of Worcefter, was born about the year if80 at Thurcation in Lacicefter. Thire, the only fon of a ycoman of that village. At the age of fourteen he was fent to Chrill's collegr. Cambridge; where he applied himtelf to the fudy of divinity, and in proper time took the degree of bar chelor in that feience. At this time he was a zealous Papi't, and was honoured with the offee of keeper of the crofs to the univerfity: but when be was about thirty jears of age, he became a convert to the Proteftant religion ; and being now one of the twelve l: cenfed preachers from Cambrisge, he promulgated his opinions with great frecdom. It was nut long befure he was accufed of herefy; and being fummoned before cardinal Wolfey, was obliged to fubferibe certain articles of faith, which he certainly did not believe. $\AA_{1}$. bout the year 1529 he was prefonted by the king w the rectory of Wetkinton in Witubite ; to which place, after refiding fome time at court with his friend and patron Dr Bats, he retired; but, refoming his former invectives againtt the Popifl doctrines, he was again fummoned to anfwer certain interrogatories, and again obliged to fubfribe. $\mathrm{In}_{\mathrm{n}} 15$ ? 5 he was promoted to the bilhopric of Worcefter; in the pofififion of which dignity be continued till the ycar r 539 , when, sather than affent to the act of the fix articles, he refigned his mitre, and retired into the country; bus was in a fhot time accufed of fyeaking againt the lix
S. 31 mmer , articles, and committed to the Tower, where he conLatin. tinued prifoner till the death of Henry VIII. which
happened in January 1547. On the acceffion of Edward VI. Latimer was releafed, but not reftored to his biihopric, theugh he preached feveral times before the king, and continued to exercife his minitterial function with unremitting zeal and refolution. Young Edward, alas! finifhed his fhort reign in 1553 ; and Mary, of infamons memory, afcending the throne, poor Latimer was immediately doomed to deftruction, and, together with Cranmer and Ridley, confined in the Tower. In April 1554, they were removed to Oxford, that they might difpute with the learned doctors of both univerfities. Latimer declining the difputation on account of his great age and infirmities, delivered his opinion in writing; and refufing to fublcribe the Popifh creed, was condemned for herefy; and in October following was, together with bifhop Ridley, burnt alive. He behaved with uncommon fortitude on the occafion, and died a real martyr to the Reformation. His general character is that of a learned, virtuous, and brave man. IIis works are, 1. Sermons, 1635, fol. 2. Letters; in Fox's Acts and Monum, vol. ii. fol. 1580. 3. An injunction to the prior and convent of St Mary's in Worcefterfhire. See record at the end of Burnet's Hillory of the Reformation, part ii. p. 293.

LATIN, a dead language, firf Spoken in Latium, and afterwards at Rome; and ftill ufed ill the Romif church, and among many of the learned.

This language is principally derived from the Greek, and particularly from the Eolic dialect of that tongue, though it has a great number of words which it borrowed from the languages of the Etrufci, Ofci, and other arcient people of Italy; and foreign commerce and wars, in courfe of time, added a great many more..

The Latin is a ftrong nervous language, perfectly fuitable to the character of the people who fouke it: we have fill works of every kind admirably well written in the Latin, though there are vaft numbers lof.

The Latin tongue was for a while confined almolt wholly within the walls of Rome; nor would the Romans allow the common ufe of it to their neighbours, or to the nations they fubdued: but by degrees they in time became fenfible of the neceffity of its being generally underitood for the conveniency of commerce; and accordingly ufed their endeavours, that all the nations fubject to their empire fhould be united by one common language; fo that at length they impofed the ufe of it by a particular law for that purpofe. After the tranीation of the feat of the empire from Rome to Conftantinople, the emperors of the ealt, being always delirous of retaining the title of Roman emperors, appointed the Latin to be ftill ufed; but at length neglecting the empire of the well, they abandoned all care of the Latin tongue, and ufed the Greek. Charlemagne coming to the empire of the welt, revived this language; but at length it gave way, and the French took place of the Latin: it was, however, prodigioufly degenerated befure it came to be laid afide, in which condition it was found at the time of the Reformation, when Vives, Erafmus, \&c. began to open the way for its recovery: fince which time the monkifl latinity has
been declining, and all endeavours have been ufed to retrieve the pure language of the Augutan age. See Language.

Latin-Cburch. See Church.
LATINS, an ancient nation of Italy. Sec Latium.

LATINUS, king of the Latins in Italy, was the fon of Faunus ; and, it is faid, began to reign about the 1216 th year before the Chrittian era. Lavinia, his only daughter, married Eneas, after that Trojan prince had killed Turnus king of the Rutuli. See Rome.

LATISSIMUS, in anatomy, the name of feveral mufcles. See Anatomy, Table of the Muficles.

LATITUDE, in altronomy, is the diftance of a far north or' fouth from the ecliptic. In geography it fignifies the diftarace of any place north or louth, from the equator. See Astronomy and Geugra. pHY, palim.

LATITUDINARJAN, a perfon of moderation with regard to religious opinions, who believes there is a latitnde in the road to heaven, which may admit people of different perfuafions.

LATIUM (aric. geog.), the country of the Latins, at firt concained within very narrow bounds, but afterwards increafed by the acceffion of various people. The appellation, according to Virgil, is a latendo, from Saturn's lying hid there from the hoftile purfuits of his fon Jupiter; and from Latium comes the name Latini, the people, (Virgil) : though Dionyfus Halicarnaffxus derives it from king Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that Latium, when under 㤧neas and his defcendents, or the Alban kings, contained only the I,atins, exclufive of the IEqui, Volfci, Hernici, and other people; only that Eneas reckoned the Rutuli, after their conquelt, among the Latins. And this conftituted the ancient Latium, confiaed to the Latins: but afterwards, under the kings, and after their time, it reached from the Tiber to Circeii. Under the confuls, the country of the Equi, Volfci, Hernici, \&c. after long and bloody wars, was added to Latium, under the appeilation adjectitious or fuperadded Latium, as far as the river Liris, the ealtern boundary, and to the north as far as the Marli and Sabines. The various people, which in fucceffion occupied Latium, were the Aborigines, the Pelafgi, the Arcades, the Siculi, the Arunci, the Rutuli; and beyond Circeii, the.Volfci, the Ofci, the Aufones : but who firll, who next, occupied the country, it is difficult to fay.
LATMUS (anc. geog.), a mountain of Ioniz, or on the confines of Caria, famous for the fable of Endymion, of whom the Moon was faid to be enamoured : hence called Latmius Heros, and Latmius Venator. In the mountain was a cave in which Endymion dwelt (Scholiart on Apollonius Rhodius). Suppufed by Hecatæus to he the Pbtbeiron Mons of Homer; but by others to be Grius MTons, nor far from Latmus (Strabo.)

LATOMIA, properly fignilies a fione quarry: But the places whence Itunes had been dug having been made ufe of fometimes as dungeons, jails, or prifons for criminals, it is oftentimes applied as a name

## L A T [ 583 ] I A T

ona for a prifon. 'There was a place of confinement of this fort at Rome, near the T'ullianum; another at
iur. Syracufe, in which Cieero fays Verres had flut up Roman citizens.

LATONA, in mythology, a pagan goddefs, whofe hitory is very obfcure. Hefiod makes her the daugliter of Titan Coêus and Phcebe his fifter. She was admired for her beauty, and celebrated for the favours which fle granted to Jupiter. Juno, always jealous of her hurband's amours, made Latona the object of her vengeance, and fent the ferpent Python to difurb her peace and perfecute her. Latona wandered fiom place to place in the time of her pregnancy, continually alarmed for fear of Python. She was driven from heaven; and Terra, influenced hy Juno, refufed to give her a place where fhe might reft and bring forth. Nepturie, moved with compafion, ftruck with his trident and made immoveable the inland of Delos, which before wandered in the Ægean, and appeared fometimes above, and fometimes below, the furface of the fea. Latona, changed into a quail by Jupiter, cane to Delos; where fhe refumed her original thape, and gave birth to Apollo and Diana, leaning againt a palm tree or an olive. Her repofe was of fhort duration: Juno difcovered the place of her retreat, and obliged her to fly from Delos. She wandered over the greatelt part of the world; and in Caria, where her fatigue compelled her to flop, fhe was infulted and ridiculed by the peafants of whom the afked for water white they were weeding a marfh. Their refufal and infolence provoked her, and fle intreated Jupiter to punifh their barbarity. They were all changed into frogs. She was alfo infulted by Niobe; who boafted herfelf greater than the mother of Apollo and Diana, and ridiculed the prefents which the piety of her neighbours had offered to Latona. At laft, Latona, though perfecuted and expofed to the refentment of Juno, became a powerful deity, and faw her children receive divine honours. Her worfhiy was generally eftablifhed where her children received adoration; particularly at Argos, Delos, \&c. where fhe had temples. She had an oracle in Egypt, celebrated for the tiue and decifive anfwers whicb it gave. Latona, Venus, and Diana, were the three goddeffes moft in veneration among tbe Roman women.

LATRIA, in theology, a religious worhip due only to God. See Adoration.

The Romanifts fay, "They honour God with the worhip of latria, and the faints with the worhip of dalia." But the terms, however diftinct, are ufually confurnded.

The worfhip of latria, befides its inner charaGers, has its external marks to ditinguilh it ; the principal whercof is facrifice, which cannot be offered to any other but God himfelf, as being a folemn acknowledgment or recognition of the fovereignty of God, and our dependence on him.

Mr Daille feems to own, that fome of the fathers of the fourth century allowed the diflinction between latria and dulia.

LATRINIE, were public houfes of office, or neceffaries, amongt the Romans. We do not find, in the writings or buildings that remain of antiquity, that they had any privies in their dwellings. The latrina
were public places where the flaves wafhed and emp. Latrunculi, tied their matier's clofe-fools. We are pretty well af.

Latten. fured that the Romans had public places of convenience, which were covered over, and had a fponge hanging up in them for cleanlinefs. Rich men had clofe-flools, which were taken away occationally to the common fhores.

LATRUNCULI, a game among the Romans, of much the farne nature with our chefs. The latrunculi were properly the chefs.men, called alfo latrones and calculi. They were made of glafs, and dittinguined by black and white colours. Sometimes they were made of wax or other convenient fabftances. Some give the invention of this game to Palamædes when at the fiege of Troy ; Seneca attributes it to Chilon, one of the feven Grecian fages; athers honour Pyrrhus with the invention; and others again conterd that it is of Perlian origin-but is not this Lis de lana caprina? Frequent allutions to this game are met with in the Roman claflues, and a little poem was wrote upon it addreffed to Pifo, which fome fay was the work of Ovid, others of Lucan, in the end of fome editions of whofe works it is to be found, and to which we refer for a fulter account of the game. This game expreffes fo well the chance and order of war, that it is, with great appearance of probability, attributed to fome military officer as the iuventor. One Canius Julius was fo exceedingly fond of chefs, that after he was fentenced to death by Caligula, he was found playing, but interrupted in his game by a call to execution; he obeyed the fummons, but firt defired the centurion who brought the fatal order, to bear witnefs that he had one man upon the board more than his antagonift, that he might not falfely brag of victory when he fhould be no more.

LA'TTEN denotes iron-plates turned over, of which tea-cannilters are made.

Plates of iron being prepared of a proper thinneis; are imoothed by rufting them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a-day, that they may be equally rufted over. After this they are taken out, and well fcoured with fand ; and, to prevent their rufting again, are immediately plunged into pure water, in which they are to be left till the inflant they are to be tinned or blanched; the manner of doing which is this: They flux the tin in a large iron crucible, whish has the figure of an oblong pyramid with four Eaces, of which two oppofite ones are lefs than the two others. The crucible is heatcd only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates whith are to be tinned are long; they always put them in downight, and the tin ought to fwim over them ; to this purpofe artificers of different trades prepare plates of different fhapes, though Mr Reaumur thinks them all exceptionable. But the Germans ufe no fort of preparation of the iron to make it receive the tin more than the keeping it always iteeped in water till the time; only when the tin is melted in the crucible, they cover it with a layer of a fort of fuet, which is ufually two inches thick, and the plate muft pafs through this before it can come to the melted tin. The firl ufe

Latten
of this covering is to keep the tin from burning; for if any part foould take fire, the fuet would foon moiften it , and reduce it to its primitive flate again. The blanchers fay, this fuet is a compounded matter. I: is indeed of a black colour; but Mr Reaumur fuppofed that to be only an artifice to make it a fecret, and that it is only coloured with foot or the fmoke of a chimney: but he found it true fo far, that the common unprepared fuet was not fufficient; for after feveral attempts, there was always fonething wanting to render the fuccefs of the operation certain. The whole fecret of blanching, therefore, was found to lie in the preparation of this fuet; and this at length lee difcovercd to confift only in the firl frying and burning it. This fimple operation not only gives it the colour, but puts it into a condition to give the iron a difpofition to be tinned, which it does furprifingly.

The melred tin muft alfo bave a certain degree of heat: for if it is not hot enough, it will not fick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have feveral colours, as red, bluc, and purple, and upon the whole will have a caft of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with fmall pieces of iron; but in general, ufe teaches them to know the degree, and they put in the iron when the $t$ in is at a different ftandard of heat, according as they would give it a thicker or thinner coat. Sometimes alfo they give the plates a double layer, as they would have theni very thickly covered. This they do by dipping them into the tin when very hot the firt time, and when lefs hot the fecond. The tin which is to give the fecond coat mult be frefh covered with fuet; and that with the common fuet, not the prepared.

Iatren-Brafs, plates of milled brafs reduced to different thicknefs, according to the ufes they are intended for.

LATTIMO, in the glafs.trade, a name for a fine milk-white glafs. There are feveral ways of making it, but the beft of all is this: take 400 weight of cryftal frit, and $\sigma 0$ pounds of calcined tin, and two pounds and a half of prepared manganefe; mix thefe well with the frit, and fet them in a pot in a furnace to melt and refine. At the end of 18 hours this will be purified; then caft it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear, add 15 pounds more of calcined tin; mix it well with the metal, and let it fand one day to purify; it will then be of a whitenefs furpaffing even that of fnow, and is fit to work into veffels.

LAVA, a frean of melted minerals which runs out of the mouths, or burfts out tlarough the fides of burning mountains during the time of an eruption. See Atta, Vesurius, Hecla, Volcano, exc.

The lava at its firt difcharge is in a ftate of prociigious ignition, greatly fuperior to any thing we call have an idea of from the fmall artificial furnaces made by us. Sir William Hamilton informs us, that the lava of Vefurius, at the place whence it iffued (in the year 1767), "had the appearance of a river of red-hot and liquid metal, fuch as we fee in the glafshoufes, on which were large floating cinders half lighted, and rolling over one another with great precipitation down the ficic of the mountaia, forming on No 175.
the whole a moft beautiful and uncommon calcade." Now, if we confider the materials of which the lapa confifts, which undoubtedly are the common matters to be found every where in the earth, namely, Rones, metallic ores, clay, fand, \&c. we thall find that our hotteft furnaces would by no means be able to bring them into any degree of fufion; fince the materiala for glafs cannot be melted without a great quantity of very fufible falts, fuch as alkalies, nitre, \&c. mixed along with them. The heat of a volcano mult therefore be immenfe: and befides its leeat, it is fometimes attended with a very uncommon circumflance; for Sir William Hamilton informs us, that " the red-hot ftones thrown up by Vefuvius on the 3 It of March 1;66 were perfeetly tranfparent;" and the like remark he makes on the valt fream of lava which iffued from this volcano in 1779: (See Vesurius). This we cannot look upon to be the mere effcet of heat: for mere heat with us will not make a folid body tranfparent; and thefe fones, we are fure, were not in a flate of fufion, or the refiftance of the air would have broke them all to pieces, even fuppofing them, which is very imprubable, to have been in that fiate detached from the reft of the lava. For the tranfparency, therefore, we mult have recourfe to electricity; which in fome of our experiments hath the property of rendering opaque bodies tranfparent *. Indeed it is fcarce poffible but ${ }^{-}$See the lava and every other matter thrown out of a vol- ticitily cano mult be in the bighelt degree electrical, feeing the fire itfelf mott probably takes its rife from electri- Probe city, as is fhown under the article Volcano.

The lava, after baving once broke out, does not fleets conflantly continue running from the fame vent, but tate often has intermifions, after which it will burf out fometimes at the fame place, and fometimes at another. No real flame ever appears to come from the lava. In the day-time its progrefs is marked by a thick ral a white fmoke, from which the light of the red hot mat- ance. ter being reflected in the night-time, makes it appear like flame. But if, during its progrefs, it meets with trees or other combuftible fubfances, which it frequently does, a bright flame immediately iffues from its furface, as hath alfo been remarked by Sir William Hamilton.-This liquid fubtance, after having run pure for about 100 yards (more or lefs, no doubt, according to different circumftances), begins to colleet cinders, tones, and a fcum is formed on the furface. Our author informs us, that the lava which he obferved, with its fcum, had the appearance of the river Thames, as he had feen it after a bard froft and a great fall of fnow, when beginuing to thaw, carrying down vaft maffes of fnow and ice. In fome places it totally difappeared, and ran in a fubterraneous paffage formed by the fcual for feveral paces; after which it came out pure, having left the fcum behind, though a new one was quickly formed. This lava at the fartheft extremity from its fource did not appear liquid, but like a heap of red hot coals, forming a wall in fome places 10 or 12 feet high, which rolling from the top foon formed another wall, and fo on.- This was the appearance alfo put on by the lava which iffued in the great eruption of 1783 in Iceland; with this difference, that the wall was at one time 210 feet high, and the general thicknefs of it was more than 100: (See Hecra). While a lava is in this ftate, Sir Wil$\AA$
liam

## L A V $[58 ;] \quad$ L A V

83. liam is of opinion, that it is sery pracicable to divert it into another channel, in a manner Comewhat fimilar to what is practifed with rivers. This he was afterwards told had been done with fuccefs during the great eruption of Etna in 166\%: that the lava was directing its courfe towards the walls of Catania, and advancing very flowly, when they prepared a channel for it round the walls of the town, and turned it into the fea. A fucceffion of men, covered with fheep $\{$ inins wetted, were employed to cut through the tough flanks of lava, till they made a paflage for that in the centre, which was in perfect fution, to difgorge itfelf into the channel prepared for it. Llut this, it is evident, can only take place in fmal! freams of this burning matter; with that above mentioned it would have been impor-
ot a1. Wble. It hath been alfo obferved of the lavas of Et-
de- ra, that they do not conftantly fall down to the lowto the efl places, but-will fometimes afcend in fuch a manner as to make the valleys rife into hills. On this Sir William Hamilton has the following note: "Having heard the fame remark with regard to the lavas of Vcfuvius, I determined, during an eruption of that volcano, to watch the progrefs of a current of lava, and I was foon enabiod to comprehend this feeming phxnomenon, though it is, I fear, very difficult to erplain. Certain it is, that the lavas, while in their molt fluid ftate, follow always the laws of other fluids; but when at a great diftance from their fource, and confequently encumbered with Icorix and cinders, the air likewife having rendered their outward coat tough, they will fometimes (as 1 have feen) be forced up a frall afcent, the frefh matter puthing forward that which went before it, and the exterior parts of the lava acting always as conductors (or pipes, if 1 may be allowed the expreffion) for the interior parts, that have retained their fluidity from not being expofed to the air."

From the year 1,67 to 1779 , this gentleman made many curious obfervations on the lavas of Vefuvius. He found, that they contantly formed channels in the mountain as regular as if they had been made by -ant; and that, whilf in a fate of perfect fufion, they continued their courfe in thofe channels, which were fometimes full to the brim, and at others more or lefs fo according to the quantity of matter thrown out. Thefe channels, atter fmall eruptions, were generally from two to five or fix feet wide, and feven or eight in depth. They were often hid from the fight by a quantity of forrise that had formed a crult over them, and the lava, having been conveyed in a covered way for fome yards, came ous again frefh into an open charinel. Our author informs us, that he had walked in fome of thefe fubterraneous galleries, which were exceedingly curious, the fides, top, and bottom, being exceedingly fmooth and even: others were incrufted with what he calls very extraordinary fcorix, beautifully ramified white falts in the form of dropping flalactites, \&c.
'On viewing a ftrcam of lava while in its fluid fate in the month of May 17\%9, he perceived the operaxion of it in the clannels above defcribed in great perfeetion. After quitting then, it fpread itfelf in the valley, and ran gently like a iver that had teen frozen, ard had maffes of ice floating upon it. The wind bappening then to hift, our traveller was fo incommoded by the fmoke, that the guide propofed to crofs

Vob. IX. Part II.
it, which was inftantly put in execution without any other inconvenience than the violent heat with which the legs and fect were affected. The cruft was fo tough, that their weight made no improfiou upon it, and the motion fo llow that they were in no danger of falling. This circurnlance, according to Sir Willian, points out a method of efcape flould any perfon happen to be inclofed betwixt two lavas, but ought never to be tried except in cafes of real neceffity; and indeed, if the current of melted matter was very broad, mult undoubtedly be attended with extreme danger, both from the lieat of the upper crull and the chance of its breaking and falling down with the paffenger into the burning liquid below. That which Sir William Hanilton croffed was about 50 or 60 feet broad.

Having pafled this burning ilream, our travellers walked up along the fide of it to its very fource. Here they faw it boiling and bubbling violently up out of the ground, with a hifling and crackling noite like that which attends the playing off an artificial fire-work. An hillock of about 15 fect high was formed by the continual fplafhing up and cooling of the vitrified matter. Under this was an arched hollow, rcd-hot within, like an heated oven; the lava which ran from it being received into a regular channel raifid upon a fort of wall of fcorite and cinders, almolt perpendicularly, of about the height of 8 or 10 feet, and much refembling an ancient aqueduct. On quitting this fountain of lava, they went quite up to the crater, where as ufual they found a little mountais throwing up flones and red-hot feoriz with loud explofions; but the finoke and fmell of fulphur was fo intolerable, that they were obliged to quit the place with precipitation.

By the great eruption in Augufl 1779, the curious channels above mentioned were entiiely deffroyed, the cone of the mountain was covered with a flratum of lava full of deep cracks, from whence continually iffued a fulphureous fmoke that tinged the fcoriz and cinders with a deep yellow, or fometimes white tint. The lava of this eruption appeared to be mere perfectly vitrified than that of any former one he had obferved. The pores of the frefl lava were generally full of a perfect vitrification, and the fcorix themfelves, viewed through a magnifying glafs, appeared like a confufed heap of filaments of a foul vitrification. When a piece of the folid lava had been cracked in its fall, without feparating entirely, fibres of perfect glafs were always obferved reaching from fide to fide within the cracks. The natural fpun glafs which fell in fome places along with the affes of this cruption, and which has likewife been obferved in other places, he is of opinion mult have proceeded from an operation of the kind jut mentioned; the lava cracking and feparating in the air at the time of its emiffion from the crater, and by that means fpinning ont the pure vitrified matter from its pores or cells; the wind at the fame cime carrying off the filaments of glafs as faft as they were produced.

Our author obferved a kind of pumice-ftone flicking to lome very large fragments of the new lava. On clofe infpection, however, he found that this fubftance had been forced out of the minute pores of the folid lava itfelf; and was a collection of tine vitreons fibres or filaments confounded torether at the time of

## L A V $\left[\begin{array}{ll}586\end{array}\right] \quad$ L A V

Lava. their being preffed out by the contraction of the large fragments of lava in cooling, and which had been bent downwards by their own weight. "This eurious fubftance (fays he) has the lightnefs of a pumice, and refembles it in every refpect, except that it is of a darker colour."

When the pores of this lava were large, and filled with pure vitrified matter, the latter was fometimes found blown into bubbles on the furface; probably by the air which had been forced out at the time the la. va contracted itfelf in cooling; and from thefe thin bubbles it appeared, that this kind of volcanic glafs has much the fame tranfparency with our common glafs bottles, and like them is of a dirty yellow colour; but when large pieces of it were broken of with a hammer, they appeared perfectly black and opaque.

In the lava of this eruption it was obferved, that many detached pieces were in the flape of a barleycorn or plum llone, fmall at each end, and thick in the middle. Some of thefe did not weigh above an ounce ; but others could not be lefs than 60 pounds. Our author took them to be diops from the liquid fountain of fire, which might naturally acquire fuch a form in their fall. There were alfo many other curious vitrilications, different from any he had feen before, mixed with this huge fhower of fcorix and maffes of lava.

In treating of Mount Etna, M. Houel makes menrion of a piece of lava which, after having been once ejected by the volcano, was fwallowed up, and thrown cut a fecond time. The intenfe heat to which it was then fubjected, had fuch an effect upon it, that it appeared all full of chinks to a confiderable depth, and which run at right angles to one another. He had alfo an opportunity of obferving to great admantage fome of the hollow channels formed by the lavas of Etna fimilar to thofe defcribed by Sir William Hamilton, but on a much larger fcale. Here the great eruption of water in 1755 liad overturned, in a veriical direction, an huge tube of this kind for the length of half a mile. The tube itfelf appeared to be compofed of enormous mafies, fonewhat rcfembling planks; each two feet thick and tivelve or fitteen in breadth, continued in at Itraight line through the whole of that fpace. At the fame time by the action of the lava a kind of walls had been formed, from ten to bixteen feet in height, and curved at the top. Some of thefe walls appear rolled together like paper; and M. Houel is of opinion, that thefe vaious appearances on the furface of the lava when cooled muft have arifen from particles heterogenoous to the real lava; and which detach themfelves from it, rifing to the furface under a variety of forms proportioned to the faces of time taken up in cooling. Theie cruls are formed of diffenent kinds of feorire and dirty lava, mixed with fand or afnes. At the fame place are found ailo gicat numbers of fmall pieces like thofe of ice heaptd upon one another after heving floated for fume time on a river. Beneath thefe the pure lava is met with, and which has evidently been in a fiate of perfect fufirn. This is extremely denfe; and by looking narrowly into its chinks, the compofition of the wh le appears to be merely homogeneous. *) It is curious (fays he) to obferve, fo near one (pecies of lava which is very fure, another which has likewife
arrived at the fame place in a fluid fite, and has there undergone fo great a change as fcarce to retain an appearance of its original fate. It is, however, like iron drofs, in grains of unequal fizes. We find it alfo at various diftances, fuch as one, two, or more hundred fathoms. It is fomerimes found in large pieces like tables, covered over with fharp points, fome longer and others Shorter. All thefe pieces are quite detach. ed from one another, as if they had been brought rhither and fcattered from a tumbril. The matter of which the crult of the lava is formed, feems to lave iffued from it in the fame manner in which froth rifes upon folution of foap in water. It sopears afterwards to have fwelled, burit, and affumed its prefent form, prefenting to the view various fpaces filled with fmall loofe Atones. A great number of new lavas were like. wife oblerved, all of them putting forth various kinds of efflorefcences in great quantity.

The hardnefs, denfity, and folidity, of lavas, no doubt proceed from the degree of heat to which they have been expofed, and which feems to be greater or lefs according to their quantity. Hence the Icelandic volcanoss, which pour forth the greatel quantities of lava, produce it alfo in the greatelt degree of lique. faction, and Dr Van Troil oblerves, that what he faw muft have been liquefied to an extreme degree.

The compofition of the lavas of different volcanoes, Obfer and even of different parts of thofe of the fame volcano, tionso is extremely different. Sir William Hamilton is of difere opinion that this difference in compofition contributes compl not a little to the facility or difficulty with which they yans by afterwards reccive earth capable of vegetation. "Some w. H1 (fays he) have been in a more perfect flate of virrifi-ton. cation than others, and are confequently lefs liable to the imprelinons of time. I have often obferved on Mount Vefuvius, when I have been clofe to a mouth from whence the lava was difgorging itfelf, that the quality of it varied greatly from tiane to time. I have feen is as fluid and coherent as glafs when in fufion; and I have feen it farinaceous, the particles feparating as they forced their way out, jult like meal coming from under the grindtlones. A Aseam of lava of this fort being lefs compact, and containing more earthy particles, would certainly be much fooner lit for vegetation than one compofed of the more perfect vitrilied matter." Mr Bergman, who has accurately analyfed fome Icelandic lavas, informs us, that one kind is very coarfe, heavy, and hard, full of bladders, almoll black, intermixed with white grains refembling quartz, which in fome places have a figure not very unlike a fquare. This black matter is not attracted by the magnet; but if a piece of it is held againt a compala, the needle vifibly moves. When tried in the crucible, it yields from ten to twelve pounds of iron in every hundred weight. It does not diffolve in the lealt with fal fod $x$, and very difficulty with borax, and forse at all with urinous falt. It feems to contain a giear deal of clay in its compofirion, which may be extracted by all acid folvents. This latt he is likewife, from experiments, affured is the cafe with the lava of Solfaterra in Italy.

The white lava, which poffeffes more or lefs of thofe tranfparent grains or rays with which lavas are generally chequered, does not feem to be of the nature of quartz, as is cannot be attacked by fal fodx; it is
how.

## L A V [587] L A V

Ira, however, foluble with fome difficulty by borax and fufible utinous falt, or microcofmic acid. Thefe effects are perfectly fimilar to thofe produced upon the diamond, ruby, fapphire, topaz, and hyacinth. The chryfolite, garnet, tourmalin, and firl, can neither be difilived by fal fodæ, though they are fome what at. tacked by it when reduced to a fine powder; and upon the two laft mentioned mes it prodices a night effervefcence ; on which account, fays Mr Bergman, it is poffible that the precious flones found uoon Mount Vefuvius, which are fold at Naples, are nearer related to the real precious fones than is generally imagived. He found no fuch grains in a finer kind of lava, quite porous within, and entirely burnt out, and confiderably lighter than the former ones.

The Iceland agate is of a black or blackifh brown colour, a little tranfparent at the thin edgres like glafs, and gives fire with theel. It cannot cafily oc melted by itfelf; but becomes white, and flies in pieces. It can hardly be diffolved in the fire by fufible urinous falt; but it fucceeds a little better with borax, though with fome difficulty. With fal fodx it diffolves very little ; though in the firf moments fome ebullition is perceived, and the whole mafs is afterwards reduced to powder. Hence Mr Bergman concludes, that this agate hath been produced by an excefive fire out cif the black lava formerly mentioned.

In the Iceland pumice-flone, quartz and cryltals are often found, particularly in the black and reddifhbrown kind. The flones thrown out of the volcano, whether grey, or burnt brown, feemed to confift of a hardened clay, mixed with a filiceous earth. They were fprinkled with rays and grains refembling quartz, and fome few flakes of mica. They fufed with great difficulity in the fire; with fal fodx they fhowed fome effervefcence at firt, but which ceafed in a fhort time. The parts refembling quartz produced no motion at all ; from whence Mr Bergman concludes, that the black lava already mentioned proceeds principally from this mafs. Several other fones which were fent him from Iceland, Mr Bergman fuppofed to have no connection with the eruptions, but to have been produced in fome other way.

In Mr lerber's travels through Italy, we are informed, that he has feen a fpecies of lava fo exactly refembling blue iron flags, that it was not to be diflinguifhed from them but with great difficulty. The fame author tells us likewife, that "the Vicentine and Veronefe lavas and volcanic athes contain inclufed feveral forts of fire-firiking and flint-horn flones, of a red, black, white, green, and variegated colour, fuch as jafpers and agates; that hyacinths, chryfolites, and pietre olfidiane, defcribed by Mr Arduini in his Giornale d'Inflia, are found at Leonedo ; and that chalcedony or opal pebbles, and noduli with inclofed water-drops, (chalceloriii cfali enbydri), are dug out of the volcanic cineritious hills near Vicenza.
M. Dolomicu confiders the chemical analy fis of laolow va as but of little account. When fubjected to the sopi- force of fire a fecond time, they are all of them reducible to the fame kind of glafs; from which it has been concluded, that all volcanic products have been formed of the fame kind of materials, and that the fubterranenus fire has always acted on and varioully modi. fied the fame kind of fone. But an analy fis by fire,
he juftly obferves, is of all others the mof fallacious. The fubflances are all futible, and we have no proper methods of meafuring the intenfity of our fire; fo that the fame fubftance which to day may come out of our furnaces untouclied, may to momiow be foumd completely altered, even though the fire eraployed fhould not appear to us to be any more violent than the furme:. Alladyfes by different menflrua have not been more fuccefsful. Mr Bergman has indeed analyfid fome lavas with acids, and gives with aftonifling pre- arammants cifion the following refult, viz. that an hundred layza of parts of lava contain 43 of 'filiceots carth, 35 of argillaceous earth, four of calcarcous tarth, and $t 2$ of iron. Thefe experiments, however, our author ob. ferves, give us no information with regard to lavas in general. They only fhow the compoficion of the particular fpecimens that he tried; and even aficr the deferiptions that he has given, we are a good dtal at a lofs to difcover the fpecies of lava which he fubjected to analyfis. "It would be as ridiculous (fays M. Dolomieu) to apply this analyfis to every velcanic product, as it would be to believe that the component parts of a fiffile rock were the fame with thofe of every rock compofed of lamine or thin Itrata." For thefe reafons his is of opinion, that, in order to underitand the nature of lavas, we thould confider not only that of volcannes themfelves, but of the bafes on which they reff. Had this been done, we would have found that the volcanic fires generally exift in heds of argillaceous fchiltus and horn thone; frequently in a fpecies of of the fer: porphyry, the gluten of which is intermediate be- of volcaric twixt horn-Rone and petrofilex; containing a large fireso quantity of fchorl, feldt-fpar, and greening quartz or chryfolite, in little rounded nodules. Thefe fubtlances, he teils us, would have been found in thofe mountains which are called primitive, and in trata buised under beds of calcareons flone; and, among other things, would have convinced us, that the fluidity of lavas does not make them lofe the diftinctive characters of their bafes. In the mountains called Primilite, thofe rocks which are afligued as the bafes of the more common lavas are found internixed with micaccous ores, with gneifs, granite, \&c. and they generally refl on maffes of granite. Hence lavas mult confift of all thefe matters, and the fire muft act upon them all whenever it meets with them. Our author has conftantly obferved, that volcanoes fituated at the greatelt diftance from the contre of the chain, or group of mountains on which they are eflablifhed, produce lavas .of a more homogeneous compofition, and lefs varied, and which contain molt iron and argillaccons earth. Thofe, on the contrary, placed nearer the centre, are more diverfified in their producis; containing fubtances of an infinite variety of different kinds. The feat of the firc, however, he obferves, does not long continue among the granites, the inflammation being either extinguifhed, or returning to the centre of the fchitus rocks in its neighbourhood.

From this knowledge of the materials of which lavas are compofed, we acquire alfo a confiderable knowledge of the matters that are found in greateft quantity in the bowtls of the earth. The excavations made by mines, \&c. on the furface of the earth, are mere Fcratche 3 in comparifon of the depths of volcanic fires; and as he confiders the mountains themfelves as the

## 1 A V

Lsya, produations of thofe fires, it thence follows, that by attentively examining the materials of which they are compofed, we may thence determine what kind of fubllanecs are moll conmon at thefe great depths in the earth.

Thus our author thinks it probable, that fchoeils and porphyries, though rare on the furface, are very common in the internal parts of the earth. As an inflance of the truth of his obfervations, our author informs us, that he was onnvinced, from no other circumflance but merely infpecting the lavas of Mount Etna, that, in fone parts of the ifland of Sicily, there exilled granites, porplyyries, with fchiflus and argillaceous hornitones. In this opinion he perfitted, notwithiftanding the generally oppofite fentiments of the inhabitanss themfelves. He fearched in vain three-fourths of the ifland ; and at laff found that all the mountains, forming the point of Sicily, called Pclorus, contain rocks of the kind above mentioned. He then faw that the bafe of thefe mountains was produced under Mount Etna on one fide, and under the Lipari iflands on the other. "We mull, therefore, (fays he) believe, that thefe mountains have furnifind the materials on which the volcanocs have, for thoufands of ycars, exerted their power."
By travelling among thofe elevations called the $N_{e}$ p. tumian Mourtains, or Mons Pelorus, he was enabled to difcover the reafon why the products of Etna and the Lipari iflands differ from one another. This, he fays, is the unequal diftribution of the granite and fchiftus rocks among them. The iflands reft almoll immediately on the granite, or are feparated from it by a very thin thatum of agillaceous rock which contains porphyry; but the Sicilian volcanc is fituated on the prolongation of the fchifous rock, which it muft pierce before it reaches the granite; and accordingly very little of its lava feems to have granite for its balis. If the feat of the fire was Atill more dillant from the centre of the mountains, their lavas, would be more homogeneous; becaufe the fchift, which fucceeds to the honn-llone, is lefo various, and hardly inchudes any bodies foreign to its own fubftance. Thus the lavas, in the extinguifhed volcanoes of the Val di Noto, which lie 15 leagues to the foutheall of Etna, contain neither granite nor porphyry; but have for their bafes fimple rocks, with particles of chryfolite and fome fchorls.

To the granites whichextend to Metazzo, oppofite to Lipari, he afcribes the formation of pumice; as they contain an immenfe quantity of fcaly and micaceous rocks, black and white, with foffile granites or gneifs, the bafis of which is a very fufible feldt-fpar; and thefe he fuppofes to be the proper materials of the pumice, having found pieces of themalmoft untouched in pumice Alones. There are beds of almort pure feldt-fpar; to the femivitrification of which he afcribes an opaque enamel like lava mentioned in other parts of his works. Few porphyries, however, he acknowledges, are to be met with among the Neptunian mountains, though thefe ftones abound.in the lavas of Etna. "They are not diflant (fays he) from the granites ; and thofe I have found have neither the hardncfs nor perfection of thofe pieces whish I gathered in the gullies, and which had been apparently wathed out of the anterior parts of the mountain by water.

But though the porphyries I faw here bear no propor tion to thofe in the productz of Etna, I was fufficient Iy convinced of their exiftence, and their analogy with thufe of volcanoes, by difonvering that the centre of thefe mountains contains a great number of them. Porphyries, in general, are very rate on the furface of the earth. Nature generally conctals them from us by burying them under calcareot:s ftrata, or by inclofing them in fchiftus rocks with which they are ahnoft always mixed: but we are indebted to the labour of volcanoes for informing us that they are among the moll common fubltances in the buwels of the earth: and they are never fo much difguifed by the fubterra. nean fire as to be miftaken in the luvas of which they form the bafis."
la Cruntede's Mineralogy we find all the volcanicproducts clalled under the general name of Slugs ; of which he enumerates the following fpecies.
I. The Aibates If.andicus Niger, or Iceland Agate. It is black, folid, and of a glatfy texture ; but in thiter pieces: it is greenilh, and iemitranfparent, like bottleglafs which contains much iron. It is found in lceland and in the iland of Afcenfion. The jewellers employ it as an agate, though it is too foft to refit: the wear. "The moft remarkable thing concerning ${ }^{\text {is }}$ (fays he) is, that fuch large folid maffes are found of it, that there is no poffibility of producing the like in any glafs houfe. In Magellan's notes on. this fubject, we tind the Iceland agate clafed among the traififarent bafaltes. To the fame clafs belong the Lapis Olifidianus of Pliny, and the Liapis Gallinuceus of Peru, which by its beautiful blacknels approaches io the colour of a large black-bird of the crow kind, in that country called the Gallincegan
2. Lapis molaris Rhenarus, Rhenifh Milllone, is blackifh.grey, porous, and perfectly refembling a fort. of flag produced by Mount Vefuvius.
3. Pumex, the pumice-ftone. See Pumex.
4. The Pearl-Slag is compounded of white and greenifl glafs particles, which feem to have been conglutinated while yet foft or ia fufion. It is found in. the ifland of Afcenfion.
5. Slag fand, or afhes, thrown out by volcanoes in larger or imaller grains. "This (fays Cronlledt) may pertaps be the principle of the Tirra Puzzolana, becaufe fuch an earth is faid at this time to cover the tuins of Herculaneum near Naples, which was de Aroyed by Vefuvius." In the notes, we arc informed, that if the afhes of a-volcano be plentifully moillened, they produce that kind of tuffa or tophi, traas, and pori, all of which are nearly of the fame kind. Great heaps of. tufa or tophi, are found in Italy, forming various hills, and covering large tracts of land; from whence it is cut, and carried, for making the walls, vaults, and upper ceilings of houfes. It is a very fofe kind of fone, extremely advantageous for the fe purpofes, on account of its little weight, and being eafily cut into any form. The inhabitants of Umbria and other parts of Italy dig with very little labour various fubterranean excavations for the keeping of wiries and provifions of different kinds.

Mr Kirwan is of opinion, that the lavas ought to be diftinguifhed from the other volcanic productions. All lavas, according to him, are magnetic, give fire with fteel, are generally of a granular texture, and fufible

## L A V

per fe. They may be'reduced in three varicties, viz. the Cellular, the Cunpact, and the Vitreous. The cellular appear to have undergone only the firt degree of fultion, being juut mollified and heated fufficiently to expel the fixed air contained in the argillaceous particles. Hence they abound in fmall cavities arifing from the expanfion of that air after it had recovered its elatic llate; and thus they are ofen fo light as to foat upon water, and have been miftaken for pamiceflones. They are of black, grey, brown, or reddifa colours; and their cavities are even filled with crytallizations. Of this kind is Cronftedt's fecond fpecits, the millitone of the Rhine. Thefe contain from 45 to 50 per cent. of filiceous earth; from 15 to 20 of iron: four or five of pure calcareous earth; the remainder being argillaceuus.

The compact lavas have undergone a more petfect degree of fuition, though even thefe are not deflitute of cavities. They contain finer cryftals, or fuch as are more completely vitrified than the furmer; they have a black or brown colour: but fill their fracture is obfcure and not glafly. Their conftievent parts are the fame with the preceding ones; the ufual fluxes attack them with difficulty, and the fufible falt of urinc has fearce any power over then.

The vitreuus lava has been mure completely melted, and forms vitrifications of different coluirs, generally black on afh-coloured, but rarely blue or greenih. A fpecies of this was analyfed by Mr Bergman, as has been already mentioned, and affurded 49 per cent. of filex, 35 of argillaceo:s, 4 of calcareous earth, and 12 of inon. Another fpecimen from the Lipari inlands afforded 69 parts of filex, 20 of argillaceous earth, and 9 of icon. This kind uf lava melts be itS.If with great difficulty. The black agate of Iceland belongs to this fpecies, as dues alfo the harder fort of pitch tlone, which gives fire with fteel. This flone is uf various colvirs, grey, green, black, red, or brown; has a glafy appearance, being compofed of femivitriSed fubliances, and intlts eafly per $\int_{\text {e }}$. It contains 65 per cent. of filex, 16 of argillaceous earth, and four of iron; ${ }^{1} 4$ parts were diflipated in the analyfis made by Wicgleb, as Mr Kirwan afferts.

The beds of lava are deepett and narrowelt near the erater, and broader and flallower as they advance, unlefs fome valley intervenes. Pumice fones lie at aftill greater diftance: and from thefe oblervations, fays Mr Kırwan, extingnihhed volcanoes may be traced.

Cronftedt conjectured that there might be a kind of circulation among the different earths, from the vegetable mould, which he fuppofed to occupy one extreme, to the flags or volcanic productions, which might be reckoned to oceupy another, and back again from the flags to the vegetable mould. "It is ubvious (fays he) how the old heaps of nags from the iron furnaces decay, and at lall produce vegetables, which cannot be aferibed folely to a black monld c.rried thither by the wind. The fame may perhaps happen with the natural flags in the open air." Other naturalifts have veritied this conjecture. All lavas are found to be decompofable by long expofure to the air, fooner or later according to the quantity of iron and calgareous eart! they contain, and according as their fufion was nore or lefs complete. Sir William Hamib.

## 89 L. A V

ton has concluded that they gain only one or two feet mould in 1000 years; from which, and Roupero's calculations, extravagant ideas have been formed of the duration of the world ; but all thefe are fonnd, when properly examined, to be built on a falfe foundation. See the article Earth, $\mathrm{n}^{2} 176,177$.

The quantity of matter thrown out from vol. 12 cances under the mame of lura is prodigious. Af- Vaf quar. ter the great eruption of Etna in 166 g , Borclii va throwe went from Pifa to Sicily is obferve the effecs of ou:。
it. The matter thrown out at that time amorated to $93,830,750$ cubical paces; fo that, had it been atended in length upon the furface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, tut confifted atfo of fand, thone, gravel, $\delta \mathrm{c}$. The lava he computed at $6,300,000$ paces, which formed a tiver, aecording to our author, fometimes two miles broad; but accurding to others it was fix or feven miles broad, and fometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of Etna are very commonly 15 or 20 miles in length, fix or feven in breatth, and 50 feet drep. The moft confiderable is fearce lefo chan 30 biriles long and 15 broad. The moft confiderable layas of Vefurius do not exceed feven miles in length. The fame author, however, tells us, that the lava which iffued from Vefuvias in 1767 , was fix miles long, two in breadth, and in-moft places 60 or 70 feet deep. In one place it had run alung a holluw-way made by currents of rain not lifs than zoo feet deep and 100 wide; and this valt hollow it had in one place filled up. He fays, he could not have believed that fo great a quantity of matter conld have been thrown out in fuch a fhort time, if he had not examined the whole courle of it himfelf. Even this quantity, however, great as it is, appears very trifting in comparifon of that thrown out in Icceland in the year 1783 , which covered a fpace of ground 90 miles in length and 42 in breadth, to the depth of more than 100 feet. Dr Van Truil, in his Letters on Iceland, tells us, that he and his companions travelled over a tract of lava upwards of 300 miles in length: and in 1728 , we are told that an eruption of lava took place, which continued fur two gears to run into a great lake, which it almolt filled up.

As the lavas are thrown from the yolcanoes in the hightf degree of ignition, it may eafily be fup. pofed that fuch vaft bodies will retain their wationg unse 10 coos. for a long time. It wouli indecd be well worth obferving, what length of time is required to cool a lava perfectly; as from thence vee might in fome meafure judge how far thofe philufophers are in the right, who argue concerning the length of time required to cool an ignited globe of the tize of our earth or larger. Sir Witliam Hamiton tells us, that in the month of April 1771 , he thruft ficis into fome of the crevices of the lava which had iffued from Vefuvius in October 1767! and they immediately took fire. On Mount Etna, in 1760, he obferved the lava that las, been difgorged three years before to fmoke in many parts. No particular obfervation, however, hath beer. nuade in what proportion the l.eat of lavas is graduulis lof.

## I A V [ 590 ] L A V

Lava, Lavandula.

Sir Willian Hamilton informs us of a curious fact relating to a lava in the illand called Lacco. Herc is a cavern flut up with a door ; and this cavern is made ufe of to cool liquors and fruit, which it does in a mort tire as offectnally as ice. Before the door was opened, he felt the cold on his legs very fenfibly; but when it was opened, the cold rufhed out fo as to give lim pain; and within the grotto it was intolerable. He was not fenfible of wind attending this cold; tho' upon Mount Etna and Vcfuvius, where there are eareins of this kind, the cold is evienently occafioned by a fubterraneous wind: the natives call fuch places venturoli. From old lapas there alfo frequently happens an eruption of noxious vapours called mofetes. 'Thefe likewife break out from wells and fubterraueous places in the reighbourhood of a voleano before an eruption. Our author tells us, that the vaponraffects the nolltils, throat, and flomach, juft as the firit of harthorn or any ftrong volatile falt ; and would foon prove fatal if you did not immediately withdraw from it. Thele mofetes, he fays, are at all times to be met with under the ancient lavas of Yefuvius, particularly the great cruption of $1 \sigma_{3} 1$.

Sir William Hamilton informs us, that the lavas of
tings, from three or four to fix inches long; ftrip off the under leaves; then plant them in a mady border, four inches afunder ; give a good watering, repeat it occafionally in dry weather, and the plants will be well rooted in fummer, and cach become a good plant fit to be tranfplanted into any place early in autumn, that is September or October; removing them, if poffible, with balls of earth; and if intended to plant them for ufe, fet them in rows two or three feet afunder, and two feet diflaner in each row: if any are defigned for the fhrubbery, they fhould be ftationed fingly at good diffances near the front. Thofe of the third fort being tender, fhould be potted to move to melter in winter. The lavendnla flochas is alfo often raifed from feed, fown in Mareh or April, in a bed of light earth.

Ufes. The two firlt fpecies are proper both for the kitchen-garden, for medicinal and other familyufes; and to plant in the pleafure-ground to adorn the front of fmall firubbery compartments, where they will increafe the varicty very agreeably; and are finelyfcented aromatics, both when growing, and their flowers when gathered, efpecially thofe or the firft fpecies, which are in great efteem for putting among cloaths, and for diftilling and other economical ufes. The fowers of the first fort are gathered for ufe in July, which being the time of their perfection, cut of the fpikes clofe in a dry day, and tie them in fmall bunches for ufe. Thefe and the fummics are in a vary eminent degree cephalic and nervinc. They arc given in palfies, vertigos, lethargies, tremors, and fuppreffion of the meultrual evacuation. The compound fipirit difilled from them is famous in thefe and many otier like cafes. The diflilled oil is particularly celcbrated for deftroying the policuli inguinales, and other cntaneous infects. If foft fpongy paper, dipt in this oil, either alone or mixed with oil of almonds, be applied at night to the parts infected, the infects will certainly, fays Geoffroy, be all found dead in the morning.

LAVATERA, in botany: A genus of the polyandria order, belonging to the polyadclphia clafs of plants; and in the natural method ranking under the 37 th order, Columifiore. The exterior calyx is double and tritid; the arilii or fued coats are very many and monofpermous. There are feveral fpecies, mot of them herbaceous fowery amnuals, or fhrubby perennials, growing esect from two or three to cight or ten feet high, garnifhed with large roundith, heart-fhaped, and angular leaves, and quinquepetalous finwers of the mallow kind. They are eafily propagated by feed in the open ground in the fpring ; and thrive bell when fown where they are defigned to remain. The lavatera tribe affect a warm fandy fituation and foil, in which they will fometimes continue to exhibit their beautics for many years; but in general they are fhort-lived, continuing only two or turce years : this readers them pecnliarly eligible to be fcattered plentifully in a newly made firobbery ; they will add warmth to young plants, and will die away themfelves before the fpaces they occupy will be required by the furrounding firubs.

Lavatory, or Layadero, a name given to certain places in Chili and Peru, where gold is got out of earth by wafling.
M. Frezier gives us the following defcription of the
ch, lavatories of Chili:- They dig deep into the carth, in fuch places as they have reafon to expect gold in ; and, in order to facilitate this digging, turn a frean of water upon the fpot, loofening the earth as much as poffible all the time, that the current may have the greater effect, and tear up the eath more ftrongly. When they are got to the earth they want, they lurn off the flream, and dig dry.

The earth that they now get, is earried on mules, and difcharged into a bafon, inade fomewhat in the manner of a finith's bellows; into which a little rimulet of water runs with a great deal of rapidity, diffolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their greai weight, precipitate to the bottom of the bafon, and mix with fine black fand, where they are almoft as much hidden as they were before in the earth.

Sometimes they find very confiderable pieces in lavatories, particularly pieces of 24 ounces each. There are feveral lavatoties, where they find pepitas, or pieces of virgin gold, of a prodigions fize. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the eaft of Coquimbo, are the laratories of Anducoll, the gold whereof is 23 carats fine.-Their works bere always turn to great profit, excepting when the water fails them.- The natives maintain that the earth is creative, that is, it produces gold continually; becaule, after having been wafted 60 or 80 years, they lind it impreg. nated afrefh, and draw ahnolt as much out of it as at firlt.

IUBACH, a handfore and Arong town of Germany, in the circle of Aullria, and in Carniola, with a bifhop's fee, a calle, and very handfome houfes. It is feated on a river of the fame name, wherein are the largeft craw-fifh in Europe. T. Long. 14. 45. N. Lat. 46. 20.

LAUD (William), archbihop of Canterbury in the 17th century, was born at Reading in 1573, and educated in St John's collerre, Oxford, of which he was afterwards a fellow and gramma:-reader. In 1610, he went into orders. In 1611 , he was elected prefident of St John's college; but his election being difputed, it was confirmed by his majety. The fame year he was fworn the king's claplain. In 1521 , he was nominated bithop of St David's. In 1628 , he was tranflated to the bilhopric of London. In 1630 , he was elected chancellor of the univerfity of Oxford. In 1633 , he attended the king into Scotland, and was fworn a privy-counfellor for that kinydom. During his ftay in Scotland, he formed the sefulution of bring. ing that chureh to an exact conformity with the church of England. In the fane year, he fucceeded archbiMop Abbot in the fee of Canterbury; and foon after came out his majelty's dechration about lawful fports on Sundays, which the archbillop was charged with having revived and enlarged, and that with the vexatious profecutions of fuch clergymen as refufed to read it in their churches. In $1634-5$, the archbifhop was put into the great conmittee of trade and the king's revenue; on the $4^{\text {th }}$ of March following, he was appointed one of the commiffoners of the trea-
fury; and on the Gth of March i635-6, he received Laudanuas the Aaff of lord high-treafurer of Lugland. In order to prcvent the printing and publifling what he theught

Lauicr. " impruper books, he procured a decree to be pafled in the Ilar-chamber, on the isth of July 1637 , whereby it was enjoined that the maller-printers hould be rtduced to a certain number, and that none of them fould print any books till they were licenfed either by the archbifiop or the bithop of London, or fome of their chaplains, or by the chancellors or vice chancellors of the two univerfities. A new parliament being fum. moned, met on the $13 \hat{h}$ of April $16+0$; and the convocation the day following: but the commons lanching out into complaints asainit the archbihop, and is. fiting upon a redrefs of grievances before they granted any fupply, the parliament was diffolved on the 7 th of May. The convocation, however, continued fitting; and made 17 canons, which were fuppofed to be formed under the immediate direction of the archbifhop. In the beginning of the long parliameut he was attacked on account of thofe canons: and they being condenmed by the houfe of commons on the 16 th of December $16+0$, "as coutaining many things contrary to the king's prerogative, to the fundamental laws and ttatutes of this realin, to the riglits of parliament, to the property and liberty of the fubject, and tending to fedition, and of dangerous confequence ;" he was, on the 18 th of December, accufed by the commons of high treafon, and fent to the Tower. Being tried before the houfe of lords, for endeavouring to fubvert the laws, and to overthrow the Proteltant religion, he was found guilty, and beheaded on Towerhill on January loth following, in the 72 d year of his age. This learned prelate, notwithfanding his being charged with a defign to bring in Popery, wroie an anfieer to Dr Fifher, which is elleemed one of the bett pieces that has been printed againt that religion. He was temperate in his diet, and regular in his private life: but his fondnefs for introducing new ceremonies, in which he thowed a hot and indifereet zeal, his encouraging of fports on Sundays, his illegal and cruel feverity in the far-chamber and high-comminion courts, and the fury with which he perfecuted the diffenters, and all who prefumed to contradict his fentiments, expofed him to popular hatred. Befides his Anfwer to Fifher, he publifhed feveral Sermons, and. other works.

## LAUDANUM. See Oprum.

LAUDATIO, in a legal fenfe, was anciently the tettimony delivered in court of the accufed perfon's good behaviour and integrity of life. It refembled the cultom, which prevails in our trials, of calling perfone to fpeak to the character of the prifoner. The kalt number of the lundatores amongit the Romans was ten.

LAUDER (William), a native of Scotland, was cducated at che univerfity of Edinburgh, where be finifhed his ftudies with great reputation, and acquired a confiderable knowledge of the Latin tongue. In May 22. $173+$, he received a teftimonial from the heads of the univerfity, certifying that he was a fit perfon to teach humanity in any fchool or college whatcver. In 739 he publifhed at Edinburgh an edition of Johnfton's Pfalms. In 1742, he was recom. mended by Mr Satrick Cuming and Mr Colin Mac:

## I A U [ 592 ] I. A U

inauder lauriu, profeffors of church-hifory and mathematics, \#f to the mafterflip of the grammar- \{chool at Dundee, then vacant. Whether he fucceeded in his application or not, is uncertain: but a few years afterwards we find him in London, contriving to ruin the reputation of Milton; an attempt which ended in the deEtruction of his own. His reafon for the attack probably frung from the virulence of a violent party fpisit, which triumphed over every principle of honour and honefty. Ife began firt to retail part of his defign in The Gentleman'a Magazine, 1747 ; and finding that his furgeries were not dctected, was encouraged in 1751 to collect then, with additions, into a volume, intitled, "An Effay on Milton's Ufe and Imiqation of the Moderns in his Paradife Loft," Svo. The fidelity of his quotations had heen doubted by feveral pcople; and the falfehood of them was foon after demonitrated by DrDouglas, in a pamplslet intitled, "Milton vindicated from the Charge of Plagiarifm brought againlt him by. Lauder, and Lauder himfelf convicted of feveral Forgeries and grofs Impofitions on the Pubiic: In a Letter humbly addrefled to the Right Honourable the Earl of Bath, 1751, " 8 vo. The appearance of this Detection overwhelmed Lauder with confufion. Fie fubfcribed a confeffion, dictated by a learned friend, wherein he ingenuoufy acknowledged his offenae, which he profefled to have been occalioned by the injury he had received from the difappointment of his expectations of profit from the publication of Johniton's Pfalms. This misfortune he aferibed to a couplet in Mr Pope's Dunciad, book iv. ver. 3. and from thence originated his rancour againft Milton. He afterwands imputed his conduet to other motives; abufed the few friends who continued to countenance him; and, finding that his character was not to be retrieved, quitted the kingdom, and went to Barbadoes, where he fome time augbt a fchool. His behaviour there was mean and defpicable; and be pafled the remainder of his life in univerfal contempt. "He died (fays Mr Nichols) fome time about the year 1771, as my friead Mr Reed was informed by the gentleman who read the funeral fervice over him."
L.AUDICOEN1, amongit the Romans, applauders, who for reward entered the rehearfal-rcoms, attended the repetition of plays, and were in waiting when orations were pronounced, in order to raife or increale the acclamation and applaufe.

LA UDOHN (Field-marfhal), a celebrated general in the imperial fervice, born in 1716 , was a native of Livonia, and defcended from a Scottifh family. He made his firlt campaigns under Mathal Munich, in the war of 1738 , between the Ruffans and Turks; and was at the taking of Oczakow, Choczim, and Stawatzchane, where the Turks were entirely defeated. Fredcrick the Great refufed, in 1743, to take young Laudohn into his fervice, faying he did not like his countenance ; though this monarch, who was contidered as the greateft general of his age, afterwards faid, that he often admired the pofitions of other generals, but that he had ever dreaded the battles of Laudohn. In 1756 , when but jut entered into the fervice of the moufe of Auftria, with the rank of lieutenant-colonel, he made fuch a rapid progrefs, that within lefs than a yjear he was a general of artillery, and within three gears commander in chief of the whole army. He $N^{2} 175$.
refened Olmutz, wleen befieged by the Prufians ; beat the king himfelf at Frankfort on the Oder; at Zorndorf, took General Fouquet prifoner; carried Glatz and Schweidnitz by affault; and flopped the progrefs of Frederick in a war which might have proved fatal to the houfe of Autria. In $: 778$, when elevated to the rank of marfhal, at the head of 60,000 men he hindered Henry, brother to the king of Pruffia, from joining his army to that of the king. At Dubicza, Novi, Gradifca, and Belgrade, in the late war between the Emperor and the 'Turks, he had but to prefent himfelf before the place, and fay with Cæfar, Veni, vidf, evici. Eut at his head-quarters in Moravia, he was feized with a fever, in confequence of an operation he underwent for an obftruction in the urethra. His im. patience under the medical auplications, the impetuous ardour of his character, and the knowledge, above all, of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He refifted the application of cataplafms, before and after the incifions were made, with a fatal obltinacy which railed the inflammation to fuch a height, that he expired under the acceffion of the fever on the 1 fth of July 1790 , in the $74^{\text {th }}$ year of his age.

LAUDS, Laudes, the fecond part of the ordinary office of the breviary, faid after matins; though, heretofore, it ended the office of the night.

The laudes confint principally of pralms, hymns, Ec. whence they took their name, from laus, laudis, "praife."

LAVENHAM, or Lanham; 6 i miles from London, is a pleafant and pretty large town of Suffolk, on a branch of the river Bret, from whenee it rifes gradually to the top of a hill, where are its church, which is a very handfome Gothic fructure, and in which are . Several ancient monuments; and a fpacious marketplace, encompaffed with nine ftreets or divifions, in a very licalthy free air. It had formerly a very confiderable trade in blue cloth; and liad three guilds or companies, with each their hall. It has dill a confiderable mannfackory of ferges, fialloons, fays, ftuffs, and fpinning fine yarn for Lendon; and many hun. dred loads of wool are delivered in a year from its woo!hall. It is governed by 6 capital buereffes, who are for life, and choofe the inferior officers. The church and its fteeple, which is $\$ 37$ feet high, are reckoned the finelt in the county. Its tenor bell, though not much more than a ton, has as deep a note as a bell of twice that weight. Here is a free-fchool and a bridewell, part of which is a workhoule where the poor children, zkc. of the pariff are employed in fpinaing hemp, flax, and yarn; befides which, here are other confiderable charicies. The tenants of the manor and the other inhabitants were always exempted from ferring at any court held for its hamlet. They have that tenure of land bere which is called Borough Englijß. Its markets are on Tuefday, and on Thurfday for wool. Its fairs are on Shrove-Tuelday, and October 10.

## LaVENDER. See Lavandula.

LAVER, in fcripture hiftory, a facred utenfil placed in the court of the Jewifh talernacle, confifting of a bafon, whence they drew water by cocks, fo: wafhing the hands and fect of the oficiatin prie:ts, and alfo the entrails and legs of the vitims.

LAVERNA,

## L A U

LAVERNA, in antiquity, the goddefs of thieves and cheats among the Romana, who honoured her with public worfhip, becaufe the was fuppofed to favour thofe who wifhed that their defigns might not be dif. covered. Varro fays, that the had an altar near one of the gates of Rome ; hetice called porta lavernalis.

LAUGERIA, in botany: A genus of the monogyoia order, belonging to the pentandria cla ts of plants; and in the natural method ranking among thofe of which the order is doubtful. The corolla is quinquefid; the fruit is a plum with a quinquelocular kernel.

LAUGFITER, an affection peculiar to mankind, occafioned by fomething that tickles the fancy.

In laughter, the ege-brows are raifed about the middle, and drawn down next the nofe; the eyes are almolt fhut ; the mouth opens and fhows the teeth, the conners of the mouth being drawn back and raifed up; the cheeks feem puffed up, and almoft hide the cyes; the face is ufually red, the noftrils are open; and the eyes wet.

Authors attribute laughter to the fifth pair of nerres, which fending branches to the eye, ear, lips, tongue, palate, and mufcles of the cheek, parts of the month, pracordia, \&c. there hence arifes a fympathy, or confent, between all thefe parts; fo that when one of them is aced upon, the others are proportionably affected. Hence a favoury thing feen, or fmelt, affects the glands, and parts of the mouth; a thing feen, or heard, that is flameful, affects the checks with blufhes: on the contrary, if it pleafe and tickle the fancy, it affects the precordia, and mufcles of the mouth and face with langhter ; if it caufe fadnefs and melancholy, it likewife affects the precordia, and demonftrates itfelf by cauting the glands of the eyes to emit tears. Dr Willis accounts for the pleafure of kiffing from the fame caufe; the branches of this fifth pair being fprcad to the lips, the pracordia, and the genital parts; whence arifes a fympathy between thofe parts.

The affection of the mind by which laughter is produced is feemingly fo very different from the other palfions with which we are endowed, that it hath engaged the attention of very eminent perfons to find it out.-1. Ariftote, in the fifth chapter of his Poetics, obferves of comedy, that "it imitates thofe vices or meanneffes only which partake of the ridiculous:-now the ridiculous (fays he) confifts of fome fault or turpitude not attended with great pain, and not deftructive." 2. "The paffion of laughter (fays Mr Hobbes) is nothing elfe but fudden glory ariting from fome fadden conception of fome eminency in ourfelves, by comparifon with the infirmity of others, or with our own formerly. For men (continues he) lavgh at the follies of themfelves paft, when they come fuddenly to remembrance, excepi when we bring with thens any fudden difhonour." 3. Akenfide, in the third book of his excellent poem, treats of ridicule at confiderable length. He gives a detail of ridiculons charakters; ignorant pretenders to learning, boalfful foldiers, and lying travellers, hypocritical churchmen, conccited politicians, old women that talk of their charms and virtue, ragged philofophers who rail at riches, virtunti intent upon triftes, romantic lovera, wits wantonly fatirical, fops that out of vanity appear to be difeafed and profligate, daftards who are affamed or afraid without reafon, and fools who are
VoL. IX. Part II.
ignorant of what they ought to know. Having finifh. Luvghero, ed the detail of characters he makes fome general re. marks on the caufe of ridicule; and explains himflf move fully in a profe definition illuftrated by examples. The definition, or rather defcription, is in thefe worde. " That which makes objects ridiculous, is fome ground of admiration or efteem connected with other more general circumftances enmparatively worthlefs or deformed : or it is fome circumftance of turpitude or defor. mity connected with what is in general excellent or heautiful; the inconfiltent properties exifting either in the objects themfelves, or in the apprehention of the perfon to whom they relate; belonging always to the fame order or clafs of being; implging fertitment and defign, and exciting no acute or vehemerit com. motion of the heart."-4. Hutchefon has given another account of the ludicrous quality, and feems to think that it is the contralt or oppofition of dignity and meannefs which occafions laughter.
All thefe opinions are refuted by Dr Beattie in his Effay on Laughter and Ludicrous Compofition, where he has treated the fubject in a mafterly manner. "To provoke laughter (fays he), is not effential either to wit or humour. For though that unexpected difcovery of refemblance between ideas fuppofed diffimilar, which is called wit-and that comic exbibition of fingular cha. racters, fentiments, and imagery, which is denominated bumour, - do frequently raife laughter, they do net raife it always. Addifon's poem to Sir Godfrey Kneller, in which the Britiin kings are likened to heathen gods, is exquifitely witty, and yet not laughable. Pupe's Efray on Man abounds in ferious wit; and examples of ferious humour are not uncommon in Fielding's Hiftory of Parion Adams, and in Addifon's accomnt of Sir Roger de Coverley. Wit, when the fubject is grave, and the allutions foblime, raifes admiration in. Head of laughter: and if the comic fingularities of a good nian appear in circumftances of real diflrefs, the imitation of thefe fingularities in the epic or dramatic comedy will form a fpecies of humour, which, if it fhould force a frnile, will draw forth a tear at the fame time. An inquiry, therefore, into the diftinguifhing characters of wit and humour has no neceffary connection with the prefent fubject.
"Some authors have treated of ridicule, without marking the diltinction between ridiculous and ludicrous ideas. But I prefume the natural order of proceeding in this inquiry, is to begin with afcertaining the nature of what is purely ludicrous. Things hudicrous and things ridiculous have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mised with difapprobation and contempt. My defign is to analyfe and explain that quality in things or ideas, which makes them provoke pure laughter, and intitles them to the name of ludicrous or laughable.
" When certain objects, qualities, or ideas, occur to our fenfes, memory, or imagination, we fnile or laugh at them, and expect that other men fhould do the fame. To fmile on certain occafions is not lefs natural, than to weep at the fight of diftefs, or cry out when we feel pain.
"There are different kinds of laughter. As a boy, palling by night through a church-yard, fings or whiftes in oreer to conceal his fear even from himfelf; 4 F fometimes to hide from others, and from themfelves too perhaps, their malevolence or envy. Such laughter is unnatural. The found of it offens!s the ear ; the features diftorted by it feem horrible to the eye. A mixture of hypocrify, malice, and crucl joy, thus difplayed on the countenance, is one of the molt hateful fights in nature, and transforms the " human face divine" into the vifage of a fiend. Similar to this is the fmile of a wicked perfon pleafing himfelf with the hope of accomplifhing his evil purpoles. Milton gives. a ftriking picture of it in that well known paffage :

> He ceas'd; for hoth feem'd highly pieas'd; and Death Grinn'd horrib'e a ghaft'y fom le, to hear
> Histamine fhould be fill'd, and bleft his maw
> Deituid to that good hour -

But enough of this. Laughter that makes man a fiend or a monfter, I have no inclination to analyfe. My inquiries are confined to that fpecies of laughter which is at once natural and innocent.
"Of this there are two forts. The laughter occafioned by tickling or gladnefs is different from that which arifes on reading the Tale of a Tub. The former may be called animal-laugbter: the latter (if it were lawful to adopt a new word which has become very common of late) I fhould term fentimental. Smiles adnit of fimilar divifions. Not to mention the fcornful, the envious, the malevolent fmile, I would only remark, that of the innocent and agreeable fmile there are two forts. The one proceeds from the rifible emotion, and has a tendency to break out into laughter. The other is the effect of good-humour, complacency, and tender affection. This laft fort of fmile renders a countenance amiable in the highelt degree. Homer alcribes it to Venus in an epithet ( $\phi$ inompeidns), which Dryden and Pope, after Waller, improperly tranflate bugghter-loring; an idea that accords better with the character of a romp or hoyden, than with the goddefs of love and beauty.
"Animal-laughter admits of various degrees; from the gentle impulfe excited in a child by moderate joy, to that terrifying and even mortal convulfion which has been known to accompany a change of fortune. This paffion may, as well as jny and forrow, be communicater by fympathy; and I know not whether the entertainment we receive from the playful tricks of kitteas and other young animals may not in part be refolved into fomething like a fellow feeling of their vivacity. - Animal and fentimental laughter are frequently blended; but it is ealy to diflinguifh them. The former is often exceffive; the latter never, unlefs heightened by the other. The latter is always pleafing, both in itfelf and in its caufe; the former may be painful in hoth. But their principal difference is this:-The one always proceeds from a fentiment or emotion excited in the mind, in confequence of certain ideas or objects being prefented to it, of which emotion we may be confcious even when we fupprefs laughter;-the other arifes not from any fentiment or perception of ludicrons ideas, but from fome bodily feeling, or fudden impulfe on what is called the animal Spirits, procceding, or feeming to proceed, from the operation of caufes purely material. The prefent inquiry recुards that fpecies tliat is here diftinguinied by the name of fentimental laughter.
"T The plealing emotion, arifing from the view of

## 594 ] L A U

ludicrous ideas, is known to every one by experience; Laugh but, being a fimple feeling, admits not of definition. It is to be diflinguified from the laughter that generally attends it, as forrow is to be diftinguinied from tears; for it is often felt in a high degree by thofe who are remarkable for gravity of countenance. Swift feldom laughed, notwithflanding his uncommon talents in wit and humour, and the extraordinary delight he feems to have had in furveying the ridiculous fide of things. Why this agreeable emotion fould be aecompanied with laughter as its outward fign, or. forrow exprefs itfelf by tears, or fear by trembling or palencfs, I cannot ultimately explain, otherwife than by fayiog, that fuch is the appoincment of the Author of nature. - All I mean by this inquiry is, to determine, "What is peculiar to thofe things which produce laughter;-or rather, which raife in the mind that pleafing fentiment or emotion whereof laughter is the external fign."
" Illilofophers have differed in their opinions concerning this matter. In Ariflotle's detinition quoted above, it is clear that he moans to characterife, not laughable qualities in general (as fome have thought), but the objects of comic riricule only.; and in this view the definition is juft, however it may have been overlooked or defpifed by comic writers. Crimes and misfortunes are often in modern plays, and were fometimes in the ancient, held up as objects of public merriment; but if poets had that reverence for nature which they ought to have, they would not fhock the common fenfe of mankind by fo abfurd a reprefentation.- The definition from Ariftotle does not, however, fuit the gencral nature of ludicrous ideas; for it will appear by and by, that men laugh at that in which there is neither fault or curpitude of any kind.
"The theory of Mr Hobbes would hardly have deferved notice, if Addifon had not fpoken of it with approbation in the 47 th paper of the Spectator. He jultly oblerves, after quoting the words of Mr Hobbes formerly mentioned, that, "according to this account, when we hear a man laugh exceffively, inftead of faying that he is very merry, we ought to tell him that he is very proud." It is Atrange, that the elegant author fhould be aware of this confequence, and yet admit the thcory: for fo guod a judge of human nature could not be ignorant, that laughter is not confidered as a fign of pride $;$ perfons of fingular gravity being often fufpected of that vice, but great laughers feldom or never. When we fee a man attentive to the innocent humours of a merry company, and yet maintain a fixed folemnity of countenance, is it natural for us to think that he is the humbleft, and the ouly humble perfon in the circle?
"A Another writer in the Spectator, $n^{\circ} 249$, remarks, in confirmation of this theory, that the vainefl part of mankind are mott addicted to the paffion of laughter. Now, how can this be, if the proudef part of mankind are alfo moft addicked to it, unlefs we fuppofe vanity and pride to be the fame thing? But they certainly are different paffions. The proud man defpifes other men, and derives his chief pleafure from the contemplation of his own importance: the vain man ftands in need of the applaufe of others, and cannot be happy without it. Pride is apt to be referved and fullen; vanity is cften affable, and officioully obliging. The proud.

## L A U [ 595$] \quad$ L A U

 proud man is fo confident of his merit, and thinks it fo obvious to all the world, that he will fcarce give himfelf the trouble to inform you of it: the vain man, to raife your admiration, fcruples not to tell you, not only the whole truth, but even a great deal more. In the fame perfon thefe two paffions may, no doubt, be united; but fome men are too proud to be vain, and fome vain men are too confcious of their own weaknefs to be proud. Be all this, however, as it will, we have not as yet made any difcovery of the caufe of laughter : in regard to which, I apprehend, that the vain are not more intemperate than other people; and I am fure that the proud arc much lefs fo."Hutchefon's account of the origin of laughter is equally unfatisfactory. Granting what he fays to be true, 1 wonld obferve, in the firft place, what the ingenious author feems to have been aware of, that there may be a mixture of meannefs and dignity where there is nothing ludicrous. A city, confidered as a collection of low and lofty houfes, is no laughable object. Nor was that perfon either ludicrous or ridiculous, whom Pope fo juftly characterifes,
" The greatelt, wifeft, meapeft, of mankind." -But, fecondly, cafes might be mentioned, of laugh. ter arifing from a group of ideas or objects, wherein there is no difcernible oppofition of meannefs or dignity. We are told of the dagger of Hudibras, that

> " It could fcrape trenchers, or clip bread,
> "Toalt cheefe or bacon, though it were
> "To bait a moufe.trap, 'twou'd not care ;
> "Twou'd make clean hoes, or in the earth
> "Set leeks and onions, and fo forth."

The humour of the paffage cannot arife from the meannefs of thefe offices compared with the dignity of the dagger, nor from any oppoficion of meannefs and dig. nity in the offices themfelves, they being all equally mean; and mult therefore be owing to fome peculiasity in the defcription. We laugh, when a droll mimics the folemnity of a grave perfon; here dignity and meannefs are indeed united: but we laugh alfo (tho' not fo heartily perhaps) when he mimics the peculiarities of a fellow as infignificant as himfelf, and difplays no oppofition of dignity and meannefs. The levities of Sancho Panca oppofed to the folcmnity of his maiter, and compared with his own fchemes of preferment, form an entertaining contrait : but fome of the vagaries of that renowned fquire are truly laughable even when his preferment and his mafler are out of the queftion. Men laugh at puns; the wifell and wittieft of our fpecies have laughed at them; queen Elifabeth, Cicero, and Shakefpear, laughed at them; clowns and children laugh ar them ; and moft men, at one time or other, are inclined to do the fame: but in this fort of low wit, is it an oppofition of meannefs and dignity that entertains us? Is it not rather a mixture of famenefs and diverfity, - famenefs in the found, and diverfity in the fignification?
" In the characters mentioned by Akenfide, the athor does not dittinguifh between what is laughable and what is contemplible; fo that we have no reafon to thirik, that he meant to fpecify the qualities peculiar to thofe things which provoke pure lausbter; and whatcver account we may make of his definition, which to thofe who acquiefce in the foregoing reafonings
may perhaps appear not quite fatisfactory, there is in 1 aughter. the poem a paffage that deferves particular notice, as it feems to contain a more exact account of the ludicrous quality than is to be found in any of the theories abovementioned. This paffage we fhall foon have occafion to quote."

Our author now goes on to lay down his own theory concerning the origin of laughter, which he fuppofers to arife from the view of things incongruous united in the fame affemblage. "However imperfect (fays he) the abovementioned theories may appear, there is none of them deflitute of merit; and indeed the mof fanciful philofopher feldom frames a theory without confulting nature in fome of her more obvious appearances. Laughter very frequently arifes from the view of dignity and meannefs united in the fame object: fometimes, no doubt, from the appearance of affumed inferiority, as well as of fmall faults and unimportant turpitudes; and fometimes, perhaps, though rarely, from that fort of pride which is defcribed in the paffage already quoted from Hobbes.
"All thefe accounts agree in this, that the caufe of laughter is fomething compounded; or fomething that difpofes the und to form a comparifon, by paffing from one object or idea to another. That this is in fact the cafc, cannot be proved a priori; but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, That laughter arifes from the view of two or more objects or ideas difpofing the mind to form a comparion? According to the theory of Hobbes, this comparifon would be between the ludicrous object and ourfelves; according to thofe writers who mifapply Arillotle's definition, it would feem to be formed between the ludicrous object and things or perfons in general ; and if we incline to Hutchefon's theory, which is the belt of the three, we thall think that there is a comparifon of the parts of the ludicrous object, firlt with one another, and fecondly with ideas or things extraneous.
" Further: every appearance that is made up of parts, or that leads the mind of the behollter to form a comparifon, is not ludicrous. The budy of a man or woman, of a horfe, a filh, or a bird, is not ludicrous, thourg it confilts of many parts; and it may be conpared to many other things without railing langhter: but the pieture defcribed in the beginnong of the epitlle to the Pifoes, with a man's head, a horfe's neck, feathers of different birds, limbs of different beats, and the tail of a fifh, would have been thought ludicrous 1800 years ago, if we believe Horace, and in ccrtain circumitances would no doube be fo at this day. It would feem then, that' the parts of a laughable affemblage mult be in fome degree unfuitable and heterogeneous.'
" Moreover : any one of the parts of the Horatian monlter, a human head, a horfe's neck, the tail of a fifl, or the plumage of a fowl, is not ludicrous in itfelf; nor would thofe feveral pieces be ludicrous, if aitended to in fucceffion, without any view to their union. For to fee them difpofed on the different fhelves of a mufeum, or even on the fame fhelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the paffage of Horace to his memory. It feems to follow, that "the incongruous parts of a laughable idea or object mult either

## L A U <br> L A U

Laughtet. he combined fo as to form an affemblage, or mult be intended for a contemptible, perfonage. Hf often lauck fuppofed to be fo combined."
"May we not then conclude, 'that laughter arifes from the view of two or more inconfiftent, unfuitable, or incongruous parts or circum'tances, confidered as united in one comple: object or affemblage. or as acquiring a fort of mutual relation from the peculiar manner in which the mind takes notice of them ?' The lines from Akenfide formerly referred to, feens to point at the fame dotirine :

> Where-e'er the pow'r of ridicule difplays Her quaint-eye'd vifage, fome incongruous form, Some fubborn diffonance of things combin'd, Strikes on the quick offerver.

And to the fame purpofe, the learned and ingenious Dr Gerard, in his Effay on Tafte: 'The fenfe of ridicule is gratified by an incontillence and difonance of circumflances in the fame object, or in objects nearly related in the main; or by a fimilitude or a relation unexpected between things on the whole oppofize and unlike.'
" And therefore, inftead of faying, with Hutchefor, that the caufe or object of laughter is an ' oppolition of dignity and meannefs;' 1 would fay, in more general terms, that it is 'an oppofition of fuitablenefs or unfuraticnefs, or of relation and the want of relation, united, or fuppofed to be united, in the fame allemblage.' 'Thus the ofices afcribed to the dagger of Hudibras feem quite heterageneous; but we difcover a bond of conncetion among them, when we are told that the fame weapon could occafionally perform them all. Thus, even in that mimicry which difplays no oppofition of dignity and meannefs, we perceive the actions of one man joined to the features and body of another ; that is, a mixture of unfuitablenefs, or want of relation, arifing from the difference of perfons, with congruity and fimilitude, arifing from the famenefs of the actions. And here let it be obferved in general, that the greater number of incongruities that are blended in the fame alfemblage, the more ludicrous it will probably be. If, as in Butler's refemblance of the morning to a boiled lobiter, there is a mixture of dignity and meannefs, as well as of likenefs and diffimilitude, the effect of the contrait will be more powerful, than if only one of thefe oppofitions had occurred in the ludicrous idea. 'The fublimity of Don Quixote's mind, contrafted and connected with his miferable equipage, forms a very comical exhibition; but when all this is ftill further connected and contrafted with Sancho Panca, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accontred, be would not bave made us fmile fo often; becaufe, the hero's mind and circumftances being more adequately matched, the whole group would have united fewer inconfiftencies, and reconciled fewer incongruities. Butler has combined a ftill greater variety of uncouth and jarring circumftances in Ralpho and Hudibras: but the picture, though more elaborate, is lefs natural. Yet this argues no defect of judgment. His defign was, to make his hero not only ludicrous, but contemptible; and therefore he jumbles together, in his equipage and perfon, a number of mean and difgufting qualities, pedantry, ignorance, nattinets, and extreme deformity. But the knight of La Mancha, though a ludicrous, was never
moves our pity, he never forfeits our eiteem; and his adventures and fentiments are generally isterelting; which could not have been the cale if his ftory had not been natural, and himflelf been ondowed with great as well as grod qualities. To have given him fuch a fhape, and fuch weapons, arguments, bocts, and breeches, as Bucler has befowed on his champion, would have deftroyed that Colemnity which is fo friking a feature in Don Quixote; and Hudibras, with the manners and perfon of the Spanifh hero, would not have been that paltry figure which the Englith poct meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quix. ote's kindred, but a different character. Smollet's defign was not to expofe him to ridicule, but rather to recommend him to our pity and admiration. He has therefure given him youth, flrength, and beauty, as well as courage and dig nity of mind ; has mounted him on a gentrous fleed, and arrayed him in an clegant fuit of armour. Yit, that the hillory might have a comic air, he lias been careful to contraft and connec: Sir Launcelot with a fquire and other affociates of very diflimilar tempers and circumiltances.
"What has been faid of the caufe of laughter does not amount to an exact defeription, far lefs to a logical dcfinition: there being iunumerable combinations of congruity and inconfiftency, of relation and contrariety, of likenefs and diflimilitude, which are not ludicrous at'all. If we could afcertain the peculiaities of thefe, we thould be able to characterife with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be pruper to evince, that of the prefent theory thus much at lealt is true, that though every incongroas combination is not ludicrous, every ludicrous combination is incongruous.
"It is only by a detail of facts or examples that any theory of this fort can be either eftablithed or overthrown. By fuch a detail, the furegoing theories have been, or may be, fhown to be ill-founded, or not fufficiently comprehenfive. A fingle inftance of a laughable object, which neither unites, nor is fuppofed to unite, incongrunus ideas, would likewife fhow the infufficiency of the prefent; nor will I undertake to prove (for indeed I cannot), that no fuch inilance can be given. A complete enumeration of ludicrous objects it would be in vain to attempt: and therefore we can never hope to afcertain, beyond the pofibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be, imagined. All that can be done in a cafe of this kind is to prove by a variety of examples, that the theory now propofed is mare comprehenlive, and better fuunded, than any of the foregoing." This our author afterwards fhows at full length; but as the variety of exa mples adduced by him would take up too much room to be inferted here, and as every reader mult be capable of addueing numberlefs inftances of ludicrous cafes to himfelf, we fhall content ourfelves with the above explanation of the different theories of laughter, referring thofe who defire further fatisfaction to the treatife already quoted.

LAVINGTON-EAST, a town of Wilts, 4 miles fouth of the Devizes, and 89 miles from London. It is called in our hilluries Stepult-Lavington; but now

vinium Cheaping or Market-Lavington on account of its markets, which ate on Monday and Wednefday, the laf a great corn-market. It is fuppufed to have been a market-town above 200 yeas. Here is a charityfchoul for 36 chaldren, who have books given tl:em, and the girls are taught to knit and few.

LAVINLUM (anc. geos ), a town of Latimm, fix miles to the eaft of Laurentum, according to an ancient map; fo named from Lavinia, confort of A.neas, and daugher of king Latinus, and buile by the Thojans. The firt town of Roman original in Latium, and the feat of the Dii Penates, (Livy): fituated wear the river Numicus, or Numicius; between which and the Tiber IEneas landed, according to Virgil. Holfenius fuppoles the town to have ltuod on an eminence, now called il Monte di Levounv.

## LAUNCE. See Lance.

LAUNCESTON, a town of Cornwal in England, feated on the river Tamar, 214 miles from London. It is alfo called Dunbirid, fiom its fituation on a down. King Henry III. made it a free borough. It was compofed before of two other boroughs, viz. Dunhivid and Newport. It has been the place for chooling knights of the fhire ever fince the reign of King Edward 1. and the alizes-town ever fince Richard II. till by a late act of parliament the lord chancellor or lord keeper was empowered to name any other place in the comnty for it ; fince which the fummer affizes hase been held at Bodnin. It was incorporated by Queen Miary in 1555 . It is governed by a mayor, recorder, and einht aldermen, has a free \{chool which was founded by Queen Elizabeth, and is a populus trading town. Its mar'Aets are on 'Thurfday and Saturday, and it has four fairs. In the 32 d of Henry VIII. an act was made for the repair of this and other decayed Cornifh boroughs ; and it endowed this town with the privileges of a fasctuary, though it does not appear to have uled them. It had a monaftery and a noble callle, which, becaufe of its Hrength, was called caflle-terrible, and was given by King Richard I. to his brother, afterwards King John. Here are two charity fchools for 48 children of both fexes, where the girls are taught to knit, few, and make bonelace, and are allowed what tiey can carn. Leland fays it was walled in lis time, and one mile in compals. Its lilt of burgeffes commences in the 23 d of Edward 1. The lower part of its ancient caltle is made ufe of for the gaol.

LAUNCH, in the fea-language, fignifies to put out: as, Launch the /2is, that is, Put her out of dock; launch aft, or forzuard, fpeaking of things that are fluwed in the hold, is, put them more forward; launch to! is a term ufed when a yard is hoilted high enougl, and fagnifies boift no more. See alfo Lance.

LAUNDER, in mineralogy, a name given in Devonthire, and other places, to a long and fhallow trough, which receives the powdcred ore after it comes cut of the box or coffer, which is a fort of mortar, in which it is powdered with iron peftles. The powdered ore, which is wafhed into the launder by the water from the coffer, is always fineft neareit the grate, and coarfer all the way down.

LAURA, in church-hillory, a name given to a colbetion of little cells at fome diftance from each other,
in which the hermits in ancient times lived together in Lau eace, a wildernefs.

Thefe hermits did not live in community, but cach monk provided fur himfelf in his diftinet cell. The moll celebrated lauras mentioned in ecelebintical hio fory were in Palcftine: as the laura of St Euthymus, at four or five leagues ditance from Jerufa. lem; the laura of St Saba, near the brook Ce. dron; the laura of the '「owers, near the river Jordan, \&c.

Puet-I.AUREATE, an ufficer of the houfchold of the kings of Britain, whofe bulisefs conflis only in co:npoling an ode annua!ly on his majetly's birth-day, and on the new year; fometimes alfu, though rarely, on occafion of any remarkable victory. - Of the firft inftitution of pocts laureate, Mr Wharton has given the following account in his hitory of Englifh poetry. "Great confulion has entered into this fubject, on account of the degrees in grammar, which includedrhetoric and verfitication, anciently taken in our univerfities, particular!y at Oxford: on which occafoon, a wreath of laurel was pretented to the new graduate, who was afterwards ufually ftyled Poeta Laurcatus. Thefe fcholaltic laureations, however, feem to have given rife to the appellation in queition. I will give fome inltances at Oxford, which at the fame time will explain the nature of the ftudies for which our academical philologifts received their rewards. Ahout the year ${ }^{1470}$, one John Watfon, a fudent in grammar. obtained a concelinon to be graduated and laureated in that fcience; on condition that he compofed one hundred I.atin verfes in praife of the univertity, and a Lacin comedy. Another grammarian was diftinguifhed with the fame badge, after Laving fipulated, that, at the next public act, be vould afix the fame number of hexameters on the great gates of St Mary's church, that they might be feen by the whole univerfity. This was at that period the molt convenient mode of publication. About the fare time, one Maurice Byrchenfaw, a fcholar in rhetoric, fisplicated to be admitted to read lectures, that is, to take a degree in that faculty; and his petition was granted, with a provifion, that he fhould write one hundred verfes on the giory of the univerfity, and not fuffer Ovid's Art of Liné, and the Elegies of Pamphilus, to be fludied in anditory. Not long afterwards, one John Bulman, another rhetorician, hasing complied with the terms inapoled, of explaining the firit book of 'rully's Offizes, and likewife the firt of his Epiltles, without any pecmaiary emolument, was graduated in rhetoric; and a crown of laurel was publicly placed on his head by the hauds of the chancellor of the univerfity. About the year 1489 . Skelton was laureated at Oxfurd, and in the year 1493 was permitted to wear his laurel at Cambridge. Robert Whittington affords the laft inflance of a rhetorical degree at Oxford. He was a fecular prieft, and eminent for his various treatifes in grammar, and for lis facility in Latin poetry: having. exercifed his art many years, and fubmitting to the cultomary demand of an hundred verfes, he was honoured with the laurel in the year 1512 .
"With regard to the poet-laureate of the kings of England, he is undoubsedly the fame that is fiyled the king's verfifer, and to whom soo fhillings were paid as

## L A U [ $\left.59^{8}\right] \quad$ L A U

Laureate his annual ftipend in the year 1251. But when or H
Laurentalia. how that title commenced, and whether this officer was ever folemnly erowned with laurel at bis firlt inveftiture, 1 will not pretend to determine, after the farches of the learned selden on this quellion have proved unfuceefsfu\}. It feems moft probable, that the barbarous and inglorious name of werfifier gradually gave way to an appellation of more elegance and dig. nity: or rather, that at length thofe only were in general invited to this appointment, who had received academical fanction, and had merited a crown of laurel in the univerfities for their abilities in Latin compofition, particularly Latin verfification. Thus the king's laureate was nothing more than 'a-graduated shetorician employed in the fervice of the king.' That he originally wrote in Latin, appears from the ancient title virficator: and may be moreover collected from the two Latin poems, which Ballon and Gulielmus, who appear to have refpectively acted in the capacity of royal poets to Richard I. and Edward II. officially compofed on Richard's crufade, and Edward's fiege of Striveling caltle.
"Andrew Bernard, fucceflively poet-laureate of Henry VII, and VIII. affords a Itill ftronger proof that this officer was a Latin fcholar. He was a native of Tholoufe, and an Augultine monk. He was not only the king's poet-laureate, as it is fuppofed, but his hiftoriographer, and preceptor in grammar to Prince Arthur. He obtained many ecclefiaftical preferments in England. All the pieces now to be found, which he wrote in the character of poet-laureate, are in Latin. Thefe are, "An Aldrefs to Henry VIII. for the molt aufpicious beginning of the roth year of his reign, with an Epitbalaniun on the marriage of Francis the dauphin of France with the king's daughter:" A New Tear's Gift for the 1515 ; and, Verfes avißing profperity to his majelty's I 3th year. He has left fome Latin hymns; and many of his Latin prole ieces, which he wrote in the quality of hiltoriographer to both monarehs, are remaining.
" I ain of opinion, that it was not cultomary for the royal laureate to write in Englith, till the reformation of religion had begun to diminifh the veneration for the Latin language; or, rather, till the love of novelty, and a better fenfe of things, had banithed the narrow pedantries of monallic erudition, and taught us to cultivate our native tongue."

LAUREL. See Prunus and Laurus.
Laurels, pieces of gold coined in the year 16t9, with the king's head laureated, which gave them the narne of luurels; the 20 s . pieces whereof were marked with XX. the 10 s . X. and the 5 s. pieces with $V$.

LaURENS Castra. Sce Laurentum.
LAURENTALIA, or IArentalia, called alfo Larentinalia, Laurertales, and Larentales, fealts celebrated among the Romans on the 1 oth of the kalends of January, or 23 d of December, in memory of Acca Laurentia, wife of the thepherd Faultulus, and nurfe of Romulus and Remus.

Acca Laurentia, from whom the folemnity took its name, is reprefented as no lefs remarkable for the beauty of her perfon, than her lafcivioufnefs; on account of which, the was nick-named by her neighbours lupa, " The-wolf;" which is faid to have given rife to the tradition of Romulus and Remus being fuckled by a
wolf. She afterwards married a very rich man, who Laures brought her great wealth, which, at her death,' fhe left to the Roman people; in confideration whereof :hey performed to ber thefe honours; thaugh others reprefent the feaft as held in honour of Jupiter Latiaris. See Larentinalia and Lares.

LAURENIIUS, one of the firlt printers, and, according to fome, the inventor of the art, was born at Haerlem about the year 1370, and executed feveral departments of magiltracy of that city. Thofe writers are miftaken who alfign to him the furname of Cofler, or affert that the office of ædituus was hereditary in his family. In a diploma of Albert of Bavaria in 1380 , in which, amons other citizens of Haerlem, our Laurentius's fatber is mentioned by the name of Founnes Laurentii filius," Beroldus is called aclituus, who was furely of another family; and in $139^{6}$ and 1398 , Henricus à Lomen enjoyed that office; after whafe refignation, Count Albert conferring on the citizens the privilege of electing their ædituus, they, probably foon after, fixed on Laurentius; who was afterwards called Cofler from his office, and not from his family name, as he was defcended from an illegitimate branch of the Gens Brederodia. His office was very lucrative; and that he was a man of great property, the elegance of his houfe may teftify. That he was the inventor of printing, is afferted in the narrative of Junius. His lirft work was an Horarium, containing the Letters of the alphabet, the Lord's prayer, the apoltle's creed, and tivo or three fhort prayers; the next was the Speculum fuhtis, in which he introduced piftures on awooden blacks; then Donatus, the larger fize; and afterwards the fame work in a lefs fize. All thefe were printed on Separate moveable wooden types fatened together by threads. If it be thought improbable, that fo ingenious a man thould have proceeded no farther than the invention of zuooden types; it may be anfwered, that he printed for prafit, not for fame; and suooden types were nut only at that time made fooner and cheaper than meral could be, but were fufficiently durable for the fmall impreffions of each book he mult neceffarily have printed.-His prefs was nearly hapod like the common wine-preffes.- He printed fome copies of all his bouks both on paper and velluin. - It has been very erroneoufly fuppofed, that he quitted the profeffion, and dicd broken hearted: but it is certain, that he did not live to fee the art brought to perfection. - He died in 1440 , aged 70 ; and was fucceeded either by his fon-in-law Thomas Peter, who married his only daughter Lucia; or by their immediate defcendants, Peter, Andrew, and Thomas; who were old enough (even if their father was dead, as it is likely he was) to conduct the bufinefs, the eldent being at lealt 22 or 2.3. What books they printed it is not eafy to determine ; they having, after the example of Laurentius (more anxious for profit than for fame), neither added to their books their names, the place where they were printed, or the date o! the year. Their firft effays were new editions of Donatus and the Spechlum. They afterwards reprinted the latter, with a Latin tranfation, in which they ufed their grandfather's wooden pictures ; and printed the book partly on wooden blockis, partly on zuooden Separate types, according to Mr Meerman, who has given an exact en-

## L A U

uren- graving of cach fort, taken from different parts of the lame book, which was publifited between the years 1442 and 1450 . Nor did they flop here: they conit. nued to print feveral editions of the Speculum, both in Latin and in Dutch; and many other works, particnlarly "Hiftoria Alexandri Magui ;" "Flavii Vedatii [for $V_{\text {egetii] }}$ Renati Epitome de Re Militari;" and "Opera varia à Thomas Kempis." Of each of thefe Mr Meerman has given an engraved (pecimen. They were all printed with feparate wooden tytes; and, by their great neatnefs, are a proof that the defcendants of Laurentius were induftrious in inpproving his invention. Kiempis was printed at Haerlem in 1472, and was the laft known work of Laurentins's defcendants, who foon after difpofed of all their materials, and probably quitted the employment; as the ufe of fufle types was about that time univerfally diffufed through Holland by the fetling of Martens at Alolt, where he purfucd the art with reputation for upwards of 60 years. See (Hiflory of) Printing.

LAURENTIUM, or Laurens Castra, (anc. geog.), a town of Latium, fuppofed to be the royal refidence of thofe molt ancient kings Latinus, Picus, and Faunus, (Virgil). Hither the emperor Commodus retired during a peltilence. Its name was from an adjoining grove of bay-trees, midway between Oitia and Antium. Suppofed to have ftood in the place now called San Loreño; which feems to be confirmed from the Via Laurentina leading to Rome.

LAURO (Philippo), a celtbrated painter, born at Rome in 1623 . He learned the fift rudiments of the art from his father Balthafar, who was himfelf a good painter. He afterward fludied under Angelo Carofello, his brother-in-law; and proved fo great a proficient, that in a Thurt time he far furpaffed his tutor in defign, colouring, and elegance of tafte. He applied himfelf to painting hiftorical fubjects in a fmall fize, emriching the back-grounds with lively landfcapes, that afforded the eye and the judgment equal entertaiument; but though his fmall paintings are bef approved, he finifhed feveral grand compofitions for al. tar-pieces that were highly etteemed. He died in 1.694 ; and his works are eagerly bought up at high prices all over Europe.

Lauro, or Lauron (anc. geog.), a town of the Hither Spain, where Cu. Pumpeius, fon of Pompey the Great, was defeatd and flain. Now Lorigne, five leagnes to the north of Liria in Valencia.

LAURUS, the bay-tree: A genus of the monogynia order, belonging to the enneandria clafs of plants; and in the natural method ranking under the 12 th order, Holoraces. There is no calyx; the corolla is calycine, or ferving in place of the caly $\mathbf{x}$, and fexpantite; the nectarium with three glandules, each terminated by two briflcs furrounding the germen. The interior filaments furnifhed with glaudules at the bafe; the fruit a monofpermous plum.

Species. 1. The notilis, or evergreen bay-tree, is a native of Italy, and hath an upright trunk branching on every fide from the botion upward; with fpearfhaped, nervous, flifi, evergreen leaves, three inches long and two broad; and linall, ycllowifh, quadrifid, diaccious flowers, fucceeded by red berries in autumn and winter. Of this fpecies there are varieties, with troad, narrow, ftriped, or waved leaves 2. The afli-
valis, or deciduous bay, grows naturally in North Ame-
rica. It rifes with an upright rica. It rifes with an upright ftem, covered with a purplifl bark; having oblong, oval, acuminated, veined, deciduous leaves, two or three inches long, and half as broad, growing oppofite; with fimall white flower3 fucceeded by red berries. 3. The benzoin, or benjamin tree, is alfo a native of Noth America; grows 15 or 20 feet high, divided into a very branchy head; with oval, acute, deciduous leaves, three or four iuches long, and half as broad ; and fnall yellowinh flowers, not fucceeded by berries in this country. 4. The fafo fafras is a native of the fame country. It hath a flrublike Itraight Item, garnifled with both oval and threelobed, shining, deciduous leaves, of difierent fizes, from three to fix inches long, and near as broad, with finall yellowifh ft wers fucceeded by blackihh berries, but not in this country. 5. The indica, or Indian bay-trce, rifes with an upright itraight trunk, branching regularly 20 or 30 feet high; adorned with very large, fpear-fhaped, plane, nervous, evergreen leaves on reddinh foothalks ; and bunches of fmall whitilh-green flowers, fucceeded by large oval black berries which do not ripen in this country. 6. The borbonia, or Carolina red bay-tree, rifes with an upright fraight ftem, branching 15 or 20 fect high; with large, fpear-fhaped, evergreen leaves, tranfverfly veined; and long bunches of flowers on red footitalks, fucceeded by large blue berries fitting in red cups. 7. The can:phuta, or camphor-tree, grows naturally in the woods of the weltern parts of Japan, and in the adjocent inlands. The root fmells ftrunger of camphor than any of the other parts, and yields it in greater plenty. The bark of the flalk is outwardly fomewhat rough; bue in the inner furface fmooth and mucous, and therefore eafly feparated from the wood, which is dry and of a white colour. The leaves ftand upon nlender footifaliss, have an entire undulated margin, running out into a point ; have the upper furface of a lively and Ihining green, the lower herbaceous and filky ; and are furnilhed with a few lateral nerves, which ftretch archwife to the circumference, and frequently terminate in imall warts; a circumftance peculiar to this fpecics of launus. The flowers are produced on the tops of foortalks, which proceed from the arm-pits of the leaves; but not till the tree has attained confiderable age and lize. The flower-lalks are flender, branched at the top, and divided into very fhort pedicles, each fupporting a fingle flower. Thefe flowers are white, and confitit of fix petals, which are fieceeded by a purple and fhining berry of the fize of a pea, and in tigare fonewhat top-fhaped. It is compofed of a foft pulpy fubitance that is purple, and has the taite of cloves and camphor; and of a nucleus or kernel of the fize of a pepper, that is covered with a black, flining, oily corticle, of an infipid tafte. 8. The cinnamomum, or cinnamon-tree, is a native of Caylon. It hath a large tout, and divides into feveral branches, covered with a bark, which on the outer fide is of a greyifh brown, and on the infide has a reddiin catt. The wood of the root is hard, white, aud has no fnell. The body of the tree, which grows to the height of 20 or 30 feet, is covered, as well as its numerous branches, with a bark which at firlt is green and afterwards red. The leaf is longer and narrower thans the common bay-tree; and it is three nerved, the

## L. A U

lunpe, nerves sauilhing towards the top. When firt unfolded, it is of a flame colour: but after it has been for fome time expofed to the air, and grows dry, it changes to a deep green on the upper furface, and to a lidhter on the lower. The flowers are fmall and white, and grow in large tunchcs at the extremity of the branches: they have an agreeable fnell, fomething like that of the lily of the valley. The fruit is fhaped like an acorn, but is not to large. 9. The caflia, or bafe cinnareon, has lanceolated leaves, triple-nerved. 10. The Perfea, avoeado-pear tree, or alligator pear, rifes to a confiderable beight, with a ftraight trunk, of which the bark and wood are of a greyif colour. The leaves are long, oval, pointed, of a fubilance like leather, and of a beautiful green colour. The flowers are produced in large knots or clufters at the extremities of the branches, and confift each of fix petale difpofed in the form of a flar, and of a dirty white or yellow colour, with an agreeable odour, which diffufes itelf to a confiderable diflance. It is a native of the Weft Indies. The Perfea begins to beat two years and a lalf, or at mott three years after being planted; and, like rnoft of the trees in warm climates, bears twice a year. There are two other fpecies of this genus, but pofffited of no remarkable properties.

Cillure. The firf fpecies is propagated by layerz, or by the berries. In order to raife a quantity of thefe trees by layers, fome flools thould be planted for the purpofe; and after thefe are fhot about a yard high, the branches muft be brought down to the ground in the winter, all the preceding fummer's fhoots laid on it, and pegged down (beirg firt fit in the joint), and the leaves taken off, which would otherwife be under ground. In one year's time thefe layers will have taken root ; and in the fpring they fould be taken up, and planted in the nuffery a foot afurder, in rows two feet ditance After they are planted out, if the weather flould prove dry, they mult be conftantly watercd ; for without fuch care, it is difficult to make this trce grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raife this tree from the berries, they ought to hang on the trees till about January before they are gathered. A well-fheltered fpot of ground for the feminary mull be made choice of; and having the mould fmooth and fine, they fhould be fown foon after they are gathered, in beds or drills, rather more than half aus inch deep. Towards the clofe of the fpring the plants will come up, and during fummer mult be duly attended; by watering and weding. In the winter following, their ficltered fituation muft not be trulted to, to defend them from the frof: : Furze-buthes, or fome fuch things, unght to be fluck in rows between the beds or drills, to guard them from the black frofts. Indeed, without this precaution, if the winter fhould prove very frofty, few of the young feedlings will be alive in fpring. During the following fummer, weeding and watering muft be cblerved, and the wititer after that they hould be defended with covering as befure ; for they will be ftill in danger of being dettroyed by fevere frofls. In the enfuing fpring, the ftrongeft may be taken out of the feed beds, and planted in the nurfery way; though, if they have not by that time made good
$\mathrm{N}^{\circ} \mathrm{s}, 5$

Thoots, it will be advifable to let them remain in their beds till the third fpring; for a finall plant of this kird is with more difficulty made to grow than one which is larger. When they are planted in the nurfery, the dittance which fhould be allowed them is the fane as the layers, a foot afunder and two feet diflance in the rows; and this will not be found too elofe; for notwithftanding the greatelt care is exerted in planting then in the nurfery, even making cboice of rainy and cloudy weather, which mult always be ohferved in fetting them out, many of them will be lof by being tranfplanted. After they are thus planted out in the nurfery, whether layers or feedlings, they mult be fill watered in dry weather, kept free from weeds, and the rows dug between every winter. You will even find, that thofe plants which fuffer leafl by being tranflanted will have met with a check, whith they will not recover in two or three years; and till they bave acquired new ftrength they flould not be taken from the nurfery; but when they appear to be good Aiff plants, having the year before made a vigorous froot, they will be then proper plants for planting out where they are to remain. Holes fould be got ready for their reception; and as foon as the firt autumnal rains fall, the work fhould be fet about, efpecially if the land be gravelly or dry ; but if it be moilt, the fpring will do as well. Being now planted at one yard difance, they will make a poor progrefs for two or three years more; but after this, when they have overeome all thefe difficulties, they will grow very fat, and arrive to be good trees in a few years. A1though this tree flourifhes beft in old gardens, where the foil has been made rich and deep, and loves the thade, Hanbury tells us, "it thrives neverthelefs exceedingly well in our hottefl gravels and fands; and after it has furmounted the hardhips of tranfplanting, will grow in fuch fituations extremely falt, and arrive to a large bulk."

The propagation of the three next forts of trees may be performed two or three ways, $x$. By the feeds. Thefe we receive, from the places where the trees grow naturally, in the fpring. They mould be preferved in fand; and as foon as they arrive, fhould be fown in largish pots an inch deep. The foil for their reception foould be taken from 3 rich pafture at leaft a year before, with the fward. It Thould alfo be laid on an heap, and frequently turned, until the fward is grown rotten, and the whole appears well mixed and fine. If the pafture from whence it was taken near the furface is a fandy loam, this is the beft compoll for thefe feeds; if not, a fmall addition of drife or fea fand Thould be added, and well mixed with the other mould. A feer filling the pots with this foil, the ferds fhould be fown an inch deep; and then they fhould be plunged into common mouid up to the rim. If the foil be naturally moift, it will keep them cooler, and be better; and if the place be well fheltered and Thaded, it will be better tull. Nothing more than weeding, which mutt be conftantly obferved during the fummer, will be neceffary; and in this flation they may remain until the March following: about the middle of which month, having prepared a good hot-bed. the pots fhould be taken up and plunged therein. Soon after the feeds will come up; and when the young plants have fufficiently received the benefit of this bed, they fhould be enu-

I. A U U 60 red by degrees to the open air. Weeding and watering muft be obferved during the fummer; and at the approach of the cold weather in the autumn, they fhould be renoved under an hot-bed frame, or fome cover, to be proteeted from the frofts during the winter. In the fpring, when this danger is over, they foould refume their furf ftation; namely, the pots fould be plunged up to the rim, as when the feeds were firl fown; and if this place be well fheltered, they may remain there all winter; if not, and fevere frolts threaten, they fhould be taken up and placed under cover as before. After they have been thins managed three years from the feeds, they flould be taken out of the pots with care, and planted in the nurferyground at fmall diftances, where they may remain until they are ftrong enough to be finally fet out. By fowing the Yeeds in pots, and affilting them by an hotbed, a year at leaft is faved; for they hardly ever come up, when fown in a natiral border, under two ycars from the feeds; nay, they have been known to remain three, and even fume plants to come up the fourth year after fowing; which at once mows the preference of the former practice, and fhould eaution ail who have not fuch convenience, not to be too lially in ciftubing the beds when the feeds are fown in the natural ground; as, efpecially if they are not well preferved in mould or fand, the fe may be fome years before they appear. Indeed, it is the long time we are in obtaining thefe plants, either by feeds, layers, \&c. that makes them at prefent fo very fearce amongit us. 2. Thefe plants may alfo be increafed by layers ; but very flowly; for they will be two, and fometimes three, or even four years, before they have fruck out good roots; though the Berjamin the is propagated the faftelt by this metlood. The young twigs thould be laid in the ground in the autumn; and it will be found that twilting the wire round the bud, fo as in fome cegree to ltop the progrefs of the fap, and taking away with a knife a litte of the bark, is a more effectual method of obtaining good roots foon than by the flit ar iwilling, efpecially when pracifed on the falliafras tree. 3. Plants of thefe forts are likewife fometimes obtaisied by fuckers, which they wili at all times throw out, and which may be often taken off with pretty good toots; but when they are weak, and with bad roots, they flowld be planted in pots, and affifted by a moderate heat in a bed: With Sueb management they will be good plants by the autumn, and in the fpring may be planted out any where. 4. Cuttings of thefe trees, when planted in a good bark bed, and duly watered, will alfo oftentimes grow. When this method is pracifed, and plan:s obtained, they mult be inured by degrees to the open air, till they are hardy enough to be finally planted out.

The Indian bay, the campher, the avocado, and the cinnamon tree, require the treatment common to green-houfe plants; the latter, however, is rather a fove plant in this country.-Of its culture or propagation in its native plaees, no particular aecount has been given by botanical writers; but it muft now become an important confideration with us, fince this valuable tree has been acquired by our own colonies. Of the advantages promiled by this acquifition we are indebied for the firft accounts to Dr Wright in 1787 万; from whom allo we learn that its propagation is very Vel. IX. Part II.
eafy, and its culture requires little care, as more parti- Lauris. eularly noticed below. Since that time, Come obferva. $\underbrace{-\quad \text { - }}$ tions by Dr Dancer, relative to its cultivation, have apprared in the Tranfactions* of the Society of Aits, "Vot. Vins. \&c. Thefe obfervations confirm, without adding any P. 214. \&cc. thing effential to the concifc notice of I)r Wright. We arc informed, that as the tree " puts out numerous fide-branches, with a denfe foliage, from the very bottom of the trunk; this furnifles an opportunity of obtaining plenty of layers, and facilitates the propagation of the trec, as it does not perfect its feeds in any quantity under fix or feven years; when it becomes fo plentifully loaded, that a fingle tree is fufficient almolt for a colony. It feems to delight in a loofe moif foil, and to require a fouthern afpect; the trees, thus planted, flourining better than others growing in loam, and not fo well ex. pofed to the fun. When liealthy, it is (from layers) of a pretty quick growth, reaching in cight years the leight of fifteen or twenty feet, is very fpreading, and furnifled with numerous bianclaes of a fit fize for decortication. The feeds, however, are a long time in coming up, and the plants make fmall progrefs for the firlt year or two." It is added, that "the birds appear to be viry fond of the berries, and will probably propagate this tree in the fame way they do many others every where over the ifland ; fo that in a fhort. time it will grow fpontaneoully, or without cultivation." The age for decortication, faid above to be eight years, it will be obferved, is different from that fpecified below for the trees in Ceylon.

Ufes. Evelyn fays, he has feen bay trees near 30 feet ligh, and almolt two feet in diameter; and enumerates the bay amonglt ufeful trets. Hambury catches at this idea, and tells us in general terms, that " it will grow to 30 feet in height, with a trunk of two feet in diameter :" and aecordiugly he arranges it among his foreft irces: he acknowledges, bowever, at the fame time, that the wood is of little value. The bay is neverthelefs a fine aromatic and a beautiful evergreen: It is faid to be the true lums or laurel of the aucient, with which they adomed the brows of their fuccefsful generals. Like the holly, box, and lanrel, the bay. will bear the fhade and drip of taller trees; and it is upon the whole a very defirable, as being a very ornamental, evergreen.

The leaves and berrics of this tree bave a moderate$l_{y^{\prime}}$ frong aromatic fmell, and a warm, bitterifl, pungent talle: the berries are ftronger in both refpects than the leaves, and afford in diflillation a larger quantity of effential aromatic oil; they yield alfo an almott infipid oil to the prefs, in confequence of which they prove unctuous in the mouth. They are warm carminatives, and fometimes eshibited in this intention againft flatulent colics, and likewife in hyfterical diforders. Their principal ufe in the prefent practice is in glyfters, and fome external applications. The decidnous bay, in a moilt rich foil, in which it principally delights, will grow to be aloout 16 feet high ; bat in fome foils, that are poffened of the oppofite qualities, it will hardly arrive at half that height. The flowers are fucceeded in May by large red berries, which never ripen in England : fo that, notwithftanding the leaves in fummer are very pretty, and the colour of the bark makes a variety in winter, it is prin4 G
cipally

## L A U [ 602 ] L A U

Inurus. cipally the fcatcity of this plant which makes it valu. able.

The benzoin tree will grow to a much larger fize than the other, and its branches are more numerous. They are fmooth, and of a fine light-green colour. The leaves on their upper furface are fmooth and of a fine light-green colcur, but their under furface is venofe, and of a whitift catt. When bruifed, they emit a fine fragrance. This tree was formerly miftaken for that which produces the drug called benzoin; which is now known to be obtained from a fpecies of flyrax. See Styrax.

The fafafras will grow to nearly the height of the others, though the branches are not fo numerous. Its bark is fmooth, and of a red colour, which beauifully diftinguifhes it in winter; whilf the fine fhining green of its leaves conflitutes its greateft beanty in fummer. In thefe, indeed, there is a variety, and a very extranrdinary one. Some are large, and of an oval figure; others are finaller, and of the fame fhape; whilit others again are fo divided into three lubes, as to refemble the leares of fome forts of the fig.tree. In America, the faffafras generally ftands fingle in the woods, and along the fences round thie fields. It flowers in May before the leaves conce ott; and being cutirely covered with them, it is dithinguifhed at a great difance by their bedutiful jellow colour.

The root of the fattifras has a fragrant fmell, and a fweetith, aromatic, fubacrid tafte; the bark talles much ftranger than any other part, and the fmall twigs Aronger than the large picces. It is a warm aperient and corroborant, and frequently employed with good fuccefs for purifying and fweetening the blood and juices. For thefe purpofes, infutions made from the rafped root or bark may be drank as tea. In fome conftitutions indecd, fuch liquurs are, by their fragrance, apt, on firtt tuking them, to affect the head ; but in fuch cafes they may be advantageoully freed from their flavour by boiling. A decoction of faffafras, boiled down to the confilience of an extrast, proves fimply biitelifh and fubaftringent. Hoffman affures us, that he hes ficquegtly given this extract to the quantity of a foluple at a time, with remarkable fuccefs, forftrengthening the tone of the vifcera in cachexies; as alfo in the decline of intermittent fevers, and in bypoehondriacal ipafms. Saffafras yields in difillation an extremely fragrant oil of a penetrating Fungent tafte, fo ponderous (notwithftanding the lighteff of the drug itfelf) as to fink in water. Rectified fpirit extracts the whole tafte and fmell of faffafras; and elevates nothirg in evaporation: hence the ipirituous extrace proves the moft elegant and efficacious preparation, as containing the virtue of the root entire.

The bark of this tree is ufed by the women in Pen. fylvania and other parts of Nosth America in dying worlted a fine lafting orange-colonr, which does not fade in the fun. They ufe urine inftead of alum in dying; and boil the dye in a brafs boiler, becaufe in an iron vefficl it does not yield fo. fine a colour. The

On cutting fome part of the faffafras tree, or its Laurus. fhoots, and holding it to the nofe, it has a ftrong but pleafant imell. Some people peel the root, and boil the peel with the beer which they are brewing, becaufe they belicve it wholefome. For the famer reafon, the peel is put into brandy either whild it is diltilling or after it is made. Profeffor Kalm informs us, that a decoction of the root of faffafras in water, drank every morning, is ufed with fuccefs in the dropry.- When part of a wood is deftined for culcivation, the faffafras trees are commonly left upon it, becaule they have a very thick foliage, and afford a cool fhade to the eattie during the great leats. Sume people get their bedpolts made of faffafras wrod, ia order to expel the bugs; for its flrong fcent, it is faid, prevents thofe vermin from fettling in them. For twe or three years together this has the defired effect, or about as long as the wrood keeps its 1lrong aromatic fmell; but after that time it has been obferved to lofe its effect. In Penfylvania fome people put chips of faffafras into their chefts, where they keep all forts of woollen Itufis, ii) order to expel the muths (or larve or caterpillars of moths or tinies) which commonly fettle in them in fummer. The ool keeps its fmell for a long while: Profeffor Kalm faw one which had lain five or fix ytars in the drawer of a table, ano nill preforved the ftength of its fcent. The peopte allo gather its nowers, and ufe it as tea.

The perfea, or alligator ear trec. is cultivateduniverfally in the Weft Indies by all ranks of people. 'The fruit is pear-fhaped, and from one to two pounds in weight. On removing a green fikin or covering, we come to a yellow butyraceous fubttance; and in the itsart find a large round feed or Hune, which is unequal in the forface, and exceedingly hard and woady. This fruit is ripe in Augut and September, and conftitutes one of the moft agreable articles of diet for fix or eight wecks to the negroes. Thefe pears, with a little falt and a plantain or two, afford a hearty meal. Thty are alfo ferved up at the tables of white prople as ctusice fruit. When the pear is ripe, the yellow or eatable fublance is firmer than butter, and taltes fomewhat like butter or marrow: hence it is called by fome the resetalle marrozu. But however exetlent this fiuit is when ripe, it is very dangerous when pulled and eaten before maturity. Dr Wright fays, he has repeatedly known it to produce fever and dyfentery, which were rimoved with difficulty. - The leaves of this tree and thofe of the head-vine or wild liquorice are made into pectoral decoctions by the common people. - The large flone is ufed for marking linen. The clothis tied or held over the ftone, and the letters are pricked ont by a needle through the cloth and into the feed. The fain is a reddifh brown, which never wafhes out. The buds of the a!ligator tree are faid to be ufed with fuecefs in ptifans againft the venereal difeafe. An infufion of them in water, drank in the morning fatting, is tirongly recommended for difodging coagulated blood in the itomach produced by a fall or a fevere flroke on that important entrail. "The wild boars in the Eaft Indies (fays Labat) cat greedily of the mammees and avocado pears, which give their flef a lufcious and mor agreceable favour"

Caffra. The bark of this fpecies is known in the fhons by the name of cuffa lignea. This bark, which

## L A U [ 603 ] A U

Laurus. is imported from different parts of the Eaft Indies and from China, has a very near refemblance to the cimamon; thougt diftinguihable from it by being of a thicker and coarfer appearance, and by its breaking fhort and fmooth, while the cinnamon breaks fibrous and fhivery.--It refembles cinnamon fill more exactly in its aromatic flavour than in its external appearance ; and feems only to differ from it in being fomewhat weaker, in abounding more with a vifcous mucilaginous matter, and in being lefs aftringent. Accordingly, it has not only a place in the Edinburgh pharmacopocia, but is alfo the balis of a diltilled water. It is perhaps furprifing that the London college lave given it no place in their lifts. But although it does not enter their pharmacopœia, yet 'we may venture to affert, that it will not be neglected by the apothecaries. At prefent it is very common with many of them to fublitute the caffia in every cafe for the more expenfive article cinnamon : and indeed almolt the whole of what is at prefent fold under the title either of fimple or fpirituous cinnamon-water is entirely prepared from caffia; and not even entirely from the bark, but from a mixture of the bark and buds.

Cinnamon is the under.bark of the cinnamomun. The beft feafon for feparating it from the outerbark, which is grey and rugged, is the fpring, when the fap flows in the greatelt abundance. It is cut into thin flices, and expofed to the fun, and curls up in drying. - The old trees produce a coarfe kind of cinnamon ; the fpice is in perfection only when the trees are not older than three or four years. When the trunk has been Itripped of its bark, it receives no further nourihment; but the root is Hill alive, and continues to throw out fiefh fhoots. The fruit of the tree is fhaped like an acorn, but is not fo large. Its feed, when boiled in water, yields an oil which fwims at top, and takes fire. If Ifft to cool, it hardens into a white fubftance, of whiclr cancles are made, which have an agreeable fmell, and are referved for the ufe of the king of Ceylon. The cinnamon is not reckoned excelleut unlefs it be fine, fmooth, brittle, thin, of a yellow colour inclining to red; fragrant, aromatic, and of a poignant, yet agreeable talte. The connoiffeurs give the preference to that the pieces of which are long, but flender. That which comes to us is generally mixed with the Caffia bark; but this latt is ealily diftinguithed. Cinnamon fplinters in breaking, and has a roughnefs along with its aromatic flavour; while the Calfia breaks over finouth, and has a mucilaginous tafte. Cinnamon is a very elegant and ufeful aromatic, more grateful both to the palate and flomach than molt other fubllances of thisclais. By its aftringent quality it likewife corroborates the vifcera, and proves of great fervice in feveral kinds of alvine fluxes, and immoderate difcharges from the uterus.

The cinnamon plant, with other valuable ones, was taken in a French thip by Admiral Rodney in the latt war, and prefented by him to the affembly of Jamaica. One of the trees was planted in the botanic garden in St Thomas in the Eaft ; the other by Hinton Eaft, Eff; in his noble garden at the foot of the Blue Mountains. From thefe parent trees fome hundreds of young trees are already produced from layers and cuttings, and difperfed to different parts of the country, in all which it thrives luxuriantly with little trouble: we
may therefore hope it will fom be a valuable addition Laurus. to our commerce. Upon comparing the parts of the tree with the defcription and figure given by Burman and other botanilts, it appears to be the real Ceylon cinnamon, and of the bett kind, called by the natives Rafi: Coronde: but the fpecimens of bark taken put it out of all doubt, being, in the opinion of the bett judges, of an equal, if not fuperior, quality to any imported from India. The fmallist bit of the bark, De Wright affures us, is quite a cordial. The cianamon we have from Holland, he obferves, is often inert, and gives room to fulpect that it has been fubjected to a flight procefs in diftillation.

In regard to the trees growing in Jamaica, Dr Dancer informs us in his paper already quoted, that "The beft cinnamon bark, according to the different trials I have made, is taken from the fmall branches, of about an inch diameter, the larger limbs noz being fo eafily decorticated, and not yielding fo good or folltrong a cinnamon. The fmaller twigs, or thofe that have not acquired a cineritious bark, are too full of fap and mucilage, and liave little aroma. It is the liber, or inner bark, that contitutes the cinnamon; from which the two external barks mult be carefully and entirely feparated, or they vitiate the flavour of the cinnamon ; to do which with dexterity, and to raife the bark fiom the wood, requires fome practice. The bark being feparated, the fmaller pieces are to be placed within the larger ; which, by expofure to the fun or the air, prefently coil up, and require no further preparation. A dry feafon is the proper one for taking the bark; as it is found to be weakened after long or heavy rains. Cinnamon, though more retentive of it3 vitues than any of the other fpices, yet requires to be protected, when taken from the air and moillure, by clofe packing in cedar chefts. - The leaves of this tree, whether recent or driad, are fo llyongly impresnated with an aroma, as to afford a good fuccedaneum for the bark both in cookery and medicine. Dittilled, they give an excellent fimple and firituous water, and an effential oil. Powdered, they are a good aromatic fpecies, or marefchal perfume."

Camphor, though folid, is the effential oil of the laurus camphora; and is obtained from it by dittillation in the Eall Indies. (See the article Camphora).This tree is another of the captured plants given to the inhabitants of Jamaica; and, if cultivated with care, will alfo be an ufeful acquifition.

The Abbe Grofier infurns us, that in China fome of thefe trees are found above 100 cubits in height, and fo thick that 20 perfons cannot inclofe them. The tree is there called tchang; and it is faid that the trunk, when old, emits fparks of fire, but of fo fubtle a nature as not even to injure the hair of th see who are near it. Common camphire cofts only a penny the ounce at Pe-king; but it is inferior to that of Borneo, in the judgment even of the Chinefe.

The manner in which fome authors have fpoken of Camphire (the Abbe obferves), gives us reafon to conclude that they have been entirely ignorant of the procefs employed to obtain this falutary guare. The camphire does not drop to the earth, like the gums of certain refinous trees, which are preferved by difcharging that part of their fubitanc. which is too olly; neither does it diltil from the top to the botom of the

Lagrus, tree through an incifion made in it. The Chinefe Laus. would practife this method could it be employed with fnecefs; for it is very common in China to make fuch kind of incifons in refinous trees. The method ufed by the Chinefe for obtaining camphire is as follows.-. 'Ihey tal:e fome branches frefh from the tchang, chop them very frall, and lay them to fteep in faing-water for three days and three nights. After they bave been foaked in this manner, they are put into a liettle, where they are boiled for a certain time, during which they keep continually firring them with a fick niade of willow. When they perceive that ihe fap of thefe fmall chips adheres fufficiently to the tlick in the form of white frolt, they ll rain the whole, talsing care to throw inway the dregrs aud refufe. This juice is afterwardo poured gently sito a new earthen bafon well sarmifhed, in which it is fuffered to remain oue night. Nesc morning it is found coagulated, and formed into a fulid mafs. To purify this dirt preparation, they procure fome earth from an cld earthen waN, which, when pounded and reduced to a very fine powder, they put into the bottom of a bafon made of red copper; uver this layer of earth, they fpread a layer of camphire, and continue thus until they have laid four firata. The laft, which is of very fine earth, they co. ver up with the leaves of the plimt po-lia, or pennyroyal; and over the whole they place another bafon, joining it very clofely to the former by means of a bind of red earth that cements their brims together. T'ne bafon thus prepated is put over a fire, which mult be managed fo as to keep up an equal heat : experience teaches them to obferve the proper degree. But above all, they mult be very attentive le!t the plaHer of fat earth which keeps the bafons together fhould crack or fall off; utherwife the fpirituous parts would cvaporate and rin the whole procefs. When the batons have been expoled to the nexceffary heat, they are taken off and left to cool; after which they are feparated, and the fublimated camphire is found adhering to the cover. If this operation be repeated two or three times, the camphire is found purer and in larger pieces. Whenever it is neceffary to ufe any quantity of this fubltance, it is put between two earthen veflels, the edges of whieh are furrounded with feveral bands of wet paper. Thefe veffels are kept for about a.t hour over an equal and moderate fire; and when they are cool, the camphire is found in its utmoft perfection and ready for ufe. 'This method of procuring camphite, cven from the heart of the tree, may be practifed in all feafons of the year; which would not be the cafe (our author obferves), were it extracted like other refinous fubllances that only flow during a certain fhort fpace of time. Betides, by lopping the branches of the camphire-tree, lefs hurt is done to it than by making incifions, which are always hazardons.

LAUS, or Laos (ane. geog.), a river of Italy, feparating Lucania from the Bruttii, and running from eat to welt into the Turcan fea; with a cognominal bay, and a town, the lalt of Lucania, a little above the fea; a colony from Sybaris, according to Strabo, Pliny, Stephanus. Buth town and river are now called Laino, in the Calabria Citra; and the bay, called Golfo della Scalec, or di Policafito, two adjuining towns, is a part of the Iufoan fea, extending between the promontory Palinurus and the month of the Laus.

Lavs Pompeia (anc. geog.), a town of Infubria, finated to the eaft of Milan, between the rivers Addua and Lamber. A town built by the Boii after their palfing the Alps: its ancient Gaulic name is unknown. Strabo Pompeius, father of Pompey, leading thither a colony, gave if a new nane, and conferred the Fus Latii on the ancient inliabitants who remained there. The modern Lodi is built from its ruias, at fume diflanee off. E. Lung. 10. 15. N. Lat. 45. 22.

LAUSANNE, a large, ancient, and handfame town of Switzerland, capital of the country of Vand, and in the canton of Bernc, with a famous college and bifhop's fee. 'The town-lroufe and the other public buildings are inganificent. It is feated between three hills near the lake of Geneva, in E. Longr. 6. 35. N. Lat. 16. 30. - The town ttands on an afcent lo iteep, that in fome places the horfes cannot draw up a carriage without great dificulty, and foot-paflengers afcend to the upper part.of the tornn by deps. Here is ant academy for the furdents of the country; the profeffurs are appriuted by government; and there is a pretty good public library. The church, formerly the cathedral, is a magnifieent Gothic building, llanding on the molt elevated part of the tuwn. Among other fepulchres it contains that of Amadxus VIII. duke of Savoy, ftyled the Solomon of his age; beit known by the title of Autipope Felix $V$. who exhibited tbe lingular example of a cnan twice abdicativg the fovereignty, and retiring from regal pomp to a private dation.

The fame year that the conntry uamed Pays de $F$ and was eonquered from the houte of Siavoy, the inhabitants of Laufanne put themfelves under the protection of the Canton of Berne, their bifhop having retired from the town. At that time its privileges were conforned and augmented, and it is tiill governed by its own magiltrates. The citizens of the principal ftrect have the privilege of pronouncing fentence in criminal cafes. If the criminal is found, and acknow. ledges bimfelf guilty, the burghers of the Itrect af. femble: one of the magiftrates pleads in his behalf, and another againt hin; the court of jutice give their opinion upon the point of law; and the majority of citizens poffeffing houfes in the principal Itreet, determine the peoalty. In capital cates there is no parion, according to the letter of the law, unlefs it can be obtained within $2+$ hours from the fovereign council of Berne, though it generally bappens that eight days are allowed hor this purpole. When the criminal is feized within the jurifdiction of the town, the fact is tried, and the burghers pronounce fentence, from which there is no appeal ; but if he bappens to be taken in the diltrict of the bailiff, tatre is an appeal to the government of Berne.

LAVORI (TERra DI), a province of Italy, in the kingdom of Naples, buunded on the weit by the Cainpagna of Rume, and by Farther Aluruzzo; on the north by the Citerior Ahruzzo, and by the county of Moliffa; on the eaft by the Ultra Principata; and on the fouch by the Principata Citra. It is about 63 miles in length and 35 in breadth; and is fertile in corn, excellent vines, and other fruits. There are alfu feveral mineral fprings and mines of fulphur ; Naples is the eapital town.

## Part I. Of the NATURE of LAWS in general.

I$A W$, in its moft general and comprehenfive fenfe, fignifics a rule of action; and is applied indiferiminately to all kirds of action, whether animate or inn; animate, rational or ioretional. 'Ihus we fay', the laws of motion, of gravitation, of optics, of mechatics, as well as the laws of nature and of nations. And it is that rule of action which is preferibed by fome fuperior, and which the inferior is hound to obey.
'Thus when the Supreme Being formed the univerfe, and created matter out of nothing, he imprefied ceriain principles upon that matter, from which it can never depart, and without which it would ceafe to be. When he put that matter into motion, he eftablifhed certain laws of motion, to which all moveable bodies mut conforni. And, to defcend from the greateft operations to the fmalleft, when a workman forms a clock, or other piece of mechanifm, he eftablifhes at his own pleafure certain arbitrary laws for its direction; as, that the hand fhall deforibe a given Space in a given time; to which law as long as the work conforms, fo long it continues in perfecion, and anfwers the end of its formation.

If we farther advance, from mere inactive matter $t o$ vegetable and animal life, we thall find them ftill governed by laws; more numerous indeed, but equally fixed and invariable. The whole progrefs of plants, from the feed to the rooi, and from thence to the feed again; the method of animal nutrition, digertion, fecretion, and all other branches of vital economy; are not left to chance, or the will of the creature itfelf, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great : cator.

This then is the general fignification of law, a rule of action dictated by fome fuperior being: and, in thofe creatures that have neither the power to think nor to will, fuch laws muft be invariably obeged, fo long as the creature itfelf fublifts; for its exiftence defends on that obedience. But laws, in their more conlined fenfe, and in which it is our prefent bufinefs to confider them, denote the rules, not of action in gre. neral, but of human action or conduct: that is, rhe precepts by which man, the nobiefl of a!l fublunary beings, a creature endowed with both reafon and freewill, is commanded to make ufe of thofe faculties in the general regulation of his behaviour.

Man, comidered as a creature, mult neceftarily be fubject to the laws of his Creator, for he is entirely a dependent being. A being, inciependent of any other, has no rule to purfue but fuch as he preferibes to himfelf: but a fate of dependance will inevitably cblige the inferior to take the will of him on whom he de. pends as the rule of his conduct; not indeed in every particular, but in all thofe points wherein his dependance confils. This principle therefore has more or lefs extent and tliect, in propartion as the fuperiority of the one and the cependance of the other is greater or lefs, abfolute or limised. And confequently, as man
depends ahfolutely upon his Maker for every thing, of Lawa it is neceflary that he thould in all peiats conform to in generak. his Maker's will.

This will of his Maker is called the law of noturc. Law ${ }^{3} \mathrm{f}$ Fur as Crod, when he created matter, and endued it naw ef with a principle of mobility, eftablifhed certain rules for the perpetual dircction of that motion ; fo, when he created man, and endued him with frecwill to conduct himfelf in all parts of life, he laid down certain iminutable laws of human nature, whereby that frcewill is in fome degree regulated and reftrained, and gave him alfo the faculty of reafon to difcover the purport of thofe laws.

Confidering the Creator only as a being of infinite power, he was able unquellionably to have prefcribed whatever laws he pleafed to his creature man, however unjult or fevere. But as he is allo a Being of in finite wifdom, he has iaid down only fuch laws as were founded in thofe relations of jutice that exifted in the nature of things antecedent to any politive precept. Thefe are the eternal immutable laws of good and evil, to which the Creator himfelf in all his difpenfations conforms; and which he has enabled human teafon to difcover, fo far as they are neceflary for the conduct of human actions. Such, among others, are thefe prificiples: That we fhould live honetly, fould hist nobody, and fhould render to every one his due; to whitich three general precepts Jultinian has reduced the whole doctrine of law.

But if the difcovery of thefe fort principles of the law of nature depended only upon the due exertion of right reafon, and could not otherwife be obtained than by a chain of metaphyfical difquilitions, mankind would have wanted fone inducement to have quickened theis inquiries, and the greater part of the world would häs: refled content in mental indolence, and iznorance its infeparable companion. As therefore tle Creator is $\approx$ being, not only of infinite power and wiidom, but alfo of intinite gooduefs, he has been pleafed fo to contive the conititution and frame of humanity, that we fhould want no other prompter to inquire after and purfue the rule of right, but only our own felf-love, that univerfal principle of action. For he has fo intimately connected, fo infeparabíy interwoven, the laws of eternal juftice with the happinefs of each indivadual, that the later cannot be attained but by obferving the former; and if the former be punctualliy obeyed, it cannot but induce the latter. In confeguence of which mutual connection of jutice and human felicity, he has not perplexed the law of nature with a inultitude of abll racted rules and precepts, referring merely to the fitnefs or unfitnels of things, as fome have vainly furmifed; but has gracioully reduced the sule of obedience to this one paternal precept, "that man fhould purfue his own happinefs." This is the foundation of what we call ethics, or natural law *. For the feveral - See Nat articles into which it is branched in our fyltems, a-rality. mount to no more than demonitrating, that this or that

Of Laws ackion tends to man'a read happinefs; and therefore very in gereral. in getieral. jutlly concluding, that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is dellructive of man's real happinefs, and thelefore that the law of nature forbids it.

This law of nature, being coëval with mankind, and dictated by God himfelf, is of courfe fuperior in obligation to any other. It is binding over all the globe, iu all countries, and at all times: no human laws are of any validity, if contrary to this; and fuch of them as a:e valid derive all their force, and all their authority, mediately or immediately, from this original.

Gut in order to apply this to the paticular exigencies of each individual, it is fill neceffary to have recourfe to reafon: whofe office it is to difcover, as was befure obferved, what the law of nature directs in cvery circumflance of life; by confidering, what method will tend the molt effectually to our own fubftantial happinefs. And if our reafon were always, as in our firfl anceftor before his tranfgreffion, clear and perfect, unruffled by paffions, unclouded by prejudice, unimpaired by difeale or intemperance, the tafk would be pleafant and eafy; we fhould need no other guide but this. But every man now finds the contrary in his own experience; that his reafon is corrupt, and his underflanding full of ignorance and error.

This has given manifold occafion for the benign interpolition of Divine Providence; which, in compaffion to the frailty, the imperfection, and the blindnefs of humau realon, hath been pleafed, at fundry times and in divers manners, to difcover and enforce its laws by an immediate and direct revelation. The doctrines thus delivered, we call the revealed or divine law, and they are to be found ouly in the Holy Scriptures. Thefe precepts, when revealed, are found upon comparifon to be really a part of the original law of nature, as they tend in all their confequences to man's felicity. But we are not from thence to conclude, that the knowledge of thefe truths was attainable by reafon in its prefent corrupted fate ; fince we find, that, until they were revealed, they were hid from the wiflom of ages. As then the moral precepts of this law are indeed of the fame uriginal with thofe of the law of nature, fo their intrinfic obligation is of equal ftrength and perpetuity. Yet undoubtedly the revealed la $\alpha$ is of infinitely more authenticity than that moral fy flem which is framed by ethical writers, and denominated the natural law : becaufe one is the law of nature, exprefsiy declared fo to be by God himfelf; the other is only what, by the affiftance of human reafon, we imagiue to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but till then they can never be put in any competition together.

Upon thefe two foundations, the law of nature and the law of revelation, depend all human laws ; that is to fay, no human laws fhould be fuffered to contradict thefe. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found neceflary, for the benefit of fociety, to be reftrained within certain limits. And herein it is that human daws have their greatef force and efficacy: for, with regard to fuch points as are not indifferent, human laws are only declaratory of, aud act in fubordination to,
the former. To inftance in thes cafe of murder: this of $L$ is exprefsly forbidden by the divine, and demonitrably in get by the natural, law ; and from thefe prohibitions arifes the true unlawiulnefs of this crime. Thoule human laws that annex a punifhment to it, do not at all increafe its moral guilt, or fuperadd any freh obligation in for, confcientis to ahflain from its perpetration. Nay, if any human law fhouid allow or enjoin us to commit it, we are bound to tran[grefs that human law, or elfc we mult offend both the natural and the divine. But with regard to matters that are in themfrlves indifferent, and are not commanded or forbidden by thofe fuperior laws; fuch, for inttance, as exporting of wool into foreign countries; here the inferior legiflature has feope and opportunity to interpofe, and to make that action unlawful which before was not fo.

If man were to live in a ftate of uature, unconnected with other dividuals, there would be no occafion for any other laws than the law of nature and the law of God. Neither could any other law puffibly exift : for a law always fuppofes fome fuperior who is to make it ; and in a ftate of nature we are all equal, without any wher fuperior but him who is the Author of our being. But man was formed for fuciety; and, as is demonflrated by the writers on this fubject, is neither capable of living alone, nor indeed has the courage to do it. However, as it is impoffible for the whole race of mankind to be united in one great fociety, they mult neceffarily divide into many; and form feparate ftates, commonwealths, and nations, entircly independent of each other, and yet liable to a mutual intercourfe. Hence arifes a third kind of law to regulaie this mutual intercourfe, called the lazv of nations: which, as none of thefe ftates will acknowledge a fuperiority in the other, cannot be dictated by either; but depends entirely upon the rules of natural law, or upon mutual compacts, treaties, leagues, and agreements, between thefe feveral communities: in the conllruction alfo of which compacts we have no other rule to refort to but the law of nature ; being the enly one to which beth communities are equally fubject : and therefore the civil law very juftly obferves, that quod naturalis ratio inter ommes bonines confituit, vecatur jus gentium.

To the confideration, then, of the law of nature, Mun the revealed law, and the law of nations, fucceeds orci that of the municipal or civil law ; that is, the rule by which particular diftriets, communities, or nations, are governed; being thus defined by Jultinian, "jus civile efl quod quifque fiui populus conjlituil." We call it municipal law, in compliance with common fpeech; for though, ftrietly, that expreffion denotes the particular cullons of one fingle municipium or free town, yet it may with fufficient propricty be applied to any one ftate or nation which is governed by the fame laws and cuitoms.

Municipal law, thus underftood, is properly defined Defi to be " a rule of civil conduct preferibed by the fu. preme power in a ftate, commanding what is right, and prohibiting what is wrong." Let us endeavour to explain its feveral properties, as they arife out of this definitior.

Aud, firlt, it is a rule: not a tranfient fudden fts $f$ order from a fuperior to or concerning a particular per- pert fon; bui fomething permanent, uniform, and univerfal. Therfore a pasticular att of the legiflature to confif-
cate the goods of Titius, or to attaint him of high trea-
eral. fon, does not enter into the idea of a muricipal law: for the operation of this act is fpent upon Titius only, and has no rolation to the community in general; it is rather a fentence than a law. But an åt to declare that the crime of anich Tiiius is accufed thall be deemed high treafon; this has permanency, unifornity, and univerfality, and therefore is properly a rule. It is alfo called a rule, to diftinguih it from adrice or counfel, which we are at liberty to follow or not as we fee proper, and to judre upon the reafonablenefs or unreafunablenefs of the thing advifed: whereas our obedience to the law depends not upon our approbaztion, but upon the Mfaker's wuill. Counfel is ouly matter of perfuafion, law is matter of injunction; comfel aets only upon the willing, law upon the unwilling alfo.
It is alfo called a rule, to diftinguifh it from a comfact or agreement; for a compach is a promife procceding from us, law is a command directed to us. The language of a compact is, "I will, or will not, do this;", that of a law is, "Thou thalt, or fhalt not, do it." It is true there is an obligation which a compact carries with it, equal in point of coarcience to that of a law ; but then the original of the obligatuon is different. In compakis, we ourfelves determine and promife what Shall be done, before we are obliged to do it : in lares, we are obliged to act without ourieves determining or promifing any thing at all. Upon thefe accounts law is defined to be "a rule."

Municipal law is alfo " a rule of civil condua." This diflinguifhes municipal law from the natural or revealed: the former of which is the rule of moral conduct; and the latter mot only the rule of moral conduct, but alfo of faith. Thefe regard man as a citature; and point out his dety to God, to himfelf, and to his meighbour, confidered in the light of an imtividual. But municipal or civil law regards him aliou as a citizen, and bound to other duticstorvalds his neightour, than thofe of or.tre mature and religion: duties which he has ellgaged $m$ by erjoring the benefits of the commen union; and which amount to no more, than that he so cuntibute, on his pari, to the fublitence and peace of the faciety.

It is likenvie "a rule prefcrited." Becaufs a bare refolutiol a antised in the oreat of the legifator, without inamisidit.g thelif by furte external fign, can never be properiy a faw. Le is requifite that this refolution be notifer to the per pue who are to obey it. But the manner in wiich ti.is nocitication is to be made, is matter of very $u$ reat indiflutince. It may be notified by univerfal tuajition anc: :ung practice, which fuppofes a previone pubibation, and is the cale of the common law ef Euglant and of Scotlend. It may be notified vivursore, iy uficers appoinitd for that purpofe; as is done with reuzal in proclamations, and fuch acts of patliamen: as are appeiritud to be publicly read in churches and witien affemblies. It may, lafly, be notified by wrating, prmatig, or the like; whith is the general courfe iaken with ail our acts of parlianent. Yet, whece.er way is made afe of, it is iucumbent on the p:omuigators in do is is the moll public and perSpicuras trainter: nut the Caligula, who (according to Dio Calfus) wrote his laws in a verv tuall character, and lung tione ug apon higlt pillars, the mere
effectually to enfnare the people. There is fill a more unreafonable method than this, which is called making of law's exp pof fado; when after an action (indifferent in itfelf) is commisted, the legiflator then for the firt time declares it to have been a crime, and inficts a punifnent upon the perfon who has committed it. Here it is impoffible that the party cou'd forefee, that an action, innocent when it was done, fhould be afterwards converted to guilt by a fubfequent law: he had therefore no caufe to abllain from it; and all pumifiment for not abllaining muft of coniequence lee cruel and unjuft. All laws thould be thertfore made to commonce in futuro, and be notified before the $r$ commence. ment ; which is implied in the term "preferibed." But when this rule is in the ufual manner notified o: preferited, it is then the fubject's Luffaefs to be thoroughly acquainted therewith: for if ignoratice, of what hie might know, were admitted as a legitimate cxcuft, the laws mould be of no effect, but might always be eluded with impunity

But further: Municipal law is "t a rule of civ:l con- Fourth irc" duck prefaibed $l y$ the fapreme forcer in a fiate." Forpersy. leginaure, as was before obferved, is the greate? zi: of fuperiority that can be exercifed by gene being over another. Wherefore it is requifite to the very effence of a law, that it be made by the fuprene power. Soverrignty and legiflature are indeed convertible terms; one cannot fubfilt without the other.

This will naturally lead us into a fhort inquiry concerning the nature of fociety and civil government; and the natcrel inherent right that belongs to the fovereignty of a ttate, wherever that foverceignty bẹ lodged, of raking and enforcing laws.

The onity :rue and natural foundations of fociety are civil fo. the warts and fears of individuals. Not that we can cie:y belicu, with fome theoretical writers, that there ever was a time when there was no fuch thing as fociety; and that, from the impulfe of reafon, and through a fenfe of their wants and weaknefics, individuls nect together in a large plain, entered into an original contract, and chofe the tailelt man prefent to be their governir. This notion, of an actually exilling unconnected tlate of nature, is too wild to be ferioufivad mitted: and befides, it is flainly coniradictory to the revealed accounts of the primative wigin of mankind, and their prefervation 2000 years afterwards ; both which were effected by the means of fingle families. Thefe formed the firf fuciety among themfelves, which every day extended its limita; and whon it grew too large to fublit with convenience in that patloral tate wherein the patriarchis appear to lave lived, it neceffarily fubdivided itfelf by varieus migrations into more. Afterwards, as agriculture increated, which employs and can maintain a much greater number of hands, migrations became lefs frequent: and various tribes, which had formerly feparated, reunited again ; fometimes by compulfion asid conque!t, fowltimes by accident, and fometines puhaps by compaci. But though fociery had not its formal beginning flom any convention of individuals actuated by their wants and their fears; yet it is the fenfe of their weaknefs and inperfection that keeps maskind together: that dereomflates the neceffity of this union; and that therefore is the fulid and natural foundation, as well as the croocnt, of fuciets. And this is what we mean by the original
original contract of fuciety; which, though perhaps in no inltance it bas ever been formally expreficd at the forl inflitution of a fate, $y \in t$ in mature ard reafon mufl always be underfood and implied in the very act of affeciating together: namely, that the whole fhould protect all its parts, and that every part fhould pay obedience to the will of the whole; or, in other words, that the cominunity hould guard the rights of earl incividual member, and that (in return for this protection) each individual fhould fubmit to the laws of the commurity; without which fubmiflion of all, it was impofible that protection could be certainly extended to any.
For when fociety is once formed, government refults of courre, as necefliary to preferve and to keep that fo- ciety in order. Unlefs fome fuperior be coultituted, whofe commands and decifions all the members are bound to obey, they would fill remain as in a flate of rature, without any judge upoa carth to define their feveral rights, and redrefs their feveral wrongs. But as all the inembers of fociety are naturally iqual, it may be afied, In whofe hands are the reins of government to be entrulted? To this the general arfwer is eafy : but the application of it to particular cafes has occafioned one half of thofe mifchiffs which are apt to proceed from mifguided political zeal. In general, all mankind will agree, that government fhould be repofed in fuch perfons, in whom thofe qualities are mott likely to be found, the perfection of which is annong the attributes of lim who is emphatically fyled the Supreme Bcing; the three grand requifites, namely, of wifdom, of goodnefs, and of power: wifdom, to differn the real intereft of the comnuunity ; goodncfs, to endeavour always to purfue that real intereft; and ftrength or power to carry this knowledge and intention into action. Thefe are the natural foundations of forereignty, and thefe are the requifites that ought to be found in every well conflituted frame of government.
How the feveral forms of government we now fee in the world at firt actually began, is matter of great uncertainty, and has occafioned infinite difputes. It is not our bufincfs or intention to enier into any of them. However they began, or by what right foever they fubfit, there is and mult be in all of them a fupreme, irrefifitible, abfolute, uncontrolled authority, in which the jura funmi imperii, or the rights of fovereignty, refide. And this authority is placed in thofe hands, wherein (according to the opinion of the fuunders of fuch refpective flates, either exprefly given or colle Eted from their tacit approbation) the qualities requifite for fupremacy, wifdom, goodnefs, and power, are the moft likely to be found.
meant the making of laws ; for wherever that power refides, all others mult couform to and be directed by it, whatever appearance the outward form and adminillration of the government may put on. For it is at any time is the option of the leginature to alter that form and adminitration by a netw edict or rule, and to put the execution of the laws into whatever hands it pleafes: and all the other powers of the fate mult obey the leginative power in the execution of their feveral functions, or elfe the conltitution is at an cnd.
In a democracy, where the right of naling laws refides in the peopie at large, public virtue or gondnels of intention is more likely to be found than cither of the other qualities of gove nment. Popular affernblics are fiequculy foolifh in their contrivance, and weak in their execution; but generally mean to do the thing that is right and juft, and have always a degree of pathiotifm or public firit. In ariftocracics there is more wiidoun to be found than in the other forms of govverumcitt ; being compoled, or intended to be compofed, of the moft experienced citizens: but there is lefs hoonefly than in a republic, and lefs flrength than in a monarchy. A munarclly is indeed the mott powerful of any, all the finews of government being knit and united together in the land of the prince ; but then there is inminent danger of his enpliuying that ftrength to improvident or oppreffive purparfes.
Thus thefe three fpecies of government have all of them their feveral perictions and inperfections. Democracies are ufually the bell caleulated to direct the end of a law; ariitrocacies, to invent the means by which that end fhall be obtained; and monarchies, to carry thofe means into execution. A nd the ancients, as was obferved, had in general no idea of any othicr permanent form of goverament but thefe three : frr though Cicero deelares himfelf of opinion, "effe optinice conlititutum rempublicam, qua ex tribus generibus illis, regaii, optimo, et populari, fit modice confýfa;" yet Tacitus treats this notion of a mixed government, formed out of them all, and partakiug of the advantages of each, as a vifionaly whim, and one that, if effected, could never be lating or feecure.
But, happily for us of this inland, the Britifh confitution lias long remainced, and we truft will long continue, a flanding exception to the truth of this ohfervation. For, as with us the executive power of the laws is lodged in a fingle perfon, they have all the atyautages of itrength and difpacch that are to be found in the moft abrilute monarchy: and, as the legiliture of the kingdom is entrufted to three diRinct powers, entiuely independent of each other; firt, the kiag; fe. condly, the lords fpiritual and temporal, which is an aritlocratical affembly of perfons felected for their piety, their birth, their wifdom, their valour, or thcir property; and, thirdly, the houfe of commons, freely chulen by the people from among thenfelves, which makes it a kind \& democraey; as this aggregate body, actuated by differcht fprings and attentive to differenc interefts, compofes the Briiifh parliarinent, and las the fupreme difpotal of every thing, there can no ineenveuience be attclupted by cither of the three brancles, but will be withtood by one of the other two, each branch being armed with a negative power fuflicient to repel any innovation which it fhall think inexpedient or dangerous.

By the fovereign power, as was before obferved, is $\mathrm{N}^{\circ}{ }_{17} 6$.
The political writers of antiquity will not allow more than three regular forms of government: the firfl, when the fovereign power is lodged in an aggregate affembly contifting of all the members of a cominunity which is called a clemocracy; the fecond, when it is lodged in a council compofed of felcet members, and then it is Atyled an arij.bacracy; the laft, when it is entrufted in the hands ot a fingle perfon, and then it takes the name of a monarchy. All other fpecies of govern. ment, they fay, are either consuptions of, or reducible to, thefe three.

Fere, then, is lodged the fovereignty of the Britith man. If it therefore is to act as one man, it ought to as by one uniform will. But, inafmuch as political communities are made up of many natural perfons, each of whom has his particular will and inclination, thefe feveral wills cannot by any natural union be joined together, or tempered and difpofed into a laffing harmony, fo as to confitute and produce that one uniform will of the whole. It can therefore be no otherwife produced than by a political union; by the confent of all perfons to fubmit their own private wills to the will of one man, or of one or more afiemblies of men, to whom the fupreme authority is entruffed; and this will of that one man, or affemblage of men, is in
Vol. IX. Part II.

different frates, according to their different congituof the law; whereby it is fignified what evil or penalty flall be incurred by fuch as commit any public wrongs, and tranfgrefs or neglect their duty.
With regard to the firf of thefe, the declaratory part of the municipal law; this depends not fo much upon the law of revelation or of nature, as upon the wifdom and will of the legiflator. This doetrine, which before was flightly touched, deferves a more particular explication. Thofe rights, then, which God and nature have eftablifhed, and are therefore called natural rights, fuch as are life and liberty, need not the aid of human laws to be more effectually invefted in every man than they are; neither do they teceive any additional ftength

#### Abstract

 

Of Laws when declated by the municipal laws to bè inviolable. ingeneral.

On the contrary, no human legifhture has power to
abridge or dettroy them, unlefs the owner fhall himfelf commit fome adt that amounts to a forfeiture. Neither do divine or natural duties (fuch as, for inflance, the worflip of Gad, the maintenance of children, and the like) receive any Atronger fanttion from being alfo, declared to be duties by the law of the land. 'The cafe is the fame as to crimes and mifdemeanours, that are forbidden by the fuperior laws, and therefore fyled mata in fe, fueh as murder, theft, and perjary ; which contract no additional turpitude from being declared unlawful by the inferior legiflature. For that legiflure in all thefe cafes acts ouly, as was before obferved, in fubordination to the Grea: Lawgiver, tranferihing aud puslifhing his precep:s. So that, upon the whole, the declaratory part of the inunicipal law has no force or operation at all, with regard to actions that are naturally and intrinfically right or wrong.

But with regard to thing 3 in themfelves indifferent, the cafe is entirely altered. Thefe become either right or wrong, juit or unjult, duties or mifdemeanors, according as the municipal leginator fees proper, for promating the welfare of the fociety, and more effectually carrying on the purpofes of civil life. Thus our own common la:v has declared, that the goods of the wife do inftantly upon marriage become the property and right of the hulband; and our flatute law has declarcd all monopolies a public offence: yet thet right, and this offence, have no foundation in wature; but are merely created by the law, for the purpofes of civil fociety. And fometimes, where the thing itfelf has its rife from the law of nature, the particular circumlances and mode of doing it become right or wrong, an the laws of the land fhall direct. Thus, for inflance, in civil duties ; obedience to fuperiors is the doctrine of revealed as well as natural religion : but who thofe fuperiors fhall be, and in what circumftances, or to what degrees they fhall be obeyed, is the province of human laws to determine. And fo, as to injuries or crimes, it murt be left to our own legillature to decide, in what cafes the feizing another's cattle fhall amount to the crime of robbery; and where it hall be a juftifiable action, as when a landlord takes them by way
of diftrefs for rent.
Thus much for the declaratory part of the municipal law : and the direfory ftands much upon the fame footing; for this virtually includes the former, the declaration being ufually collected from the direction. The law that fays, "Thou fhalt not Iteal," implies a declaration that fealing is a crime. And we have feen, that, in things naturally indifferent, the very effence of right and wrong depends upon the direction of the laws to do or to omit them.
death in Titius," "and the directiory part has "forbid. den any one to enter on another's property without the leave of the owner ;" if Caius after this will prefume to take poffeflion of the land, the remedial part of the law will then interpofe its uffice ; will make Gaius refture the poffefion to Titius, and alfo pay him danages for the invalian.

With regard to the fanction of laws, or the cvil that may attend the breach of public duties; it is ob. ferved, that human legillators have for the molt purt chofen to make the fanction of their laws rather vindicatory thatr remuneratory, or to conlitt rather in punifhments than in actual putticular rewards: Becaufe, in the firit place, the quiet enjoyment and protetion of all our civil rights and libertis, which are the fure and general confequence of o'setience to the manicipal law, are in themelves the bett and moit valuable of all rewards: becaufe aifo, were the exercife of every virtue to be inforced by the propofal of particular re:ards, it were impofible for any Itate to fursifla tock enough for fo profufe a bounty :and farther, becaufe the dread of evil is a much more Eorcible principle of human actions than the profpeet. of good. For which reafons, though a prudent beflowing of rewards is frometimes of exquifite ufe, yet we find that thofe civil laws, which enforee and enjoin our duty, do feldom, if ever, propofe any privilege or gift to fuch as obey the law ; but do contantly cone armed with a penalty denounced again!t tranfgreflors, cither exprefsly defining the nature and quantity of the punithment, or elfe leaving it to the difcretion of the judges, and thofe who are intrutted with the care of putting the laws in execution.

Of all the parts of a law the moft effectual is the vin- Vindicadicatory. For it is but loft labour to fay, "Do this, or tory para avoid that," unlefs we alfo declare, "This fhall be the confequence of your non-compliance."' We mult therefore obferve, that the main flrength and force of a law confifts in the penalty annexed to it. Herein is to be found the principal obligation of human laws.

Leegiflators and their laws are faid to compel and oblige: not that, by any natural violence, they fo conAtrain a man as to render it impoffible for him to act otherwife than as they direct, which is the Atrict fenfe of obligation; but becaufe, by declaring and exhibiting a penalty againft offenders, they bring it to pafs that no man can eatily choofe to tranfgrefs the law : fince, by reafon of the impending correction, compliance is in a high degree preferable to difobedience. And, even where rewards are propofed as well as punithments. threatened; the obligation of the law feems chiefly to confift in the penalty: for rewards, in their nature can only perfuade and allure; zothing is compulfory: but punifliment.

It is true, it hath been holden, and very jufly, hy the principal of our ethical writers, that human laws are binding upon mens confciences. But if that were. the only or moft forcible obligation, the good only would regard the laws, and the bad would fet them at defiance. And, true as this principle is, it muft fill be underftood with forme reftriction. It holds, we ap. prehend, as to rights; and that, when the law has determined the field to belong to Titius, it is a matter of confcience no longer to with-hold or to invade it. So alfo in regard to natural duties, and fuch offences as are
tavs mala in fe: liere we are bound in confcience, becaufe meral. we are bound by fuperior laws, before thofe human laws were in being, to perform the one and abllain from the other. But in relation to thofe laws which enjoin only pofitive duties, and forhid only fuch things as are not nata in fe, but mala probilitita merely, with. out any intermixture of moral guilt, annexing a penalty to non-compliance; here feems to be confcience no farther concerned, than by directing a fubminion to the penalty, in cale of our breach of thofe laws: for otherwife the muititude of penal laws in a flate would not only be looked upnn asan impolitic, but would alfo be a very wieked, thing; if every fuch law were a fnare for the confcience of the fubject. But in thefe cafes the alternative is offered to every man; "either ablain from this, or fubmit to fuch a penalty :" and his confcience will be clear, whichever fide of the alternative he thinks proper to embrace. Thus, by the flatutes for preferving the game, a penalty is denounced againft every unqualfied perfon that kills a hare, and againft every perfon who poffefies a partridge in Abguft. And fo too, by other ftatutes, pecuniary petralties are inflicted for exercifing trades without lerving an apprenticefhip thereto, for erecting cottages without amexing four acres of land to each, for not burying the dead in woollen, for not performing ftatute work on the public roads, and for innumerable -other pofitive mifdemeanors. Now thefe prohibitory daws do not make the tranfgreffion a moral offence, or fin: the only obligation in confeience is to fubmit to the penalty, if levied. It muf, however, be obferved, that we are here fpeaking of laws that are finiply and purely penal, where the thing furbidden or enjoined is wholly a matter of indifference, and where the penalty inflifted is an adequate compenfation for the civil inconvenience fuppofed to arife from the offence. Dut where difobedience to the law involves in it alfo any degree of public mifchief or private injury, there it falls within our former diftinction, and is alfo an offence againft confcience.

We lave now gone through the definition laid down of a municipal law; and have fhown that it is " a rule-of civil conduct-prefcribed-by the fupreme power in a flate-commanding what is right, and prohibiting what is wrong:" in the explication of which we have endeavoured to interweave a few ufeful principles, concerning the nature of civil government, and the obligation of human laws. Bcfore we conclude this part, it may not be amifs to add a few obferva. tions concerning the interpretation of laws.

Whien any doubt arofe upon the conftruction of the Roman laws, the ufage was to fate the cafe to the emperor in writing, and take his opinion upon it. This was certainly a bad method of interpretation. To interrogate the legilature to decide particular difputes, is not only endlefs, but affords great room for partiality and oppreflion. The anfwers of the emperor were called his refcripts, and thefe had in fucceeding cafes the force of perpetual laws; though they ought to be carefully diftinguifhed, by every rational civilian, from thofe general contlitutions which had only the nature of things for their guide. The emperor Macrims, as his hiforian Capitolinus informs us, had once refolved to abolifh thefe referipts, and retain only the general edicts: he could not bear that the haity
and crude anfwers of fuch princes as Commodns and of laws Caracalla fhould he reverenced as laws. But Jultinian in general. thought otherwife, and lie has preferved them all. $\underbrace{-}$ In like manner the canon laws, or decretal epillles of the popes, are all of them referipts in the friteet fenfe. Contrary to all true forms of reafoning, they argue from particulars to generals.

The faireft and moft rational method to interpret the will of the leginator, is by exploring his intentions at the time when the law was made, by figns the moft natural and probable. And thefe figns are either the words, the contest, the fubject natter, the effects and confequence, or the fpirit and reafon of the law. Let us take a fhort view of them all.

1. Words are genesally to be undertood in their ufual and moft known fignification; not fo much regarding the propricty of grammar, as their general and popular ufe. Thus the law mentioned by Puffendorf, which forbad a layman to lay hands on a prief; uas adjudged to extend to him who had hurt a prieft with a weapon. Again: T'erms of art, or technical terms, mult be taken according to the acceptation of the learned in each art, trade, and fcience. So in the act of fettlement, where the croven of England is limited "to the princefs Saphia, and the heirs of her body being Proteflants, it becomes neceffary to call. in the affitance of lawyers, to afcertain the precife iJea of the words " heirs of her body;", which in a legal fenfe comprife oally certain of her lineal defeendants. Lafly, where words are clearly repugnant in two laws, the latter law takes place of the elder: leges toleriores priores contrarias abrogant, is a maxim of univerfal law, as well as of our own conflicutions. And accordingly it was laid down by a law of the twelve tables at Rome, Quod popuhes fofliemum juffit, id jus. ratum effo.
2. If words happen to be fill dubious, we may ellablif their meaning from the context; with which it may be of fingular ufe to compare a word or a fentence, whenever they are ambiguous, equivocal, or intricate. Thus the prö̈me, or preamble, is often called in to belp the conftruction of an aet of parliament. Of the fame nature and ufe is the comparifon of a law with other laws that are made by the fame legiflator, that lave fome affinity with the fubject, or that exprefsly relate to the fame point. Thus, when the law of England declares murder to be felony without benefit of clergy, we mult refort to the fame law of England to learn what the benefit of clergy is : and, when the common law cenfures fimoniacal contracts, it affords great light to the fubject to conlider what the canon law has adjudged to be fimony.
-3. As to the Jubletr-matter, words are always to be underfood as having a regard thereto ; for that is always fuppofed to be in the eye of the legiflator, and all his expreffions directed to that end. Thus, when a law of Edward 111. forbids all ecclefiafical perfons to purchafe provitions at Rome, it might feem to prohibit the tuying of grain and other victual ; but when we confider that the flatute was made to reprefs the ufurpations of the papal fee, and that the nominations to benefices by the lope were called provifions, we thall fee that the reftraint is intended to be laid upon fuch provifiens only.
3. As to the effects and confequence, the rule is, $4 \mathrm{~Hz}_{2}$ That

Of Laws That where words bear either none, or a very abfurd ingeneral. fignification, if literally underfood, we muft a little deviate from the received fenfe of them. Therefore the Bolognian law, mentioned by Puffendorf, which enacted " that whoever drew blood in the flreets fhould be punifhed with the utmoft feverity," was held after long debate not to extend to the furgeon who opened the vein of a perfon that fell down in the flreet with a fit.

From this method of interpreting laws by the reafon of them, arifes what we call equity: which is thus defined by Grotius, "the correction of that, wherein the law (by reafon of its univerfality) is deficient." For fince in laws all cafes cannot be forefeen or expref. fed, it is neceflary, that, when the general decrees of
the law come to be applied to particular cafes, there fhould be fomewhere a power vefted of defining thofe circumitances, which (had they been forefeen) the legiflator himfelf would have expreffed. And thefe are the cafes which, according to Grotius, "lex non exalie definit, Sed arbitria boni viri permittit."

Equity thus depending, effentially, upon the particular cireumflances of each individual cafe, there can be no eflablifhed rules and fixed precepts of equity laid down, without deftroying its very effence, and reducing it to a pofitive law. And, on the other hand, the 1 i berty of confidering all cales in an equitable light mult not be indulged too far; lett thereby we deftroy all law, and leave the decifion of every queftion entirely in the brealt of the judge. And law, without equity, though hard and difagreeable, is much more defirable for the public good, than equicy without law; which would make every judge a legiffator, and introduce moft in. Ginite confufion: as there would then be almolt as many different rules of action laid down in our courts, as there are differences of capacity and fentiment in the human mind.

Having thus confijered the nature of laws in gene- plan of ${ }^{35}$ ral, we fhall proceed to give a view of the particular two follo law of our own country ; 1. Of England; 2. Of Scot-ing parto land. The Englifh law, however, being too extenfive to admit of detail in a body, we can only here give fuch a fiketch of it as may be fufficient to fhow the connection of its parts; but the principal of thefe parts themfelves are explained at large, under their proper names, in the general alphabet - A contrary method is followed with regard to the law of Scotland. This being lefs extenfive, is given in a body, with all its parts not only in regular connection, but lufficiently explained; thefe parts, again, not being explained in the order of the alphabet,' but marked with numerical references to their explanations in the fyftem.

## Partil. The LaW of ENGLAND.

## INTRODUCTION.

THE municipal law of England, or the rule of civil conduct prefcribed to the inhabitants of that kingdom, may with fufficient propriety be divided into two kinds: the lex non foripta, the unwritten or common law; and the lex foripta, the written or fature law.
The lew non foripta, or unwritten law, includes not only general cuftoms, or the common law properly fo called; but alfo the particular cuftoms of certain parts of the kingdom, and likewife thefe particular laws that are by cuitom obferved only in certain courts and jurifdictions.

In calling thefe parts of the law leges non foripte, we would not be underflood as if all thofe laws were at prefent merely oral, or communicated from the former ages to the prefent folely by word of month. It is true indeed, that in the profound ignorance of letters which formerly overfpread the whole weftern world, all laws were entirely traditional ; for this plain reafon, shat the nations among which they prevailed had but listle idea of writing. Thus the Britifh as well as the

Gallic druids committed all their laws as well as learning to memory ; and it is faid of the primitive Saxuns here, as well as their brethren on the continent, that leges fola memoria et ufu retinebant. But, with us ai. prefent, the monuments and evidences of our legal cufloms are contained in the records of the feveral courte. of jultice, in books of reports and judicial decifions, and in the treatifes of learned fages of the profeflion, preferved and handed down to us from the times of higheft antiquity. However, we therefore tyle thefe parts of our law leges non fcripta, becaufe their original inflitution and authority are not fet down in writing, as acts of parliament are; but they receive their binding fower, and the force of laws, by long and. immemorial ufage, and by their univerfal reception throughout the kingdom: in like manner as Aulus. Gellius defines the jus non foriptum to be that which is tacito et illiterato bominum confenfu et moribus expreflun.

Our ancient lawyers, and particularly Fortefcue ${ }_{3}$. infift with abundance of warmth, that thefecultome. are as old as the primitive Britons, and continued down. through the feveral mutations of government and in..
nv of habitants, to the prefent time, unchanged and unadulgeneral, as Mr Selden in his notes obferves, this affer- tion mutl be underftood with many grains of allowance; and ought only to fignify, as the truth feems to be, that there never was any formal exchange of one fyftem of laws for another: though doubtlefs, by the intermixture of adventicious nations, the Romans, the Picts, the Saxons, the Danes, and the Normans, they mult have infenfibly introduced and incorporated many of their own cufloms with thofe that were before efta. blifhed; thereby, in all probability, improving the texture and wifdom of the whole, by the accumulated wifdom of divers particular countries. Our laws, faith lord Bacon, are mixed as our language; and as our language is fo much the richer, the laws are the more complete.

And indeed our antiquarians and firft hiftorians do all pofitively alfure us, that our body of laws is of this compounded nature. For they tell us, that in the time of Alfred the local cuftoms of the feveral provinces of the kingdom were grown fo various, that he found it expedient to compile his, dome book, or liler juclicialis, for the general ure of the whole kingdom. This book is faid to have been extant fo late as the rcign of Edward IV. but is now unfortunately loft. It contained, we may probably fuppofe, the principal maxims of the common lase the penalties for midemeanors, and the forms of judicial proceedings. 'Thus much may at leaft be collected from that injunction to oblerve it, which we find in the laws of king Edward the tlder, the fon of Alfred. Onnibus qui reipublice prefunt etiam atque etiam mando, ut omnibus aquos fe prebeant ju. dices, perinde ac in judiciali libro jcriptum babetur : nec quiq⿴uam formident quin jus commune audader litereque dicant.

But the irruption and eftablimment of the Danes in England, which followed foon after, introduced new cuftoms, and caufed this code of Alfred in many pro. vinces to fall into difufe, or at leaft to be mixed and debafed with other laws of a coarfer alloy. So that, about the beginning of the 1 th .century there were thrce principal fyttems of laws prevailing in different dittrits. 1. The Meren-Lage, or Mercian laws, which were obferved in many of the inland countics, and thofe bordering on the principality of Wales, the retreat of the ancient Britons; and therefore very probably intermixed with the Britifh or Druidical cuftoms. 2. The Weft Saxon Lage, or laws of the Weft Saxoas, which obtained in the counties to the fouth and weft of the ifland, from Kent to Devonflire. Thefe were probably much the fame with the laws of Alfred above-mentioned, being the municipal law of the far moft confiderable part of his dominions, and particularly including Berkfhire, the feat of his peculiar refidence. 3. The Dane-Lage, or Danifh law, the very name of which fpeaks its original and compofition. This was principally maintained in the reft of the midland counties, and alfo on the eaftern coalt, the part mott expofed to the vifits of that piratical people. As for the very northern provinces, they were at that time ander a diftinct government.

Out of thefe three laws, Roger Hoveden and Rarulphus Ceftrenfis informs us, king Edward the confeffor extracted one uniform law, or digeft of laws, to be obferved throughout the whole kingdom; though

Hoveden and the author of an old manufeript chronicle affure us likewife, that this work was projected and begun by his grandfather king Edgar. And indeed a general digett of the fame nature has been conitantly found expedient, and thercfore put in practice by other great nations, which were formed from an affemblage of little provinces, governed by peculiar cuftoms. As in Portugal, under king Edward, about the heginning of the 15 th century. In Spain, under Monzo X. who about the year 1250 executed the plan of his father St Ferdinand, and collected all the provincial cuftoms into one uniform law, in the celebrated code eatitled las partilas. And in Sweden, about the faine cra, a univerfal body of common law was compiled out of the particular cultoms eftablifhed by the laghman of every province, and entitled the land's lagh, being analogous to the common law of England.

Both thefe undertakings, of king Edgar and Edward the Confeffor, feem to have been no more than a new edition, or frefh promulgation, of Alfred's code or dome-book, with fuch additions and improvements as the experience of a century and an half had fuggetted. For Alfred is generally flyled by the fame hittoriana the legunh Anglicanarunn conditor, as Edward the confeffor is the reflitutor. Thefe, however, are the laws which our hittories fo often mention under the name of the lawus of Edzward the Confeflor; which our anceftors Itruggled fo hardly to maintain, under the firft princes of the Norman line; and which fubfequent princes fo frequently promifed to keep and to reltore as the moft popular act they could do, when preffed by foreign emergencies or domeitic difcontents. Thefe are the laws, that fo vigorouly withltood the sepeated attacks of the civil law; which eftablifhed in the 12 th century a new Roman empire over the moft of the flates on the continent: ftates that have loft, and perhaps upon that account, their political liberties; while the free conflitution of England, perhaps upon the fame account, has been rather improved than debafed. Thefe, in thort, are the laws which gave rife and origin to that collestion of maxins and cultoms which is now known by the name of the common lary. A name either given to it, in contraditinction to other laws, as the ftatute law, the civil law, the law merchant, L and the like; or, more probably, as a lav common to all the realm, the jus commune or folcright, mentioned by king Ëdward the Elder, after the abolition of the feveral provincial cuftoms and particular laws bcfore mentioned.

But though this is the mont likely foundation of this collection of maxims and cuftoms; yet the maxime and cutoma, fo collected, are of higher antiquity than memory or hittory can reach : notbing being more difficult than to afcertain the precife beginning and firt fpring of an ancient and long eftablifhed cultom. Whence it is, that in our law the goodnefs of a cultom depends upon its having been ufed time out of mind: or, in the folemnity of our legal phrafe, time whereof the memory of man runneth not to the contraiy. This it is that gives it its weight and authority ; and of this nature are the maxims and cuftoms which compofe the common law, or lex non fcripta, of this kingdom.

This unwritten, or common law, is properly dis ftinguifhable into three kinds: 1. General cuttoms; which are the univerfal rule of the whole kingdom ${ }_{p}$.

cultoms.
and form the common law in its Aricter and more ufual fignification. 2. Particular cuftoms; which for the moft part affect only the inhabitants of particular dittricts. 3. Certain particular laws; which by cuitons are adopted and ufed by fome particular courts, of pretty general and extenfive juridiction.
I. As to general cuftoms, or the common law properly fo called; this is that law, by which proceedings and determinations in the king's ordinary courts of ju. ftice are guided and directed. This, for the moft part, fettles the courfe in which lands defcend by inheritance; the manner and form of acquiring and transferring property ; the folemnities and obligation of contracts; the rules of expounding wills, deeds, and ads of parliament ; the refpective remedies of civil injuries; the feveral fpecies of temporal offences, with the manrer and degice of punifment, and an in-- finite number of minuter particulars, which diffufe themfelves as extenfively as the ordinary diftribution of common juftice requires. Thus, for example, that there flall be four fuperior courts of record, the chancery, the kirg's bench, the common pleas, and the exchequer; - that the eldeft fon alone is heir to his anceftor;-that property may be acquired and tranfSeared by writing;-thar a deed is of no validity unlefs fealed and delivered;-that wills thall be conltrued more favourably, and decds more ftrictly;-that money lent upon bond is recoserable by action of debt; -that breaking the public peace is an offence, and punifable by fine and imprifonment :-all the fe are doctrines that are not fet down in any written ftatute or ordinance ; but depend merely upon immemorial afage, that is, upon common law, for their fupport.

Some have divided the common law into two principal grounds or foundations: 1. Eitablihhed cuftoms; fuch as that, where there are three brothers, the eldeft brother fhall be heir to the fecond, in exclution of the youngeft: and, 2. Ellablinied rules and maxims; as, © that the king can do no wrong, that no man fhall " be bound to accule himfelf," and the like. But thele feem to be one and the fame thing. For the authority of thefe maxims refts entirely upon general reception and ufage; and the only method of proving that this or that maxim is a rule of the common law, is by fhowing that it hath been always the cuftom to obferve it.

But here a sery natural, and very material, queftion arifes: How are thefe cuftoms or maxims to be known, and by whom is their validity to be determined? The anfwer is, By the judges in the feveral courts of juftice. They are the depofitory of the laws; the living oracles who muft decide in all cafes of doubt, and who are bound by an oath to decide according to the law of the land. Their knowledge of that law is derived from experience and Itudy; from the viginti annorum lusubrationes, which Fortefcue mentions; and from being long perfonally accultomed to the judicial decifions of their predeceffors. And indeed thefe judicial decitions are the principal and moft authoritative evidence, that can be given, of the exiftence of fuch a cuftom as fhall form a part of the common law. The judgment itfelf, and all the proceedings previous thereto, are carefully regittered and preferved under the name of records, in public repolitories fer apart for that particular purpofe; and to them frequent recourfe is had, when any critical queftion arifes, in the determination of which for-
mer precedents may give light or affilance. And therefore, even fo early as the conquelt, we find the prateritorun memeria crentorum reckoned up as one of the chief qualifications of thofe who were held to be legibus patrice optime inflifuti. For it is an eftablifted rule, To abide by former precedents, where the fame points come again in litigation: as well to keep the fale of juttice even and tteady, and not liable to waver with every new judge's opinion; as alfo becaufe the law in that cafe being folemnly declared and determined, what before was uncertain, and perhaps indifferent, is now become a permanent rule, which it is not in the breaft of any fubfequent judge to alter or vary from according to his private fentiments: he being fwoun to determine, not according to his own private judgement, but according to the known laws and ouftoms of the land ; not delegated to pronounce a new law, but to maintain and expound the old one. Yet this rule admits of exception, where the former determination is mot evidently contrary to reafon; much more if it be contrary to the divine law. But, even in fuch cafes, tlie fubfequent judges do not pretend to make a new law, but to vindicate the old one from mifreprefenta. tion. For if it be found that the former decifion is. manifeftly abfurd or unjuft, it is declared, not that fuch a fentence was bad law, but that it was not law; that is, that it is not the eftablifhed cultom of the realm, as has been erroneouly determined. And hence it is that our lawyers are with jultice fo copions in their encomiums on the reafon of the common law ; that they tell us, that the law is the perfection of reafon, that it always intends to conform thereto, and that what is not reafon is not law. Not that the particular reafon of every rule in the law can at this ditance of time be always precifely affigned; but it is fufficient that there be nothing in the rule fatly contradictory to reafon, and then the law will prefume it to be well founded. And it bath been an ancient obfervation in the laws of England, that whenever a ftanding rule of law, of which the reafon perhaps could not be remembered or difcerned, hath been wantonly broke in upon by ftatutes or new refolutions, the wifdom of the rule hath in the end appeared from the inconveniences that have followed the innovation.

The doctrine of the law then is this: That prece* dents and rules mutt be followed, unlefs flatly abfurd or unjult: for though their reafon be not obvious at firft view, yet we owe fuch a deference to former times, as not to fuppofe they acted wholly without confidera. tion. To illuftrate this doctrine by examples. It has been determined, time out of mind, that a brother of the half blood thall never fucceed as heir to the eftate of his half brother, but it fhall rather efcheat to the king, or other fuperior lord: Now this is a politive law, fixed and eftablifhed by suftom; which cuftom is evidenced by judicial decifions; and therefore can never be departed from by ariy modern judge without a breach of his oath and the law. For herein there is nothing tepugnant to natural juftice ; though the artificial reafon of it, drawn from the feodal law, may not be quite obvious to every body. And therefore, on account of a fuppofed hardhip.upon the half brother, a modern judge might wift it had been otherwife fettled; yet it is not in his power to alter it. But if any court were now to determine, that an elder brother of the half blood might enter upon and feize any
lands that were purchafed by his younger brother, no fubfequent judges would fcruple to declare that fuch prior determination w'as unjuit, was unreafonable, and therefore was not law. So that the law, and the opinion of the judre, are not always conventible terms, or one and the fame thing; fince it fometimes may happen that the judge nay mifake the law. Upon the whole, however, we maly take it as a genseral rule, " 'l'hat the decifions of courts of jutice are the evidence of what is common law;" in the fame manner as in the civil law, what the empetor had once determined was to ferve for a guide for the future.

The decilions therefore of courts arc held in the highef regard, and are not only preterved as authentic rccords in the treafuries of the feveral courts, but are haded our to putlic view in the numerous volumes of reports which furnifh the lawer's library. 'Thefe reports are hiftories of the \{eversl cafes, with a fhort fummary of the proceedings, which are preferved at larse in the record; the arguments on both lides, and the reafons the court gave for its judgment; taken down in fhort notes by perfons prefent at the determi. nation. And thefe ferve as indexes to, and alfo to explain, the records; which always, in matters of confeguence and nicety, the judges direet to be fearched. The reports are extant in a regular feries from the reign of king Edward II. inclufive; and from his time to that of Henry VIII. were taken by the prothonotaries, or chief fcribes of the court, at the expence of the crown, and publifhed annually, whence thry are known under the denomination of the yearbooks. And it is much to be withed that this beneficial cultom lad, under proper regulations, been continued to this day; for though king James I. at the inllance of lord Bacon, appointed two reporters, with a handfome ltipend, for this purpofe; yet that wife iriltitution was foon neglected, and from the reign of Henry VIII. to the prefent time this tafk has been ex. ccuted by many private and cotemporary liands; who fonctimes through halte and inaccuracy, fometimes through miltake and want of fkill, have publifhed very crude and imperfect (perhaps contradictory) accounts of one and the fame determination. Some of the molt valuable of the ancient reports are thofe publifhed by lord chief juttice Coke; a man of infinite learning in his profeffion, though not a little infected with the pedantry and quaintnefs of the times be lived in, which appear Arongly in all his works. Hnwever, his writings are fo highly efteemed, that they are generally cited without the author's name (A).

Befides thefe reporters, there are alfo other authors, to whom great vencration and refpect are paid by the fudents of the common law. Such are Glanvil and Bracton, Britton and Fleta, Littleton and Fitzherbert,
with fome others of ancient date, whefe treatifes are cited as authority; and are evidenec that cafes have furoncrly happened in which fuch and fuch points were deternined, which are now become fetted and firlt principles. One of the latk of thefe methodical writers in point of time, whole works are of any intriatic an. thority in the connts of jallice, and do not entirely depend on the flength of their quotations from older authors, is the fame leanned judge we lave jult mentioned, Sir Eriward Coke; who hath wnitten four volumes of Inititutes, as he is pleafed to call them, tho" they liave little of the inditutional method to warranc fuch a title. The firtl volume is a very extenfive comment upon a litte excellent treatife of tenures, comp:lat by judge Littleton in the reign of Ed. ward 1 V . 'This conment is a rich mine of valuable common-law bearming, collected and heaped together from the ancient reports ind year. books, but greatly defective in method ( B ). The fecond volume is 2 . comment upen many old acts of parliament, without any fytlematical order; the third a in are methodical treatife of the pleas of the crown; and the fourth an: account of the feveral farcies of courrs (c).

And thus much for the firft ground and chief cornerftone of the laws of England; which is general immemorial cuftom, or common lav, from time to time declared in the decifions of the courts of jultice; which. decilions are preferved amnng the pablic records, explained in the reports, and digefted for general ufe in the authoritative writings of the vencrable fages of the law.
